
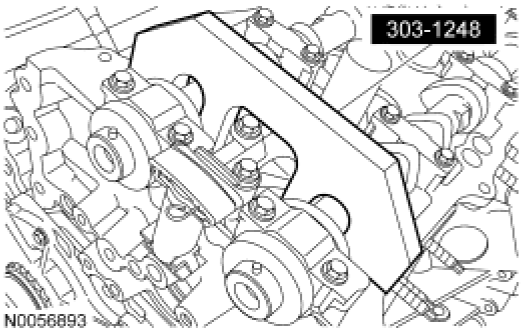

Fig. 483: Removing Special Tool (303-1248) From LH Camshafts
Courtesy of FORD MOTOR CO.

CAUTION: **The camshafts must remain in the neutral position during removal or engine damage may occur.**

106. Verify the LH camshafts are in the neutral position.

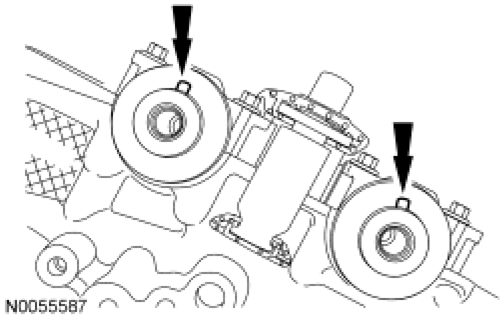

Fig. 484: Verifying LH Camshafts Are In Neutral Position

Courtesy of FORD MOTOR CO.

107. Remove the 2 bolts and the LH secondary timing chain tensioner.

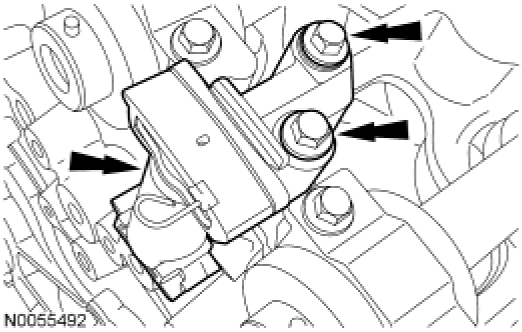

Fig. 485: Locating LH Secondary Timing Chain Tensioner & Bolt
Courtesy of FORD MOTOR CO.

NOTE: Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

108. Remove the bolts and the LH camshaft bearing caps.
   - Remove the LH camshafts.

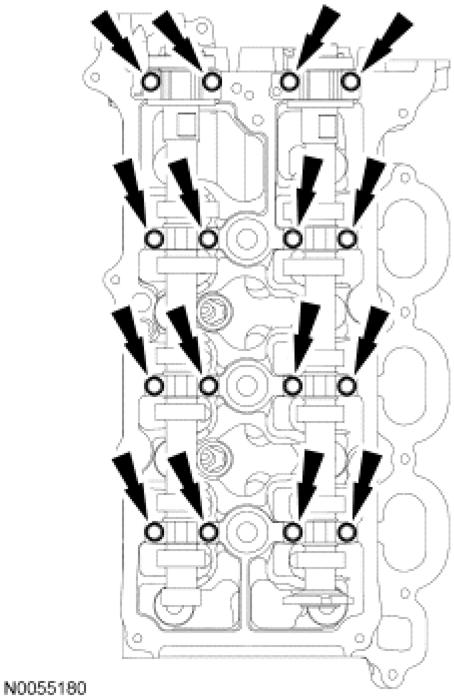

Fig. 486: Identifying LH Camshafts Bolts
Courtesy of FORD MOTOR CO.

109. Compress the RH secondary timing chain tensioner and install a suitable lock pin to retain the tensioner in the collapsed position.

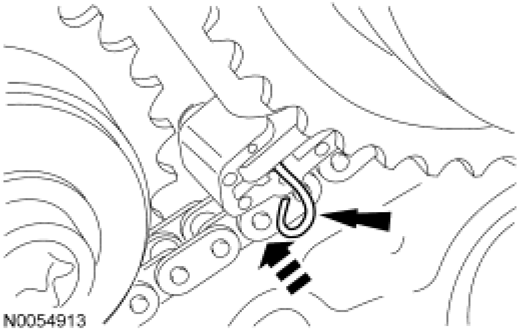

Fig. 487: Compressing RH Secondary Timing Chain Tensioner & Installing Suitable Lock Pin To Retain Tensioner In Collapsed Position
Courtesy of FORD MOTOR CO.

NOTE: **The VCT bolt and the exhaust camshaft bolt must be discarded and new ones installed. However, the exhaust camshaft washer is reusable.**

110. Remove and discard the RH VCT assembly bolt and the RH exhaust camshaft sprocket bolt.
    - Remove the RH VCT assembly, secondary timing chain and the RH exhaust camshaft sprocket as an assembly.

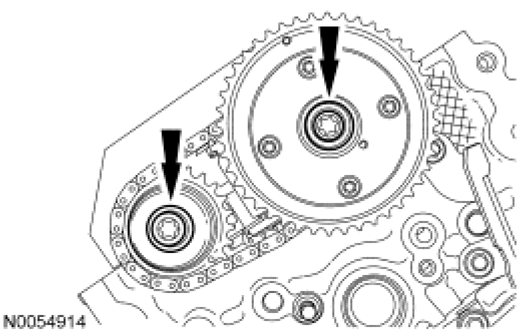

Fig. 488: Locating RH VCT Assembly Bolt & RH Exhaust Camshaft Sprocket Bolt
Courtesy of FORD MOTOR CO.

111. Remove the special tool from the RH camshafts.

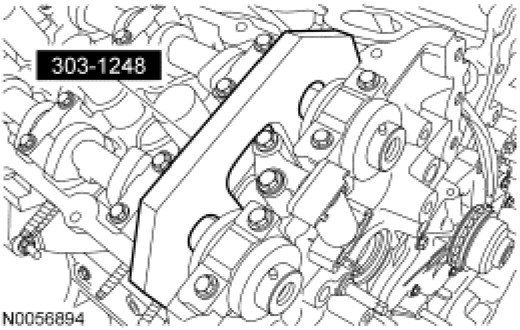

Fig. 489: Removing Special Tool (303-1248) From RH Camshafts
Courtesy of FORD MOTOR CO.

CAUTION: The camshafts must remain in the neutral position during removal or engine damage may occur.

112. Rotate the RH camshafts counterclockwise to the neutral position.

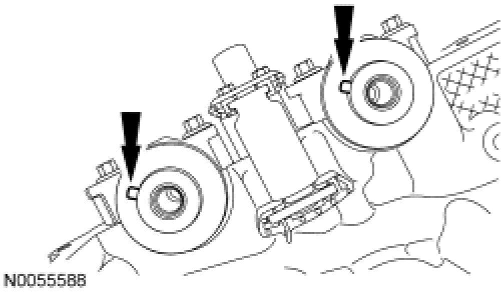

Fig. 490: Rotating RH Camshafts Counterclockwise To Neutral Position
Courtesy of FORD MOTOR CO.

113. Remove the 2 bolts and the RH secondary timing chain tensioner.

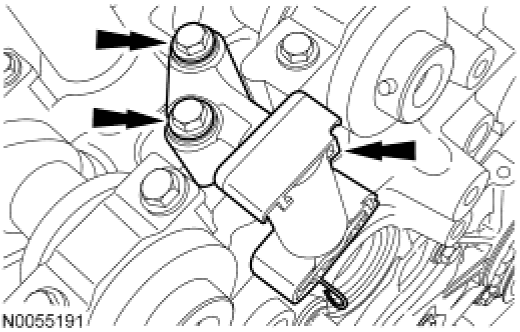

Fig. 491: Locating RH Secondary Timing Chain Tensioner & Bolts
Courtesy of FORD MOTOR CO.

114. Remove the 2 bolts and the RH primary timing chain guide.

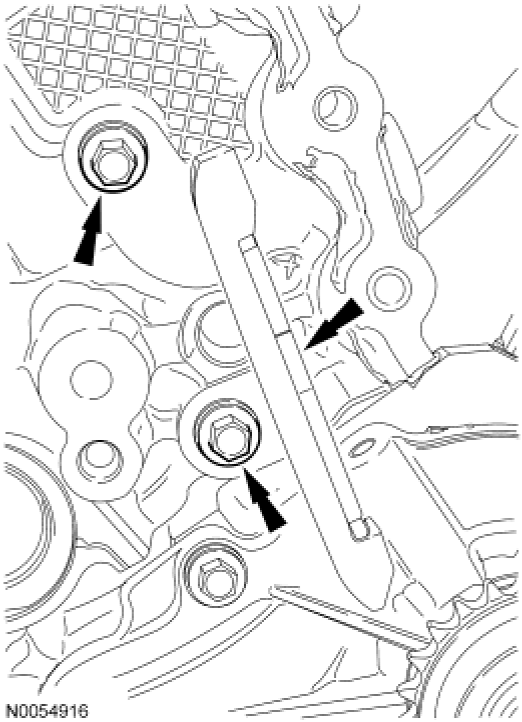

Fig. 492: Locating RH Primary Timing Chain Guide Lower Bolt
Courtesy of FORD MOTOR CO.

NOTE:	**Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.**

115. Remove the bolts and the RH camshaft bearing caps.
    - Remove the RH camshafts.

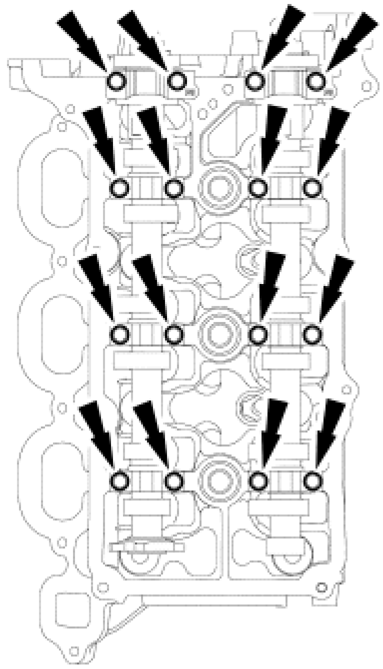

Fig. 493: Identifying RH Camshafts Bolts
Courtesy of FORD MOTOR CO.

NOTE: **If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.**

NOTE: **LH shown, RH similar.**

116. Remove the valve tappets from the cylinder heads.

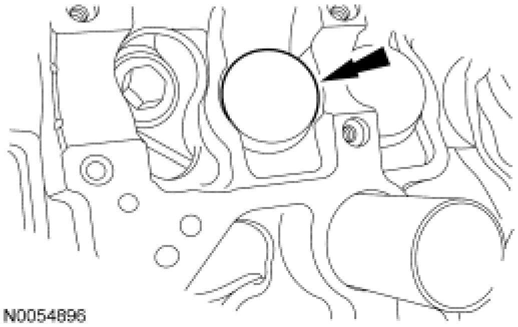

Fig. 494: Identifying Valve Tappets From Cylinder Head
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

117. Remove and discard the M6 bolt from each cylinder head.

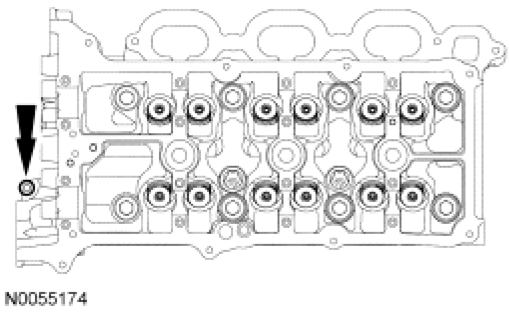

Fig. 495: Identifying M6 Bolt
Courtesy of FORD MOTOR CO.

CAUTION: Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.

CAUTION: Aluminum surfaces are soft and may be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.

NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are tighten-to-yield design and cannot be reused.

NOTE: LH shown, RH similar.

118. Remove and discard the 8 bolts from each cylinder head.
- Remove the cylinder heads.
- Discard the cylinder head gaskets.

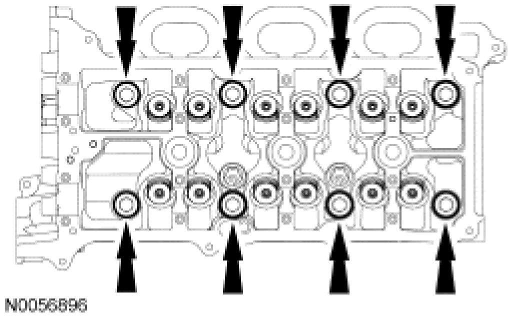

Fig. 496: Identifying Cylinder Head Bolts
Courtesy of FORD MOTOR CO.

CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the gasket.

NOTE: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

119. Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder heads and the cylinder block.
    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.
120. Support the cylinder heads on a bench with the head gasket side up.

NOTE: The straightedge used must be flat within 0.0051 mm (0.0002 in) per foot of tool length.

121. Inspect all areas of the deck face with a straightedge and feeler gauge. The cylinder heads must not have depressions deeper than 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area, or scratches more than 0.0254 mm (0.001 in).
122. Remove the coolant tube.
    - Remove and discard the O-ring seals.

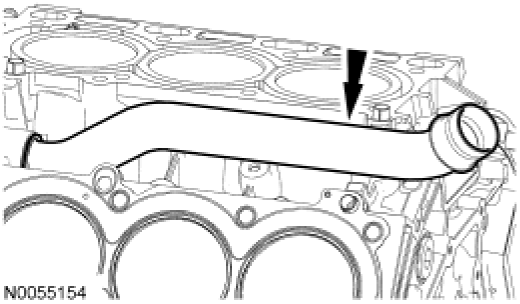

Fig. 497: Identifying Coolant Tube
Courtesy of FORD MOTOR CO.

123. Remove the 2 bolts and the knock sensor (KS).

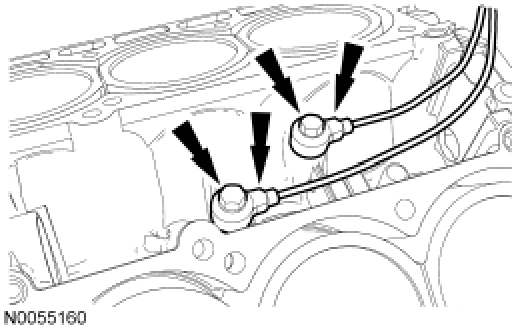

Fig. 498: Locating Knock Sensor (KS) Bolts
Courtesy of FORD MOTOR CO.

124. Remove the 8 bolts and the coolant pump.

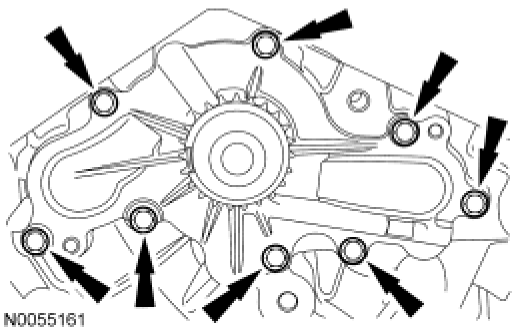

Fig. 499: Locating Coolant Pump Bolts
Courtesy of FORD MOTOR CO.

125. Remove the 16 oil pan bolts.

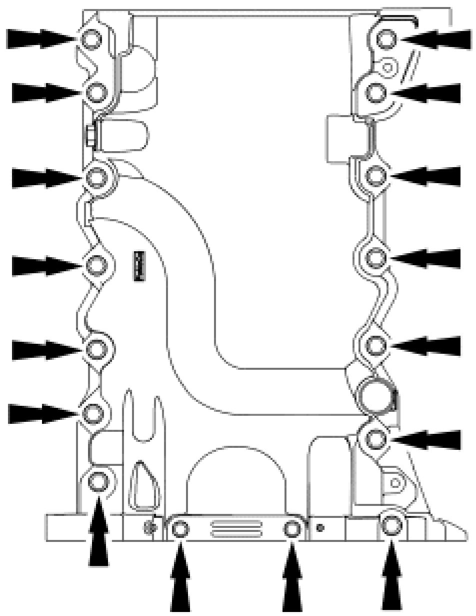

Fig. 500: Identifying Oil Pan Bolts
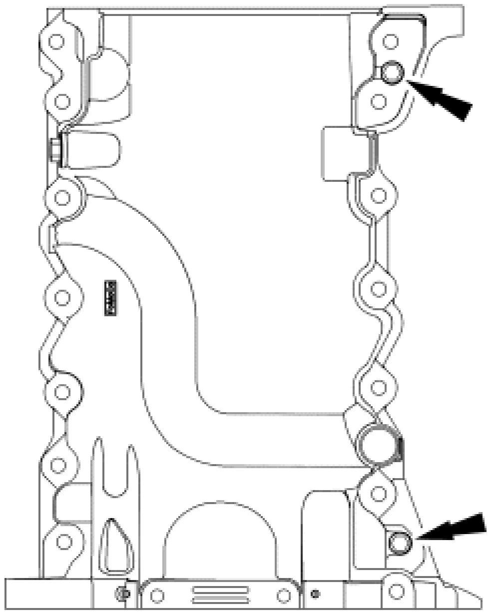
Courtesy of FORD MOTOR CO.

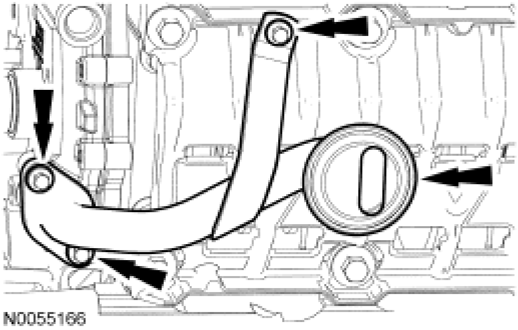
126. Install 2 of the oil pan bolts (finger tight) into the 2 threaded holes in the oil pan in the following sequence.
    1. Alternately tighten the 2 bolts one turn at a time until the oil pan-to-cylinder block seal is released.
    2. Remove the oil pan.



N0055164

Fig. 501: Installing 2 Of Oil Pan Bolts (Finger Tight) Into 2 Threaded Holes In Oil Pan
Courtesy of FORD MOTOR CO.

127. Remove the 3 bolts and the oil pump screen and pickup tube.
    - Discard the O-ring seal.



N0055166

Fig. 502: Identifying Oil Pump Screen, Pickup Tube & Bolts
Courtesy of FORD MOTOR CO.

128. Remove the 3 bolts and the oil pump.

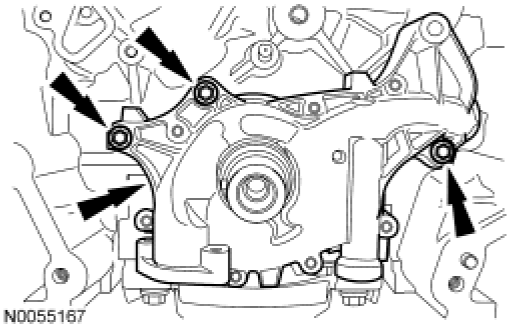


Fig. 503: Identifying Oil Pump & Bolts
Courtesy of FORD MOTOR CO.

129. Remove the 8 crankshaft rear seal retainer bolts.

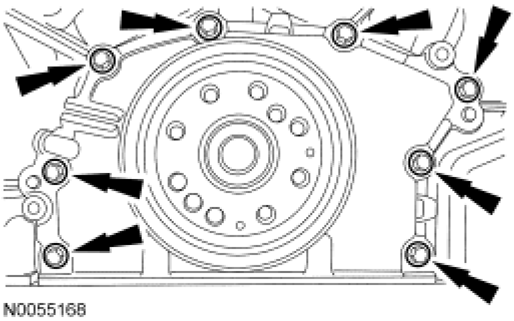

Fig. 504: Locating Crankshaft Rear Seal Retainer Bolts
Courtesy of FORD MOTOR CO.

130. Install the 2 M6 oil pan bolts (finger tight) into the 2 threaded holes in the crankshaft rear seal retainer in the following sequence.
    1. Alternately tighten the 2 bolts one turn at a time until the crankshaft rear seal retainer-to-cylinder block seal is released.
    2. Remove the crankshaft rear seal retainer.

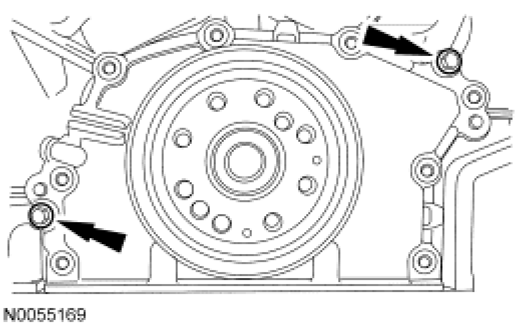

Fig. 505: Identifying M6 Oil Pan Bolts
Courtesy of FORD MOTOR CO.

CAUTION: Only use a 3M Roloc® Bristle Disk (2-in white, part number 07528) to clean the engine front cover, oil pan and crankshaft rear seal retainer plate. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean the engine front cover, oil pan and crankshaft rear seal retainer plate. These tools cause scratches and gouges that make leak paths.

131. Clean the engine front cover, oil pan and crankshaft rear seal retainer plate using a 3M Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15,000 RPM.
    - Thoroughly wash the engine front cover, oil pan and crankshaft rear seal retainer plate to remove any foreign material, including any abrasive particles created during the cleaning process.

CAUTION: Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.

CAUTION: Do not use wire brushes, power abrasive discs or 3M Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that will cause premature engine failure. Remove all traces of the gasket.

132. Clean all engine sealing surfaces of the cylinder block in the following sequence.
    1. Remove any large deposits of silicone or gasket material.
    2. Apply silicone gasket remover and allow to set for several minutes.
    3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep to remove any remaining traces of oil or coolant and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.
    5. Make sure the 2 engine front cover locating dowel pins are seated correctly in the cylinder block.

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES

CYLINDER HEAD

Special Tools

Illustration	Tool Name	Tool Number

4	6A517	Intake valve stem seal (6 required)
5	6505	Intake valve (6 required)
6	6507	Exhaust valve (6 required)
7	6A517	Exhaust valve stem seal (6 required)
8	6513	Exhaust valve spring (6 required)
9	6514	Exhaust valve spring retainer (6 required)

10	6518	Exhaust valve spring retainer key (12 required)
11	6G004	Cylinder Head Temperature (CHT) sensor

DISASSEMBLY

All cylinder heads

NOTE: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

1. Using the Valve Spring Compressors, remove the keys, retainer and spring.

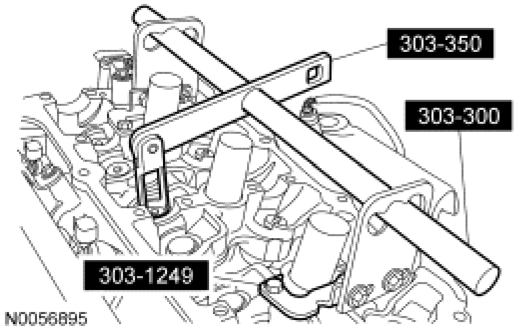

Fig. 507: Removing Keys, Retainer & Spring Using Special Tools (303-1249, 303-350, 303-300)
Courtesy of FORD MOTOR CO.

2. Remove the valve from the cylinder head.
3. Remove and discard the valve stem seal.
4. Repeat the above steps for each valve.

RH cylinder head

5. Remove and discard the Cylinder Head Temperature (CHT) sensor.

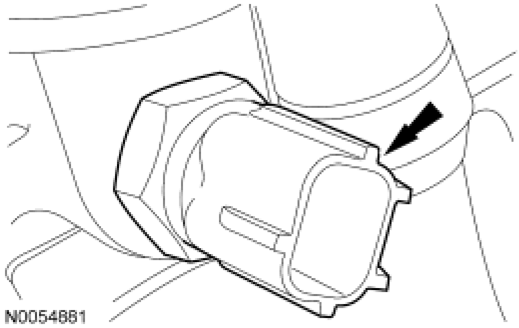

Fig. 508: Identifying Cylinder Head Temperature (CHT) Sensor
Courtesy of FORD MOTOR CO.

ASSEMBLY

All cylinder heads

NOTE: Lubricate the valve stem seal with clean engine oil prior to installation.

1. Using the Valve Stem Oil Seal Installer, install a new valve stem seal.

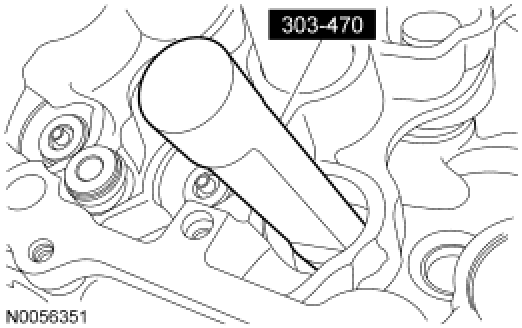

Fig. 509: Installing New Valve Stem Seal Using Special Tool (303-470)
Courtesy of FORD MOTOR CO.

2. Install the valve.
3. Using the Valve Spring Compressors, install the valve spring, retainer and key.

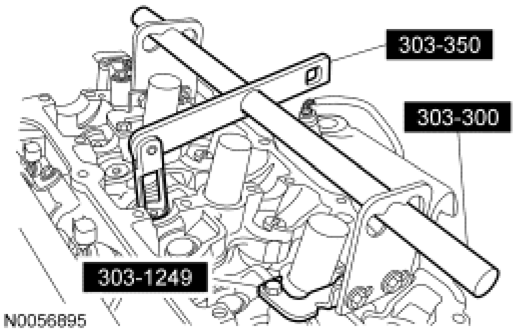

Fig. 510: Removing Keys, Retainer & Spring Using Special Tools (303-1249, 303-350, 303-300)
Courtesy of FORD MOTOR CO.

4. Repeat the above steps for each valve.

RH cylinder head

5. Install a new CHT sensor.
   - Tighten to 10 Nm (89 lb-in).

20	6C270	RH secondary timing chain tensioner

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.

All vehicles

CAUTION: Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: The crankshaft rear seal retainer must be installed and the bolts tightened within 4 minutes of sealant application.

1. Apply a 3 mm (0.11 in) bead of Motorcraft High Performance Engine RTV Silicone to the sealing surface of the crankshaft rear seal retainer.

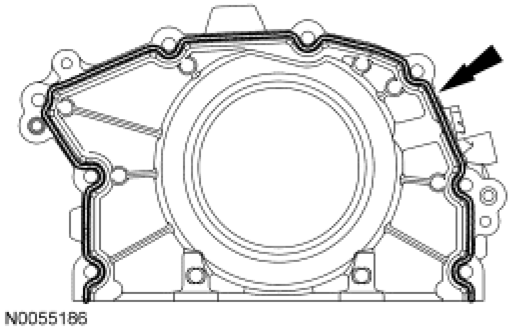

Fig. 516: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Sealing Surface Of Crankshaft Rear Seal Retainer
Courtesy of FORD MOTOR CO.

2. Install the rear seal retainer and the 8 bolts.
   - Tighten in the sequence shown to 10 Nm (89 lb-in).

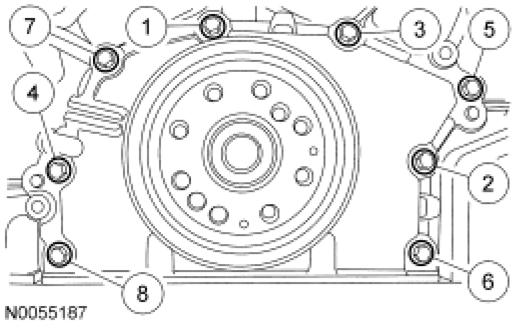

Fig. 517: Installing Crankshaft Rear Seal Retainer Bolts In Sequence
Courtesy of FORD MOTOR CO.

3. Install the oil pump and the 3 bolts.
   - Tighten to 10 Nm (89 lb-in).

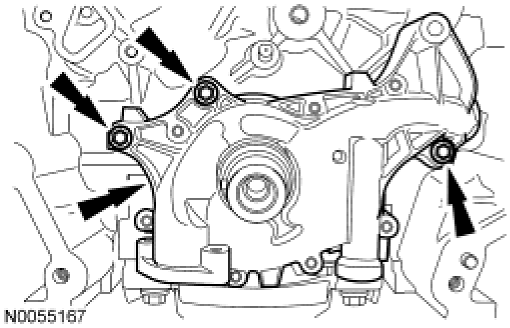

Fig. 518: Identifying Oil Pump & Bolts
Courtesy of FORD MOTOR CO.

4. Using a new O-ring seal, install the oil pump screen and pickup tube and the 3 bolts.
   - Tighten to 10 Nm (89 lb-in).

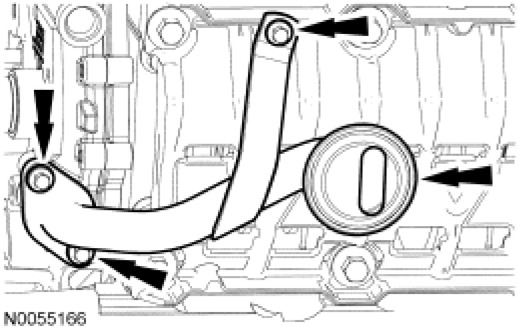

Fig. 519: Identifying Oil Pump Screen, Pickup Tube & Bolts
Courtesy of FORD MOTOR CO.

NOTE: **The A/C compressor must be installed on the cylinder block and the 2 bolts tightened prior to installing the oil pan.**

5. Install the A/C compressor and the 2 bolts.
   - Tighten to 25 Nm (18 lb-ft).

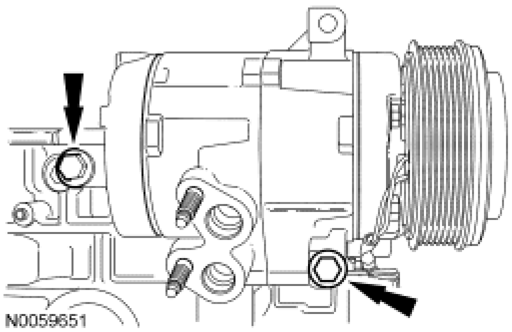

Fig. 520: Identifying A/C Compressor Bolts
Courtesy of FORD MOTOR CO.

CAUTION: Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: The oil pan and the 4 specified bolts must be installed and the oil pan aligned to the cylinder block and A/C compressor within 4 minutes of sealant application. Final tightening of the oil pan bolts must be carried out within 60 minutes of sealant application.

6. Apply a 3 mm (0.11 in) bead of Motorcraft High Performance Engine RTV Silicone to the sealing surface of the oil pan.
   - Apply a 5.5 mm (0.21 in) bead of Motorcraft High Performance Engine RTV Silicone to the 2 crankshaft seal retainer plate-to-cylinder block joint areas on the sealing surface of the oil pan.

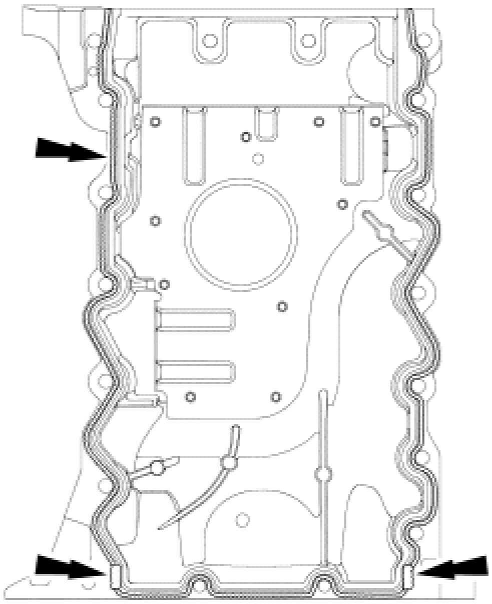

Fig. 521: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Crankshaft Seal Retainer Plate-To-Cylinder Block
Courtesy of FORD MOTOR CO.

NOTE: **The oil pan and the 4 specified bolts must be installed within 4 minutes of the start of sealant application.**

7. Install the oil pan and bolts 10, 11, 13 and 14.
    - Tighten the bolts in the sequence shown to 3 Nm (27 lb-in).
    - Loosen the bolts 180 degrees.

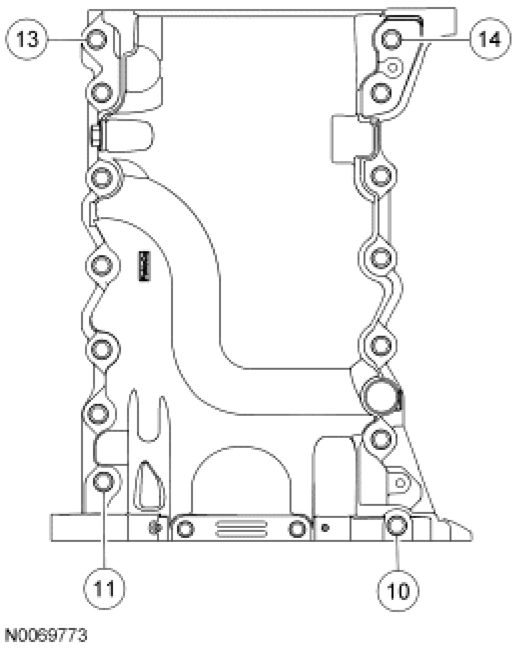

Fig. 522: Installing Oil Pan Bolts 10, 11, 13 & 14 In Sequence
Courtesy of FORD MOTOR CO.

8. Align the oil pan to the cylinder block and A/C compressor.
   - Position the oil pan so the mounting boss is against the A/C compressor and using a straightedge, align the oil pan flush with the rear of the cylinder block at the 2 areas shown.

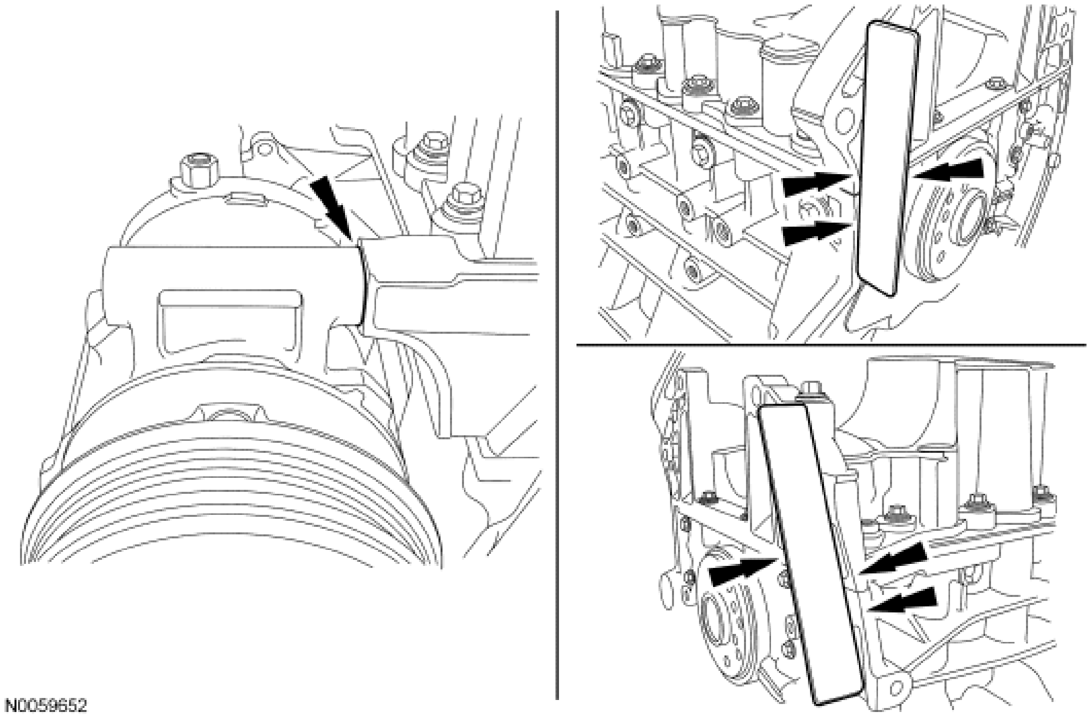

Fig. 523: Aligning Oil Pan Flush With Rear Of Cylinder Block
Courtesy of FORD MOTOR CO.

9. Tighten bolts 10, 11, 13 and 14 in the sequence shown, to 3 Nm (27 lb-in).

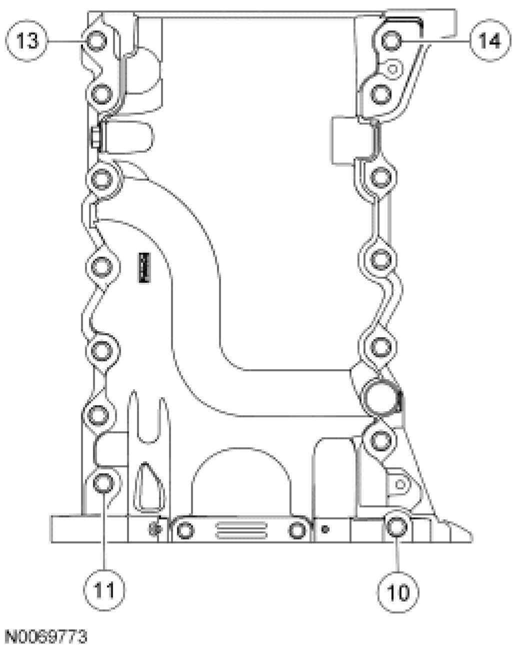

Fig. 524: Installing Oil Pan Bolts 10, 11, 13 & 14 In Sequence

Courtesy of FORD MOTOR CO.

10. Install the remaining oil pan bolts. Tighten all the oil pan bolts in the sequence shown.
    - Tighten the large bolts (1-14) to 24 Nm (18 lb-ft).
    - Tighten the small bolts (15 and 16) to 10 Nm (89 lb-in).

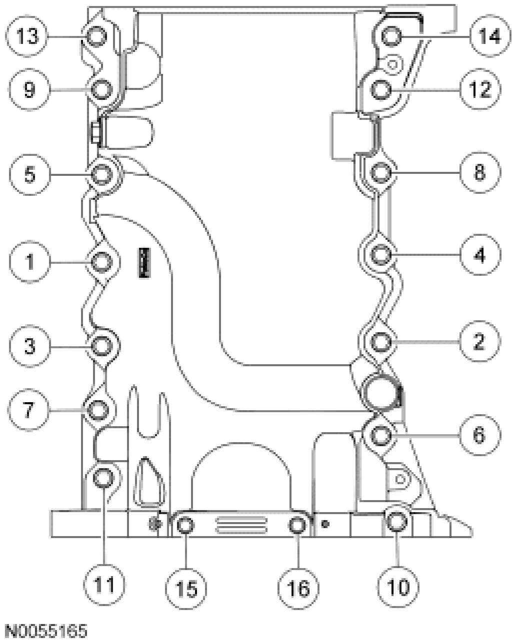

Fig. 525: Installing Remaining Oil Pan Bolts In Sequence
Courtesy of FORD MOTOR CO.

11. Install the A/C compressor mounting stud and nut.
    - Tighten the stud to 9 Nm (80 lb-in) and the nut to 25 Nm (18 lb-ft).

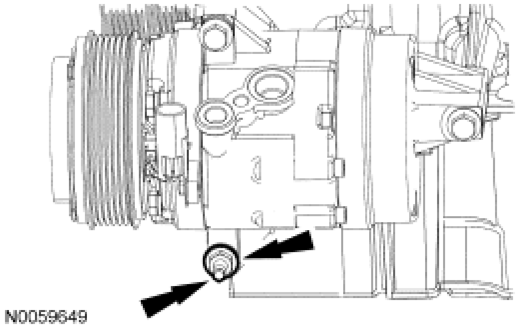

Fig. 526: Identifying A/C Compressor Nut & Stud
Courtesy of FORD MOTOR CO.

12. Install the coolant pump and the 8 bolts.

- Tighten in the sequence shown to 10 Nm (89 lb-in).

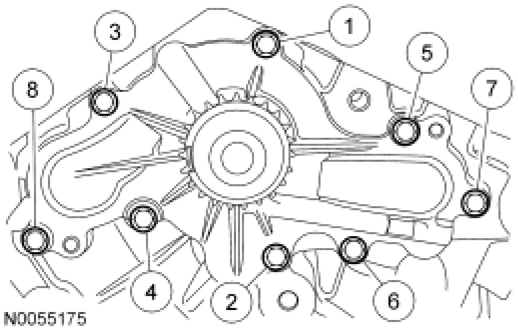

Fig. 527: Identifying Coolant Pump Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

13. Install the knock sensor (KS) and the 2 bolts.
    - Tighten to 20 Nm (15 lb-ft).

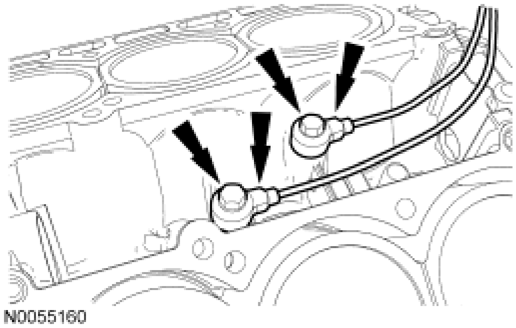

Fig. 528: Locating Knock Sensor (KS) Bolts
Courtesy of FORD MOTOR CO.

NOTE: Apply clean engine coolant to the O-ring seals prior to installation.

14. Using new O-ring seals, install the coolant tube.

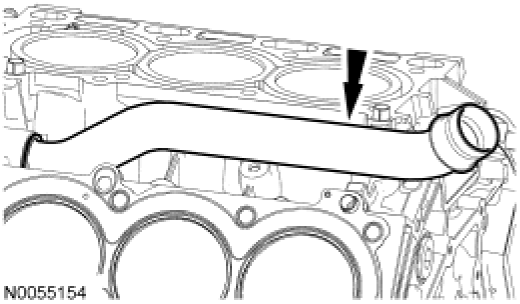

Fig. 529: Identifying Coolant Tube
Courtesy of FORD MOTOR CO.

15. Install a new gasket, the RH cylinder head and 8 new bolts. Tighten in the sequence shown in 5 stages:
    - Stage 1: Tighten to 20 Nm (15 lb-ft).
    - Stage 2: Tighten to 35 Nm (26 lb-ft).
    - Stage 3: Tighten 90 degrees.
    - Stage 4: Tighten 90 degrees.
    - Stage 5: Tighten 90 degrees.

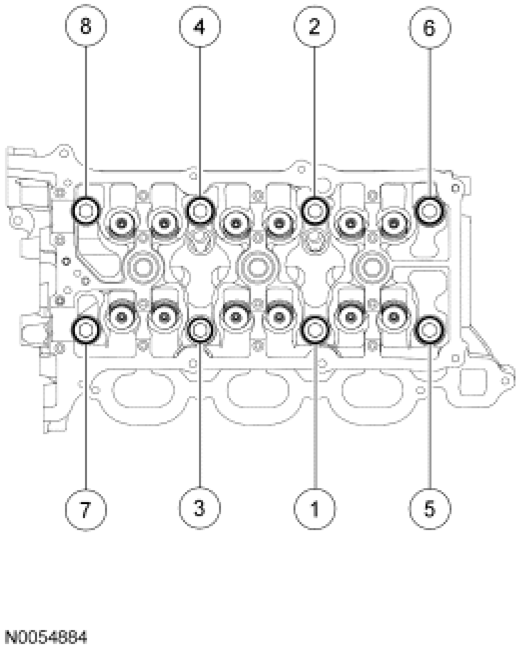

Fig. 530: Installing RH Cylinder Head Bolts In Sequence
Courtesy of FORD MOTOR CO.

16. Install the bolt.
    - Tighten to 10 Nm (89 lb-in).

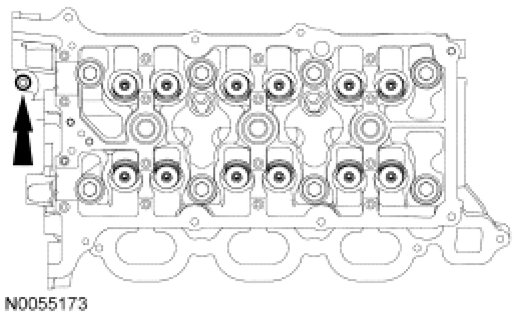

Fig. 531: Identifying M6 Bolt
Courtesy of FORD MOTOR CO.

17. Install a new gasket, the LH cylinder head and 8 new bolts. Tighten in the sequence shown in 5 stages:
    - Stage 1: Tighten to 20 Nm (15 lb-ft).
    - Stage 2: Tighten to 35 Nm (26 lb-ft).
    - Stage 3: Tighten 90 degrees.
    - Stage 4: Tighten 90 degrees.
    - Stage 5: Tighten 90 degrees.

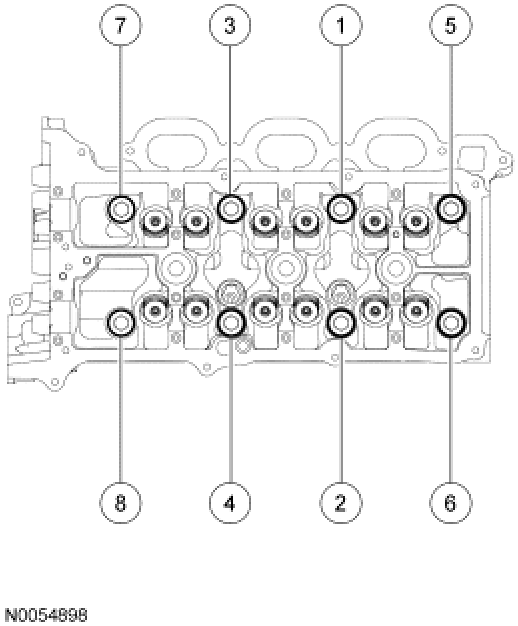

Fig. 532: Installing LH Cylinder Head Bolts In Sequence
Courtesy of FORD MOTOR CO.

18. Install the bolt.
    - Tighten to 10 Nm (89 lb-in).

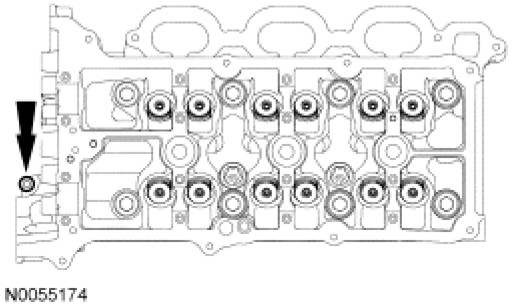

Fig. 533: Identifying M6 Bolt
Courtesy of FORD MOTOR CO.

CAUTION: The crankshaft must remain in the freewheeling position (crankshaft dowel pin at 9 o'clock) until after the camshafts are installed and the valve clearance is checked/adjusted. Do not turn the crankshaft until instructed to do so. Failure to follow this process will result in severe engine damage.

19. Position the crankshaft dowel pin in the 9 o'clock position.

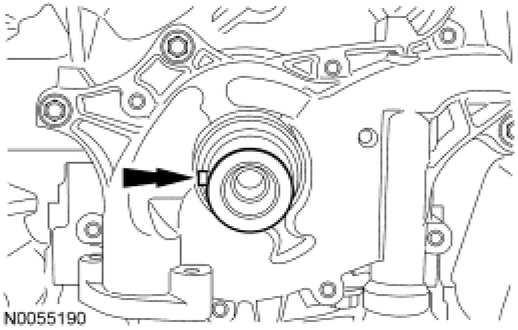

Fig. 534: Positioning Crankshaft Dowel Pin In 9 O'clock Position
Courtesy of FORD MOTOR CO.

NOTE: The valve tappets must be installed in their original positions.

NOTE: Coat the valve tappets with clean engine oil prior to installation.

NOTE: LH shown, RH similar.

20. Install the valve tappets.

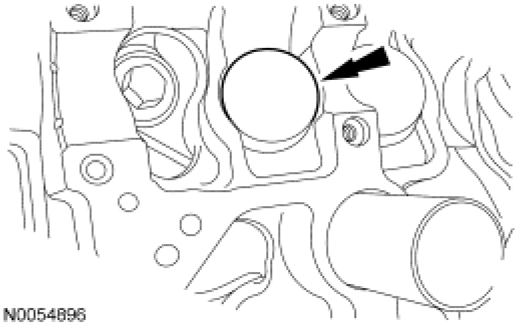

Fig. 535: Identifying Valve Tappets From Cylinder Head
Courtesy of FORD MOTOR CO.

CAUTION: The camshafts must remain in the neutral position during installation or engine damage may occur.

NOTE: **Coat the camshafts with clean engine oil prior to installation.**

21. Position the camshafts onto the RH cylinder head in the neutral position as shown.

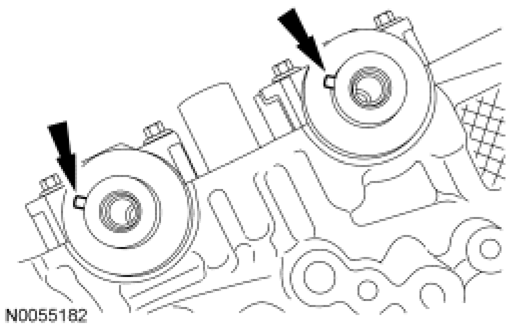

Fig. 536: Positioning Camshafts Onto RH Cylinder Head In Neutral Position
Courtesy of FORD MOTOR CO.

NOTE: **Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.**

22. Install the 8 camshaft caps and the 16 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

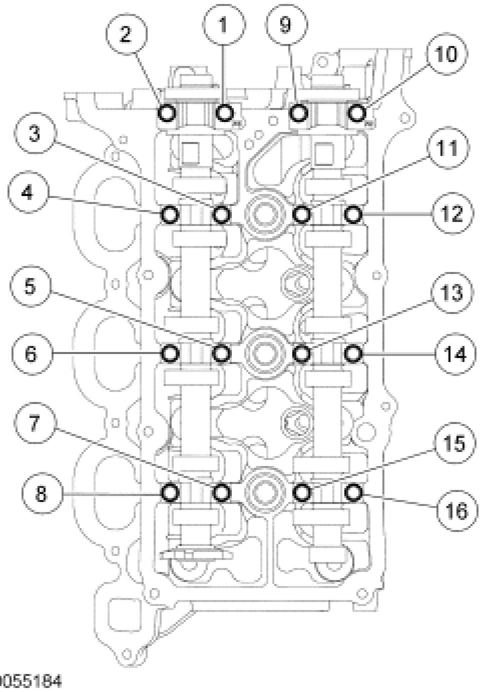

Fig. 537: Installing Camshaft Caps & Bolts In Sequence
Courtesy of FORD MOTOR CO.

CAUTION: The camshafts must remain in the neutral position during installation or engine damage may occur.

NOTE: Coat the camshafts with clean engine oil prior to installation.

23. Position the camshafts onto the LH cylinder head in the neutral position as shown.

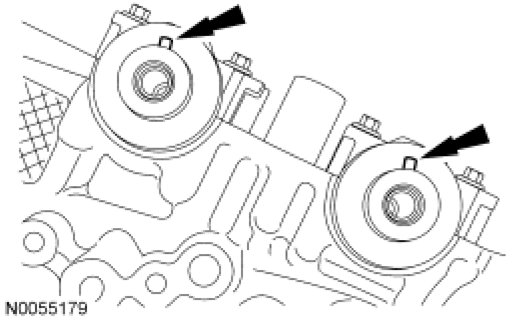

Fig. 538: Positioning Camshafts Onto LH Cylinder Head In Neutral Position
Courtesy of FORD MOTOR CO.

NOTE: Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

24. Install the 8 camshaft caps and the 16 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

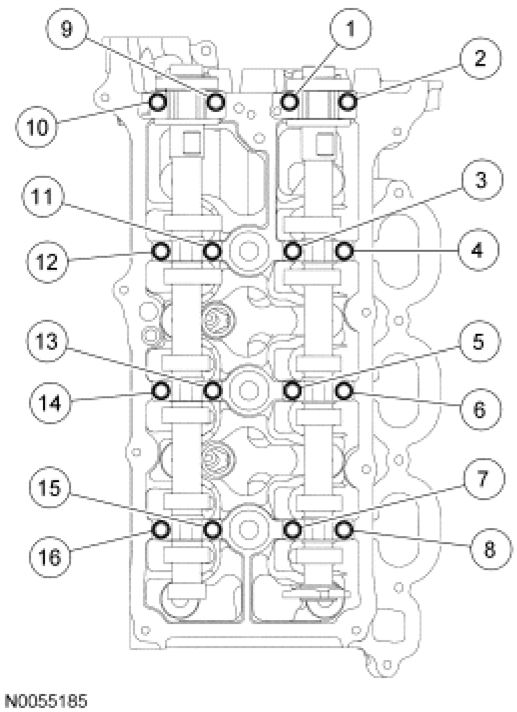

Fig. 539: Installing Camshaft Caps & Bolts In Sequence
Courtesy of FORD MOTOR CO.

CAUTION: If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage may occur.

NOTE: Use a camshaft sprocket bolt to turn the camshafts.

25. Using a feeler gauge, confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet(s) of the correct size. For additional information, refer to **Valve Clearance Check**.

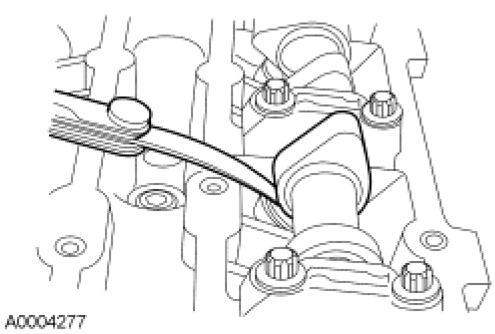

Fig. 540: Measuring Valve Clearance
Courtesy of FORD MOTOR CO.

26. Install the RH primary timing chain guide and the 2 bolts.

- Tighten to 10 Nm (89 lb-in).

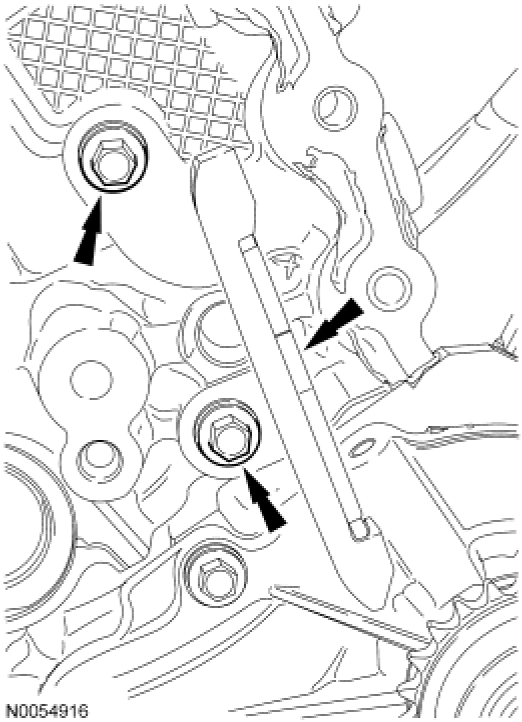

Fig. 541: Locating RH Primary Timing Chain Guide Lower Bolt
Courtesy of FORD MOTOR CO.

27. Install the RH secondary timing chain tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

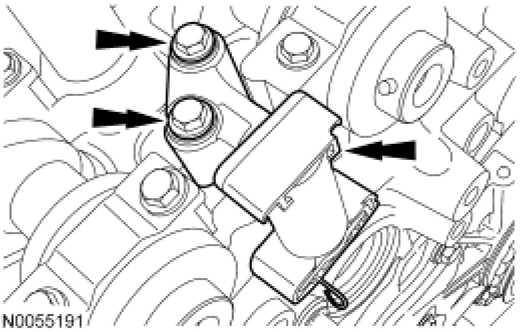

Fig. 542: Locating RH Secondary Timing Chain Tensioner & Bolts
Courtesy of FORD MOTOR CO.

NOTE: Use a camshaft sprocket bolt to turn the camshafts.

28. Rotate the RH camshafts to the top dead center (TDC) position and install the special tool on the flats of the camshafts.

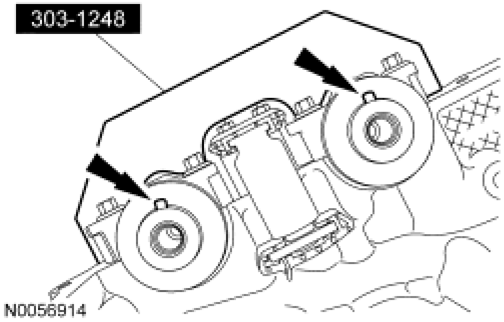

Fig. 543: Installing Special Tool (303-1248) On Flats Of Camshafts
Courtesy of FORD MOTOR CO.

29. Assemble the RH variable camshaft timing (VCT) assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
    - Align the colored links with the timing marks.

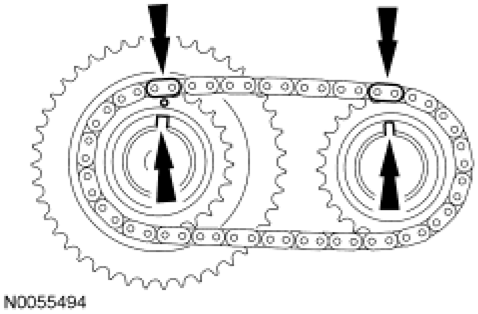

Fig. 544: Aligning RH Exhaust Camshaft Sprocket & RH Secondary Timing Chain Colored Links With Timing Marks
Courtesy of FORD MOTOR CO.

30. Position the RH secondary timing assembly onto the camshafts.

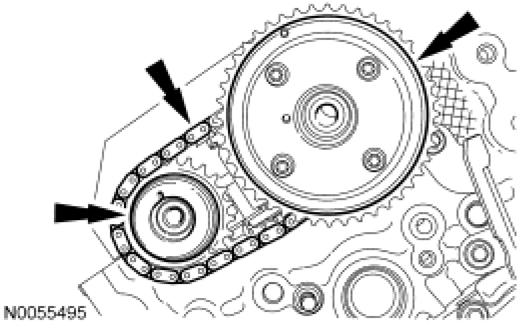

Fig. 545: Positioning RH Secondary Timing Assembly Onto Camshafts
Courtesy of FORD MOTOR CO.

31. Install 2 new bolts and the original washer. Tighten in 4 stages.

- Stage 1: Tighten to 40 Nm (30 lb-ft).
- Stage 2: Loosen one full turn.
- Stage 3: Tighten to 10 Nm (89 lb-in).
- Stage 4: Tighten 90 degrees.

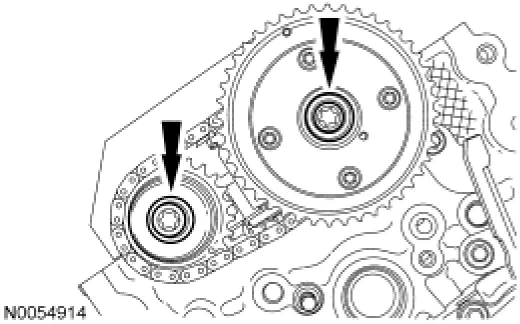

Fig. 546: Locating RH VCT Assembly Bolt & RH Exhaust Camshaft Sprocket Bolt
Courtesy of FORD MOTOR CO.

32. Remove the lock pin from the RH secondary timing chain tensioner.

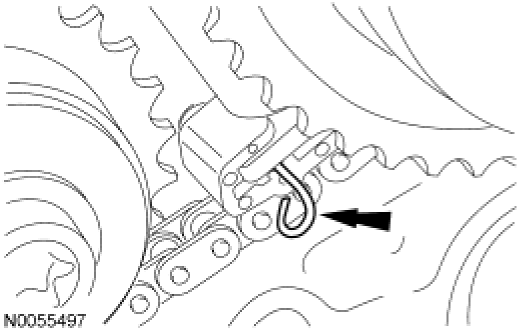

Fig. 547: Identifying Lock Pin On RH Secondary Timing Chain Tensioner
Courtesy of FORD MOTOR CO.

33. Install the LH secondary timing chain tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

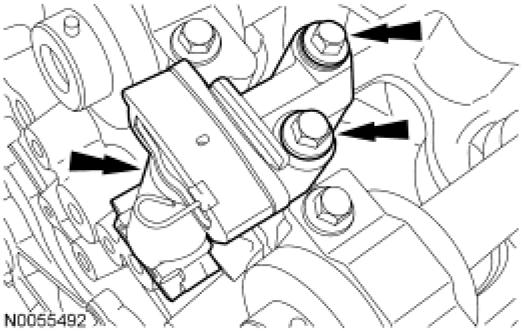

Fig. 548: Locating LH Secondary Timing Chain Tensioner & Bolt
Courtesy of FORD MOTOR CO.

NOTE: Use a camshaft sprocket bolt to turn the camshafts.

34. Rotate the LH camshafts to the TDC position and install the special tool on the flats of the camshafts.

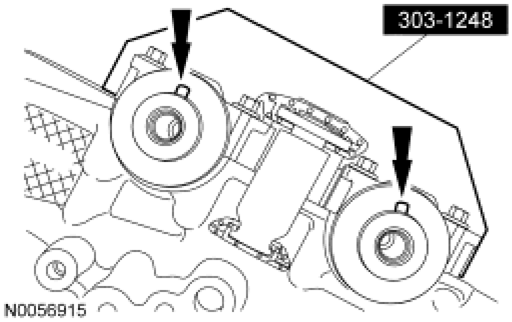

Fig. 549: Installing Special Tool (303-1248) On Flats Of Camshafts
Courtesy of FORD MOTOR CO.

35. Assemble the LH VCT assembly, the LH exhaust camshaft sprocket and the LH secondary timing chain.
    - Align the colored links with the timing marks.

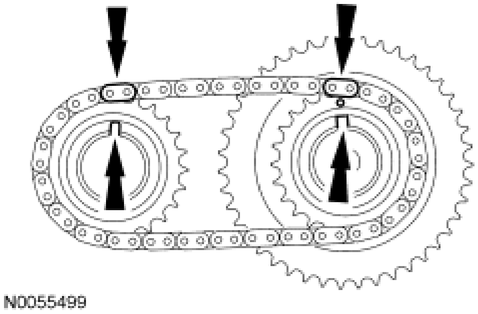

Fig. 550: Aligning LH Exhaust Camshaft Sprocket & LH Secondary Timing Chain Colored Links With Timing Marks
Courtesy of FORD MOTOR CO.

36. Position the LH secondary timing assembly onto the camshafts.

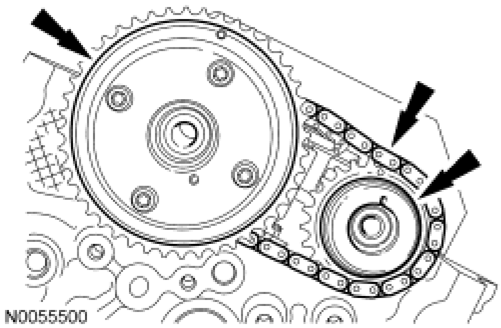

Fig. 551: Positioning LH Secondary Timing Assembly Onto Camshafts
Courtesy of FORD MOTOR CO.

37. Install 2 new bolts and the original washer. Tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 10 Nm (89 lb-in).
    - Stage 4: Tighten 90 degrees.

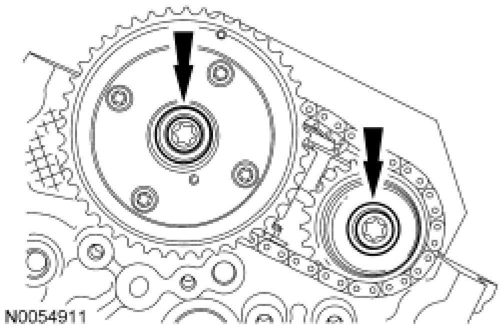

Fig. 552: Locating LH VCT Assembly Bolt & LH Exhaust Camshaft Sprocket Bolt
Courtesy of FORD MOTOR CO.

38. Remove the lock pin from the LH secondary timing chain tensioner.

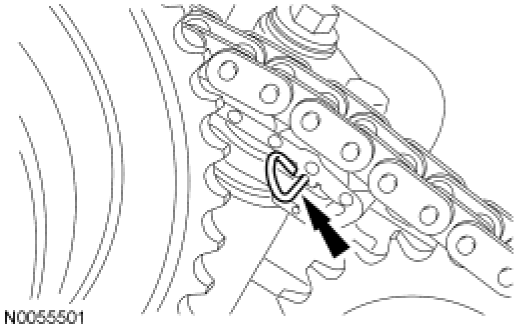

Fig. 553: Locating Lock Pin On LH Secondary Timing Chain Tensioner
Courtesy of FORD MOTOR CO.

39. Rotate the crankshaft clockwise 60 degrees to the TDC position (crankshaft dowel pin at 11 o'clock).

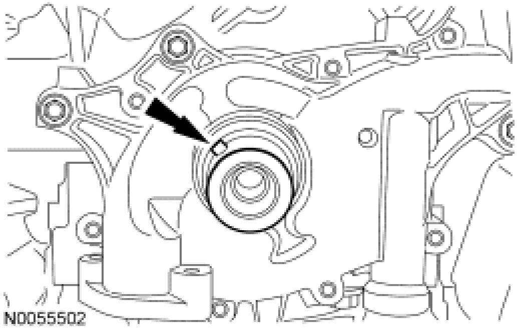

Fig. 554: Identifying Crankshaft Dowel Pin
Courtesy of FORD MOTOR CO.

40. Install the crankshaft timing chain sprocket.

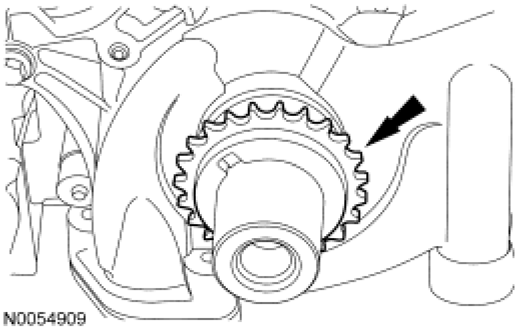

Fig. 555: Locating Crankshaft Timing Chain Sprocket
Courtesy of FORD MOTOR CO.

41. Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.

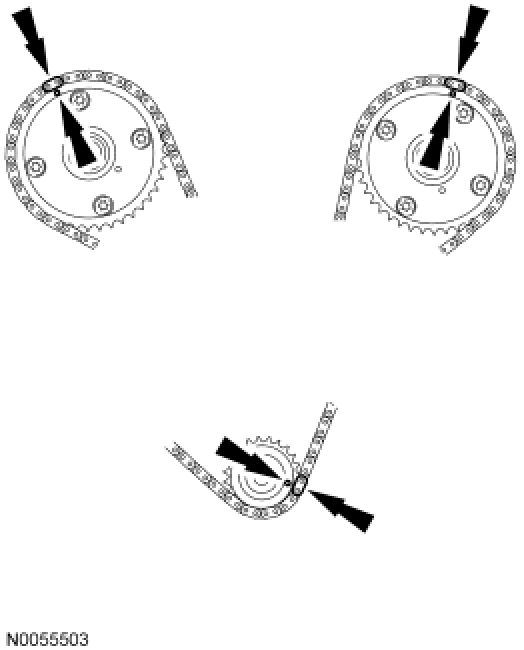

Fig. 556: Aligning Timing Marks On VCT Assemblies & Crankshaft Sprocket
Courtesy of FORD MOTOR CO.

42. Install the upper LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

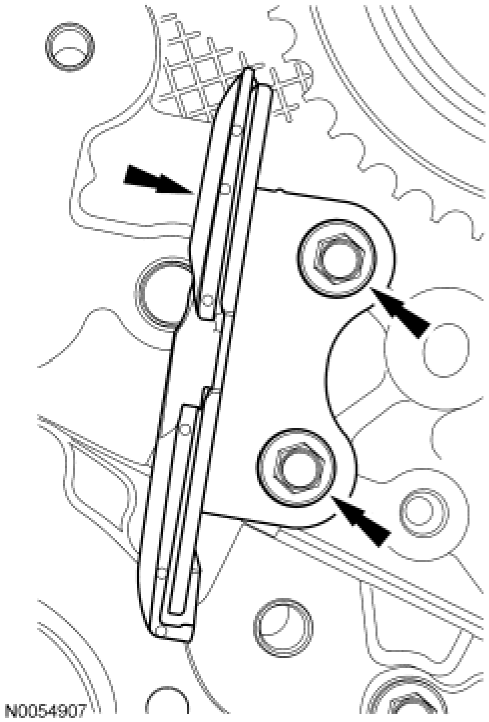

Fig. 557: Locating Upper LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

43. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

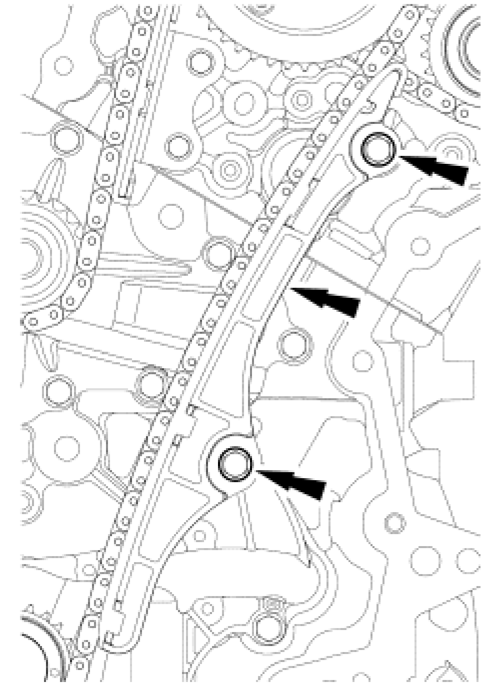

Fig. 558: Locating Lower LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

44. Install the primary timing chain tensioner arm.

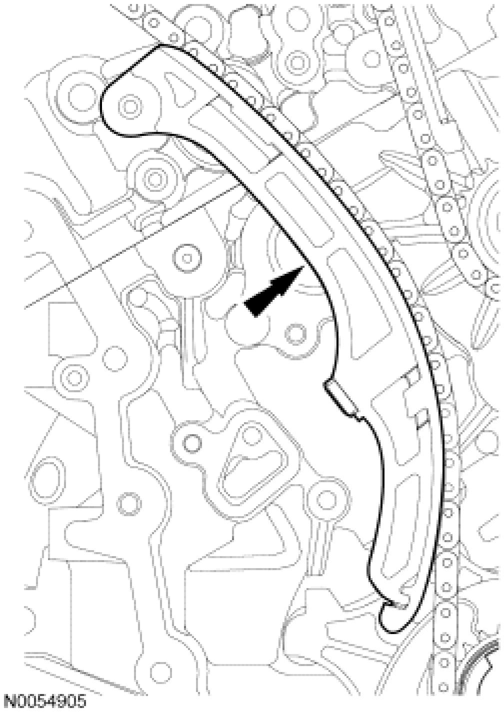

Fig. 559: Locating Primary Timing Chain Tensioner Arm
Courtesy of FORD MOTOR CO.

45. Reset the primary timing chain tensioner.
    - Rotate the lever counterclockwise.
    - Using a soft-jawed vise, compress the plunger.
    - Align the hole in the lever with the hole in the tensioner housing.
    - Install a suitable lock pin.

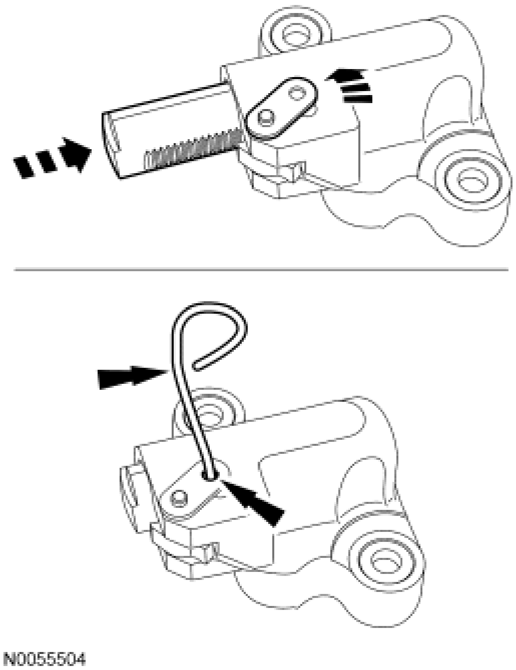

Fig. 560: Compressing Plunger Using A Soft-Jawed Vise
Courtesy of FORD MOTOR CO.

NOTE: It may be necessary to rotate the crankshaft slightly to remove slack from the timing chain and install the tensioner.

46. Install the primary tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the lock pin.

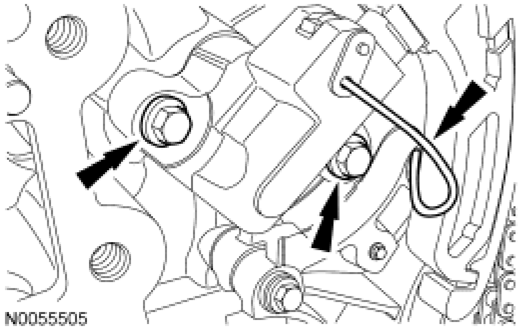

Fig. 561: Locating Primary Tensioner Bolts
Courtesy of FORD MOTOR CO.

47. As a post-check, verify correct alignment of all timing marks.

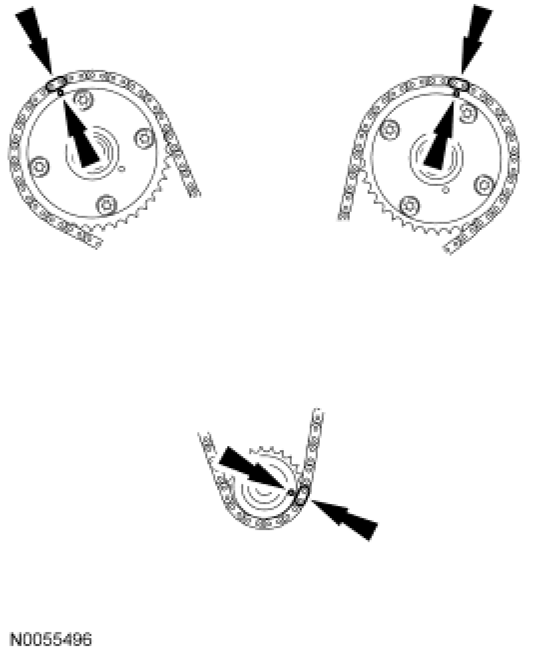

Fig. 562: Verifying Correct Alignment Of All Timing Marks
Courtesy of FORD MOTOR CO.

48. Install new VCT housing seals.

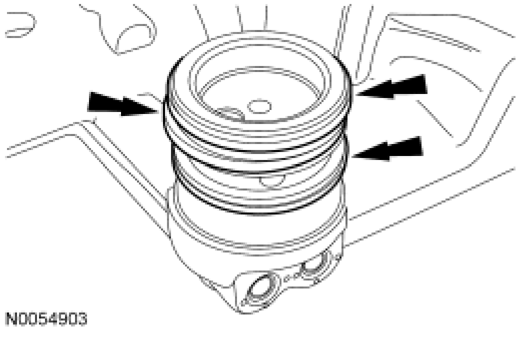

Fig. 563: Locating VCT Housing Seals
Courtesy of FORD MOTOR CO.

CAUTION: Make sure the dowels on the variable camshaft timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.

49. Install the LH VCT housing and the 3 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

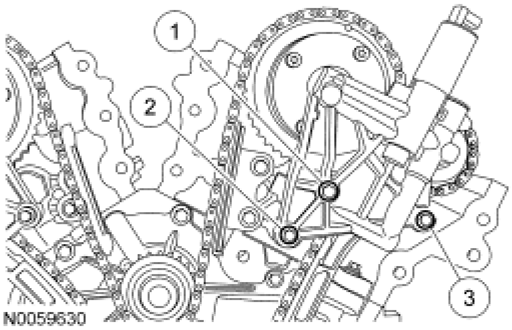

Fig. 564: Identifying LH VCT Housing Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

CAUTION: Make sure the dowels on the variable camshaft timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.

50. Install the RH VCT housing and the 3 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

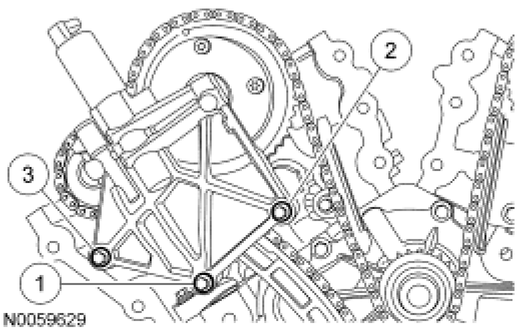

Fig. 565: Identifying RH VCT Housing Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

51. Install the special tools.

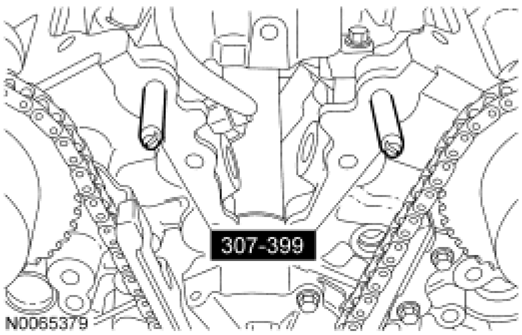

Fig. 566: Identifying Special Tool (307-399)
Courtesy of FORD MOTOR CO.

CAUTION: Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: The engine front cover and bolts 17, 18, 19 and 20 must be installed within 4 minutes of the initial sealant application. The remainder of the engine front cover bolts and the engine mount bracket bolts must be installed and tightened within 35 minutes of the initial sealant application. If the time limits are exceeded, the sealant must be removed, the sealing area cleaned and sealant reapplied. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

52. Apply a 3.0 mm (0.11 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover sealing surfaces including the 3 engine mount bracket bosses.
    - Apply a 5.5 mm (0.21 in) bead of Motorcraft High Performance Engine RTV Silicone to the oil pan-to-cylinder block joint and the cylinder head-to-cylinder block joint areas of the engine front cover in 5 places as indicated.

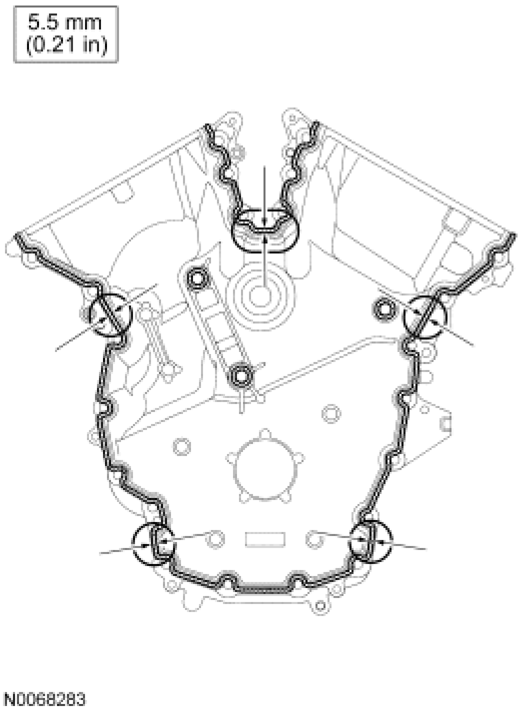

Fig. 567: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Engine Front Cover Sealing Surfaces
Courtesy of FORD MOTOR CO.

NOTE: Make sure the 2 locating dowel pins are seated correctly in the cylinder block.

53. Install the engine front cover and bolts 17, 18, 19 and 20.
    - Tighten in sequence to 3 Nm (27 lb-in).

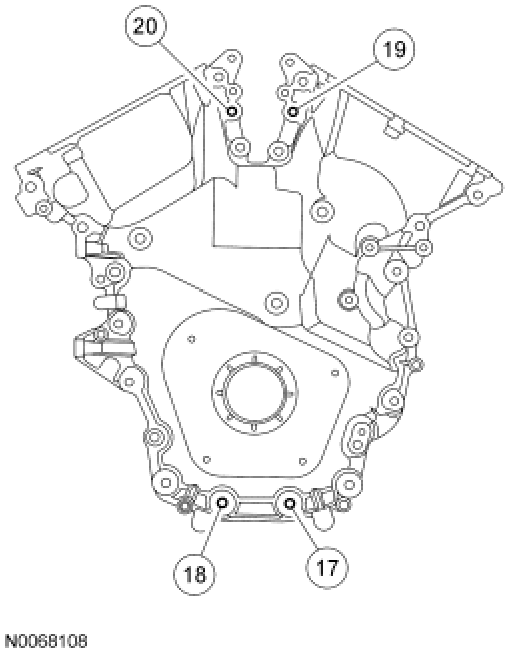

Fig. 568: Installing Engine Front Cover & Bolts In Sequence
Courtesy of FORD MOTOR CO.

54. Remove the special tools (alignment pins).

NOTE: **Do not tighten the bolts at this time.**

55. Install the engine mount bracket and the 3 bolts.

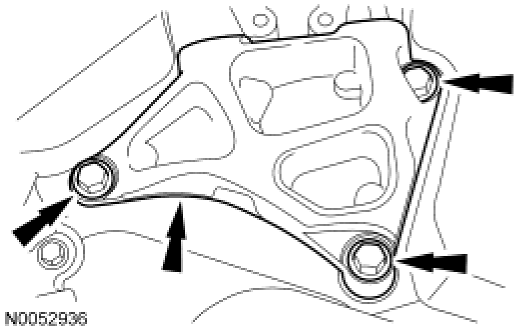

Fig. 569: Locating Engine Mount Bracket & Bolts
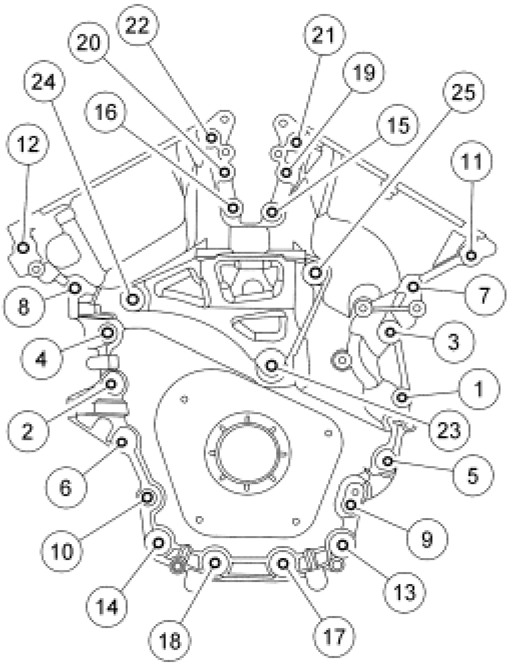
Courtesy of FORD MOTOR CO.

CAUTION: **Do not expose the Motorcraft High Performance Engine RTV Silicone**

to engine oil for at least 90 minutes after installing the engine front cover. Failure to follow this instruction may cause oil leakage.

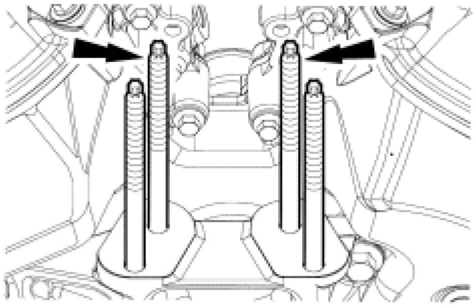
56. Install the remaining engine front cover bolts. Tighten all of the engine front cover bolts and engine mount bracket bolts in the sequence shown in 2 stages:
    - Stage 1: Tighten bolts 1 thru 22 to 10 Nm (89 lb-in) and bolts 23, 24 and 25 to 15 Nm (11 lb-ft).
    - Stage 2: Tighten bolts 1 thru 22 to 24 Nm (18 lb-ft) and bolts 23, 24 and 25 to 75 Nm (55 lb-ft).



N0068109

Fig. 570: Identifying Tightening Of Engine Front Cover Bolts & Engine Mount Bracket Bolts In Sequence
Courtesy of FORD MOTOR CO.

57. Install the 2 engine mount studs.
    - Tighten to 18 Nm (13 lb-ft).



N0057960

Fig. 571: Locating Engine Mount Studs

Courtesy of FORD MOTOR CO.

58. Install the engine mount bracket and the 2 bolts.
    - Tighten to 24 Nm (18 lb-ft).

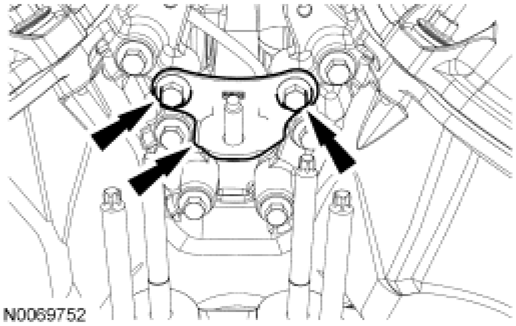


Fig. 572: Locating Engine Mount Bracket & Bolts
Courtesy of FORD MOTOR CO.

NOTE: Apply clean engine oil to the crankshaft front seal bore in the engine front cover.

59. Using the special tools, install a new crankshaft front seal.

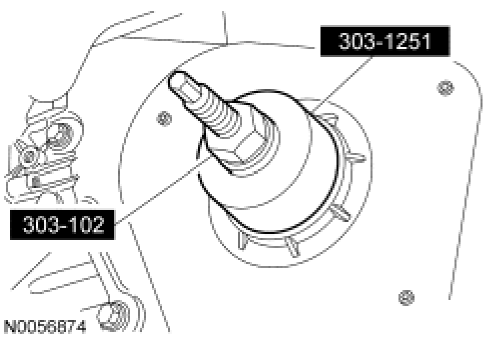

Fig. 573: Installing Crankshaft Front Seal Using Special Tools (303-102) & (303-1251)
Courtesy of FORD MOTOR CO.

NOTE: Lubricate the outside diameter sealing surfaces with clean engine oil.

60. Using the special tools, install the crankshaft pulley.

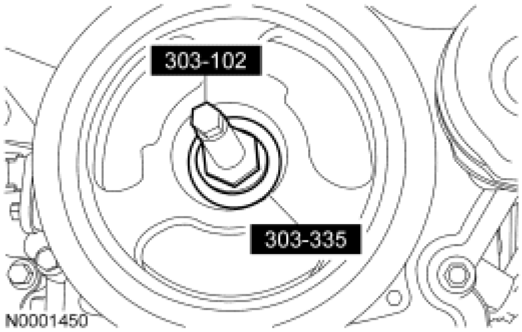

Fig. 574: Installing Crankshaft Pulley
Courtesy of FORD MOTOR CO.

61. Using the special tool, install the crankshaft pulley washer and new bolt and tighten in 4 stages.
    - Stage 1: Tighten to 120 Nm (89 (lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

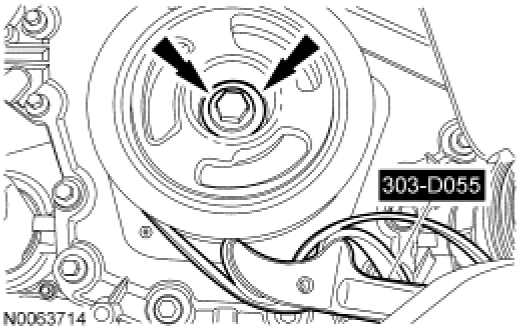

Fig. 575: Installing Crankshaft Pulley Washer & Bolt Using Special Tools (303-D055)
Courtesy of FORD MOTOR CO.

NOTE: Installation of new seals is only required if damaged seals were removed during disassembly of the engine.

NOTE: Spark plug tube seal installation shown, VCT seal installation similar.

62. Using the special tools, install new VCT solenoid and/or spark plug tube seals.

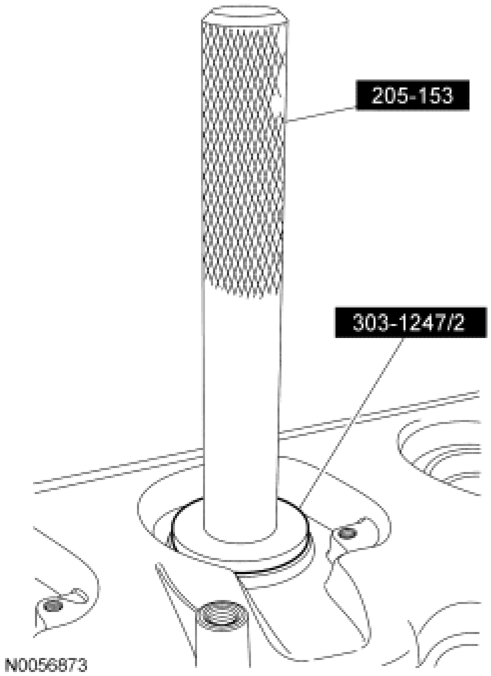

Fig. 576: Installing VCT Solenoid And/Or Spark Plug Tube Seals Using Special Tools (205-153) & (303-1247/2)
Courtesy of FORD MOTOR CO.

CAUTION: Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

63. Apply an 8 mm (0.31 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover-to-RH cylinder head joints.

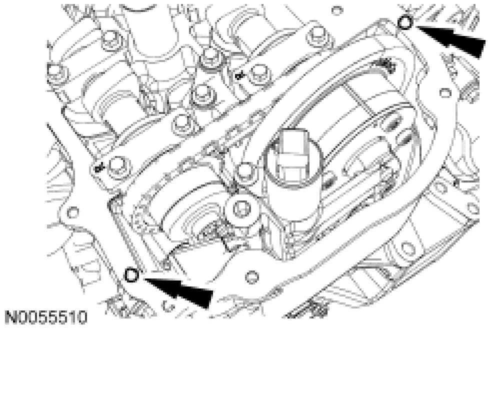

Fig. 577: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Engine Front Cover-To-RH Cylinder Head Joints
Courtesy of FORD MOTOR CO.

64. Using a new gasket, install the RH valve cover, bolt and the 10 stud bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

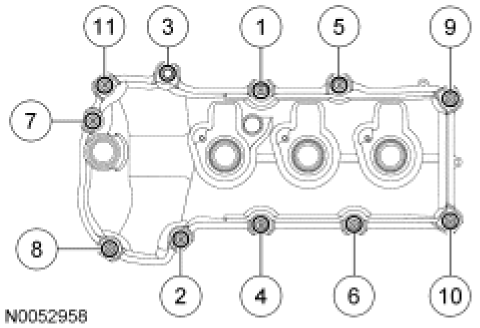

Fig. 578: Installing RH Valve Cover Stud Bolts In Sequence
Courtesy of FORD MOTOR CO.

CAUTION: Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

65. Apply an 8 mm (0.31 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover-to-LH cylinder head joints.

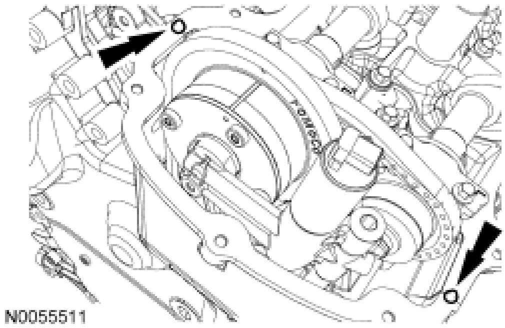

Fig. 579: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Engine Front Cover-To-LH Cylinder Head Joints
Courtesy of FORD MOTOR CO.

66. Using a new gasket, install the LH valve cover and 11 stud bolts.

- Tighten in the sequence shown to 10 Nm (89 lb-in).

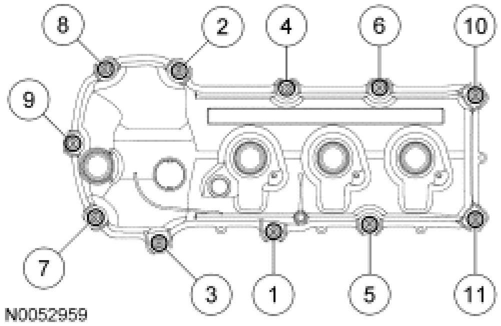

Fig. 580: Installing LH Valve Cover Stud Bolts In Sequence
Courtesy of FORD MOTOR CO.

67. Install the wiring harness retaining bracket and the 2 nuts.
    - Tighten to 9 Nm (80 lb-in).

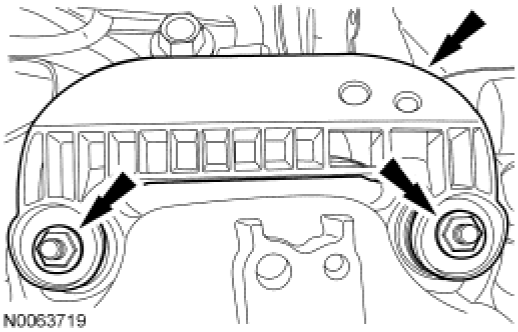

Fig. 581: Identifying Wiring Harness Retaining Bracket & Nuts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

68. Install the 6 coil-on-plug assemblies and the 6 bolts.
    - Tighten to 7 Nm (62 lb-in).

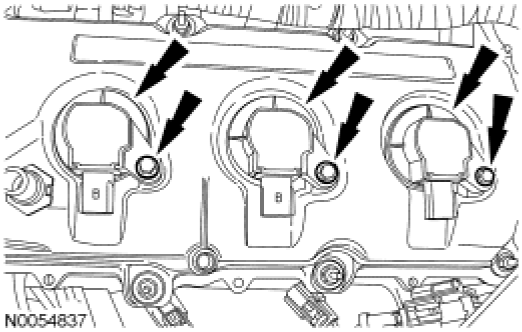

Fig. 582: Locating Coil-On-Plugs & Bolts

Courtesy of FORD MOTOR CO.

69. Using a new gasket and O-ring seal, install the oil filter adapter and the 2 bolts.
    - Tighten the large bolt to 57 Nm (42 lb-ft).
    - Tighten the small bolt to 10 Nm (89 lb-in).

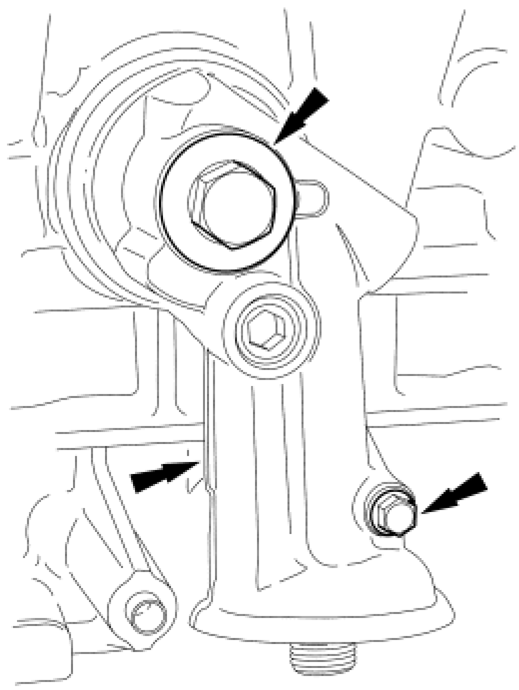

Fig. 583: Locating Oil Filter Adapter & Bolts
Courtesy of FORD MOTOR CO.

NOTE: **Apply pipe sealant with Teflon® to the engine oil pressure (EOP) switch threads.**

70. Install the EOP switch.
    - Tighten to 18 Nm (13 lb-ft).

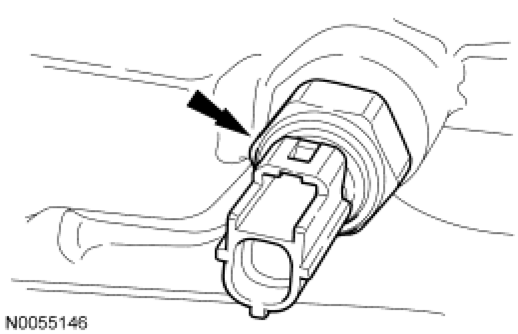

Fig. 584: Identifying EOP Switch

Courtesy of FORD MOTOR CO.

71. Install the crankshaft position (CKP) sensor and install the bolt.
    - Tighten to 10 Nm (89 lb-in).

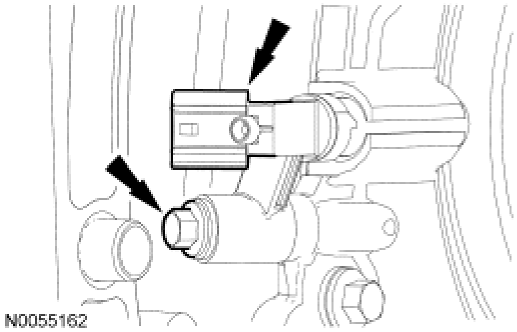

Fig. 585: Identifying CKP Sensor & Bolt
Courtesy of FORD MOTOR CO.

72. Install LH camshaft position (CMP) sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).

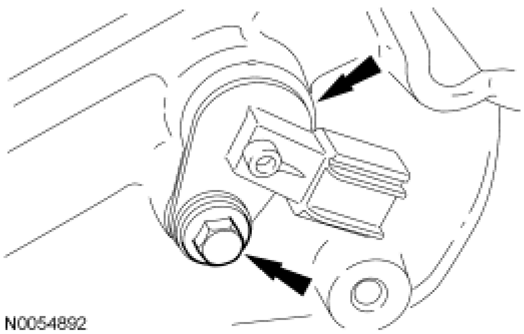

Fig. 586: Locating LH CMP Sensor & Bolt
Courtesy of FORD MOTOR CO.

73. Install and connect the cylinder head temperature (CHT) sensor jumper harness.

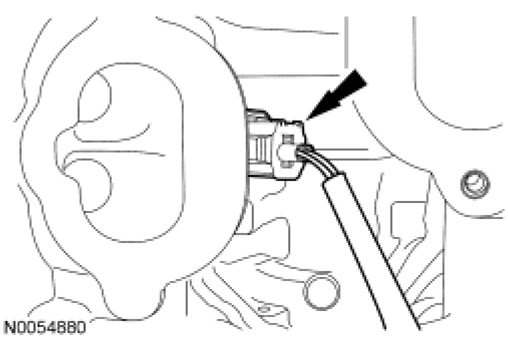

Fig. 587: Identifying CHT Sensor Jumper Harness

Courtesy of FORD MOTOR CO.

74. Using new gaskets, install the lower intake manifold and the 10 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

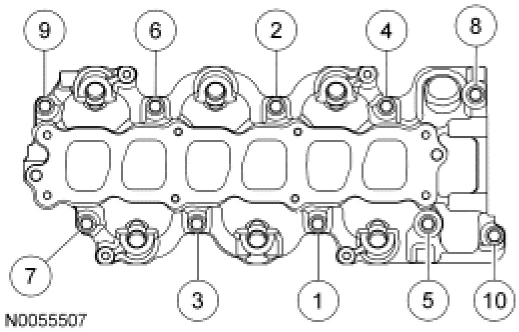

Fig. 588: Installing Lower Intake Manifold Bolts In Sequence
Courtesy of FORD MOTOR CO.

75. Using a new gasket, install the thermostat housing and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

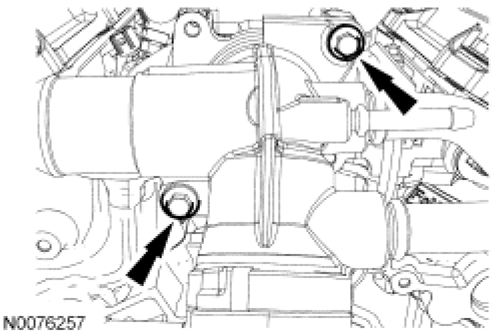

Fig. 589: Locating Thermostat Housing-To-Lower Intake Manifold Bolts
Courtesy of FORD MOTOR CO.

CAUTION: Use O-ring seals that are made of special fuel-resistant material. The use of ordinary O-rings may cause the fuel system to leak. Do not reuse the O-ring seals.

NOTE: The upper and lower O-ring seals are not interchangeable.

76. Install new fuel injector O-ring seals.
    - Remove the retaining clips and separate the fuel injectors from the fuel rail.
    - Remove and discard the O-ring seals.
    - Install new O-ring seals and lubricate with clean engine oil.
    - Install the fuel injectors and the retaining clips onto the fuel rail.

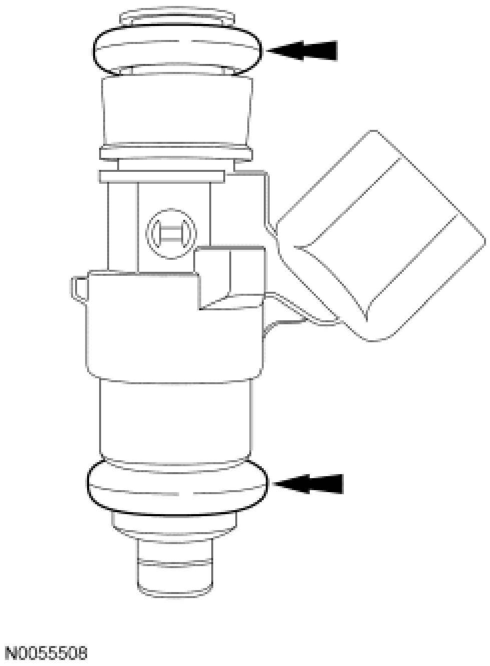

Fig. 590: Identifying Fuel Injector O-Ring Seals
Courtesy of FORD MOTOR CO.

77. Install the fuel rail and injectors as an assembly and install the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).

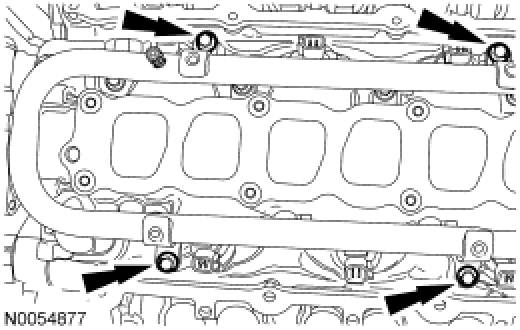

Fig. 591: Locating Fuel Rail And Injectors & Bolts
Courtesy of FORD MOTOR CO.

All wheel drive (AWD) vehicles

78. Install the catalytic converter bracket and the 2 bolts.
    - Tighten to 40 Nm (30 lb-ft).

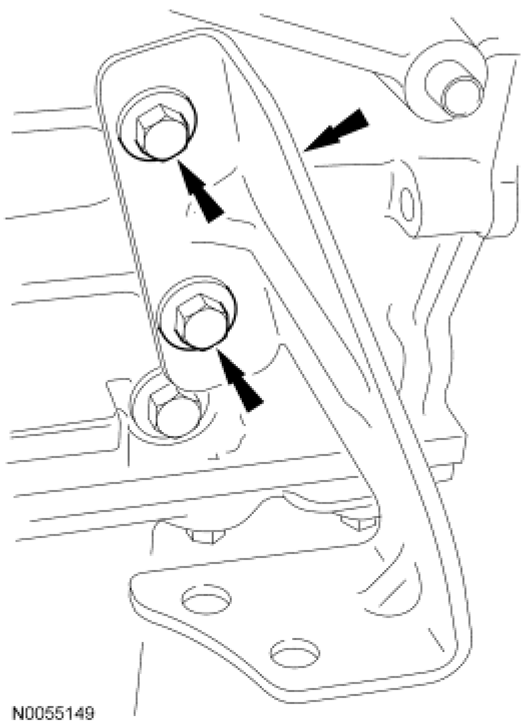

Fig. 592: Locating Catalytic Converter Bracket & Bolts
Courtesy of FORD MOTOR CO.

All vehicles

79. Install the RH CMP sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).

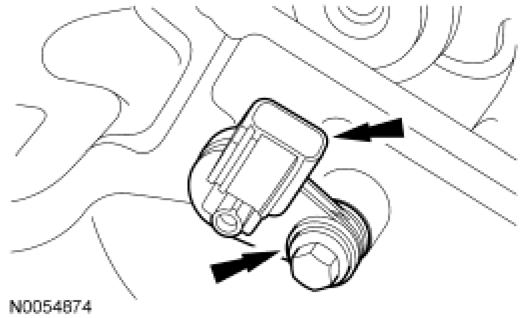

Fig. 593: Locating RH CMP Sensor & Bolt
Courtesy of FORD MOTOR CO.

80. Install the engine lifting eye and the 2 bolts.
    - Tighten to 24 Nm (18 lb-ft).

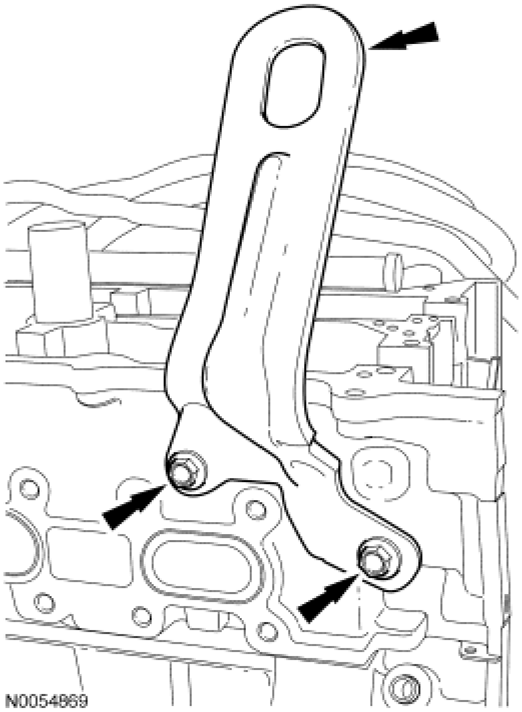

Fig. 594: Locating Engine Lifting Eye & Bolts
Courtesy of FORD MOTOR CO.

81. Install the cover and the pin-type retainer.

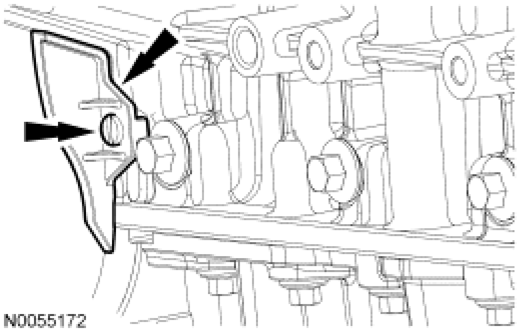

Fig. 595: Locating Pin-Type Retainer & Cover
Courtesy of FORD MOTOR CO.

82. Install the LH cylinder block drain plug.
    - Tighten to 20 Nm (15 lb-ft) plus an additional 180 degrees.

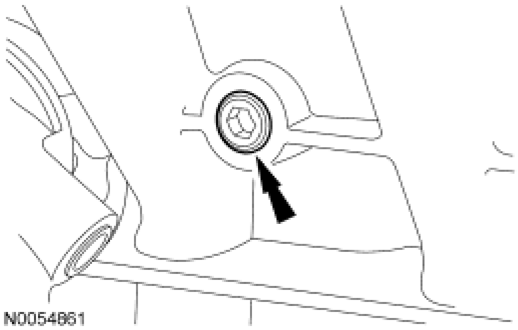

Fig. 596: Locating LH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

83. Install the RH cylinder block drain plug or, if equipped, the block heater.
    - Tighten to 40 Nm (30 lb-ft).

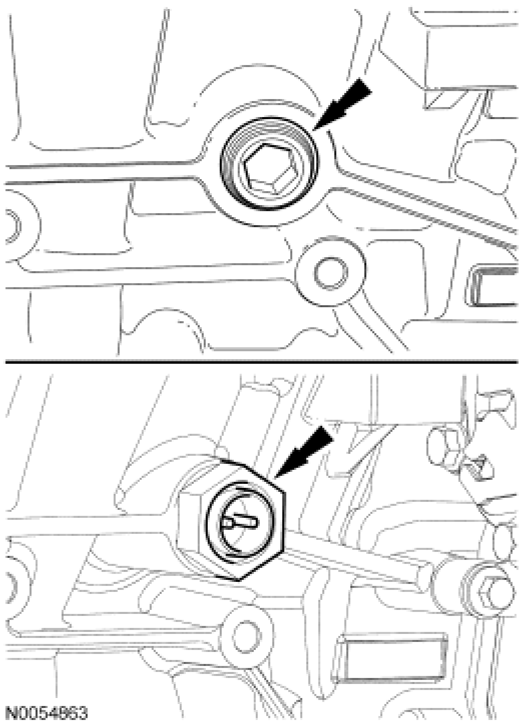

Fig. 597: Locating RH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

84. Install 6 new RH exhaust manifold studs.
    - Tighten to 12 Nm (9 lb-ft).

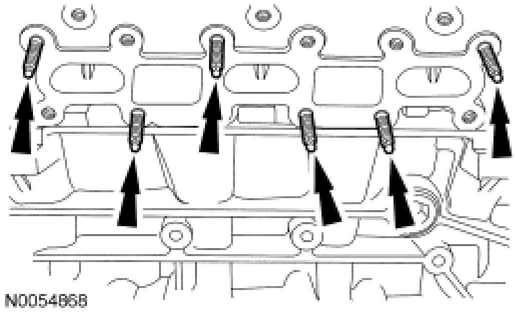

Fig. 598: Locating RH Exhaust Manifold Studs
Courtesy of FORD MOTOR CO.

CAUTION: Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.

85. Using a new gasket, install the RH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:
    - Stage 1: Tighten to 20 Nm (15 lb-ft).
    - Stage 2: Tighten to 20 Nm (15 lb-ft).

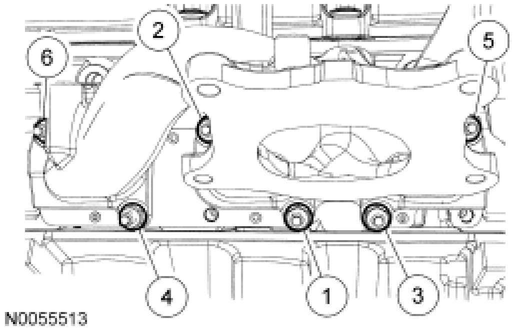

Fig. 599: Installing RH Exhaust Manifold Nuts In Sequence
Courtesy of FORD MOTOR CO.

Front wheel drive (FWD) vehicles

86. Using a new gasket, install the RH catalytic converter and the 4 new nuts.
    - Tighten to 40 Nm (30 lb-ft).

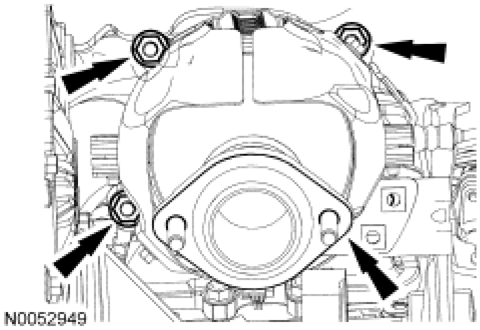

Fig. 600: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

All vehicles

87. Install 6 new LH exhaust manifold studs.
    - Tighten to 12 Nm (9 lb-ft).

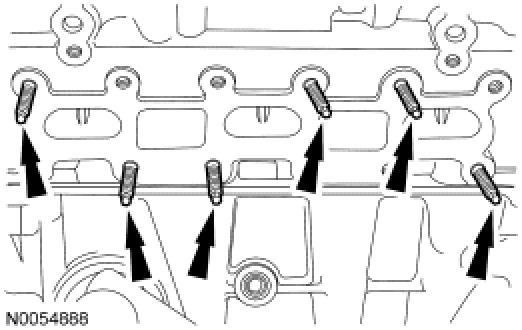

Fig. 601: Locating LH Exhaust Manifold Studs
Courtesy of FORD MOTOR CO.

CAUTION: Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.

88. Using a new gasket, install the LH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:
    - Stage 1: Tighten to 20 Nm (15 lb-ft).
    - Stage 2: Tighten to 20 Nm (15 lb-ft).

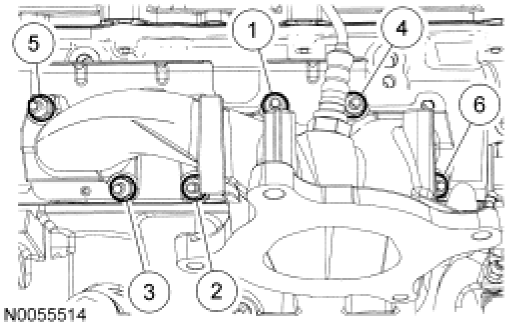

Fig. 602: Installing LH Exhaust Manifold Nuts In Sequence
Courtesy of FORD MOTOR CO.

89. Install the LH exhaust manifold heat shield and the 3 bolts.
    - Tighten to 14 Nm (10 lb-ft).

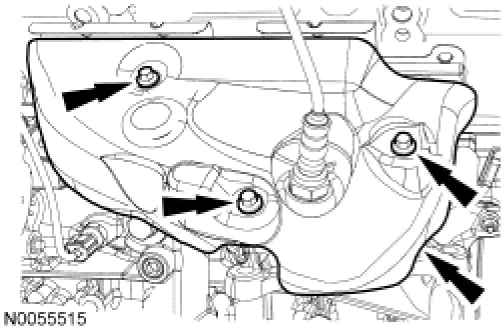

Fig. 603: Locating LH Exhaust Manifold Heat Shield & Nuts
Courtesy of FORD MOTOR CO.

90. Using a new gasket, install the LH catalytic converter and the 4 new nuts (3 shown).
    - Tighten to 40 Nm (30 lb-ft).

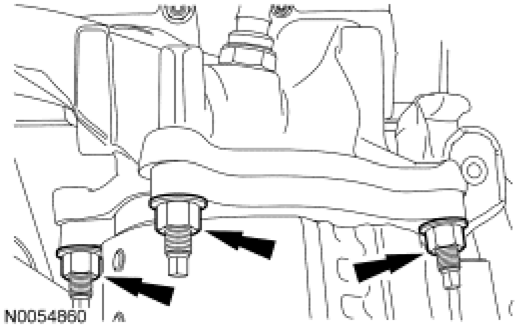

Fig. 604: Locating LH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

91. Install the accessory drive belt tensioner and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

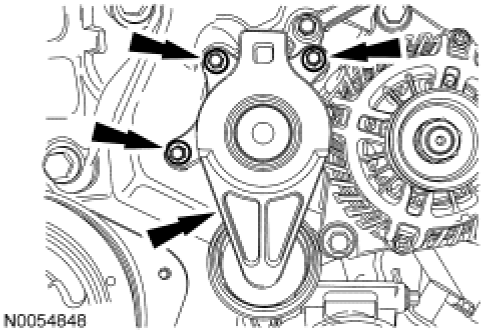

Fig. 605: Locating Accessory Drive Belt Tensioner Bolts
Courtesy of FORD MOTOR CO.

92. Install the power steering pump and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

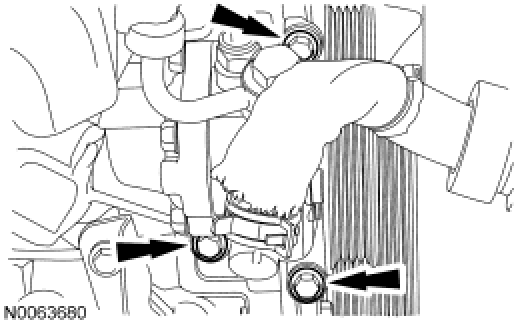

Fig. 606: Locating Power Steering Pump Bolts
Courtesy of FORD MOTOR CO.

93. Install the power steering pressure (PSP) tube bracket and bolt to the RH cylinder head.
    - Tighten to 10 Nm (89 lb-in).

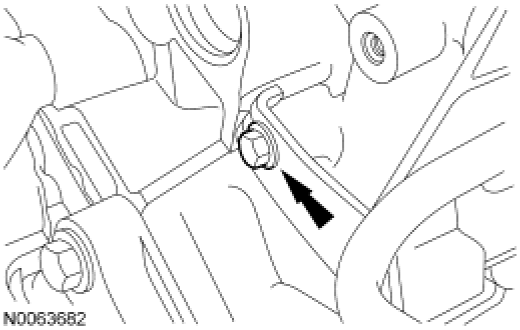

Fig. 607: Identifying Power Steering Pressure (PSP) Tube & Bracket Assembly
Courtesy of FORD MOTOR CO.

94. Install the PSP hose bracket nut.
    - Tighten to 9 Nm (80 lb-in).

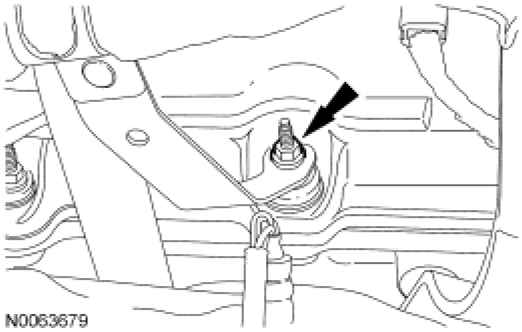

Fig. 608: Identifying PSP Hose Bracket Nut
Courtesy of FORD MOTOR CO.

95. Attach the PSP hose retainer to the engine lifting eye.

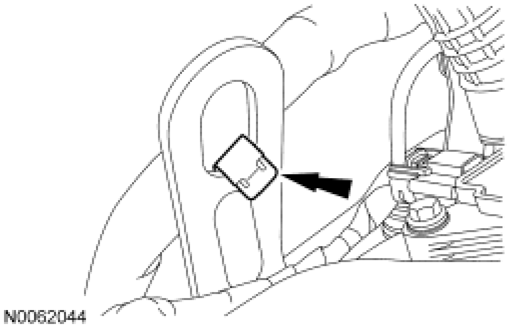

Fig. 609: Locating PSP Hose Retainer From Engine Lifting Eye
Courtesy of FORD MOTOR CO.

96. Install the generator, the nut and the bolt.
    - Tighten to 48 Nm (35 lb-ft).

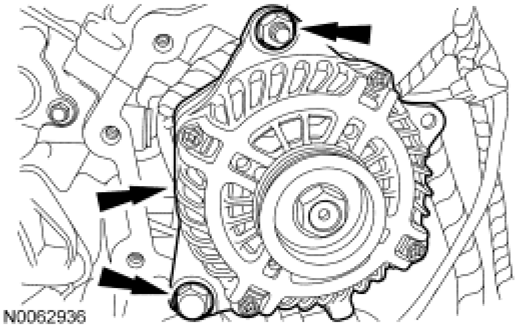

Fig. 610: Locating Generator, Bolts & Nuts
Courtesy of FORD MOTOR CO.

97. Using new O-ring seals, install the A/C manifold and the bolt.
    - Tighten to 25 Nm (18 lb-ft).

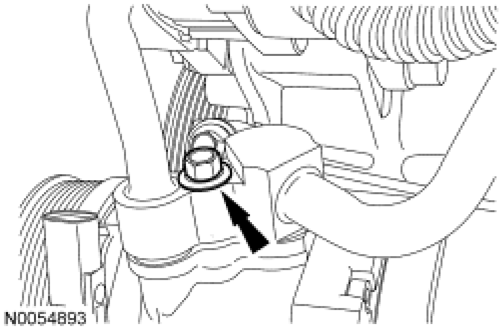

Fig. 611: Locating A/C Manifold Bolt
Courtesy of FORD MOTOR CO.

98. Position the wiring harness onto the engine.
99. Connect the EOP switch electrical connector and the wiring harness pin-type retainer.

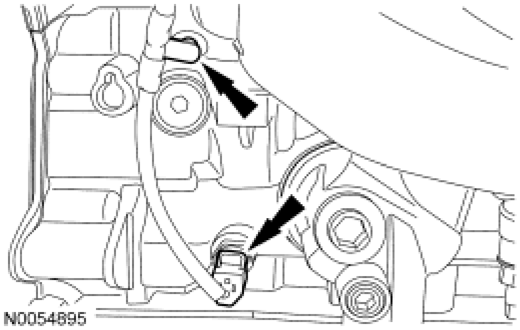

Fig. 612: Locating Engine Oil Pressure (EOP) Switch Electrical Connector & Wiring Harness Pin-Type Retainer
Courtesy of FORD MOTOR CO.

100. Attach the wiring harness retainer to the generator.

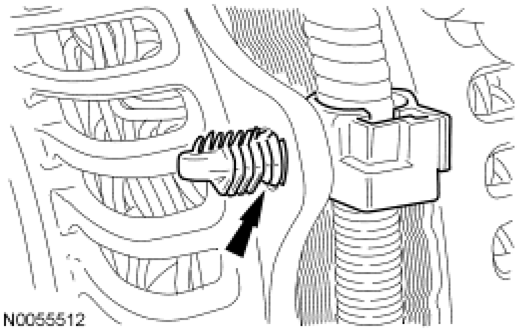

Fig. 613: Identifying Wiring Harness Retainer From Generator
Courtesy of FORD MOTOR CO.

101. Connect the generator electrical connector.

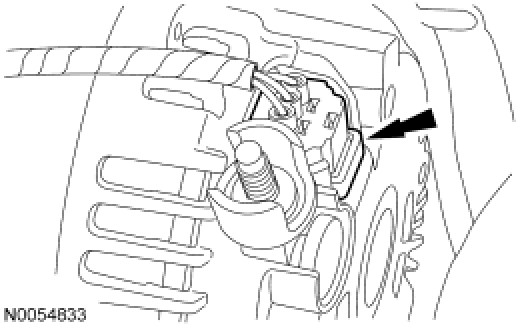

Fig. 614: Identifying Generator Electrical Connector
Courtesy of FORD MOTOR CO.

102. Connect the generator B+ cable and install the nut.
    - Tighten to 6 Nm (53 lb-in).

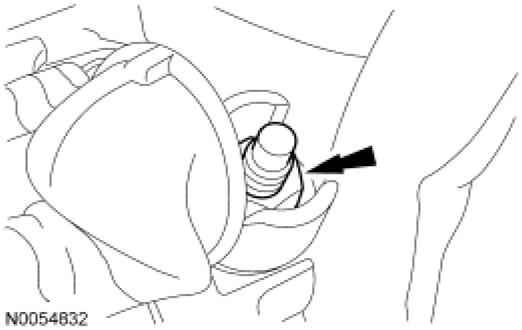

Fig. 615: Identifying Generator B+ Cable & Nut
Courtesy of FORD MOTOR CO.

103. Connect the A/C compressor electrical connector.

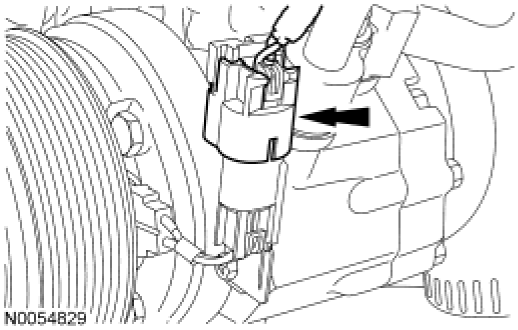

Fig. 616: Identifying A/C Compressor Electrical Connector
Courtesy of FORD MOTOR CO.

104. Connect the CKP sensor electrical connector.

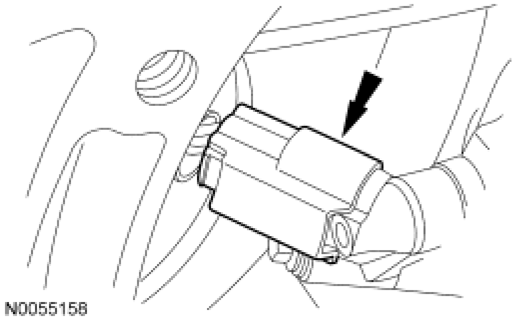

Fig. 617: Identifying Crankshaft Position (CKP) Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

105. Install the wiring harness grommet.

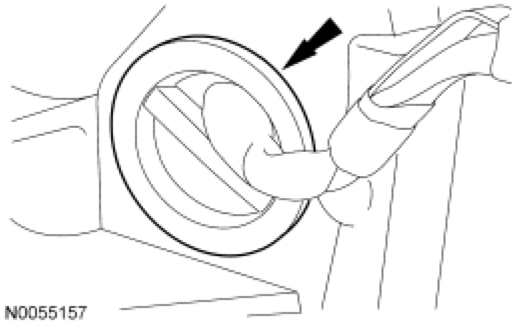

Fig. 618: Identifying Wiring Harness Grommet
Courtesy of FORD MOTOR CO.

106. Install the wiring harness retainer stud bolt.
    - Tighten to 10 Nm (89 lb-in).

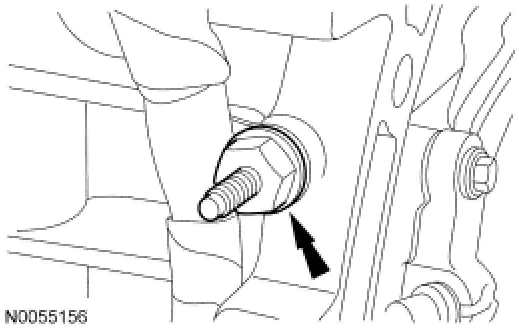

Fig. 619: Identifying Wiring Harness Retainer Stud Bolt
Courtesy of FORD MOTOR CO.

107. Install the heat shield, the nut and the bolt.
    - Tighten to 10 Nm (89 lb-in).

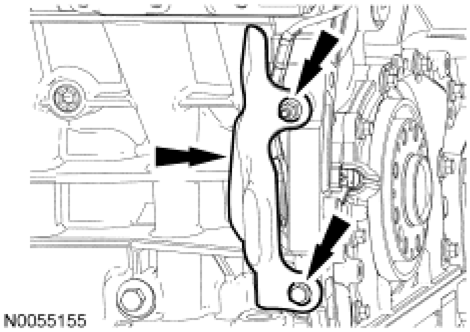

Fig. 620: Identifying Heat Shield, Nut & Bolt
Courtesy of FORD MOTOR CO.

108. Install the wiring harness retainer bolt on the rear of the LH cylinder head.
    - Tighten to 10 Nm (89 lb-in).

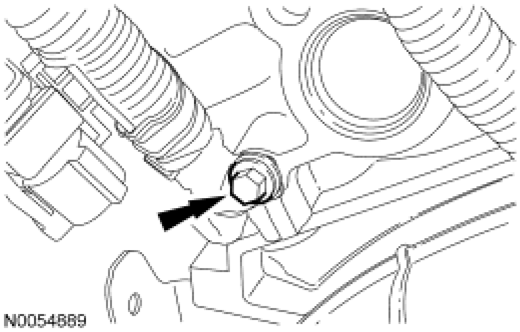

Fig. 621: Identifying Wiring Harness Retainer Bolt From Rear Of LH Cylinder Head
Courtesy of FORD MOTOR CO.

109. Attach all of the wiring harness retainers to the LH valve cover and stud bolts.
110. Connect the LH camshaft VCT solenoid electrical connector.

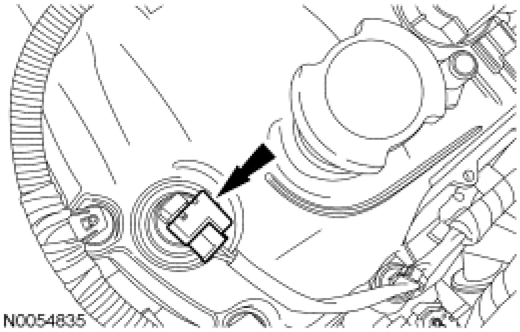

Fig. 622: Locating LH VCT Solenoid Electrical Connector
Courtesy of FORD MOTOR CO.

111. Connect the 3 LH coil-on-plug electrical connectors.

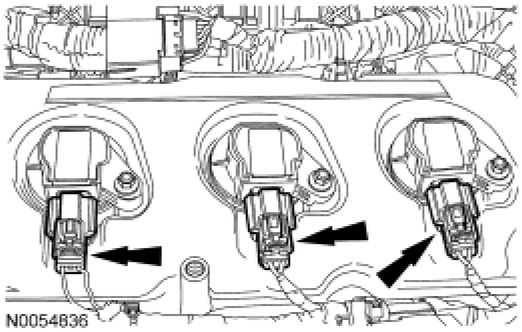

Fig. 623: Locating LH Coil-On-Plug Electrical Connectors
Courtesy of FORD MOTOR CO.

112. Connect the LH HO2S electrical connector.

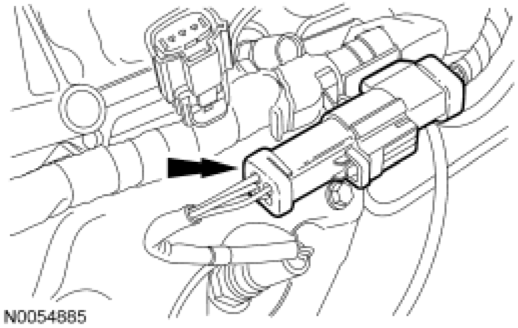

Fig. 624: Locating LH Heated Oxygen Sensor (HO2S) Electrical Connector
Courtesy of FORD MOTOR CO.

113. Connect the LH catalyst monitor sensor electrical connector.

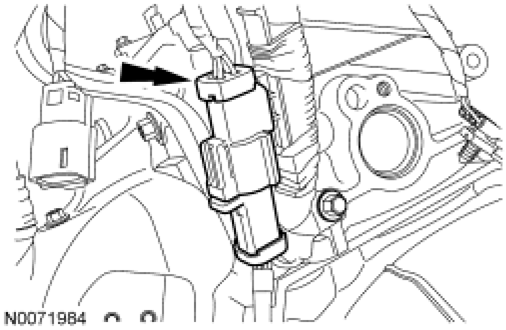

Fig. 625: Identifying LH Catalyst Monitor Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

114. Connect the LH CMP sensor electrical connector.

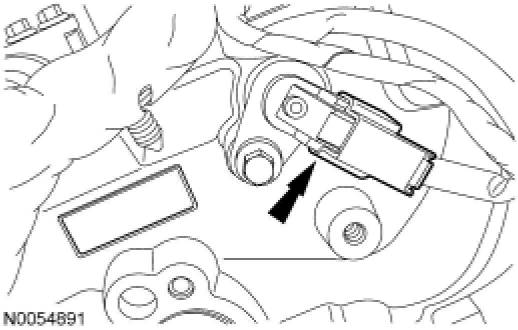

Fig. 626: Locating LH CMP Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

115. Connect the CHT sensor electrical connector.

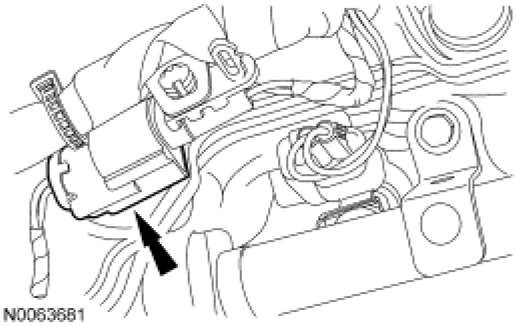

Fig. 627: Locating Cylinder Head Temperature (CHT) Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

116. Connect the 6 fuel injector electrical connectors (3 shown).

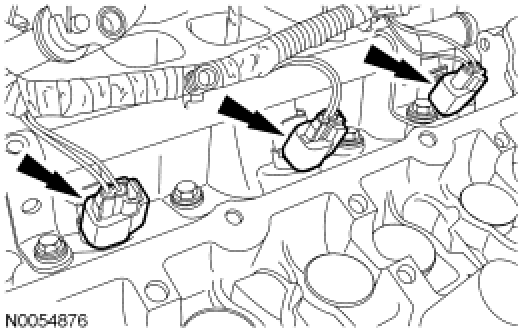

Fig. 628: Locating Fuel Injector Electrical Connectors
Courtesy of FORD MOTOR CO.

117. Connect the KS electrical connector.

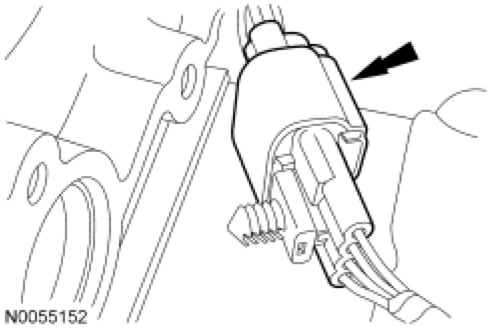

Fig. 629: Locating Knock Sensor (KS) Electrical Connector
Courtesy of FORD MOTOR CO.

118. Connect the RH CMP sensor electrical connector.

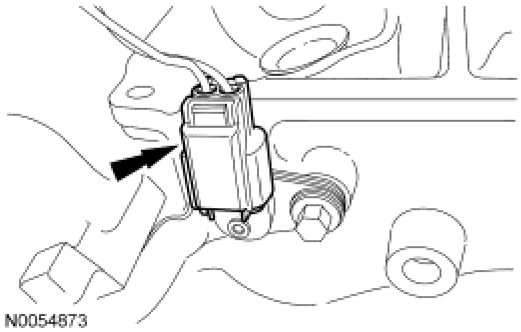

Fig. 630: Locating RH Camshaft Position (CMP) Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

119. Connect the coolant bypass hose to the thermostat housing.

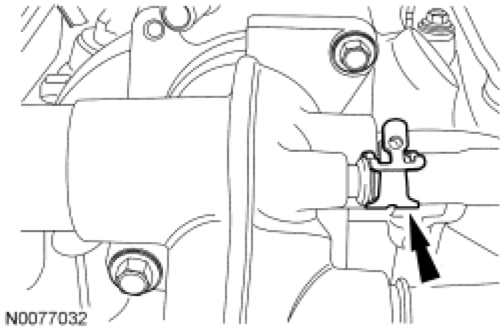

Fig. 631: Identifying Coolant Bypass Hose From Thermostat Housing
Courtesy of FORD MOTOR CO.

120. Attach all of the wiring harness retainers to the RH valve cover and stud bolts.
121. If equipped, connect the heated PCV valve electrical connector.

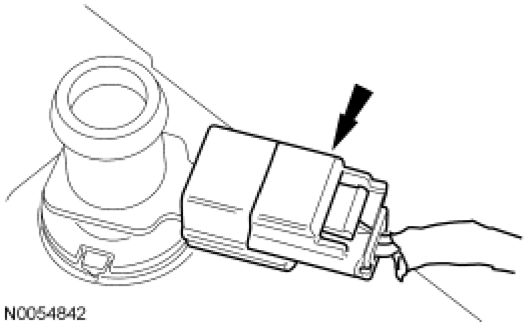

Fig. 632: Locating Heated PCV Valve Electrical Connector
Courtesy of FORD MOTOR CO.

122. Connect the 3 RH coil-on-plug electrical connectors.

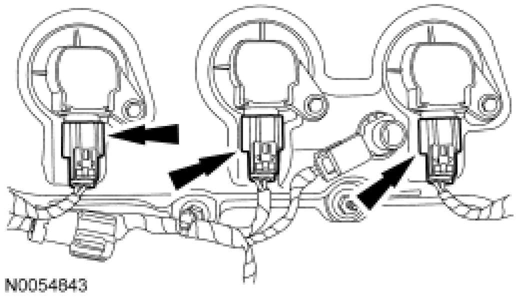

Fig. 633: Locating RH Coil-On-Plug Electrical Connectors
Courtesy of FORD MOTOR CO.

123. Connect the RH VCT solenoid electrical connector.

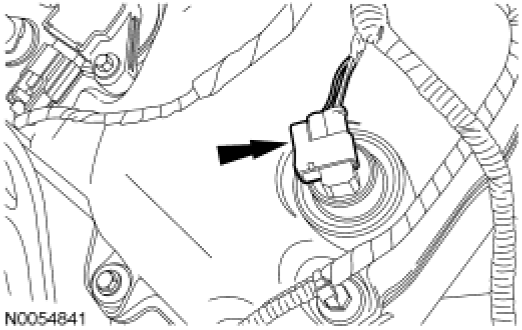

Fig. 634: Locating RH Variable Camshaft Timing (VCT) Solenoid Electrical Connector
Courtesy of FORD MOTOR CO.

FWD vehicles

124. Connect the RH catalyst monitor sensor electrical connector.

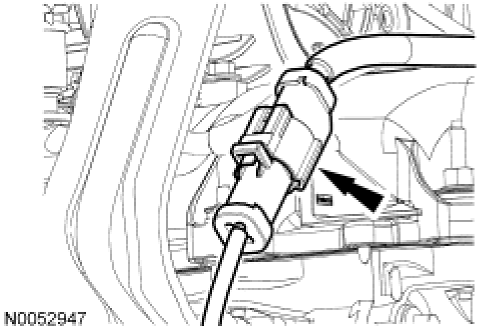

Fig. 635: Locating RH Catalyst Monitor Electrical Connector
Courtesy of FORD MOTOR CO.

All vehicles

125. Connect the PSP switch electrical connector.

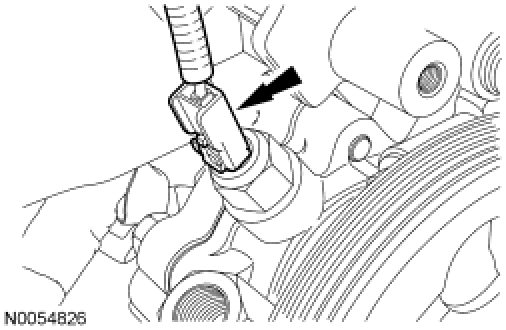

Fig. 636: Locating PSP Switch Electrical Connector
Courtesy of FORD MOTOR CO.

126. Using new gaskets, install the upper intake manifold and the 6 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

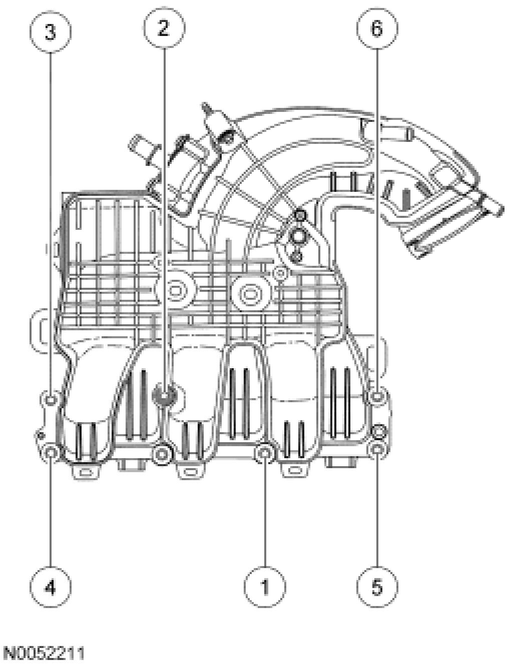

Fig. 637: Installing Upper Intake Manifold Bolts In Sequence
Courtesy of FORD MOTOR CO.

127. Install the upper intake manifold short support bracket and the 2 bolts (one shown).
    - Tighten to 10 Nm (89 lb-in).

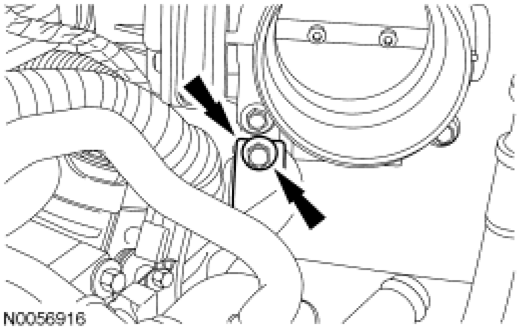

Fig. 638: Identifying Upper Intake Manifold Support Bracket & Bolt
Courtesy of FORD MOTOR CO.

128. If equipped, install the upper intake manifold long support bracket and the 2 bolts (one shown).
    - Tighten the upper bolt 10 Nm (89 lb-in).
    - Tighten the lower bolt 24 Nm (18 lb-ft).

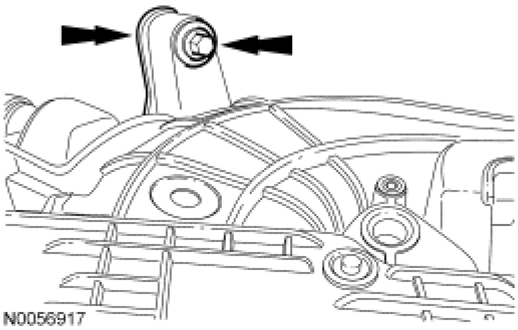

Fig. 639: Identifying Upper Intake Manifold Support Bracket & Bolts
Courtesy of FORD MOTOR CO.

129. Install the RH exhaust manifold heat shield and the 3 bolts.
    - Tighten to 14 Nm (10 lb-ft).

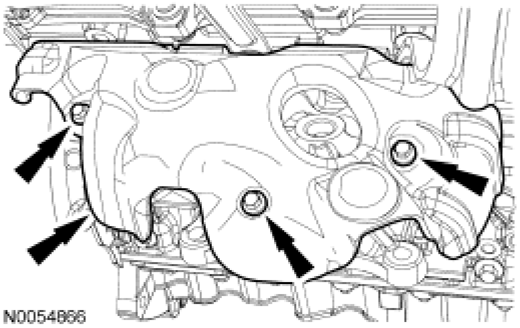

Fig. 640: Locating RH Exhaust Manifold Heat Shield & Nuts
Courtesy of FORD MOTOR CO.

130. Connect the RH HO2S electrical connector.

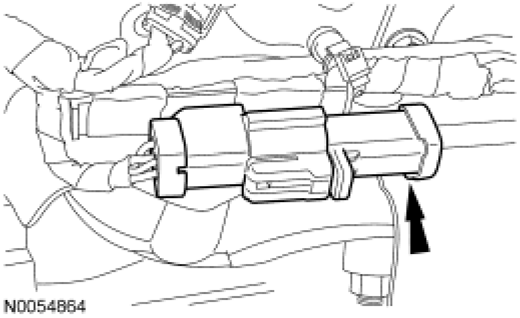

Fig. 641: Locating RH Heated Oxygen Sensor (HO2S) Electrical Connector
Courtesy of FORD MOTOR CO.

131. Attach the wiring harness retainers to the upper intake manifold.

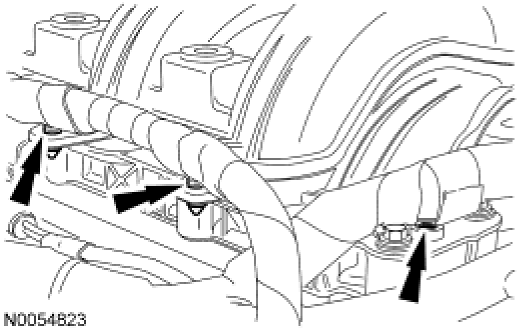

Fig. 642: Locating Wiring Harness Retainers From Upper Intake Manifold
Courtesy of FORD MOTOR CO.

132. Connect the throttle body (TB) electrical connector.

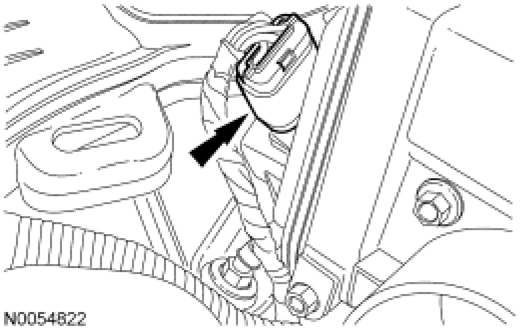

Fig. 643: Locating Throttle Body Electrical Connector
Courtesy of FORD MOTOR CO.

133. Connect the PCV hose to the PCV valve.

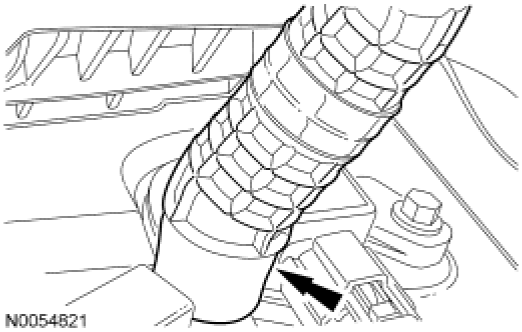

Fig. 644: Identifying PCV Hose From PCV Valve
Courtesy of FORD MOTOR CO.

134. If equipped, connect the heated PCV electrical connector.

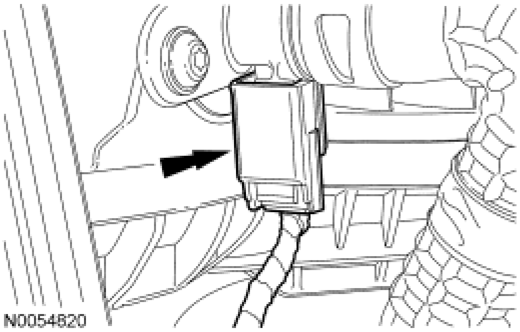

Fig. 645: Identifying Positive Crankcase Ventilation (PCV) Fitting Electrical Connector
Courtesy of FORD MOTOR CO.

135. If equipped, position the block heater wiring harness onto the engine.
    - Attach the block heater wiring harness retainer to the power steering reservoir hose and the PSP hose.

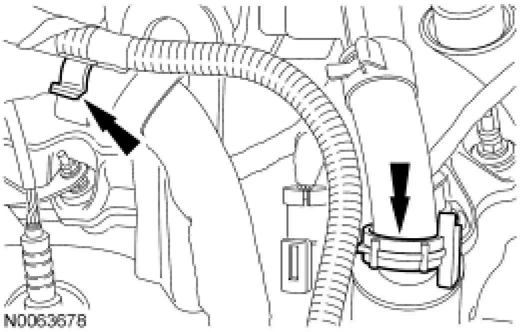

Fig. 646: Identifying Block Heater Wiring Harness From Engine
Courtesy of FORD MOTOR CO.

136. If equipped, connect the block heater electrical connector and install the heat shield.

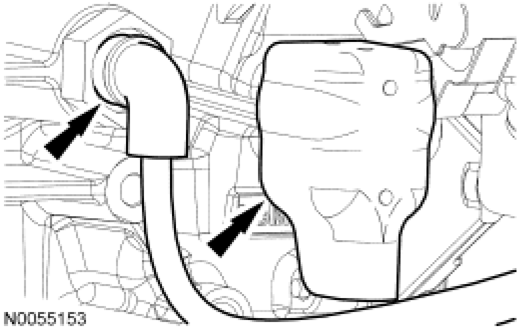

Fig. 647: Identifying Block Heater Wiring Harness
Courtesy of FORD MOTOR CO.

137. If equipped, attach the block heater wiring harness retainer to the upper intake manifold.

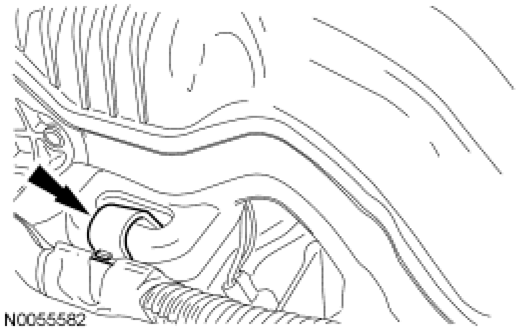

Fig. 648: Identifying Block Heater Wiring Harness Retainer From Upper Intake Manifold
Courtesy of FORD MOTOR CO.

138. Install the special tool on the LH cylinder head.

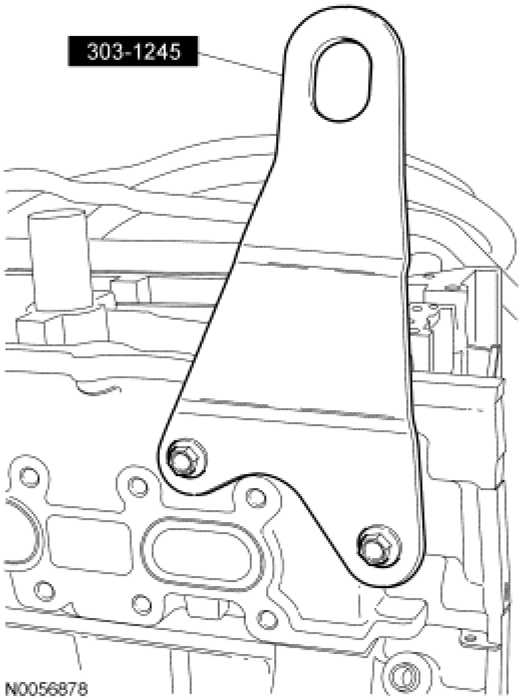

Fig. 649: Installing Special Tool (303-1245) On LH Cylinder Head
Courtesy of FORD MOTOR CO.

139. Using the special tools, remove the engine from the stand.

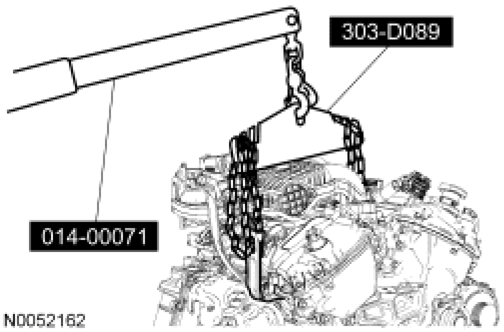

Fig. 650: Removing Engine & Transaxle From Lift Table Using Special Tools (303-D089, 014-00071) & Suitable Engine Crane
Courtesy of FORD MOTOR CO.

NOTE: Lubricate the seal lips and bore with clean engine oil prior to installation.

140. Position the special tool onto the end of the crankshaft and slide a new crankshaft rear seal onto the tool.

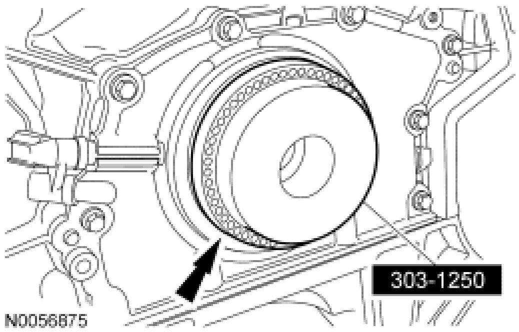

Fig. 651: Positioning Special Tool (303-1250) Onto End Of Crankshaft
Courtesy of FORD MOTOR CO.

141. Using the special tools, install the new crankshaft rear seal.

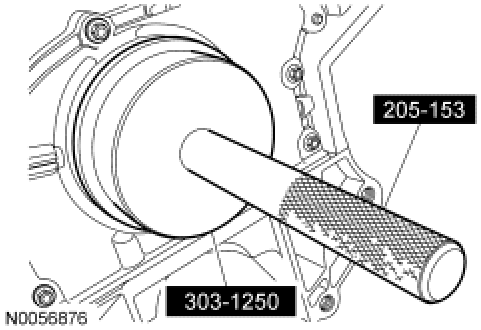

Fig. 652: Installing New Crankshaft Rear Seal Using Special Tools (303-1250) & (205-153)
Courtesy of FORD MOTOR CO.

142. Install the crankshaft sensor ring.

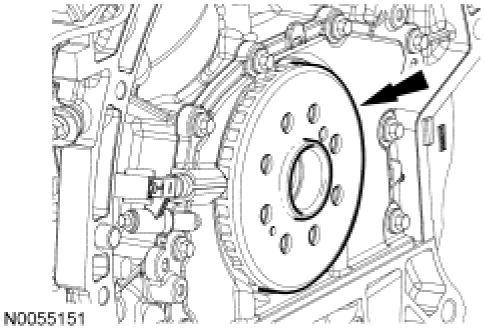

Fig. 653: Identifying Crankshaft Sensor Ring
Courtesy of FORD MOTOR CO.

143. Install the flexplate and the 8 bolts.
    - Tighten to 80 Nm (59 lb-ft).

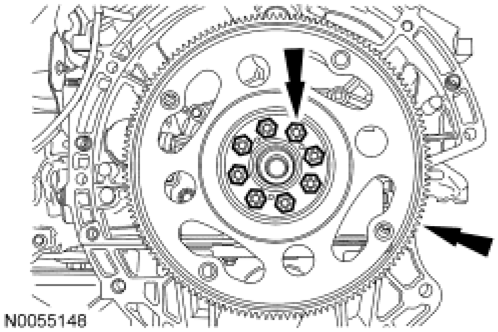

Fig. 654: Identifying Flexplate & Bolts
Courtesy of FORD MOTOR CO.

INSTALLATION

ENGINE

Special Tools

Illustration	Tool Name	Tool Number
	Heavy Duty Floor Crane	014-00071 or equivalent

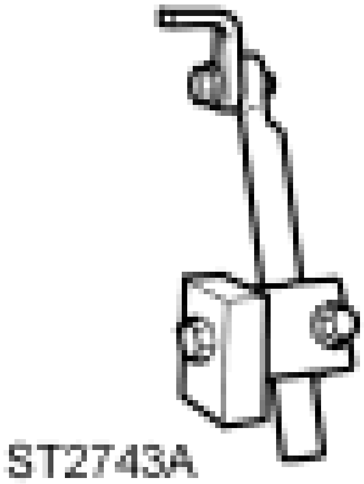
 ST1293-A	Powertrain Lift	014-00765
 ST1602-A	Spreader Bar	303-D089 (D93P-6001-A3) or equivalent
	Universal Adapter Brackets	014-0001



Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

All vehicles

1. Align the transaxle to the engine.
2. Install the 4 transaxle-to-engine bolts and the transaxle-to-engine stud bolt.
   - Tighten to 48 Nm (35 lb-ft).

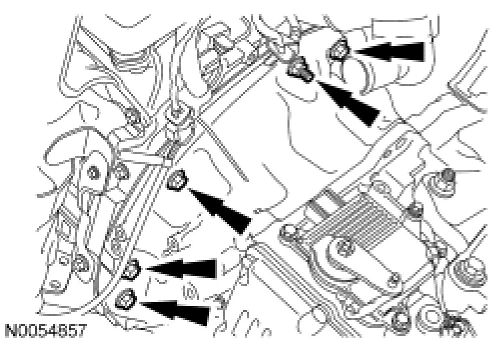


Fig. 655: Locating Transaxle-To-Engine Stud Bolt & Transaxle-To-Engine Bolts
Courtesy of FORD MOTOR CO.

3. Install the 2 engine-to-transaxle bolts.
   - Tighten to 48 Nm (35 lb-ft).

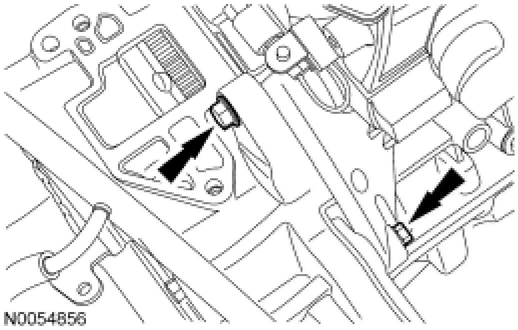

Fig. 656: Locating Engine-To-Transaxle Bolts
Courtesy of FORD MOTOR CO.

4. Using the special tools, position the engine and transaxle onto the lift table.

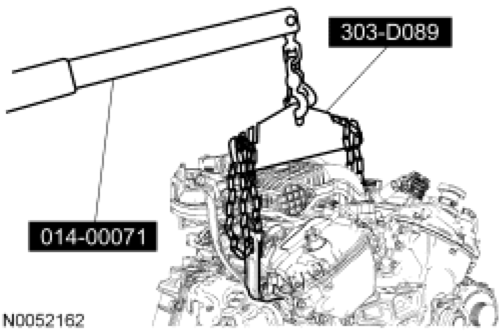

Fig. 657: Removing Engine & Transaxle From Lift Table Using Special Tools (303-D089, 014-00071) & Suitable Engine Crane
Courtesy of FORD MOTOR CO.

NOTE: Position a block of wood under the transaxle.

5. Install the special tools.

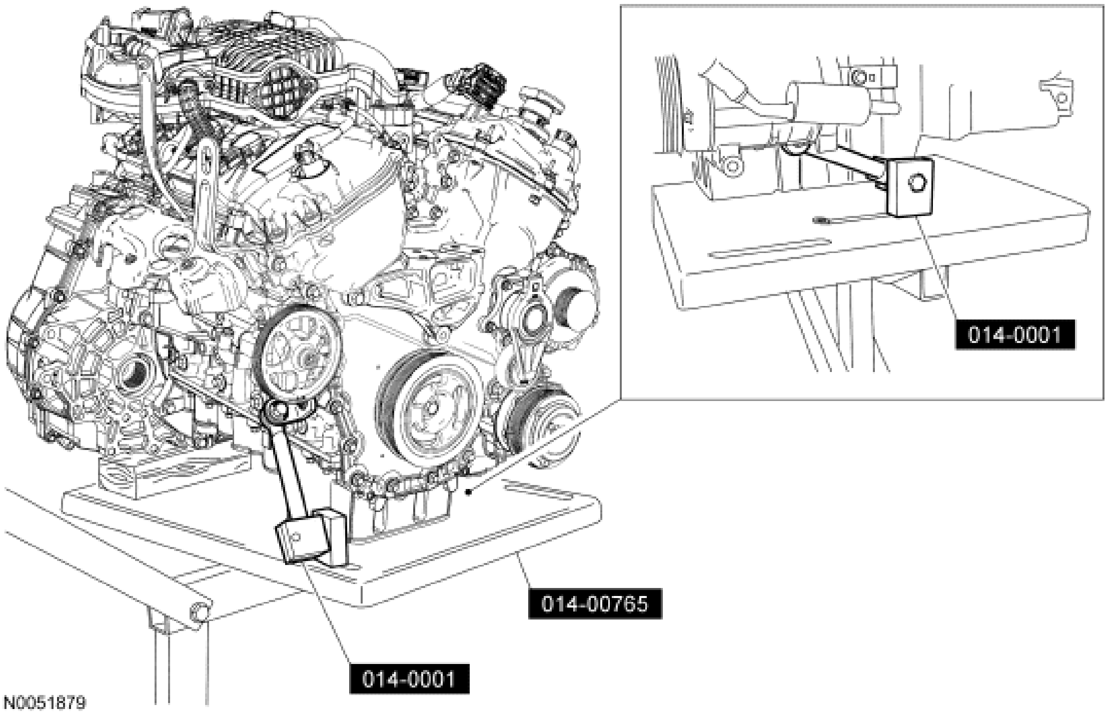

Fig. 658: Positioning Block Of Wood Under Transaxle Using Special Tools (014-0001) & (014-00765)
Courtesy of FORD MOTOR CO.

6. Install the starter and the 2 bolts.
   - Tighten to 26 Nm (19 lb-ft).

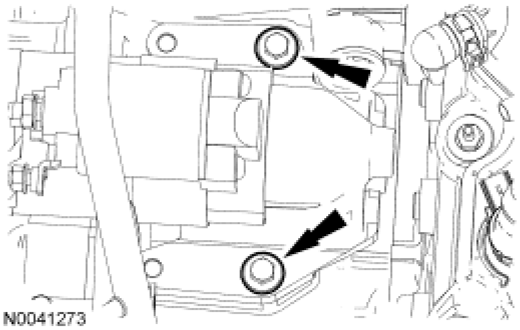

Fig. 659: Locating Starter Motor Bolts
Courtesy of FORD MOTOR CO.

7. Attach the starter wire terminals and install the 2 nuts.
   1. Tighten to 12 Nm (9 lb-ft).
   2. Tighten to 5 Nm (44 lb-in).
      - Position the starter terminal boot over the starter terminal.

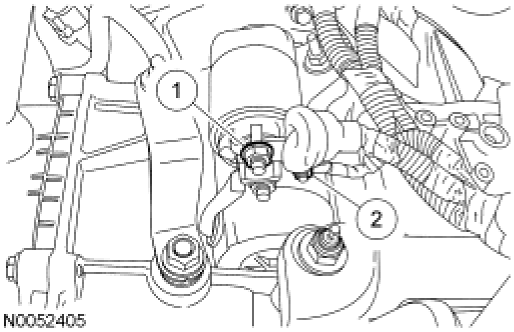

Fig. 660: Identifying Starter Motor Wire Terminals & Nuts
Courtesy of FORD MOTOR CO.

8. Connect the transmission control module (TCM) electrical connector.

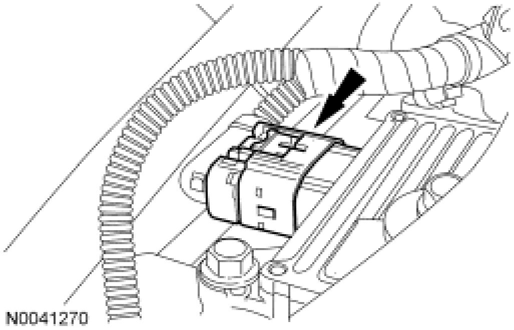

Fig. 661: Locating Transmission Control Module (TCM) Electrical Connector
Courtesy of FORD MOTOR CO.

9. Install the ground wire and bolt.
   - Tighten to 12 Nm (9 lb-ft).

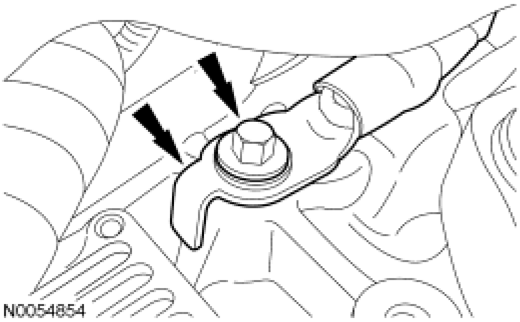

Fig. 662: Identifying Ground Wire & Bolt
Courtesy of FORD MOTOR CO.

10. Connect the wiring harness fasteners to the transaxle-to-engine stud bolt and the starter.

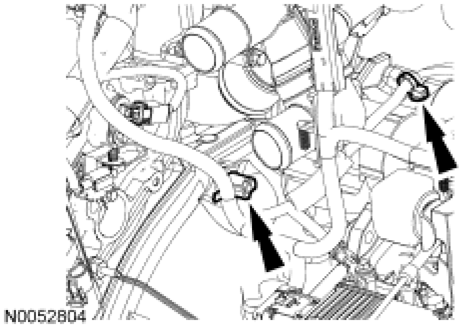

Fig. 663: Identifying Wiring Harness Fasteners & Torque Converter Housing Stud Bolt
Courtesy of FORD MOTOR CO.

11. Raise the engine and transaxle assembly into the vehicle.
12. Install the engine mount, the nut and the 2 bolts.
    - Tighten the bolts to 55 Nm (41 lb-ft).
    - Tighten the nut to 63 Nm (46 lb-ft).

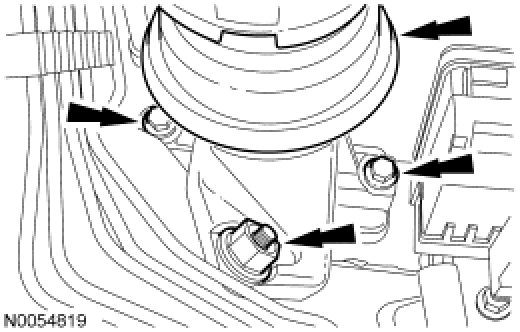

Fig. 664: Identifying Nut, Bolts & Engine Mount
Courtesy of FORD MOTOR CO.

13. Install the 4 engine mount nuts.
    - Tighten to 63 Nm (46 lb-ft).

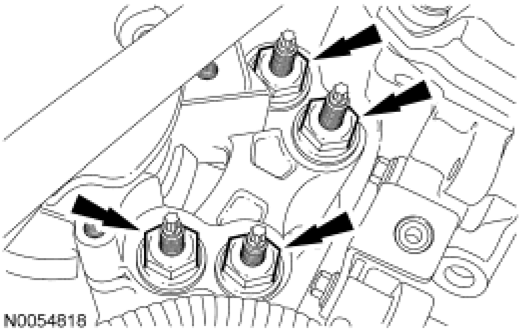

Fig. 665: Identifying Engine Mount Nuts
Courtesy of FORD MOTOR CO.

14. Install the 2 transaxle mount bracket nuts and the bolt.
    - Tighten to 80 Nm (59 lb-ft).

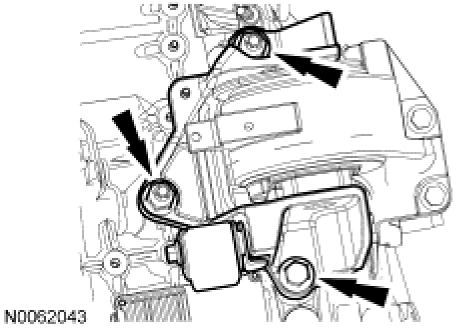

Fig. 666: Identifying Transaxle Mount Bracket Bolt
Courtesy of FORD MOTOR CO.

15. Install the transaxle mount through bolt and nut.
    - Tighten to 90 Nm (66 lb-ft).

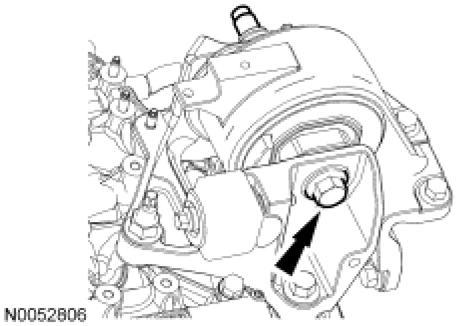

Fig. 667: Identifying Transaxle Support Insulator Through Bolt
Courtesy of FORD MOTOR CO.

All wheel drive (AWD) vehicles

16. Position the power transfer unit (PTU) in place and install the 5 bolts.
    - Tighten to 90 Nm (66 lb-ft).

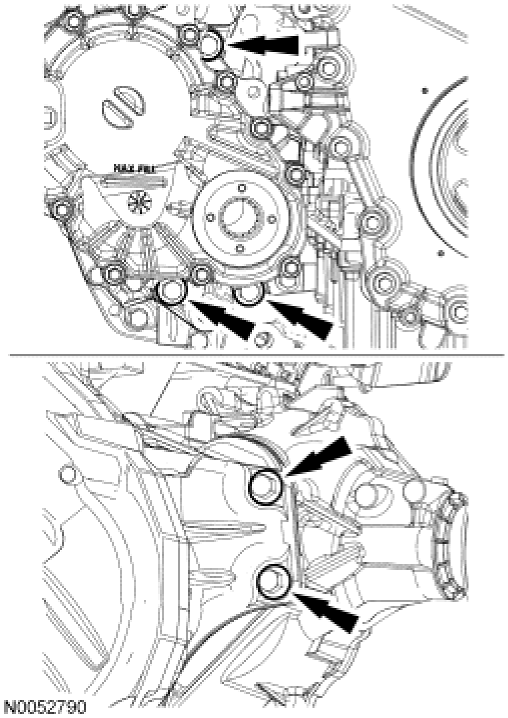

Fig. 668: Locating PTU Bolts
Courtesy of FORD MOTOR CO.

17. Position the PTU support bracket in place and install the 5 bolts.
    - Tighten to 70 Nm (52 lb-ft).

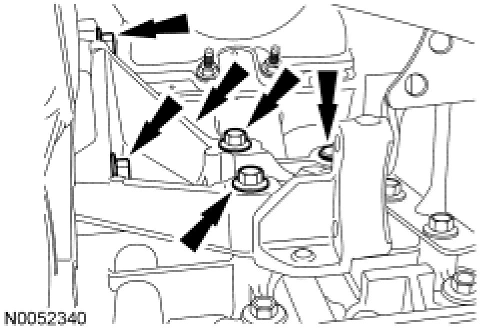

Fig. 669: Locating Power Transfer Unit (PTU) Support Bracket & Bolts
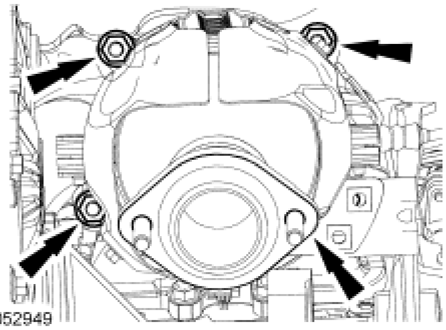
Courtesy of FORD MOTOR CO.

NOTE: Do not tighten the 4 catalytic converter nuts at this time.

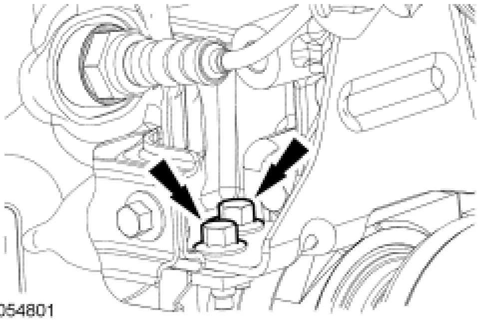
18. Using a new gasket, install the RH catalytic converter and 4 new nuts.



N0052949

Fig. 670: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

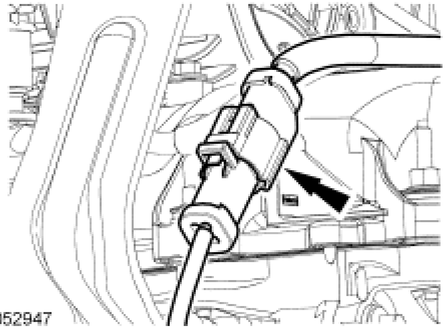
19. Install the 2 catalytic converter-to-bracket bolts.
    - Tighten the 4 catalytic converter nuts to 40 Nm (30 lb-ft).
    - Tighten the 2 catalytic converter-to-bracket bolts to 20 Nm (15 lb-ft).



N0054801

Fig. 671: Identifying RH Catalytic Converter Support Bracket Bolts
Courtesy of FORD MOTOR CO.

20. Connect the RH catalyst monitor electrical connector.



N0052947

Fig. 672: Locating RH Catalyst Monitor Electrical Connector
Courtesy of FORD MOTOR CO.

NOTE: **A new PTU seal must be installed whenever the intermediate shaft is removed.**

21. Install a new PTU seal. For additional information, refer to **TRANSFER CASE - POWER TRANSFER UNIT (PTU)** article.

NOTE:	Prior to installation of the halfshaft, inspect the halfshaft sealing surface for wear or damage and install new, if necessary.

22. Position the RH halfshaft in the transaxle and install the 2 bolts.
    - Tighten to 23 Nm (17 lb-ft).

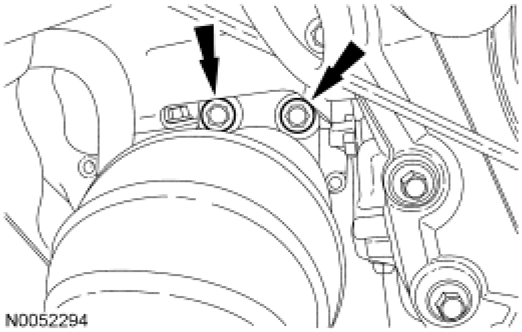


Fig. 673: Locating RH Halfshaft Bearing Support Bracket Bolts
Courtesy of FORD MOTOR CO.

Front wheel drive (FWD) vehicles

NOTE:	Prior to installation of the halfshaft, inspect the halfshaft sealing surface for wear or damage and install new if necessary.

23. Position the RH halfshaft in the transaxle and install the bolt and the 2 stud bolts.
    - Tighten to 55 Nm (41 lb-ft).

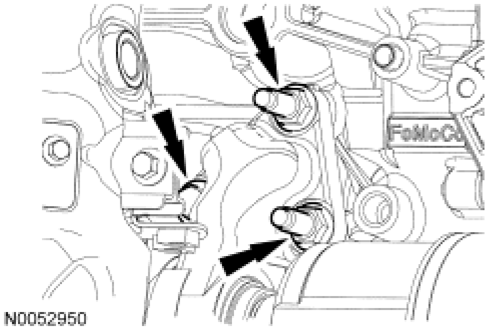

Fig. 674: Identifying Intermediate Shaft Bearing Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

NOTE:	Do not tighten the 2 catalytic converter support bracket bolts at this time.

24. Install the RH catalytic converter support bracket and the 2 bolts.

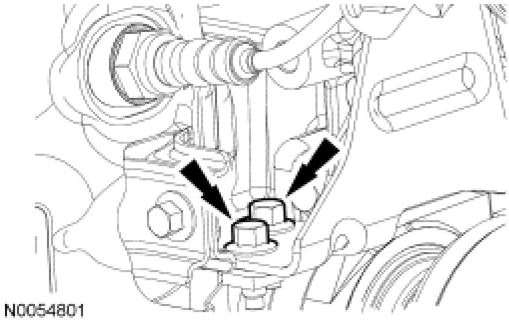

Fig. 675: Identifying RH Catalytic Converter Support Bracket Bolts
Courtesy of FORD MOTOR CO.

25. Install the 2 catalytic converter support bracket nuts.
    - Tighten to 40 Nm (30 lb-ft).
    - Tighten the 2 catalytic converter support bracket bolts to 20 Nm (15 lb-ft).

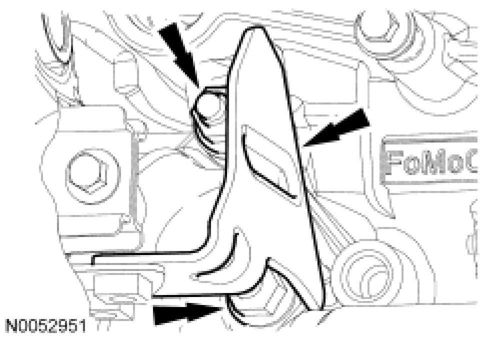

Fig. 676: Identifying Catalytic Converter Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

All vehicles

NOTE: **Prior to installation of the halfshaft, inspect the halfshaft sealing surface for wear or damage and install new, if necessary.**

26. Install the LH halfshaft into the transaxle.

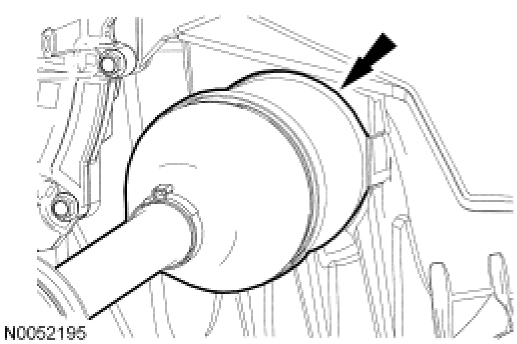

Fig. 677: Identifying LH Halfshaft
Courtesy of FORD MOTOR CO.

27. Using the special tool, raise the subframe into the installed position.

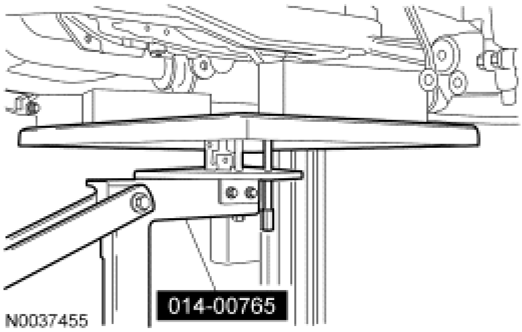

Fig. 678: Positioning Special Tool (014-00765) Under Subframe Assembly
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

28. Install the 2 front subframe nuts.
    - Tighten to 150 Nm (111 lb-ft).

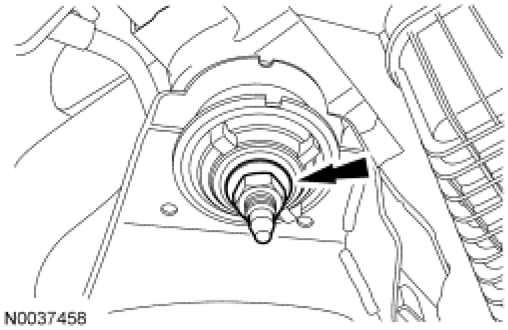

Fig. 679: Locating Front Subframe Nuts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

29. Position the subframe brackets and install the 4 bolts finger-tight.

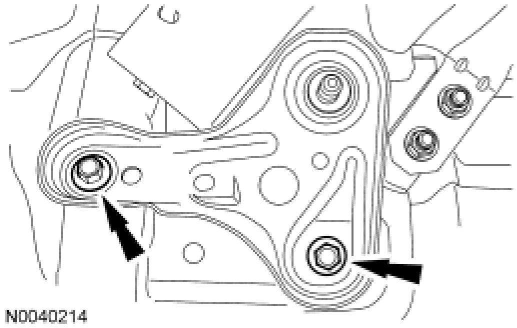

Fig. 680: Locating Subframe Brackets And Bolts Finger-Tight
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

30. Install the 2 rear subframe nuts.
    - Tighten to 150 Nm (111 lb-ft).

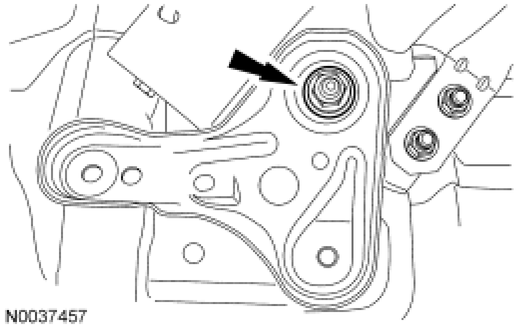

Fig. 681: Locating Subframe Nuts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

31. Tighten the 4 subframe bracket-to-body bolts to 103 Nm (76 lb-ft).

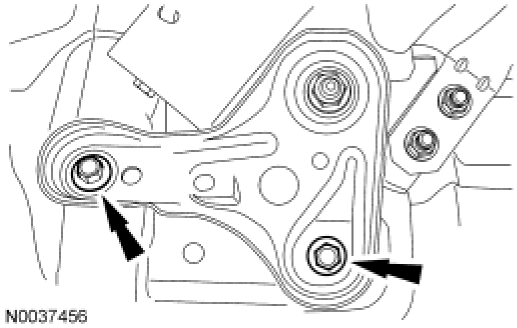

Fig. 682: Locating Subframe Bracket-To-Body Bolts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

32. Install the through bolts into the lower control arms.
    - Tighten to 103 Nm (76 lb-ft).

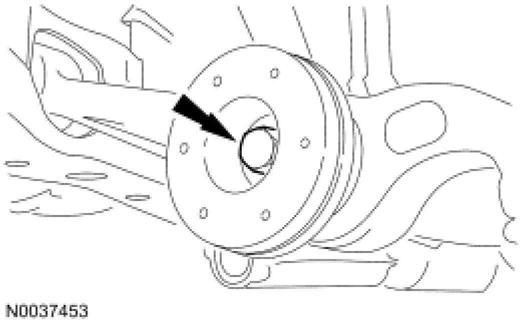

Fig. 683: Locating Lower Control Arms Through Bolt
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

33. Install the 4 lower ball joint nuts.
    - Tighten to 200 Nm (148 lb-ft).

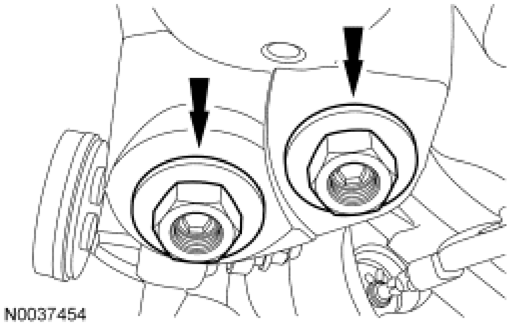

Fig. 684: Locating Lower Ball Joint Nuts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

34. Install the stabilizer bar links and nuts to the struts.
    - Tighten to 40 Nm (30 lb-ft).

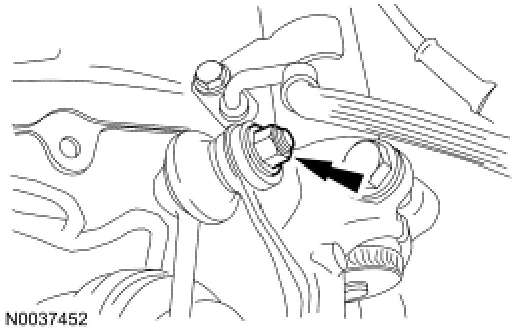

Fig. 685: Locating Stabilizer Bar Links Nut
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

35. Install the tie-rod ends and nuts.
    - Tighten to 48 Nm (35 lb-ft).
    - Install new cotter pins.

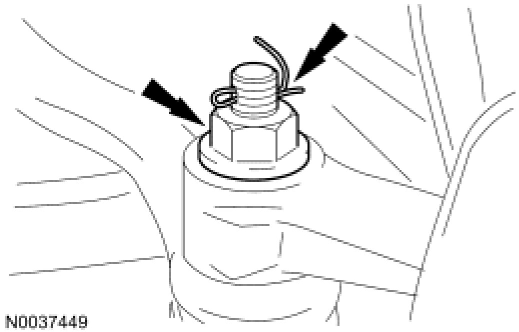

Fig. 686: Locating Tie-Rod Ends Nuts And Cotter Pin
Courtesy of FORD MOTOR CO.

36. Install the engine roll restrictor-to-subframe through bolt.
    - Tighten to 90 Nm (66 lb-ft).

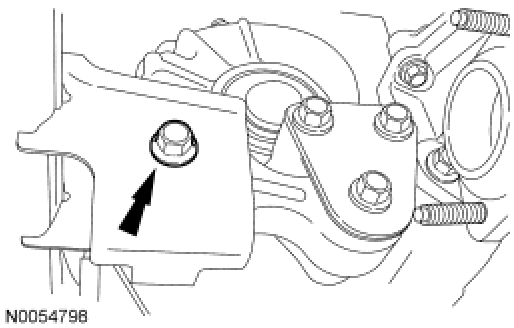

Fig. 687: Locating Roll Restrictor Bolt
Courtesy of FORD MOTOR CO.

AWD vehicles

37. Line up the index marks on the rear driveshaft to the index marks on the PTU flange made during removal and install the 4 bolts.
    - Tighten to 70 Nm (52 lb-ft).

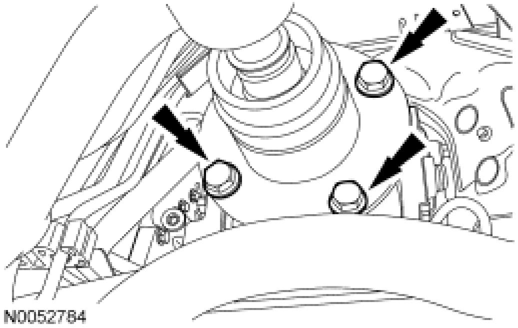

Fig. 688: Identifying Drive Shaft Bolts
Courtesy of FORD MOTOR CO.

All vehicles

38. Install 4 new torque converter nuts.
    - Tighten to 36 Nm (27 lb-ft).

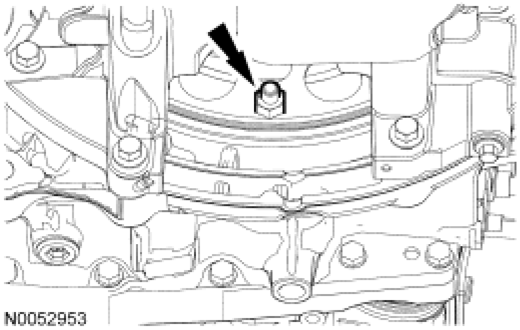

Fig. 689: Identifying Torque Converter Nuts
Courtesy of FORD MOTOR CO.

39. Install the inspection cover and the 2 fasteners.

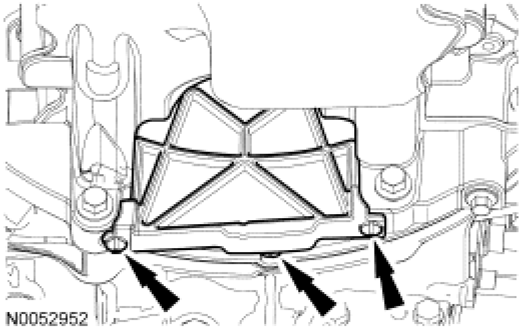

Fig. 690: Identifying Inspection Cover & Fasteners
Courtesy of FORD MOTOR CO.

40. Install the 4 oil pan-to-transaxle bolts.
    - Tighten to 48 Nm (35 lb-ft).

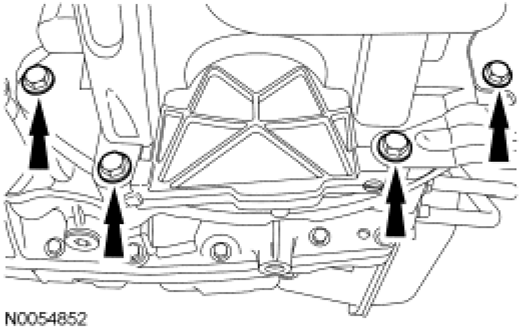

Fig. 691: Locating Oil Pan-To-Transaxle Bolts
Courtesy of FORD MOTOR CO.

41. Using new gaskets, install the Y-pipe assembly and 6 new nuts.
    - Tighten to 40 Nm (30 lb-ft).

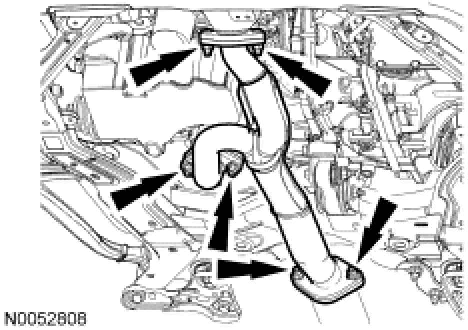

Fig. 692: Locating Y-Pipe Nuts & Y-Pipe Assembly
Courtesy of FORD MOTOR CO.

NOTE: **Lubricate the engine oil filter gasket with clean engine oil prior to installing the oil filter.**

42. Install a new engine oil filter.
    - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

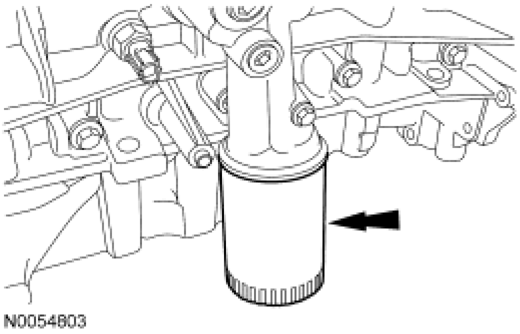

Fig. 693: Identifying Engine Oil Filter
Courtesy of FORD MOTOR CO.

43. Connect the 2 transmission fluid cooler hoses.

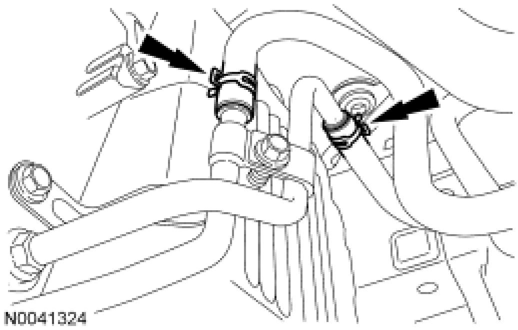

Fig. 694: Locating Transmission Fluid Cooler Hoses
Courtesy of FORD MOTOR CO.

44. Connect the power steering cooler tube.

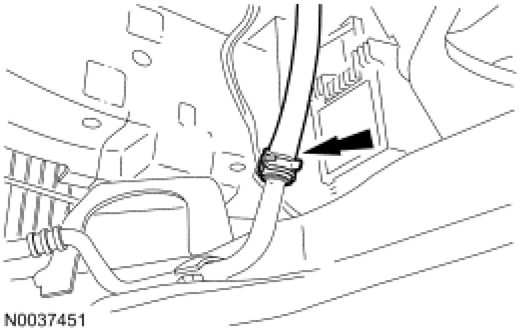

Fig. 695: Locating Power Steering Cooler Tube
Courtesy of FORD MOTOR CO.

45. Slide the steering gear-to-dash seal onto the steering gear and engage the 4 retaining clips into the body.

- From under the vehicle, verify that the seal is properly installed on the steering gear and the retaining clips are fully engaged into the body.

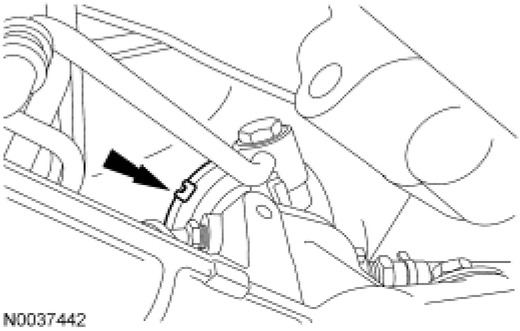

Fig. 696: Locating Steering Gear-To-Dash Seal Clips
Courtesy of FORD MOTOR CO.

46. If equipped, install the underbody shield and the 6 screws.

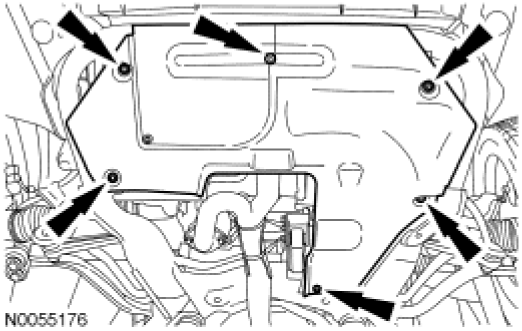

Fig. 697: Locating Underbody Shield Screws
Courtesy of FORD MOTOR CO.

47. Install the LH splash shield and the 6 pin-type retainers (4 shown).

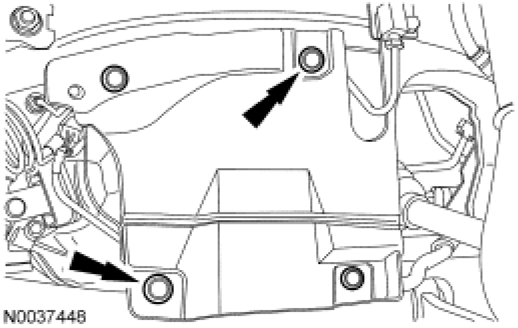

Fig. 698: Locating LH Splash Shield And Pin-Type Retainers
Courtesy of FORD MOTOR CO.

48. Position the LH fender splash shield and install the 4 screws.

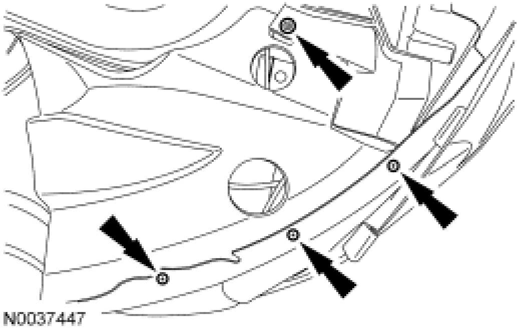

Fig. 699: Locating LH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

NOTE: Align the index marks made during removal.

49. Install the steering intermediate shaft onto the steering gear and install a new bolt.
    - Tighten to 23 Nm (17 lb-ft).

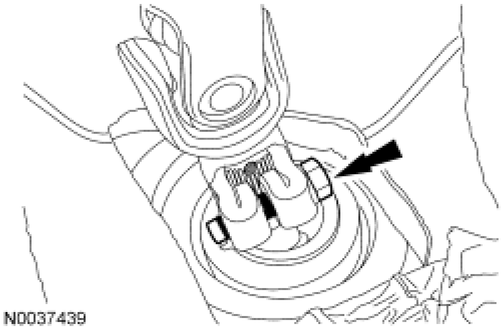

Fig. 700: Locating Steering Intermediate Shaft Bolt
Courtesy of FORD MOTOR CO.

50. Install the steering joint cover and the 2 nuts.

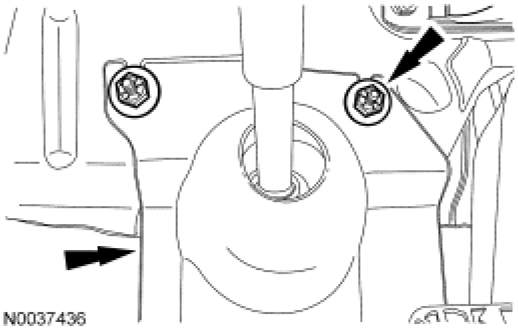

Fig. 701: Locating Steering Joint Cover And Nuts
Courtesy of FORD MOTOR CO.

51. Using a new banjo bolt and 2 new seals, install the power steering pressure (PSP) tube onto the steering

gear.

- Tighten to 37 Nm (27 lb-ft).

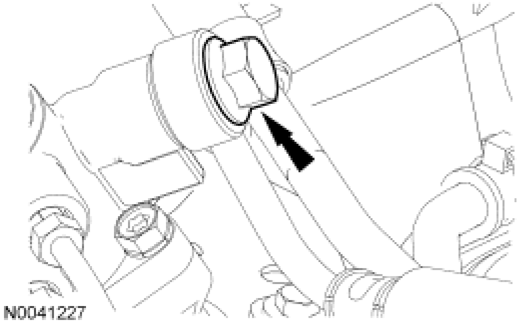

Fig. 702: Locating PSP Hose Banjo Bolt
Courtesy of FORD MOTOR CO.

52. Install the PSP tube bracket and bolt.
    - Tighten to 10 Nm (89 lb-in).

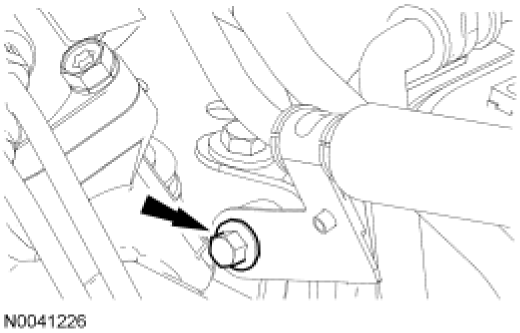

Fig. 703: Locating Power Steering Pressure (PSP) Hose Bracket Bolt
Courtesy of FORD MOTOR CO.

53. Connect the PCM electrical connectors and pin-type retainers.

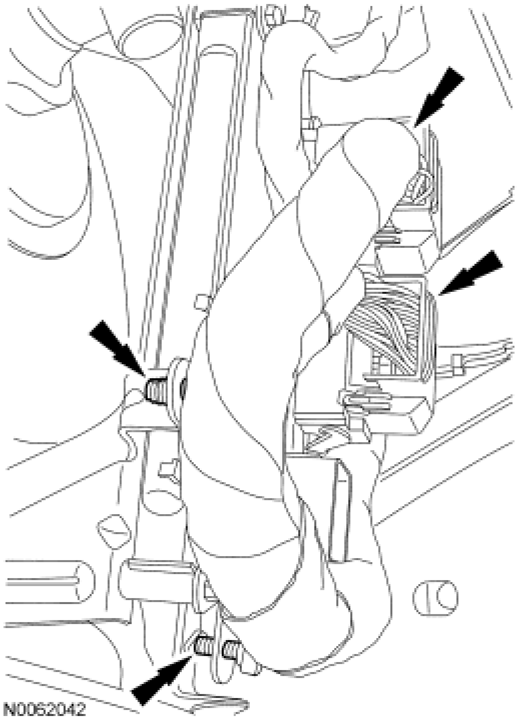

Fig. 704: Locating PCM Electrical Connectors & Pin-Type Retainers
Courtesy of FORD MOTOR CO.

54. Install the engine mount brace and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

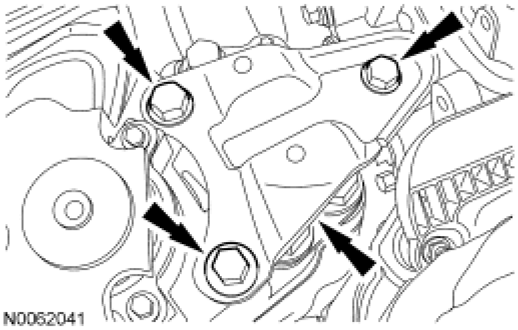

Fig. 705: Locating Engine Mount Brace Bolts
Courtesy of FORD MOTOR CO.

55. Install the ground wire and the bolt.
    - Tighten to 10 Nm (89 lb-in).

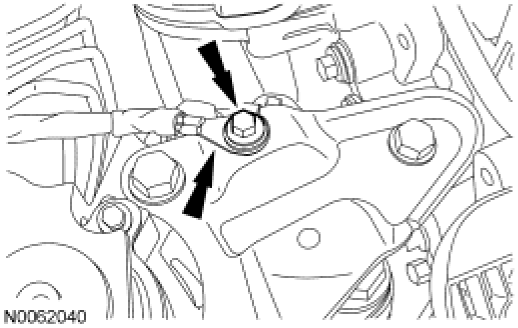

Fig. 706: Identifying Ground Wire Bolt From Engine Mount Brace
Courtesy of FORD MOTOR CO.

56. Connect the fuel supply tube from the fuel rail. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.

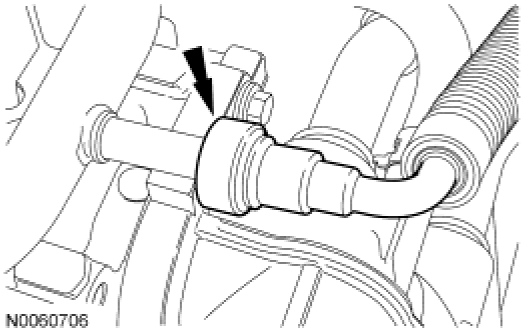

Fig. 707: Identifying Fuel Supply Tube From Fuel Rail
Courtesy of FORD MOTOR CO.

57. Attach the power steering reservoir onto the cowl.

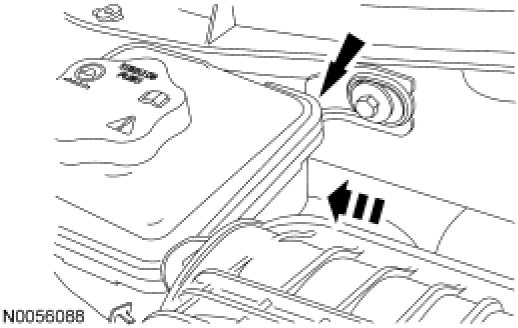

Fig. 708: Attaching Power Steering Reservoir Onto Cowl
Courtesy of FORD MOTOR CO.

58. Connect the hose to the power steering reservoir.
    - Attach the pin-type retainer to the engine mount brace.

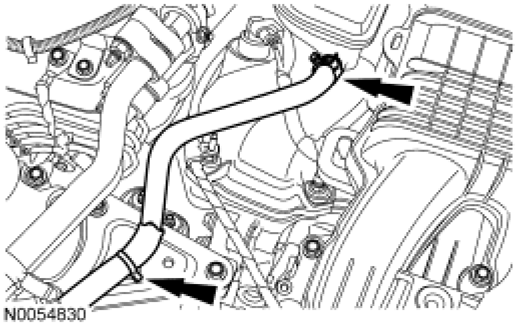

Fig. 709: Identifying Pin-Type Retainer From Engine Mount Brace
Courtesy of FORD MOTOR CO.

59. Install the oil level indicator.

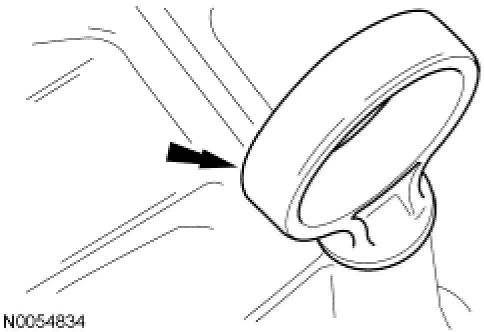

Fig. 710: Identifying Oil Level Indicator
Courtesy of FORD MOTOR CO.

60. Attach the 2 wiring harness retainers to the LH valve cover stud bolts.

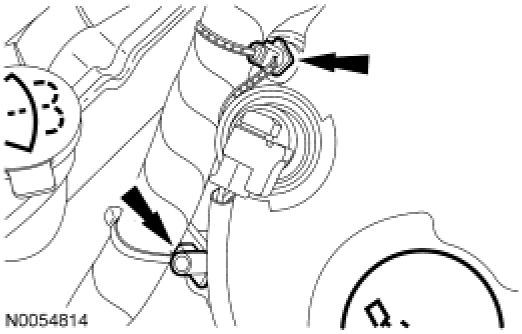

Fig. 711: Identifying Wiring Harness Retainers From LH Valve Cover Stud Bolts
Courtesy of FORD MOTOR CO.

61. Connect the 2 engine wiring harness electrical connectors.

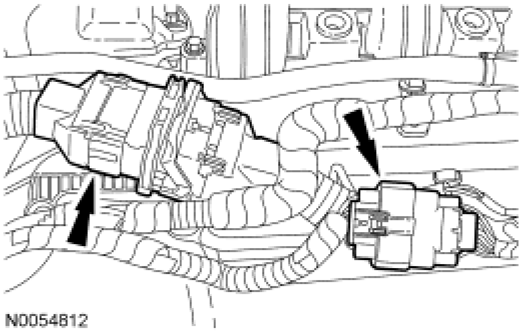

Fig. 712: Identifying Engine Wiring Harness Electrical Connectors
Courtesy of FORD MOTOR CO.

62. Attach the 2 wiring harness retainers.

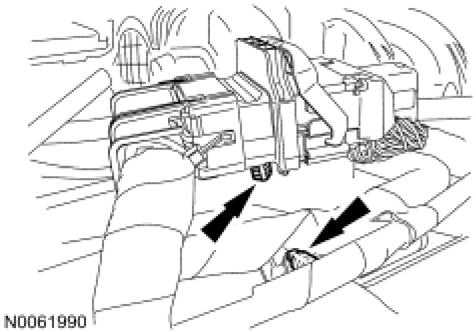

Fig. 713: Identifying Wiring Harness Retainers
Courtesy of FORD MOTOR CO.

63. Using new O-ring seals, connect the A/C tubes and install the 2 nuts.
    - Tighten to 8 Nm (71 lb-in).

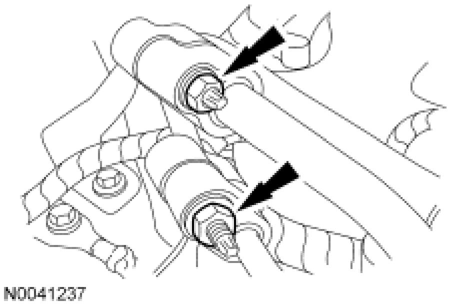

Fig. 714: Locating A/C Tubes And Nuts
Courtesy of FORD MOTOR CO.

64. Install the A/C tube bracket bolt.
    - Tighten to 8 Nm (71 lb-in).

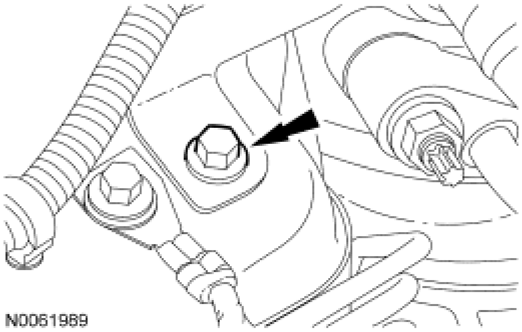

Fig. 715: Locating A/C Tube Bracket Bolt
Courtesy of FORD MOTOR CO.

65. Install the 2 A/C tube bracket bolts.
    - Tighten to 10 Nm (89 lb-in).

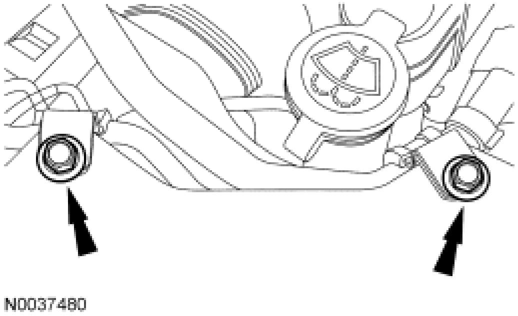

Fig. 716: Locating A/C Tube Bracket Bolts
Courtesy of FORD MOTOR CO.

66. Using a new O-ring seal, connect the A/C tube to the condenser and install the nut.
    - Tighten to 8 Nm (71 lb-in).

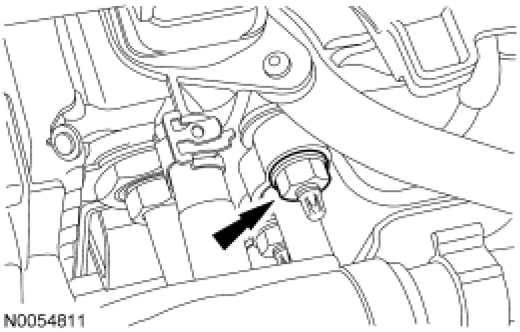

Fig. 717: Locating A/C Tube From Condenser
Courtesy of FORD MOTOR CO.

67. Attach the coolant tube retainer clips to the A/C tube.

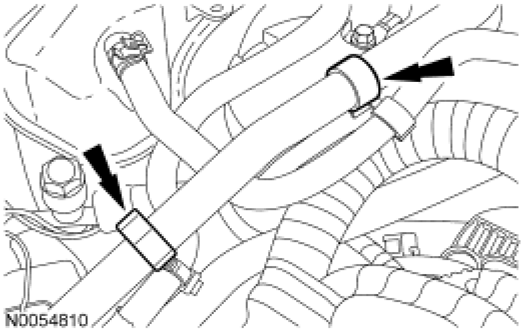

Fig. 718: Identifying Coolant Tube Retainer Clips
Courtesy of FORD MOTOR CO.

68. If equipped, attach the engine block heater harness to the radiator support, power steering hose, A/C tube and the engine wiring harness.
69. Install the ground wire and bolt.
    - Tighten to 12 Nm (9 lb-ft).

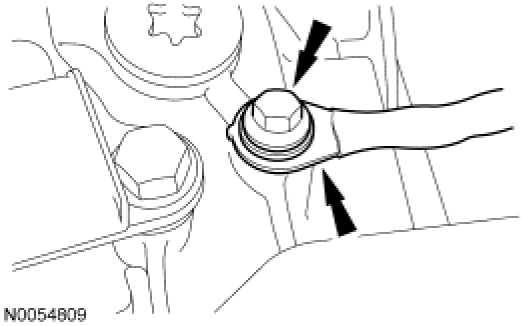

Fig. 719: Locating Ground Wire And Bolt
Courtesy of FORD MOTOR CO.

70. Position the transaxle control cable bracket in place and install the 3 nuts.
    - Tighten to 12 Nm (9 lb-ft).

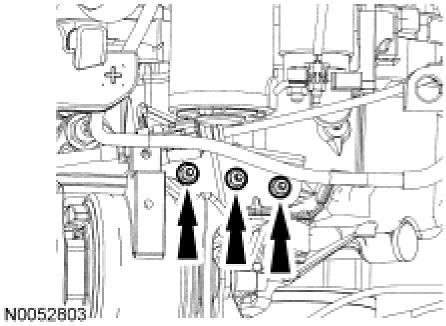

Fig. 720: Identifying Selector Lever Cable Bracket Bolts & Nuts
Courtesy of FORD MOTOR CO.

71. Connect the transaxle control cable to the control lever.

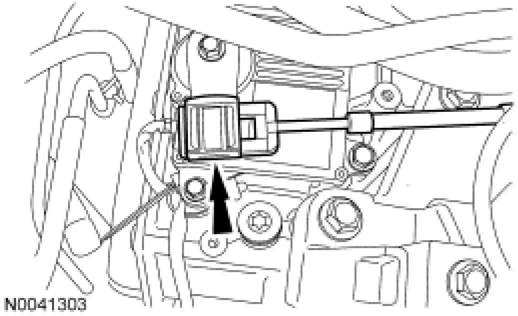

Fig. 721: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

72. Connect the upper radiator hose, lower radiator hose and 2 heater hoses to the thermostat housing.

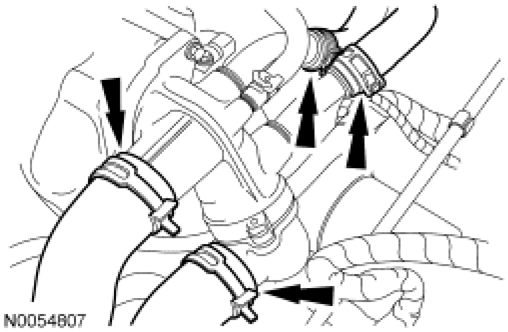

Fig. 722: Locating Upper Radiator Hose, Lower Radiator Hose & Heater Hoses From Thermostat Housing
Courtesy of FORD MOTOR CO.

73. Connect the vacuum hose and the evaporative emissions (EVAP) tube to the upper intake manifold.

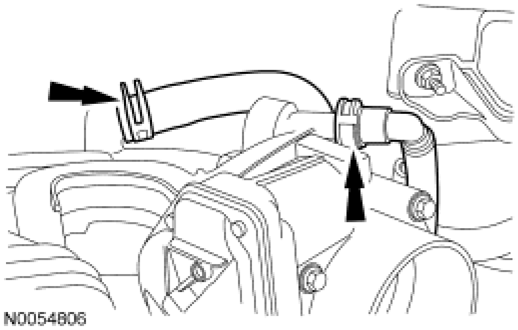

Fig. 723: Locating Vacuum Hose & Evaporative Emissions (EVAP) Tube From Upper Intake Manifold
Courtesy of FORD MOTOR CO.

74. Install the ground wire and the bolt.

- Tighten to 10 Nm (89 lb-in).

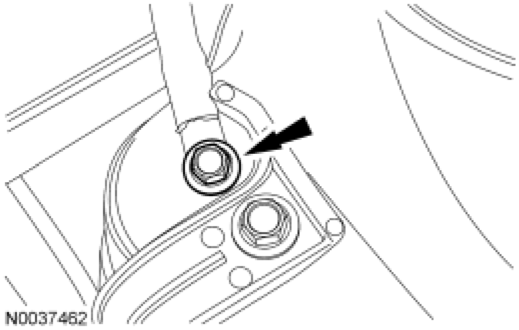

Fig. 724: Locating Ground Wire And Bolt
Courtesy of FORD MOTOR CO.

75. Connect the power feed to the battery terminal and install the nut.
    - Tighten to 6 Nm (53 lb-in).

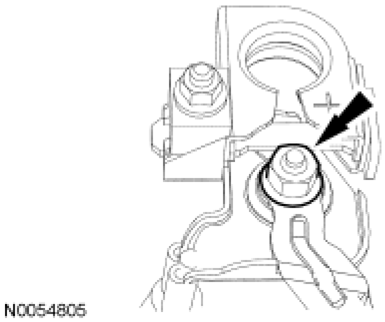

Fig. 725: Locating Power Feed To Battery Terminal And Nut
Courtesy of FORD MOTOR CO.

76. Attach the 2 wiring harness retainers to the transmission mount and the battery tray bracket.

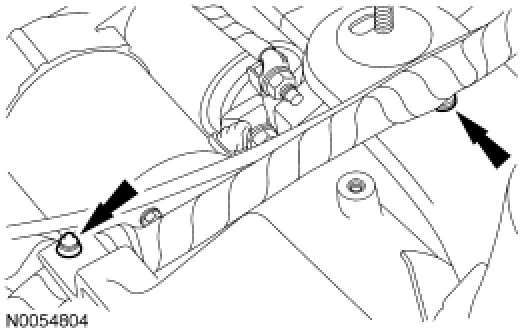

Fig. 726: Locating Wiring Harness Retainers From Transmission Mount & Battery Tray Bracket
Courtesy of FORD MOTOR CO.

77. Connect the 2 engine wiring harness electrical connectors.

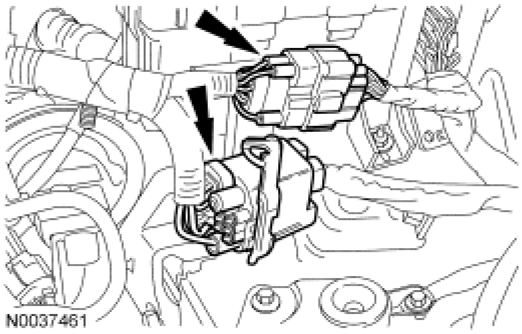

Fig. 727: Locating Engine Wiring Harness Electrical Connectors
Courtesy of FORD MOTOR CO.

78. Install the battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
79. Install the engine air cleaner and the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.
80. Install the degas bottle. For additional information, refer to **ENGINE COOLING** article.
81. Install the accessory drive belt and the power steering belt. For additional information, refer to **ACCESSORY DRIVE - 3.5L** article.
82. Fill the engine with clean engine oil.
83. Fill and bleed the cooling system. For additional information, refer to **ENGINE COOLING** article.
84. Fill the power steering system. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** article.
85. Check the transaxle fluid and add fluid if necessary. For additional information, refer to the Transmission Fluid Drain and Refill procedure in **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article.
86. Recharge the air conditioning system. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

Material

Item	Specification
Motorcraft High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft Metal Surface Prep ZC-31-A	-
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Silicone Gasket Remover ZC-30	-

All vehicles

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.

1. Install the special tools.

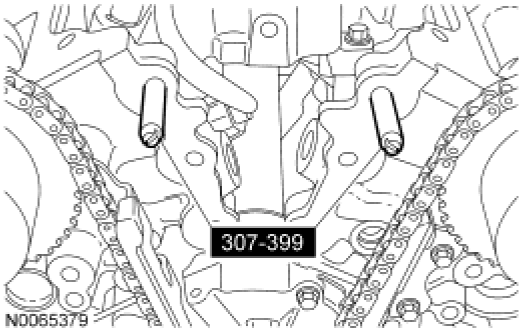

Fig. 728: Identifying Special Tool (307-399)
Courtesy of FORD MOTOR CO.

CAUTION: Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: The engine front cover and bolts 17, 18, 19 and 20 must be installed within 4 minutes of the initial sealant application. The remainder of the engine front cover bolts and the engine mount bracket bolts must be installed and tightened within 35 minutes of the initial sealant application. If the time limits are exceeded, the sealant must be removed, the sealing area cleaned and sealant reapplied. To clean the sealing area, use silicone

gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

2. Apply a 3.0 mm (0.11 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover sealing surfaces including the 3 engine mount bracket bosses.
   - Apply a 5.5 mm (0.21 in) bead of Motorcraft High Performance Engine RTV Silicone to the oil pan-to-cylinder block joint and the cylinder head-to-cylinder block joint areas of the engine front cover in 5 places as indicated.

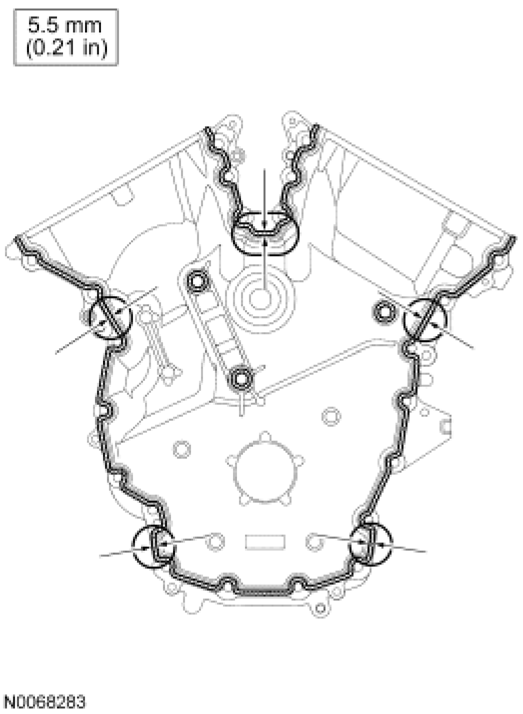

Fig. 729: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Engine Front Cover Sealing Surfaces
Courtesy of FORD MOTOR CO.

NOTE: **Make sure the 2 locating dowel pins are seated correctly in the cylinder block.**

3. Install the engine front cover and bolts 17, 18, 19 and 20.
   - Tighten in sequence to 3 Nm (27 lb-in).

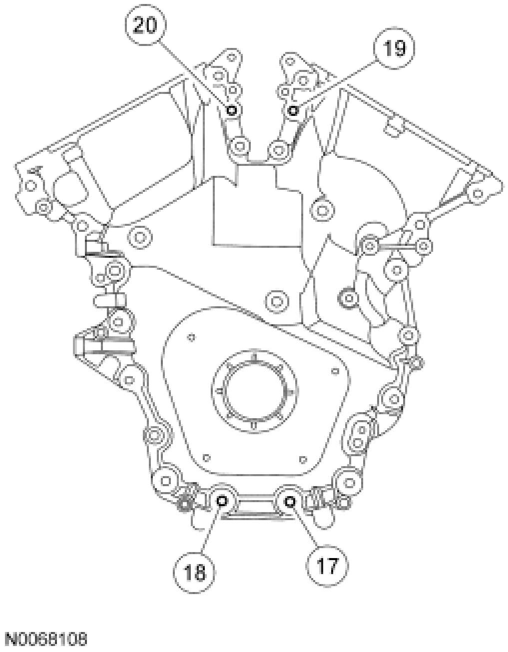

Fig. 730: Installing Engine Front Cover & Bolts In Sequence
Courtesy of FORD MOTOR CO.

4. Remove the special tools (alignment pins).

NOTE: Do not tighten the bolts at this time.

5. Install the engine mount bracket and the 3 bolts.

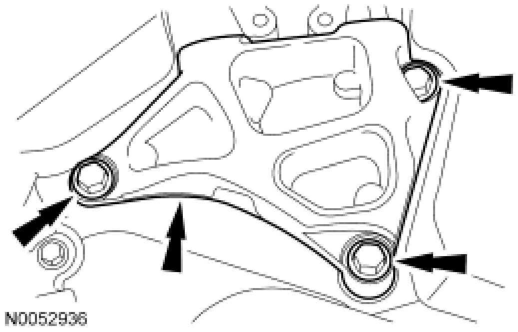

Fig. 731: Locating Engine Mount Bracket & Bolts
Courtesy of FORD MOTOR CO.

CAUTION: Do not expose the Motorcraft High Performance Engine RTV Silicone to engine oil for at least 90 minutes after installing the engine front cover. Failure to follow this instruction may cause oil leakage.

6. Install the remaining engine front cover bolts. Tighten all of the engine front cover bolts and engine mount bracket bolts in the sequence shown in 2 stages:
    - Stage 1: Tighten bolts 1 thru 22 to 10 Nm (89 lb-in) and bolts 23, 24 and 25 to 15 Nm (11 lb-ft).
    - Stage 2: Tighten bolts 1 thru 22 to 24 Nm (18 lb-ft) and bolts 23, 24 and 25 to 75 Nm (55 lb-ft).

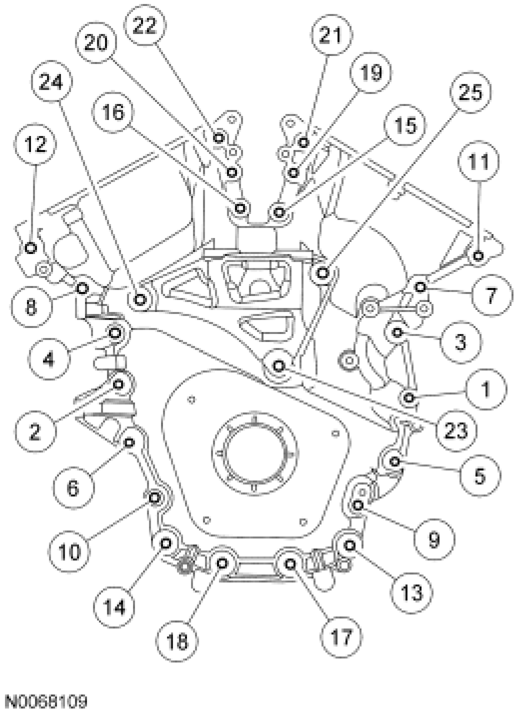

Fig. 732: Identifying Tightening Of Engine Front Cover Bolts & Engine Mount Bracket Bolts In Sequence
Courtesy of FORD MOTOR CO.

7. Install the 2 engine mount studs.
    - Tighten to 18 Nm (13 lb-ft).

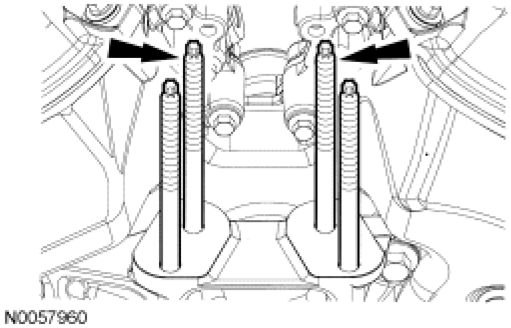

Fig. 733: Locating Engine Mount Studs
Courtesy of FORD MOTOR CO.

8. Install the engine mount bracket and the 2 bolts.

- Tighten to 24 Nm (18 lb-ft).

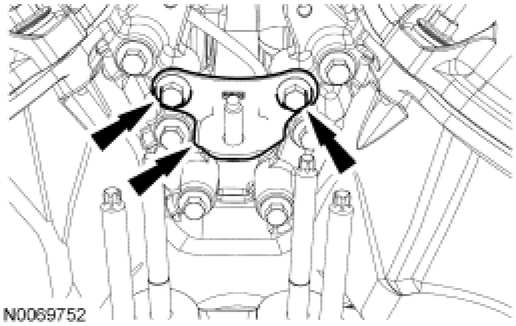

Fig. 734: Locating Engine Mount Bracket & Bolts
Courtesy of FORD MOTOR CO.

NOTE: Apply clean engine oil to the crankshaft front seal bore in the engine front cover.

9. Using the special tools, install a new crankshaft front seal.

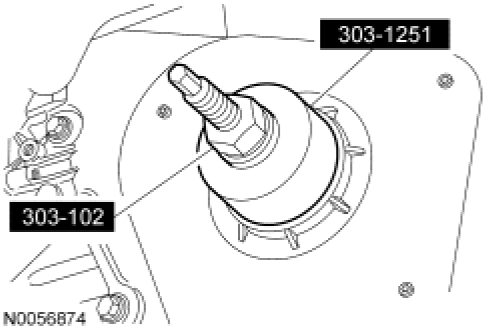

Fig. 735: Installing Crankshaft Front Seal Using Special Tools (303-102) & (303-1251)
Courtesy of FORD MOTOR CO.

NOTE: Lubricate the outside diameter sealing surfaces with clean engine oil.

10. Using the special tools, install the crankshaft pulley.

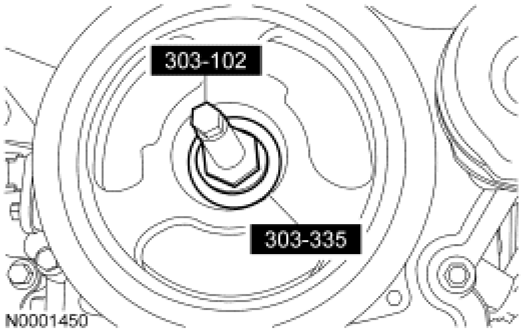

Fig. 736: Installing Crankshaft Pulley
Courtesy of FORD MOTOR CO.

11. Using the special tool, install the crankshaft pulley washer and new bolt and tighten in 4 stages.
    - Stage 1: Tighten to 120 Nm (89 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

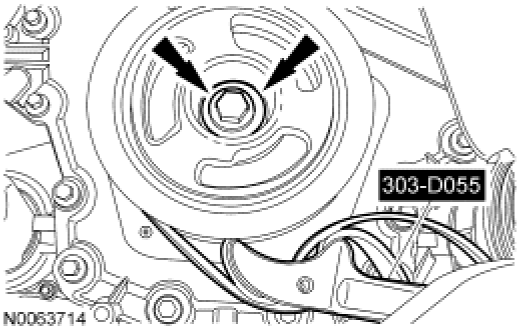

Fig. 737: Installing Crankshaft Pulley Washer & Bolt Using Special Tools (303-D055)
Courtesy of FORD MOTOR CO.

12. Install the accessory drive belt tensioner and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

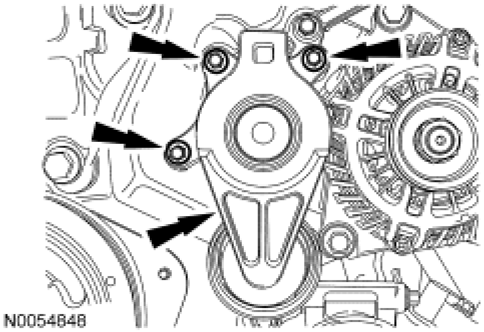

Fig. 738: Locating Accessory Drive Belt Tensioner Bolts
Courtesy of FORD MOTOR CO.

13. Install the power steering pump and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

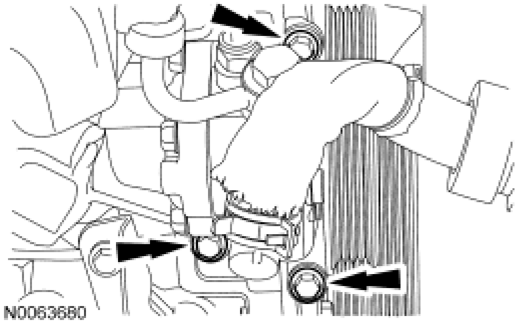

Fig. 739: Locating Power Steering Pump Bolts
Courtesy of FORD MOTOR CO.

NOTE: Installation of new seals is only required if damaged seals were removed during disassembly of the engine.

NOTE: Spark plug tube seal installation shown, variable camshaft timing (VCT) seal installation similar.

14. Using the special tools, install new VCT solenoid and/or spark plug tube seals.

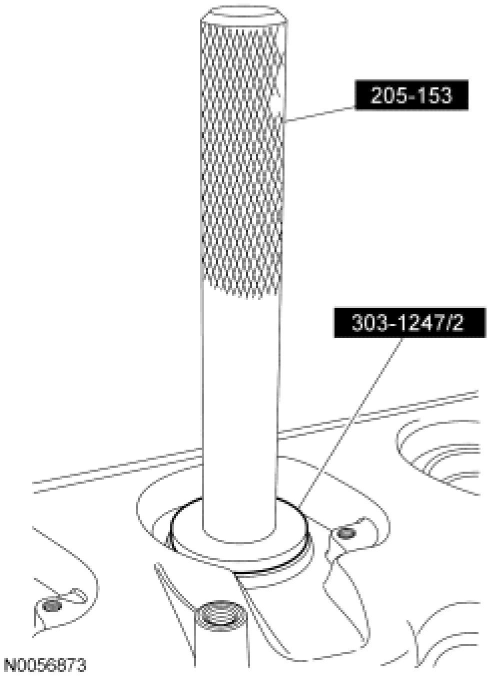

Fig. 740: Installing VCT Solenoid And/Or Spark Plug Tube Seals Using Special Tools (205-153) & (303-1247/2)
Courtesy of FORD MOTOR CO.

CAUTION: Failure to use Motorcraft High Performance Engine RTV Silicone may

cause the engine oil to foam excessively and result in serious engine damage.

NOTE: **If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.**

15. Apply an 8 mm (0.31 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover-to-RH cylinder head joints.

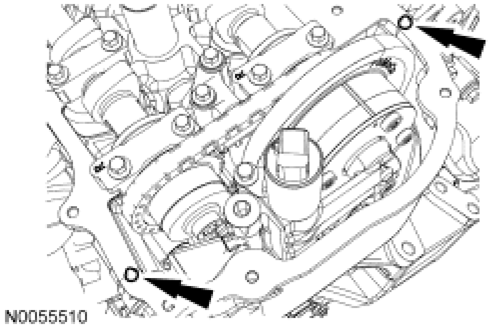

Fig. 741: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Engine Front Cover-To-RH Cylinder Head Joints
Courtesy of FORD MOTOR CO.

16. Using a new gasket, install the RH valve cover, bolt and the 10 stud bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

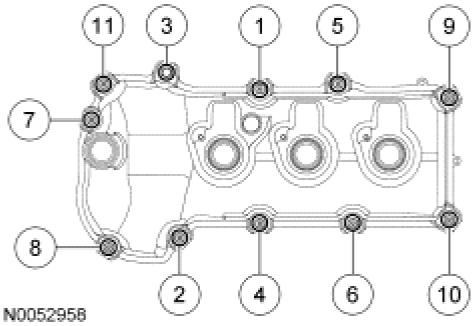

Fig. 742: Installing RH Valve Cover Stud Bolts In Sequence
Courtesy of FORD MOTOR CO.

CAUTION: **Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

NOTE: **If the valve cover is not installed and the fasteners tightened within 4**

minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

17. Apply an 8 mm (0.31 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover-to-LH cylinder head joints.

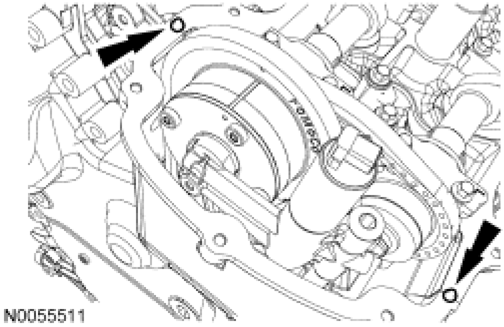

Fig. 743: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Engine Front Cover-To-LH Cylinder Head Joints
Courtesy of FORD MOTOR CO.

18. Using a new gasket, install the LH valve cover and 11 stud bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

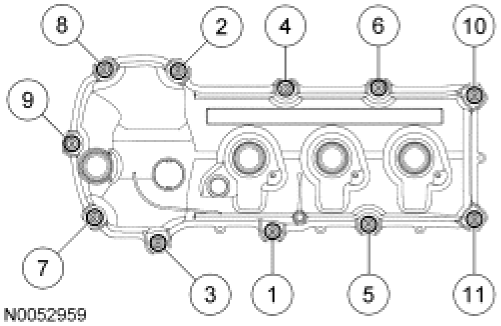

Fig. 744: Installing LH Valve Cover Stud Bolts In Sequence
Courtesy of FORD MOTOR CO.

19. Install the wiring harness retaining bracket and the 2 nuts.
    - Tighten to 9 Nm (80 lb-in).

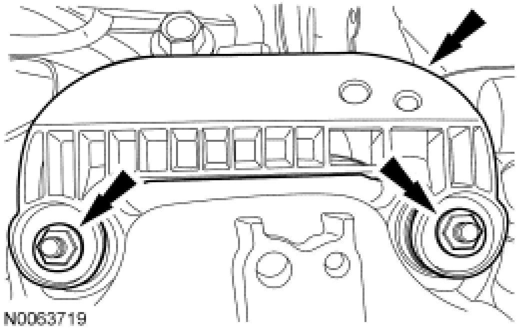

Fig. 745: Identifying Wiring Harness Retaining Bracket & Nuts
Courtesy of FORD MOTOR CO.

20. Install the power steering pressure (PSP) hose bracket and nut.
    - Tighten to 9 Nm (80 lb-in).

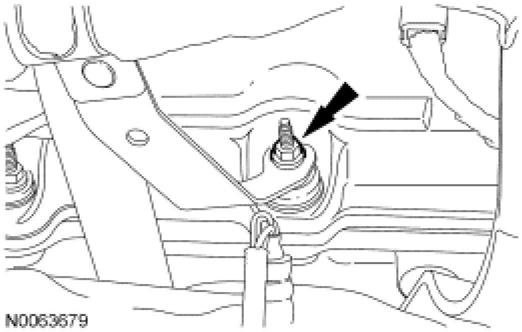

Fig. 746: Identifying PSP Hose Bracket Nut
Courtesy of FORD MOTOR CO.

21. Attach the PSP hose retainer to the engine lifting eye.

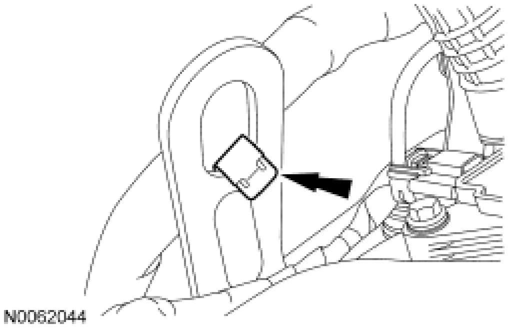

Fig. 747: Locating PSP Hose Retainer From Engine Lifting Eye
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

22. Install the 6 coil-on-plug assemblies and the 6 bolts.

- Tighten to 7 Nm (62 lb-in).

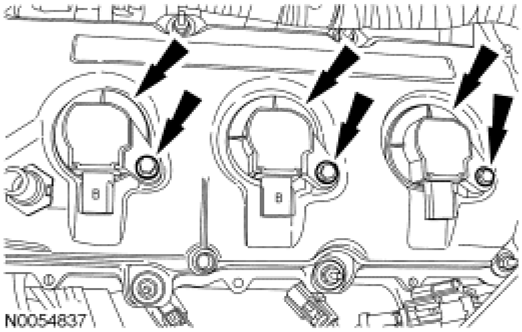

Fig. 748: Locating Coil-On-Plugs & Bolts
Courtesy of FORD MOTOR CO.

23. Attach all of the wiring harness retainers to the LH valve cover and stud bolts.
24. Connect the 3 LH coil-on-plug electrical connectors.

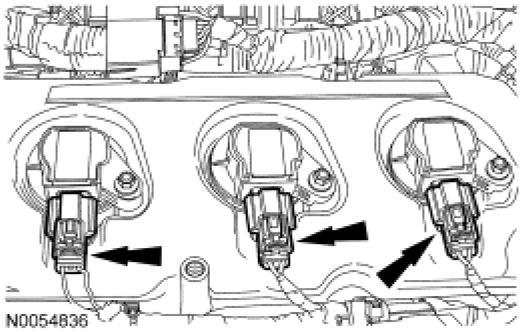

Fig. 749: Locating LH Coil-On-Plug Electrical Connectors
Courtesy of FORD MOTOR CO.

25. Connect the LH camshaft VCT solenoid electrical connector.

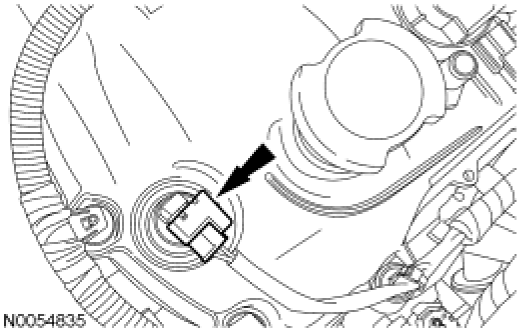

Fig. 750: Locating LH VCT Solenoid Electrical Connector
Courtesy of FORD MOTOR CO.

26. Attach all of the wiring harness retainers to the RH valve cover and stud bolts.

27. If equipped, connect the heated PCV valve electrical connector.

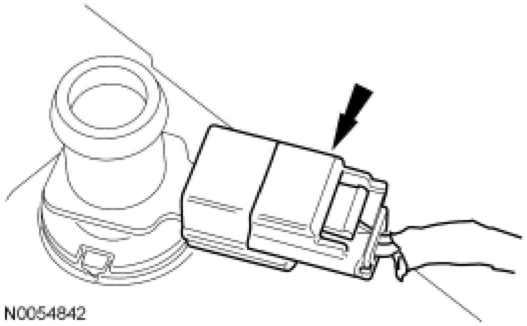

Fig. 751: Locating Heated PCV Valve Electrical Connector
Courtesy of FORD MOTOR CO.

28. Connect the 3 RH coil-on-plug electrical connectors.

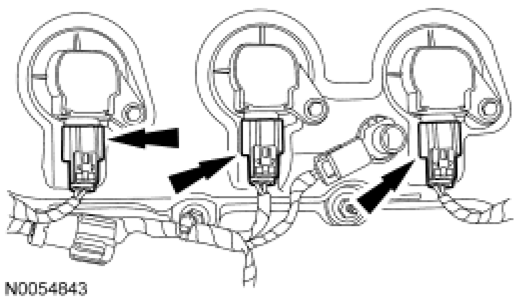

Fig. 752: Locating RH Coil-On-Plug Electrical Connectors
Courtesy of FORD MOTOR CO.

29. Connect the RH VCT solenoid electrical connector.

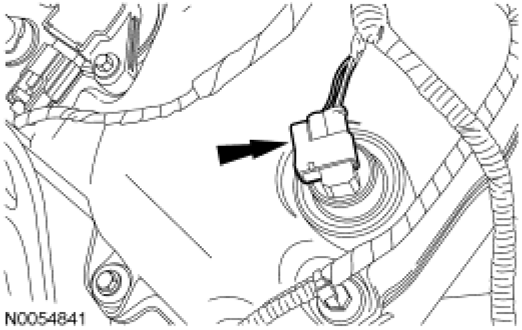

Fig. 753: Locating RH Variable Camshaft Timing (VCT) Solenoid Electrical Connector
Courtesy of FORD MOTOR CO.

30. Connect the PSP switch electrical connector.

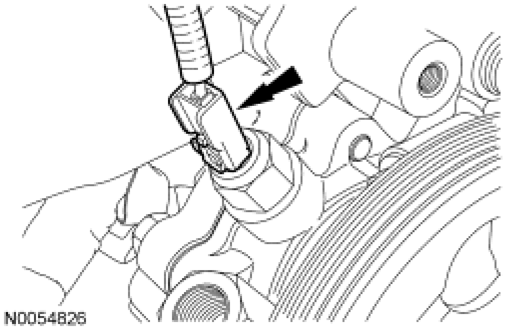

Fig. 754: Locating PSP Switch Electrical Connector
Courtesy of FORD MOTOR CO.

31. Connect the RH catalyst monitor sensor electrical connector.

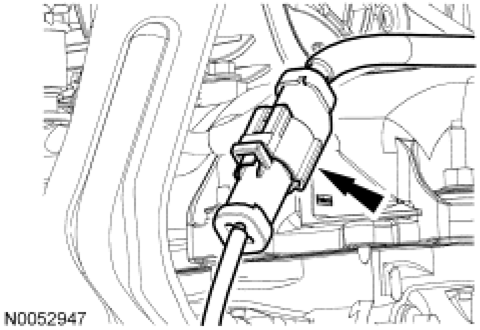

Fig. 755: Locating RH Catalyst Monitor Electrical Connector
Courtesy of FORD MOTOR CO.

32. Using new gaskets, install the upper intake manifold and the 6 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

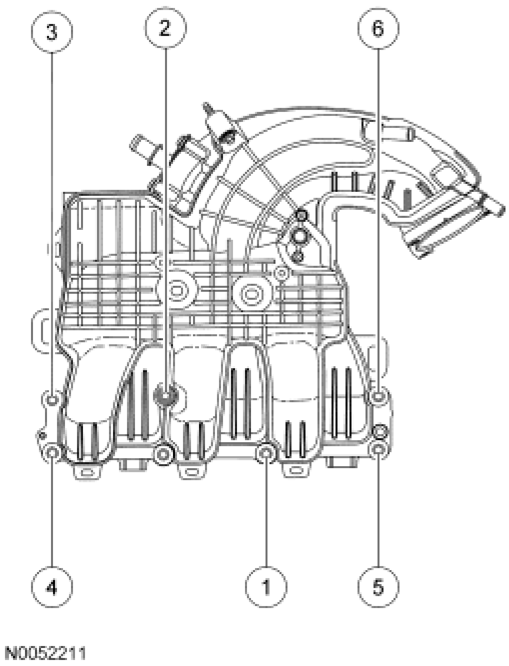

Fig. 756: Installing Upper Intake Manifold Bolts In Sequence
Courtesy of FORD MOTOR CO.

33. Install the upper intake manifold short support bracket bolt.
    - Tighten to 10 Nm (89 lb-in).

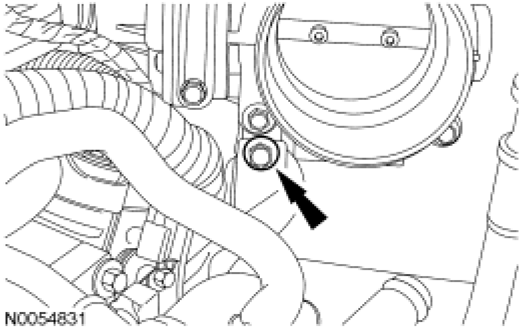

Fig. 757: Locating Upper Intake Manifold Support Bracket Bolt
Courtesy of FORD MOTOR CO.

34. If equipped, install the upper intake manifold long support bracket bolt.
    - Tighten to 10 Nm (89 lb-in).

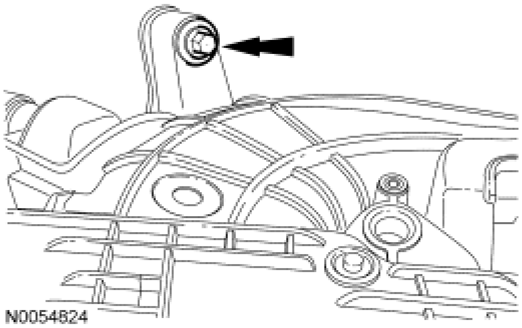

Fig. 758: Locating Upper Intake Manifold Support Bracket Bolt
Courtesy of FORD MOTOR CO.

35. Attach the wiring harness retainers to the upper intake manifold.

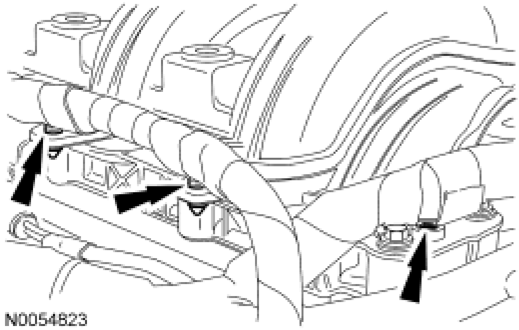

Fig. 759: Locating Wiring Harness Retainers From Upper Intake Manifold
Courtesy of FORD MOTOR CO.

36. Connect the throttle body (TB) electrical connector.

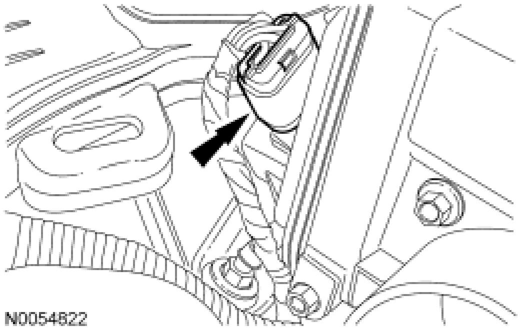

Fig. 760: Locating Throttle Body Electrical Connector
Courtesy of FORD MOTOR CO.

37. Connect the PCV hose to the PCV valve.

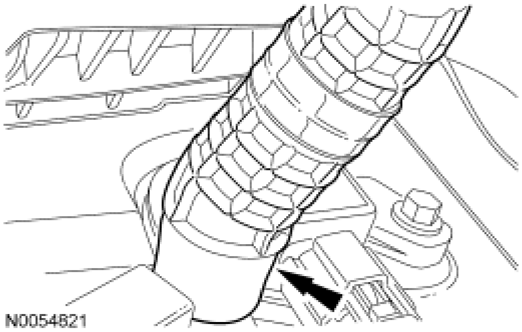

Fig. 761: Identifying PCV Hose From PCV Valve
Courtesy of FORD MOTOR CO.

38. If equipped, connect the PCV electrical connector.

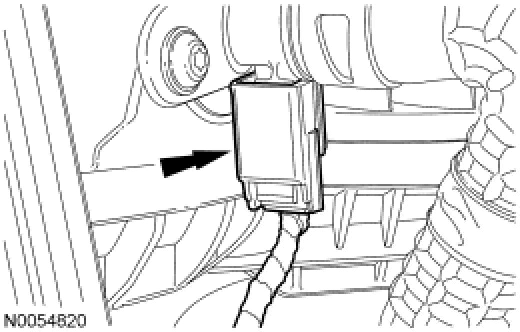

Fig. 762: Identifying Positive Crankcase Ventilation (PCV) Fitting Electrical Connector
Courtesy of FORD MOTOR CO.

39. If equipped, attach the block heater wiring harness retainer to the PSP tube and the power steering reservoir hose.

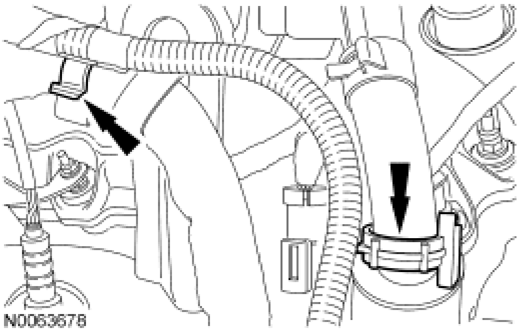

Fig. 763: Identifying Block Heater Wiring Harness From Engine
Courtesy of FORD MOTOR CO.

40. If equipped, attach the block heater wiring harness retainer to the upper intake manifold.

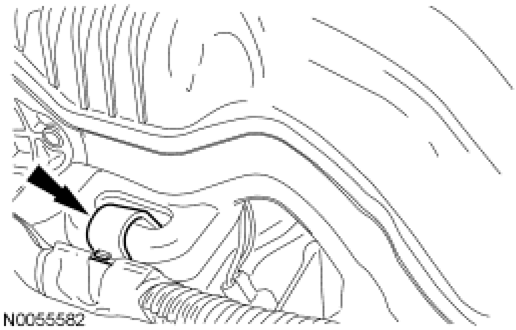

Fig. 764: Identifying Block Heater Wiring Harness Retainer From Upper Intake Manifold
Courtesy of FORD MOTOR CO.

41. Raise the engine and transaxle assembly into the vehicle.
42. Install the engine mount, the nut and the 2 bolts.
    - Tighten the bolts to 55 Nm (41 lb-ft).
    - Tighten the nut to 63 Nm (46 lb-ft).

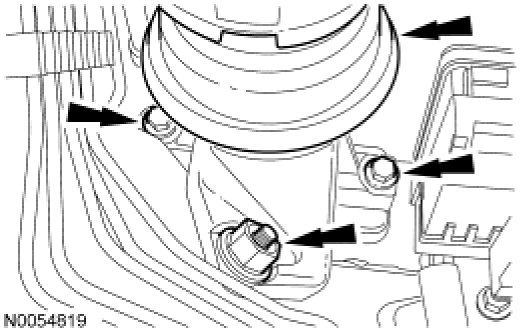

Fig. 765: Identifying Nut, Bolts & Engine Mount
Courtesy of FORD MOTOR CO.

43. Install the 4 engine mount nuts.
    - Tighten to 63 Nm (46 lb-ft).

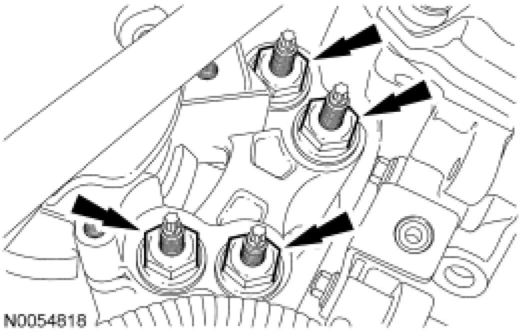

Fig. 766: Identifying Engine Mount Nuts
Courtesy of FORD MOTOR CO.

44. Install the transaxle mount bracket, bolt and the 2 nuts.
    - Tighten to 80 Nm (59 lb-ft).

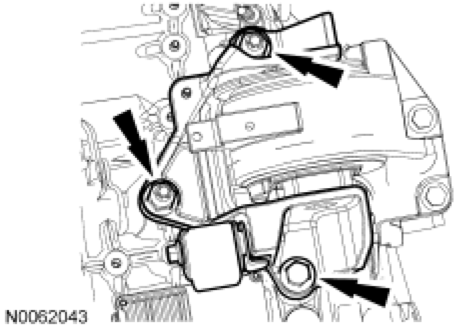

Fig. 767: Identifying Transaxle Mount Bracket Bolt
Courtesy of FORD MOTOR CO.

45. Install the transaxle mount through bolt and nut.
    - Tighten to 90 Nm (66 lb-ft).

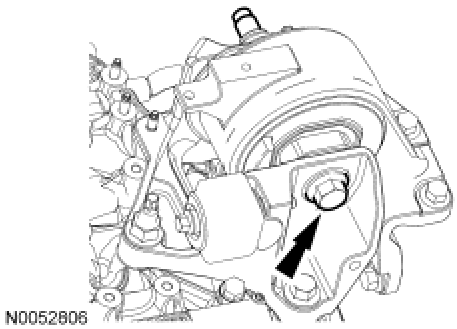

Fig. 768: Identifying Transaxle Support Insulator Through Bolt
Courtesy of FORD MOTOR CO.

Front wheel drive (FWD) vehicles

NOTE: Prior to installation of the halfshaft, inspect the halfshaft sealing surface for wear or damage and install new if necessary.

46. Position the RH halfshaft in the transaxle and install the bolt and the 2 stud bolts.
    - Tighten to 55 Nm (41 lb-ft).

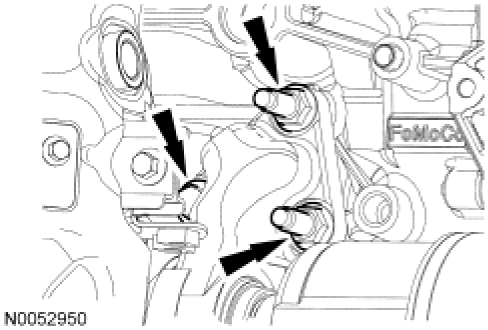

Fig. 769: Identifying Intermediate Shaft Bearing Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

NOTE: **Do not tighten the 2 catalytic converter support bracket bolts at this time.**

47. Install the RH catalytic converter support bracket and the 2 bolts.

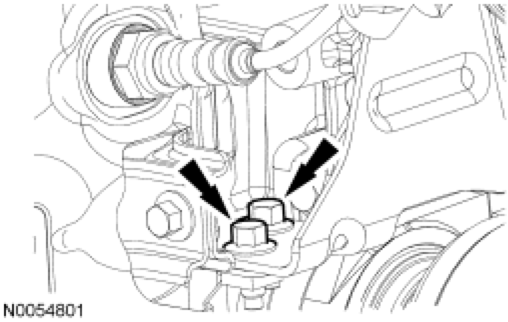

Fig. 770: Identifying RH Catalytic Converter Support Bracket Bolts
Courtesy of FORD MOTOR CO.

48. Install the 2 catalytic converter support bracket nuts.
    - Tighten to 40 Nm (30 lb-ft).
    - Tighten the 2 catalytic converter support bracket bolts to 20 Nm (15 lb-ft).

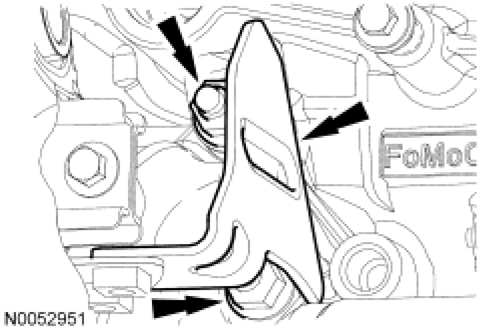

Fig. 771: Identifying Catalytic Converter Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

All wheel drive (AWD) vehicles

NOTE:	**A new powertrain transfer unit (PTU) seal must be installed whenever the intermediate shaft is removed.**

49. Install a new PTU seal. For additional information, refer to **ENGINE IGNITION - 3.0L (4V)** article.

NOTE:	**Prior to installation of the halfshaft, inspect the halfshaft sealing surface for wear or damage and install new, if necessary.**

50. Position the RH halfshaft in the transaxle and install the 2 bolts.
    - Tighten to 23 Nm (17 lb-ft).

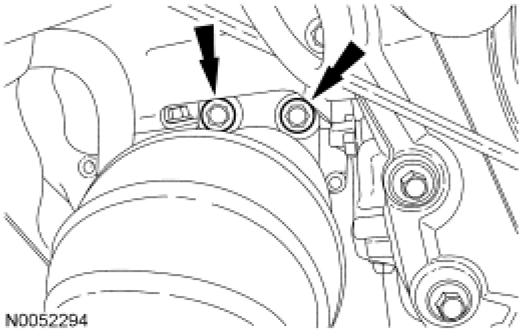

Fig. 772: Locating RH Halfshaft Bearing Support Bracket Bolts
Courtesy of FORD MOTOR CO.

All vehicles

NOTE:	**Prior to installation of the halfshaft, inspect the halfshaft sealing surface for wear or damage and install new, if necessary.**

51. Install the LH halfshaft into the transaxle.

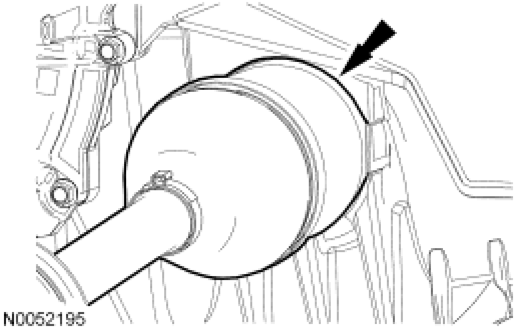

Fig. 773: Identifying LH Halfshaft
Courtesy of FORD MOTOR CO.

52. Using the special tool, raise the subframe into the installed position.

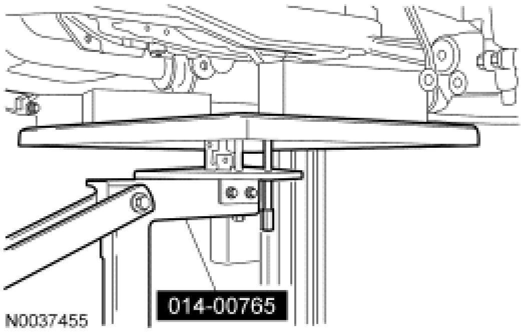

Fig. 774: Positioning Special Tool (014-00765) Under Subframe Assembly
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

53. Install the 2 front subframe nuts.
    - Tighten to 150 Nm (111 lb-ft).

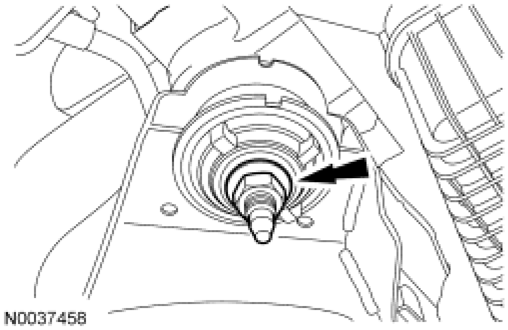

Fig. 775: Locating Front Subframe Nuts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

54. Position the subframe brackets and install the 4 bolts finger-tight.

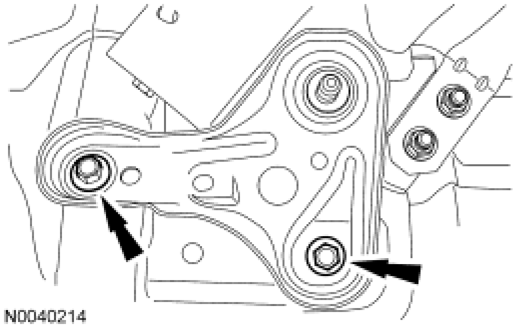

Fig. 776: Locating Subframe Brackets And Bolts Finger-Tight
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

55. Install the 2 rear subframe nuts.
    - Tighten to 150 Nm (111 lb-ft).

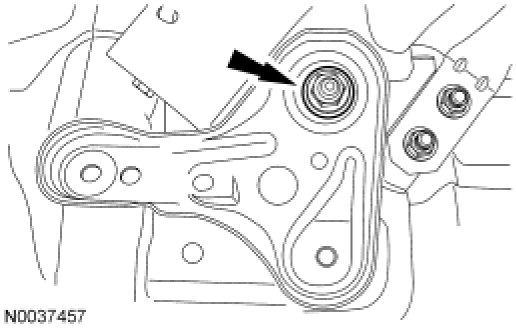

Fig. 777: Locating Subframe Nuts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

56. Tighten the 2 subframe bracket-to-body bolts to 103 Nm (76 lb-ft).

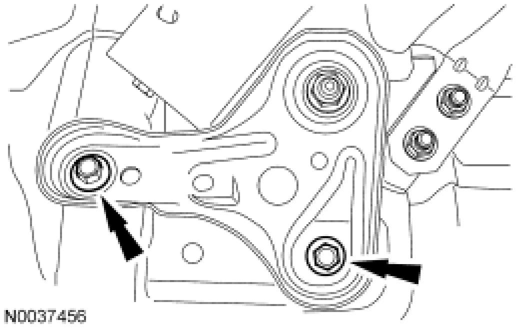

Fig. 778: Locating Subframe Bracket-To-Body Bolts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

57. Install the through bolts into the lower control arms.
    - Tighten to 103 Nm (76 lb-ft).

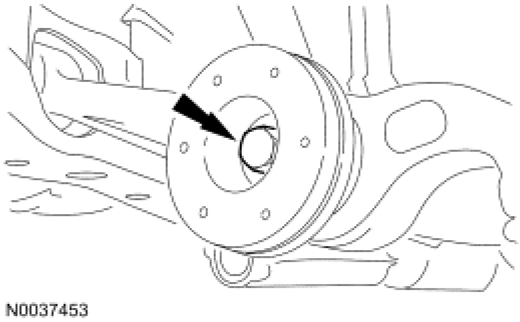

Fig. 779: Locating Lower Control Arms Through Bolt
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

58. Install the 4 lower ball joint nuts.
    - Tighten to 200 Nm (148 lb-ft).

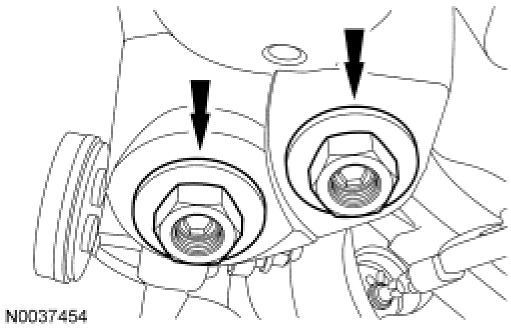

Fig. 780: Locating Lower Ball Joint Nuts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

59. Install the stabilizer bar links and nuts to the struts.

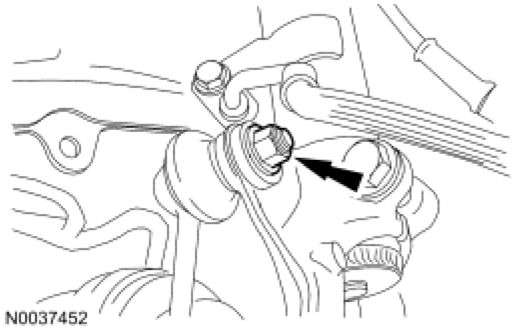

Fig. 781: Locating Stabilizer Bar Links Nut
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

60. Install the tie-rod ends and nuts.
    - Tighten to 48 Nm (35 lb-ft).
    - Install new cotter pins.

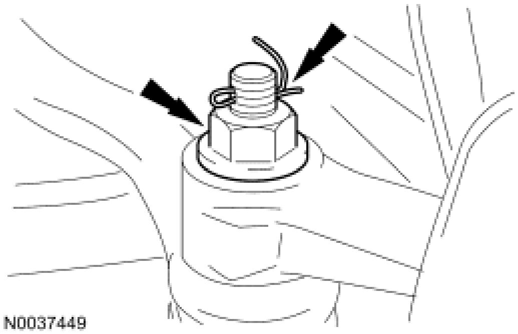

Fig. 782: Locating Tie-Rod Ends Nuts And Cotter Pin
Courtesy of FORD MOTOR CO.

61. Install the engine roll restrictor-to-subframe through bolt.
    - Tighten to 90 Nm (66 lb-ft).

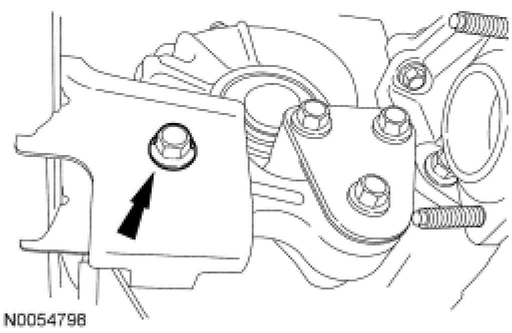

Fig. 783: Locating Roll Restrictor Bolt
Courtesy of FORD MOTOR CO.

AWD vehicles

62. Line up the index marks on the rear driveshaft to the index marks on the PTU flange made during removal and install the 4 bolts (3 shown).
    - Tighten to 70 Nm (52 lb-ft).

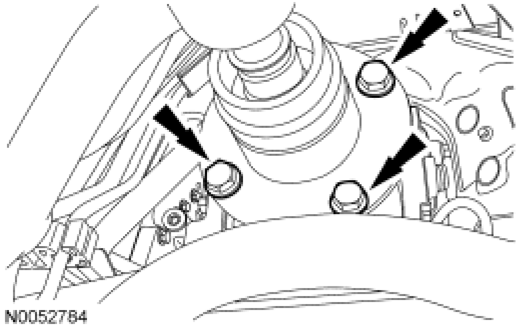

Fig. 784: Identifying Drive Shaft Bolts
Courtesy of FORD MOTOR CO.

All vehicles

63. Using new gaskets, install the Y-pipe assembly and the 6 new nuts.
    - Tighten to 40 Nm (30 lb-ft).

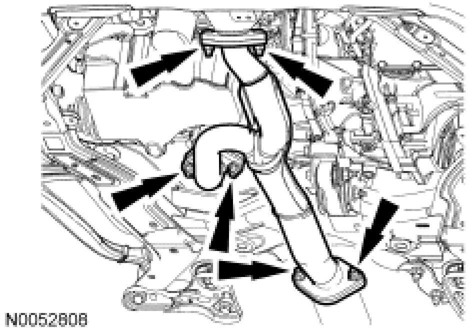

Fig. 785: Locating Y-Pipe Nuts & Y-Pipe Assembly
Courtesy of FORD MOTOR CO.

NOTE:	**Lubricate the engine oil filter gasket with clean engine oil prior to installing the oil filter.**

64. Install a new engine oil filter.
    - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

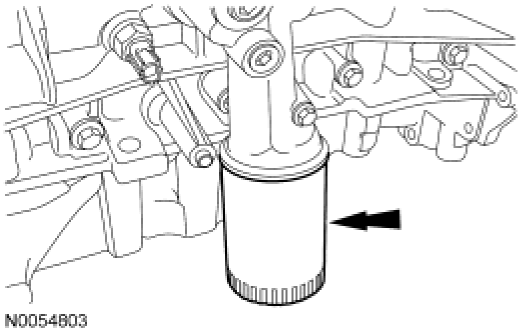

Fig. 786: Identifying Engine Oil Filter
Courtesy of FORD MOTOR CO.

65. Connect the 2 transmission fluid cooler hoses.

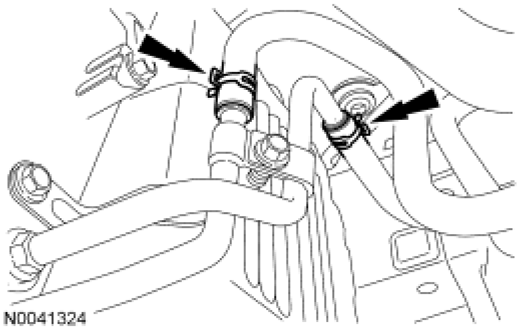

Fig. 787: Locating Transmission Fluid Cooler Hoses
Courtesy of FORD MOTOR CO.

66. Connect the power steering cooler tube.

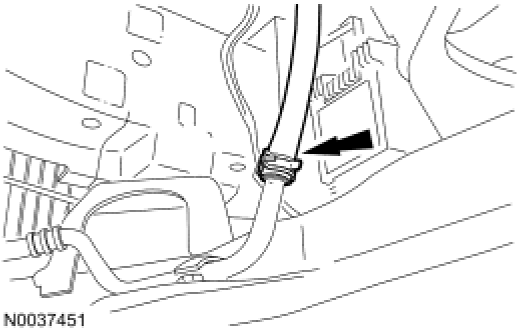

Fig. 788: Locating Power Steering Cooler Tube
Courtesy of FORD MOTOR CO.

67. Slide the steering gear-to-dash seal onto the steering gear and engage the 4 retaining clips into the body.
    - From under the vehicle, verify that the seal is correctly installed on the steering gear and the retaining clips are fully engaged into the body.

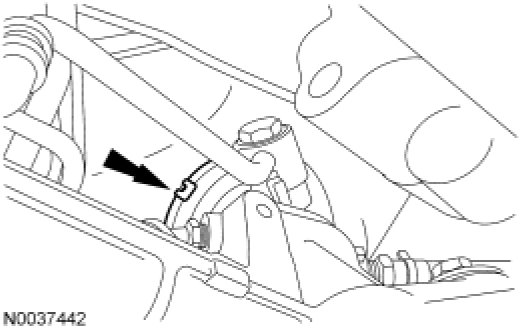

Fig. 789: Locating Steering Gear-To-Dash Seal Clips

Courtesy of FORD MOTOR CO.

68. If equipped, install the underbody shield and the 6 screws.

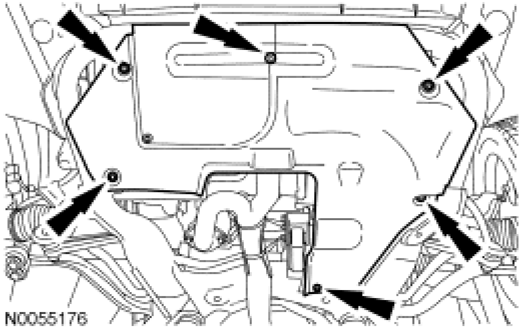

Fig. 790: Locating Underbody Shield Screws
Courtesy of FORD MOTOR CO.

69. Install the LH splash shield and the 6 pin-type retainers (4 shown).

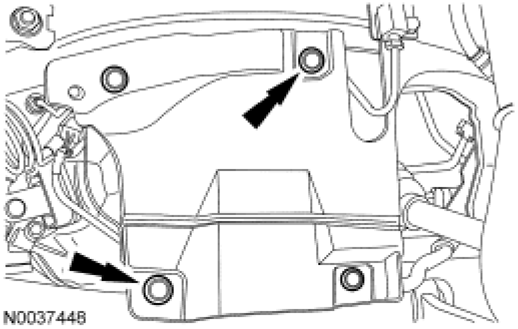

Fig. 791: Locating LH Splash Shield And Pin-Type Retainers
Courtesy of FORD MOTOR CO.

70. Position the LH fender splash shield and install the 4 screws.

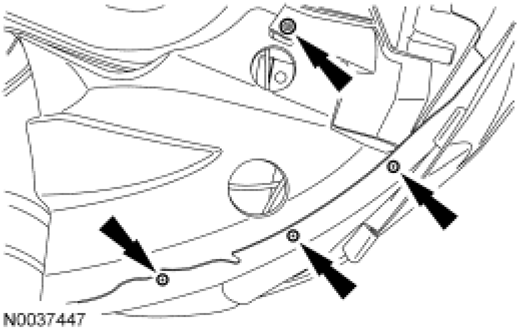

Fig. 792: Locating LH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

NOTE: Align the index marks made during removal.

71. Install the steering intermediate shaft onto the steering gear and install a new bolt.
    - Tighten to 23 Nm (17 lb-ft).

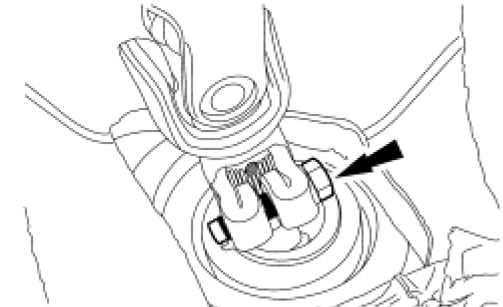

Fig. 793: Locating Steering Intermediate Shaft Bolt
Courtesy of FORD MOTOR CO.

72. Install the steering joint cover and the 2 nuts.

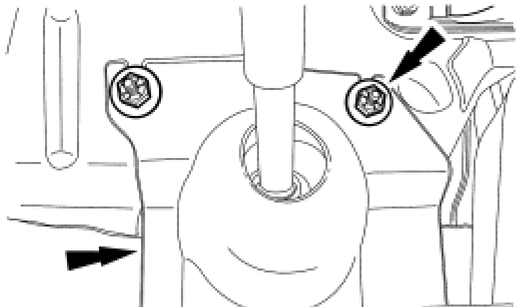

Fig. 794: Locating Steering Joint Cover And Nuts
Courtesy of FORD MOTOR CO.

73. Using a new banjo bolt and 2 new seals, install the PSP tube onto the steering gear.
    - Tighten to 37 Nm (27 lb-ft).

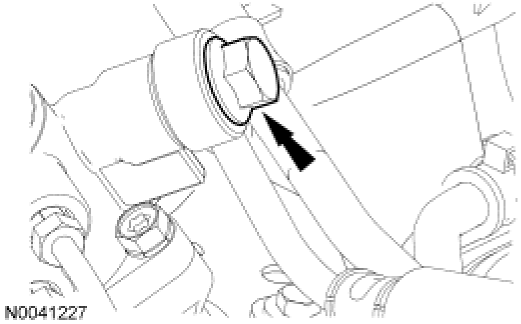

Fig. 795: Locating PSP Hose Banjo Bolt

Courtesy of FORD MOTOR CO.

74. Install the PSP tube bracket and nut.
    - Tighten to 10 Nm (89 lb-in).

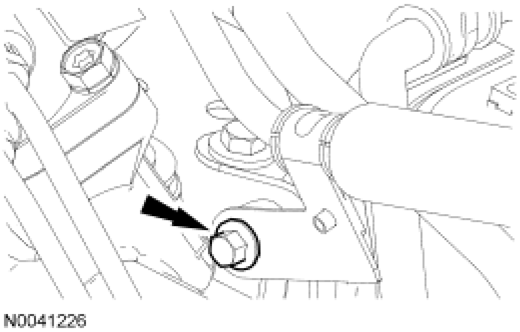

Fig. 796: Locating Power Steering Pressure (PSP) Hose Bracket Bolt
Courtesy of FORD MOTOR CO.

75. Connect the PCM connectors and pin-type retainers.

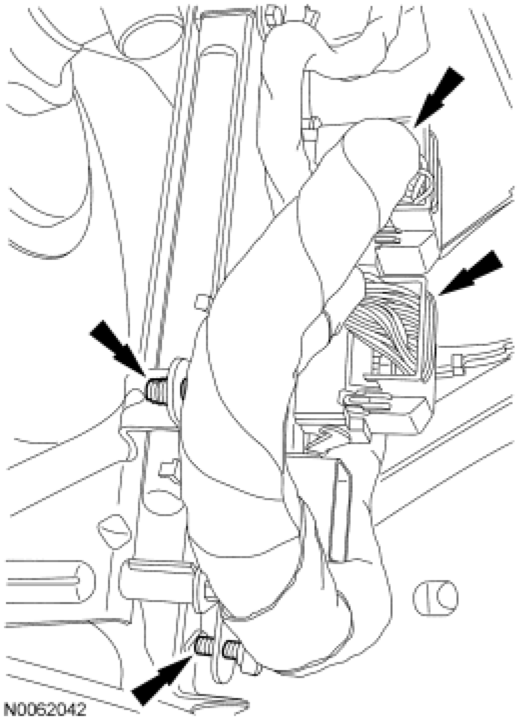

Fig. 797: Locating PCM Electrical Connectors & Pin-Type Retainers
Courtesy of FORD MOTOR CO.

76. Install the engine mount brace and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

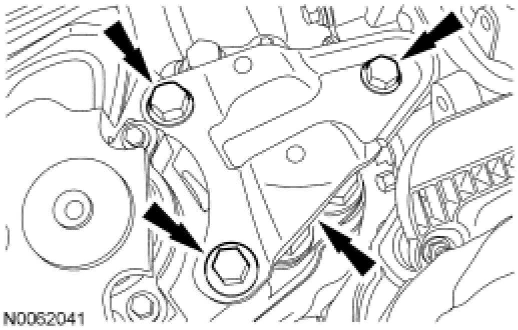

Fig. 798: Locating Engine Mount Brace Bolts
Courtesy of FORD MOTOR CO.

77. Install the ground wire and the bolt.
    - Tighten to 10 Nm (89 lb-in).

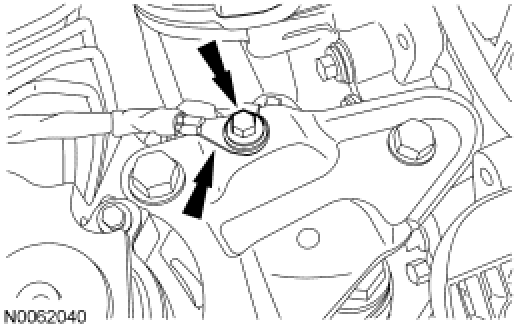

Fig. 799: Identifying Ground Wire Bolt From Engine Mount Brace
Courtesy of FORD MOTOR CO.

78. Connect the fuel supply tube to the fuel rail. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.

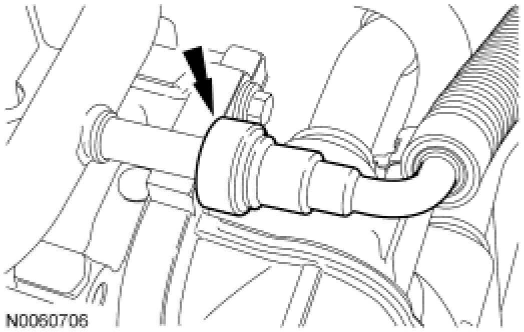

Fig. 800: Identifying Fuel Supply Tube From Fuel Rail
Courtesy of FORD MOTOR CO.

79. Attach the power steering reservoir onto the cowl.

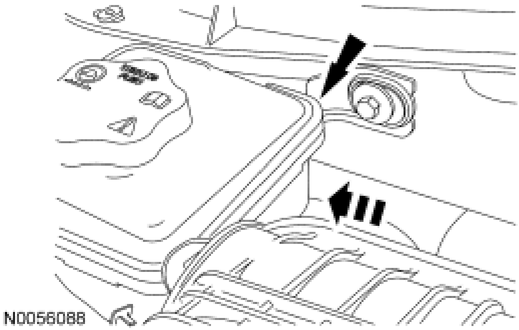

Fig. 801: Attaching Power Steering Reservoir Onto Cowl
Courtesy of FORD MOTOR CO.

80. Connect the hose to the power steering reservoir.
    - Attach the pin-type retainer to the engine mount brace.

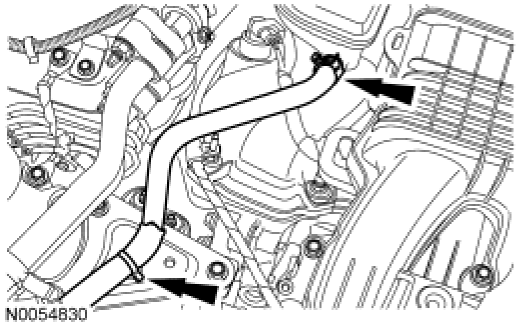

Fig. 802: Identifying Pin-Type Retainer From Engine Mount Brace
Courtesy of FORD MOTOR CO.

81. Install the oil level indicator.

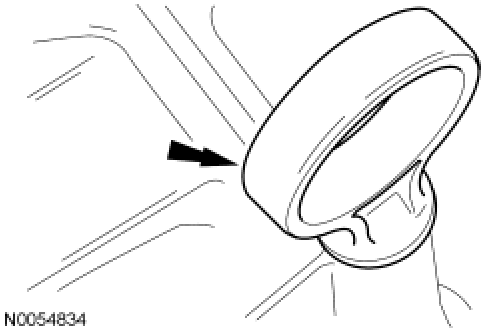

Fig. 803: Identifying Oil Level Indicator
Courtesy of FORD MOTOR CO.

82. Attach the 2 wiring harness retainers to the LH valve cover stud bolts.

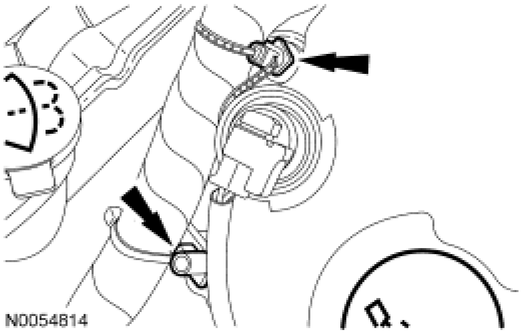

Fig. 804: Identifying Wiring Harness Retainers From LH Valve Cover Stud Bolts
Courtesy of FORD MOTOR CO.

83. Connect the 2 engine wiring harness electrical connectors.

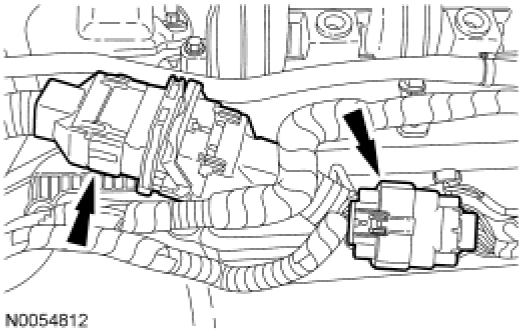

Fig. 805: Identifying Engine Wiring Harness Electrical Connectors
Courtesy of FORD MOTOR CO.

84. Attach the 2 wiring harness retainers.

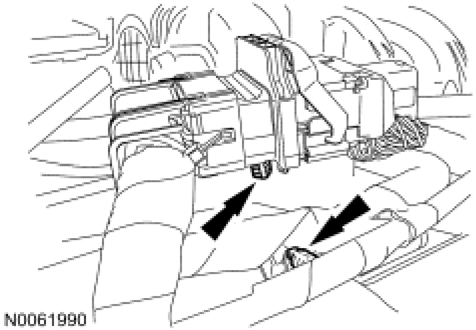

Fig. 806: Identifying Wiring Harness Retainers
Courtesy of FORD MOTOR CO.

85. Using new O-ring seals, connect the A/C tubes and install the 2 nuts.
    - Tighten to 8 Nm (71 lb-in).

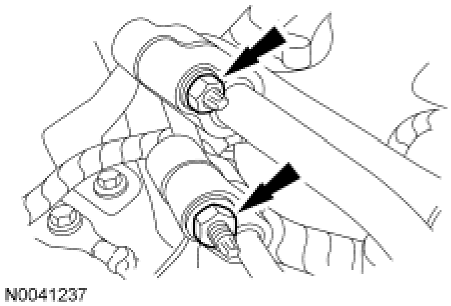

Fig. 807: Locating A/C Tubes And Nuts
Courtesy of FORD MOTOR CO.

86. Install the A/C tube bracket bolt.
    - Tighten to 8 Nm (71 lb-in).

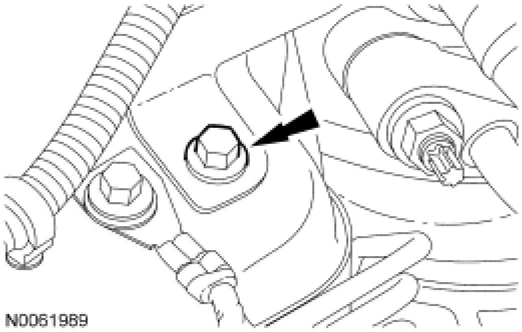

Fig. 808: Locating A/C Tube Bracket Bolt
Courtesy of FORD MOTOR CO.

87. Install the 2 A/C tube bracket bolts.
    - Tighten to 10 Nm (89 lb-in).

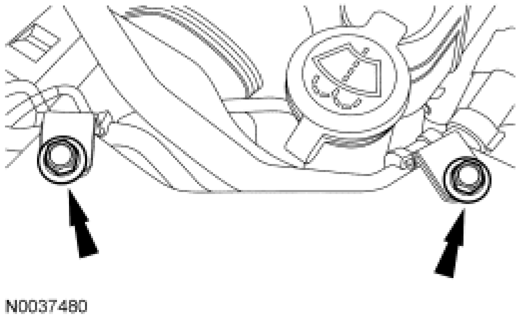

Fig. 809: Locating A/C Tube Bracket Bolts
Courtesy of FORD MOTOR CO.

88. Using a new O-ring seal, connect the A/C tube to the condenser and install the nut.
    - Tighten to 8 Nm (71 lb-in).

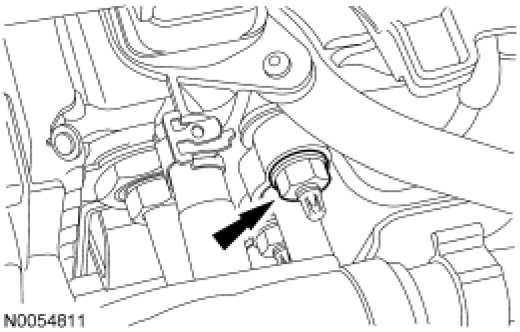

Fig. 810: Locating A/C Tube From Condenser
Courtesy of FORD MOTOR CO.

89. Attach the coolant tube retainer clips to the A/C tube.

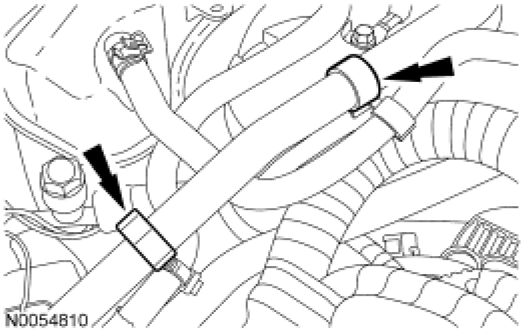

Fig. 811: Identifying Coolant Tube Retainer Clips
Courtesy of FORD MOTOR CO.

90. If equipped, attach the engine block heater harness to the radiator support, power steering hose, A/C tube and the engine wiring harness.
91. Install the ground wire and bolt.
    - Tighten to 12 Nm (9 lb-ft).

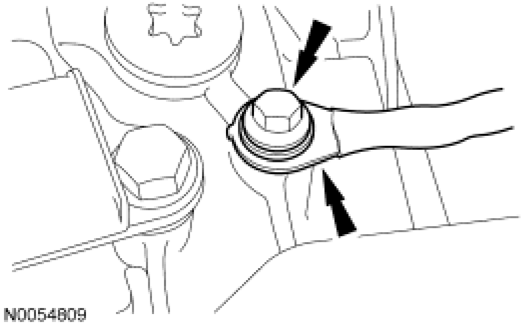

Fig. 812: Locating Ground Wire And Bolt
Courtesy of FORD MOTOR CO.

92. Position the transaxle control cable bracket in place and install the 3 nuts.

- Tighten to 12 Nm (9 lb-ft).

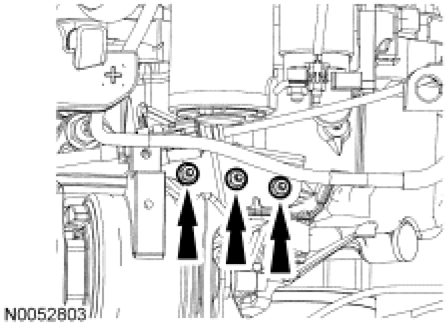

Fig. 813: Identifying Selector Lever Cable Bracket Bolts & Nuts
Courtesy of FORD MOTOR CO.

93. Connect the transaxle control cable to the control lever.

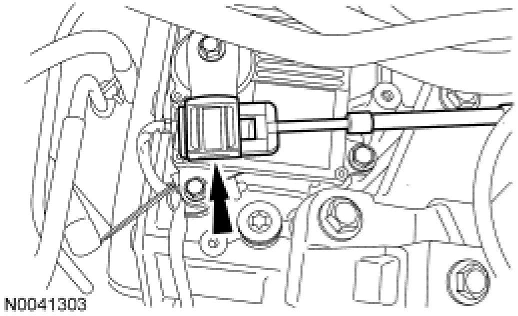

Fig. 814: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

94. Connect the upper radiator hose, lower radiator hose and 2 heater hoses to the thermostat housing.

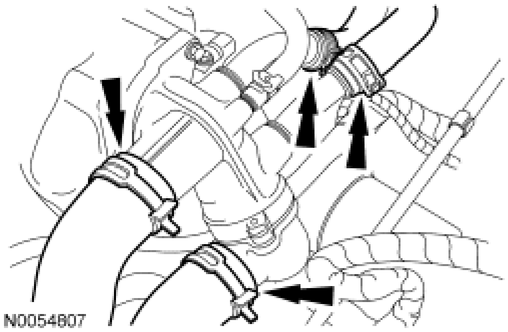

Fig. 815: Locating Upper Radiator Hose, Lower Radiator Hose & Heater Hoses From Thermostat Housing
Courtesy of FORD MOTOR CO.

95. Connect the vacuum hose and the evaporative emissions (EVAP) tube to the upper intake manifold.

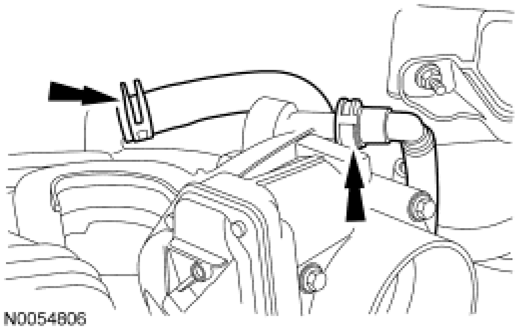

Fig. 816: Locating Vacuum Hose & Evaporative Emissions (EVAP) Tube From Upper Intake Manifold
Courtesy of FORD MOTOR CO.

96. Install the ground wire and the bolt.
    - Tighten to 10 Nm (89 lb-in).

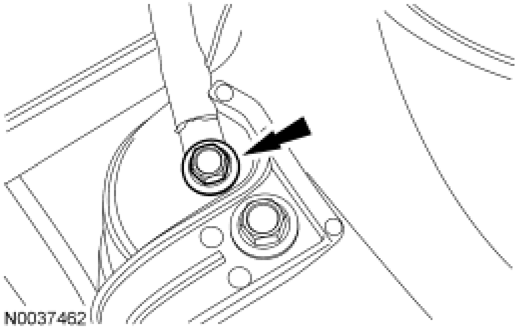

Fig. 817: Locating Ground Wire And Bolt
Courtesy of FORD MOTOR CO.

97. Connect the power feed to the battery terminal and install the nut.
    - Tighten to 6 Nm (53 lb-in).

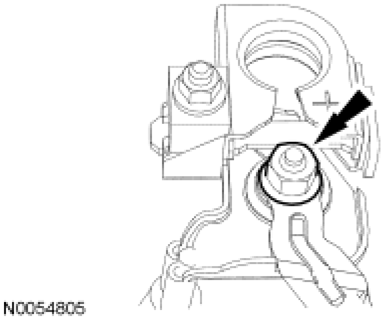

Fig. 818: Locating Power Feed To Battery Terminal And Nut
Courtesy of FORD MOTOR CO.

98. Attach the 2 wiring harness retainers to the transmission mount and the battery tray bracket.

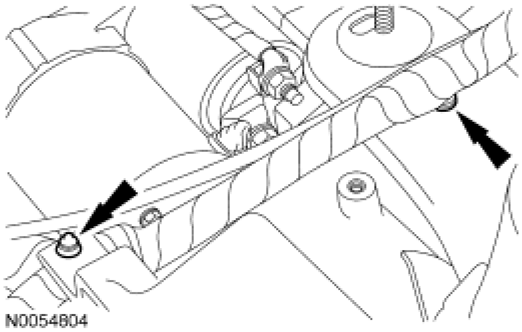

Fig. 819: Locating Wiring Harness Retainers From Transmission Mount & Battery Tray Bracket
Courtesy of FORD MOTOR CO.

99. Connect the 2 engine wiring harness electrical connectors.

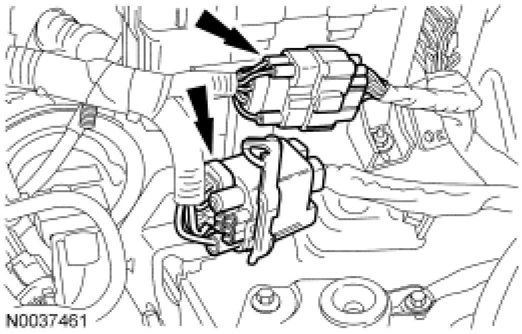

Fig. 820: Locating Engine Wiring Harness Electrical Connectors
Courtesy of FORD MOTOR CO.

100. Install the battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
101. Install the engine air cleaner and the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.
102. Install the degas bottle. For additional information, refer to **ENGINE COOLING** article.
103. Install the accessory drive belt and the power steering belt. For additional information, refer to **ACCESSORY DRIVE - 3.5L** article.

CAUTION: Do not expose the Motorcraft High Performance Engine RTV Silicone to engine oil for at least 90 minutes after installing the engine front cover. Failure to follow this instruction may cause oil leakage.

104. Fill the engine with clean engine oil.
105. Fill and bleed the cooling system. For additional information, refer to **ENGINE COOLING** article.
106. Fill the power steering system. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** article.
107. Check the transaxle fluid and add fluid if necessary. For additional information, refer to the Transmission Fluid Drain and Refill procedure in **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21**

article.

108. Recharge the air conditioning system. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

TIMING DRIVE COMPONENTS

Special Tools

Illustration	Tool Name	Tool Number
	Tool, Camshaft Holding	303-1248

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.

1. Install the RH primary timing chain guide and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

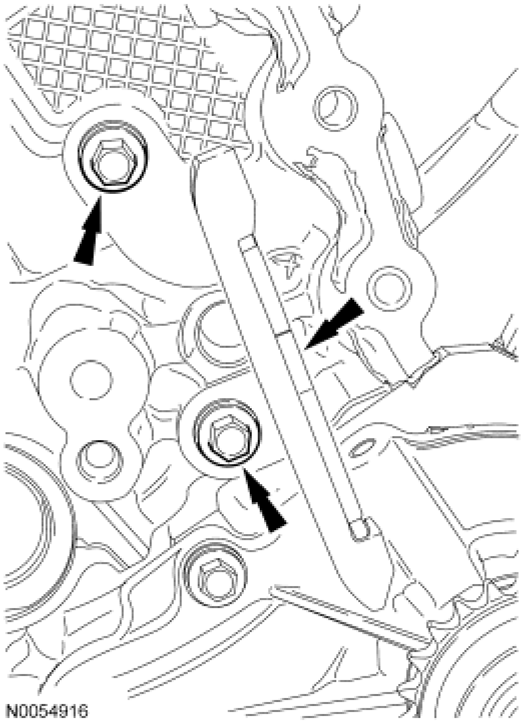

Fig. 821: Locating RH Primary Timing Chain Guide Lower Bolt
Courtesy of FORD MOTOR CO.

NOTE: **It is necessary to tilt the Camshaft Holding Tool toward the rear of the engine to access the rearmost secondary timing chain tensioner bolt.**

2. Install the RH secondary timing chain tensioner and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

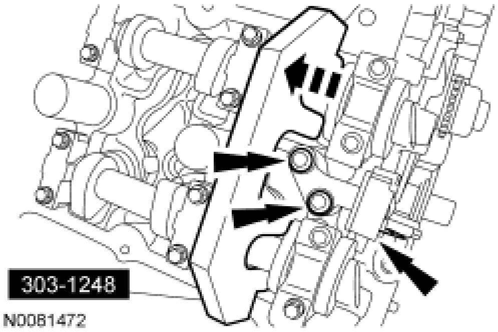

Fig. 822: Locating RH Secondary Timing Chain Tensioner & Bolts
Courtesy of FORD MOTOR CO.

3. Assemble the RH Variable Camshaft Timing (VCT) assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
   - Align the colored links with the timing marks.

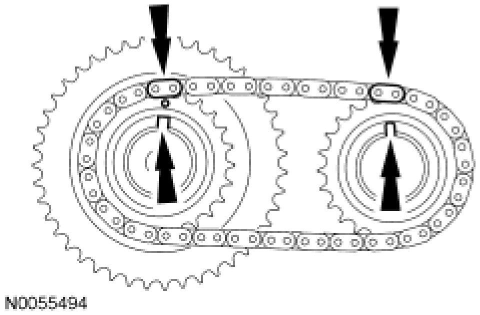

Fig. 823: Aligning RH Exhaust Camshaft Sprocket & RH Secondary Timing Chain Colored Links With Timing Marks
Courtesy of FORD MOTOR CO.

4. Position the RH secondary timing assembly onto the camshafts.

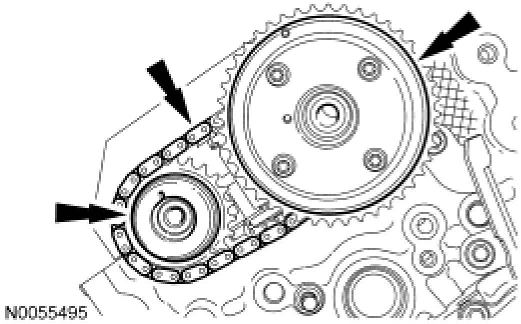

Fig. 824: Positioning RH Secondary Timing Assembly Onto Camshafts
Courtesy of FORD MOTOR CO.

5. Install 2 new bolts and the original washer. Tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 10 Nm (89 lb-in).
    - Stage 4: Tighten 90 degrees.

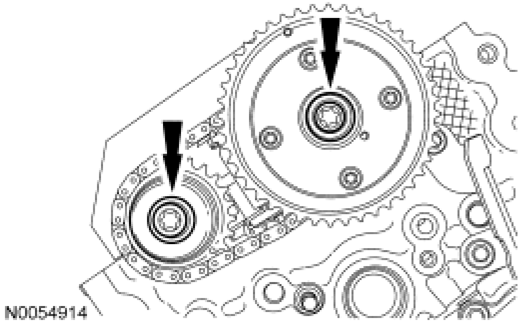

Fig. 825: Locating RH VCT Assembly Bolt & RH Exhaust Camshaft Sprocket Bolt
Courtesy of FORD MOTOR CO.

6. Remove the lock pin from the RH secondary timing chain tensioner.

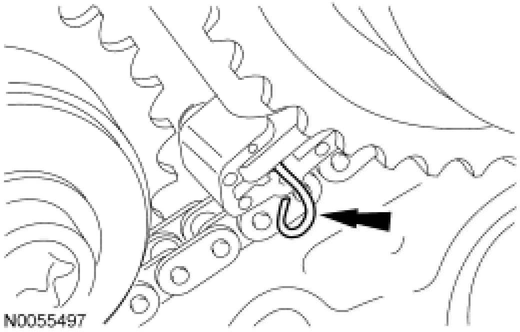

Fig. 826: Identifying Lock Pin On RH Secondary Timing Chain Tensioner
Courtesy of FORD MOTOR CO.

NOTE:	**It is necessary to tilt the Camshaft Holding Tool toward the rear of the engine to access the rearmost secondary timing chain tensioner bolt.**

7. Install the LH secondary timing chain tensioner and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

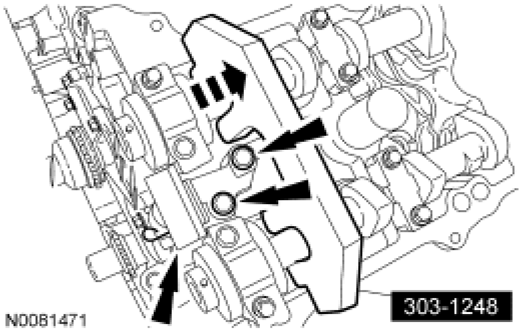

Fig. 827: Locating LH Secondary Timing Chain Tensioner & Bolts
Courtesy of FORD MOTOR CO.

8. Assemble the LH VCT assembly, the LH exhaust camshaft sprocket and the LH secondary timing chain.
   - Align the colored links with the timing marks.

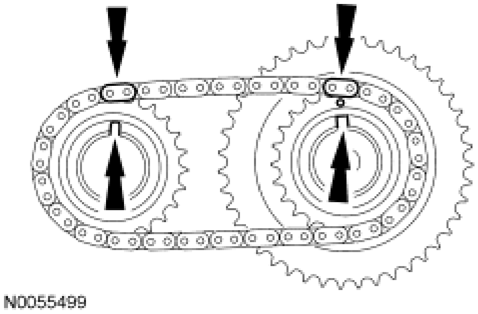

Fig. 828: Aligning LH Exhaust Camshaft Sprocket & LH Secondary Timing Chain Colored Links With Timing Marks
Courtesy of FORD MOTOR CO.

9. Position the LH secondary timing assembly onto the camshafts.

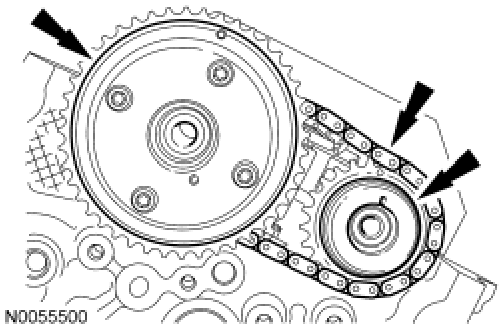

Fig. 829: Positioning LH Secondary Timing Assembly Onto Camshafts
Courtesy of FORD MOTOR CO.

10. Install 2 new bolts and the original washer. Tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 10 Nm (89 lb-in).
    - Stage 4: Tighten 90 degrees.

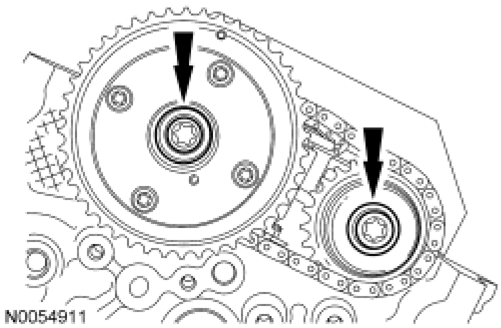

Fig. 830: Locating LH VCT Assembly Bolt & LH Exhaust Camshaft Sprocket Bolt
Courtesy of FORD MOTOR CO.

11. Remove the lock pin from the LH secondary timing chain tensioner.

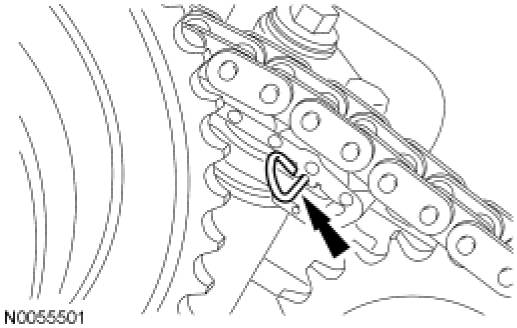

Fig. 831: Locating Lock Pin On LH Secondary Timing Chain Tensioner
Courtesy of FORD MOTOR CO.

12. Install the crankshaft timing chain sprocket.

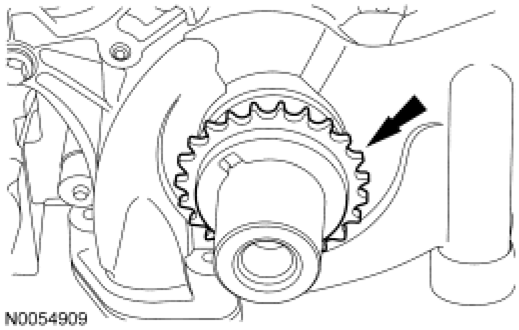

Fig. 832: Locating Crankshaft Timing Chain Sprocket
Courtesy of FORD MOTOR CO.

13. Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.

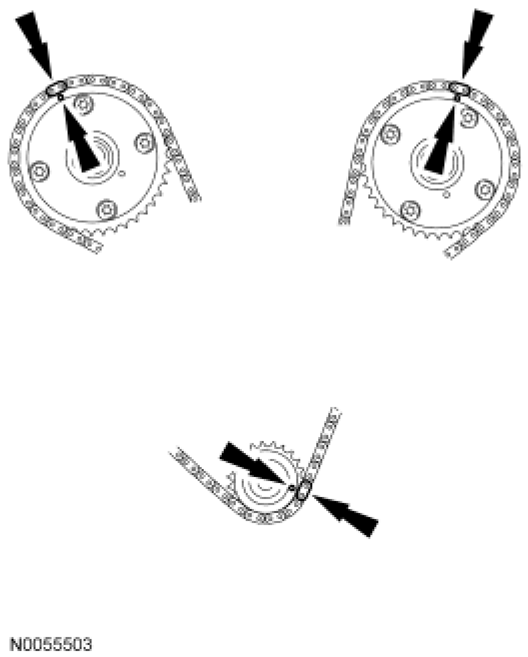

Fig. 833: Aligning Timing Marks On VCT Assemblies & Crankshaft Sprocket
Courtesy of FORD MOTOR CO.

14. Install the upper LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

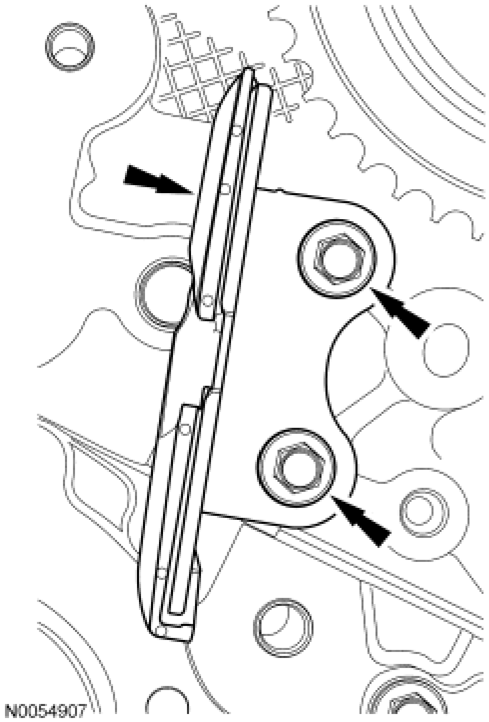

Fig. 834: Locating Upper LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

15. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

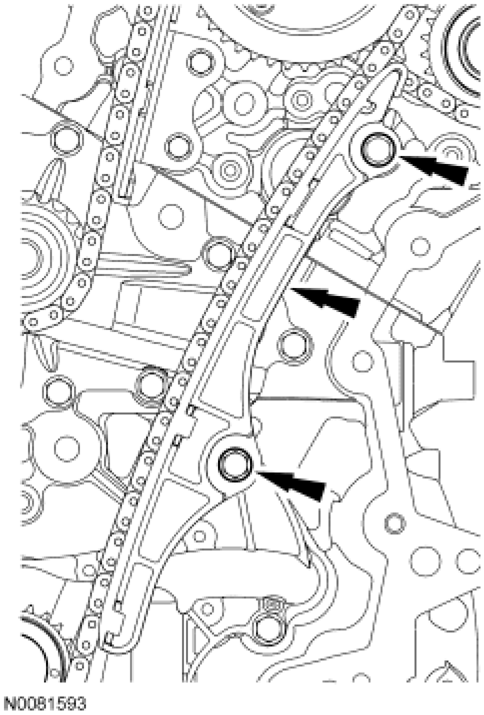

Fig. 835: Locating Lower LH Primary Timing Chain Guide & Bolts
Courtesy of FORD MOTOR CO.

16. Install the primary timing chain tensioner arm.

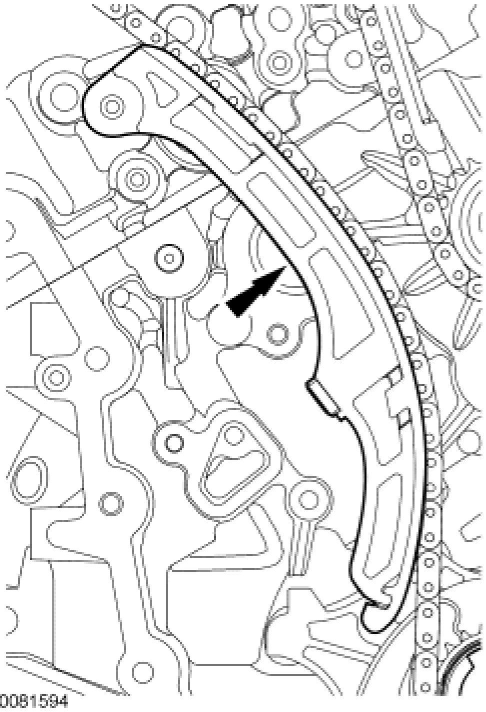

Fig. 836: Locating Primary Timing Chain Tensioner Arm
Courtesy of FORD MOTOR CO.

17. Reset the primary timing chain tensioner.
    - Rotate the lever counterclockwise.
    - Using a soft-jawed vise, compress the plunger.
    - Align the hole in the lever with the hole in the tensioner housing.
    - Install a suitable lock pin.

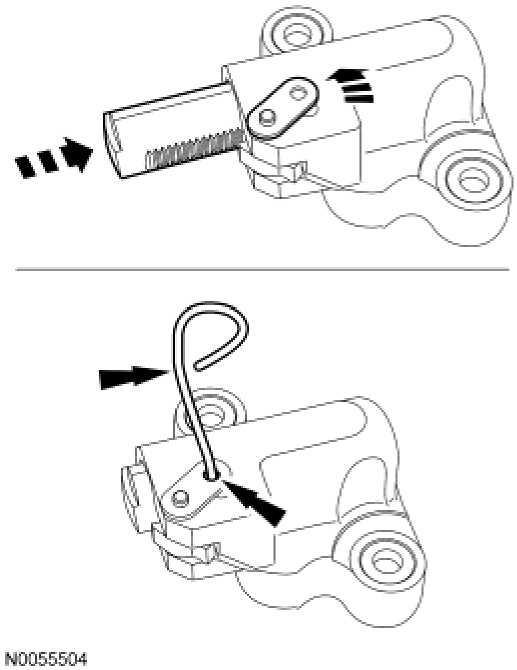

Fig. 837: Compressing Plunger Using A Soft-Jawed Vise
Courtesy of FORD MOTOR CO.

NOTE: It may be necessary to rotate the crankshaft slightly to remove slack from the timing chain and install the tensioner.

18. Install the primary tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the lock pin.

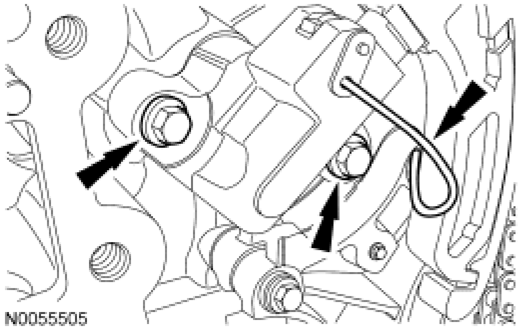

Fig. 838: Locating Primary Tensioner Bolts
Courtesy of FORD MOTOR CO.

19. As a post-check, verify correct alignment of all timing marks.

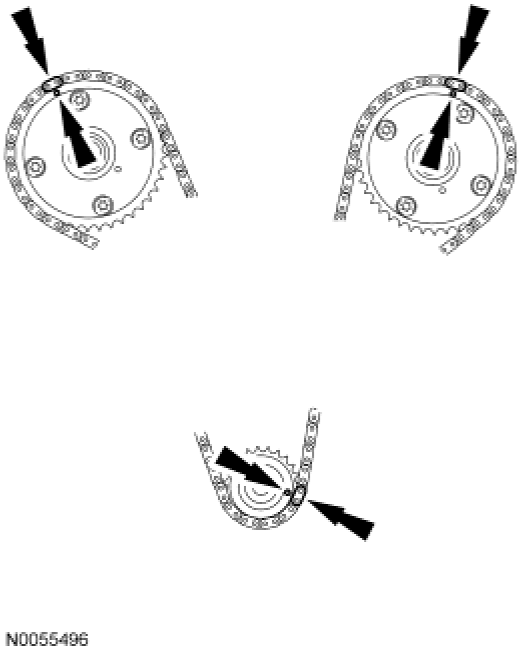

Fig. 839: Verifying Correct Alignment Of All Timing Marks
Courtesy of FORD MOTOR CO.

20. Install new VCT housing seals.

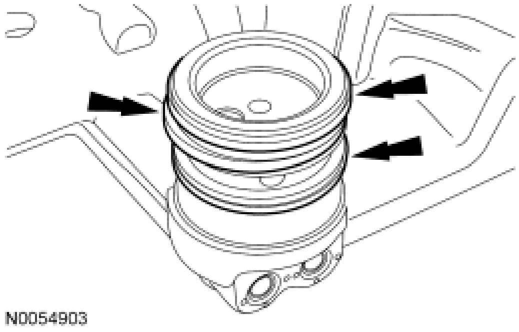

Fig. 840: Locating VCT Housing Seals
Courtesy of FORD MOTOR CO.

NOTE:	**Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

21. Install the LH VCT housing and the 3 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

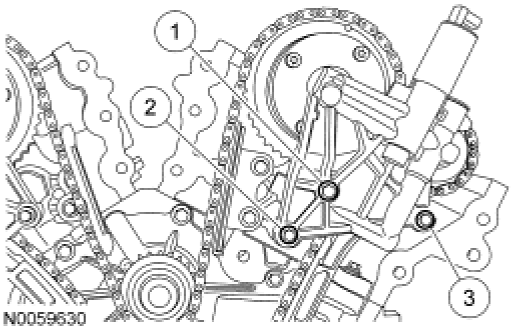

Fig. 841: Identifying LH VCT Housing Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

NOTE: Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.

22. Install the RH VCT housing and the 3 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

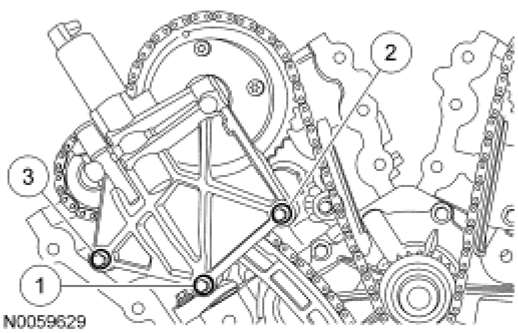

Fig. 842: Identifying RH VCT Housing Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

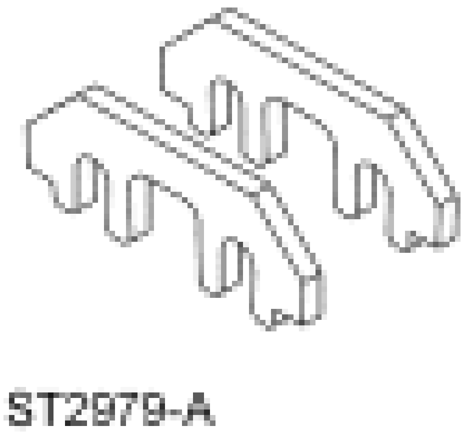
23. Install the engine front cover. For additional information, refer to **Engine Front Cover**.

CAMSHAFT

Special Tools

Illustration	Tool Name	Tool Number
	Tool, Camshaft Holding	303-1248



Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

All camshafts

NOTE: **The crankshaft must remain in the freewheeling position (crankshaft dowel pin at 9 o'clock) until after the camshafts are installed and the valve clearance is checked/adjusted. Do not turn the crankshaft until instructed to do so. Failure to follow this process will result in severe engine damage.**

1. Rotate the crankshaft counterclockwise until the crankshaft dowel pin is in the 9 o'clock position.

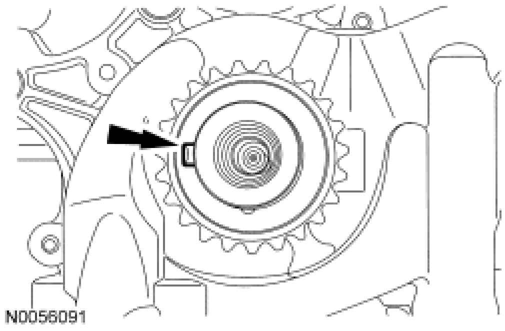


Fig. 843: Rotating Crankshaft Counterclockwise Until Crankshaft Dowel Pin Is In 9 O'clock Position
Courtesy of FORD MOTOR CO.

LH camshafts

NOTE: The camshafts must remain in the neutral position during installation or engine damage may occur.

NOTE: Coat the camshafts with clean engine oil prior to installation.

2. Position the camshafts onto the LH cylinder head in the neutral position as shown.

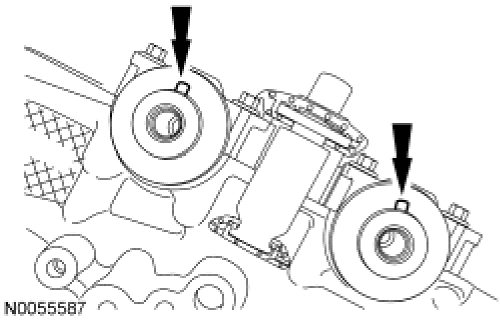

Fig. 844: Verifying LH Camshafts Are In Neutral Position
Courtesy of FORD MOTOR CO.

NOTE: Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

3. Install the 8 camshaft caps and the 16 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

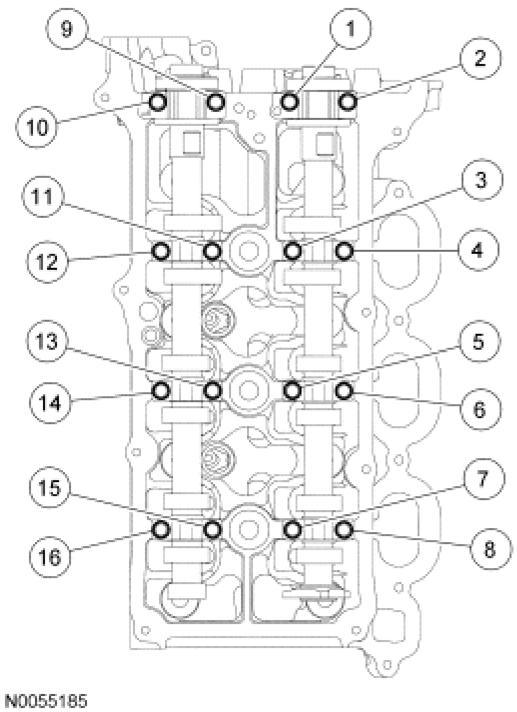

Fig. 845: Installing Camshaft Caps & Bolts In Sequence
Courtesy of FORD MOTOR CO.

RH camshafts

NOTE:	**The camshafts must remain in the neutral position during installation or engine damage may occur.**

NOTE:	**Coat the camshafts with clean engine oil prior to installation.**

4. Position the camshafts onto the RH cylinder head in the neutral position as shown.

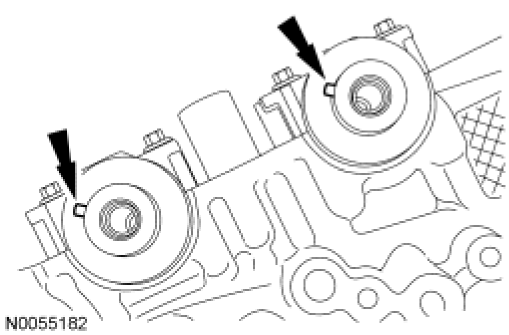

Fig. 846: Positioning Camshafts Onto RH Cylinder Head In Neutral Position
Courtesy of FORD MOTOR CO.

NOTE:	**Cylinder head camshaft bearing caps are numbered to verify that they are**

assembled in their original positions.

5. Install the 8 camshaft caps and the 16 bolts.
   - Tighten in the sequence shown to 10 Nm (89 lb-in).

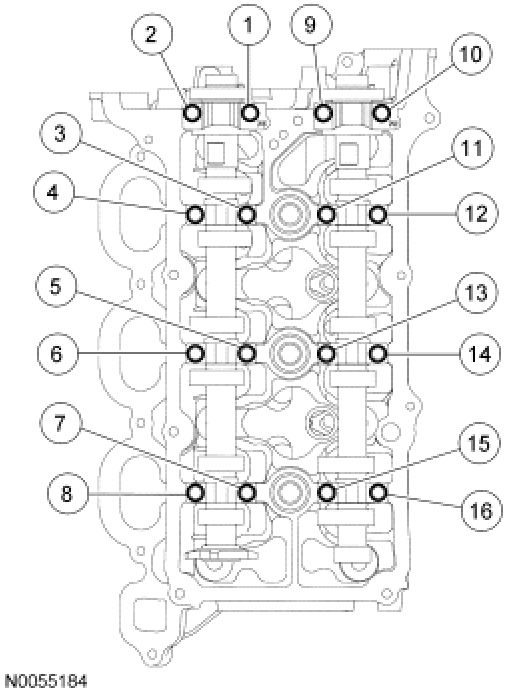

Fig. 847: Installing Camshaft Caps & Bolts In Sequence
Courtesy of FORD MOTOR CO.

All camshafts

NOTE:	**If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage can occur.**

NOTE:	**Use a camshaft sprocket bolt to turn the camshafts.**

6. Using a feeler gauge, confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet(s) of the correct size. For additional information, refer to **Valve Clearance Check**.

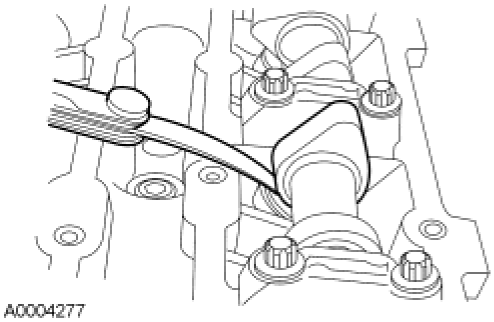

Fig. 848: Measuring Valve Clearance
Courtesy of FORD MOTOR CO.

LH camshafts

NOTE: Use a camshaft sprocket bolt to turn the camshafts.

7. Rotate the LH camshafts to the Top Dead Center (TDC) position and install the Camshaft Holding Tool on the flats of the camshafts.

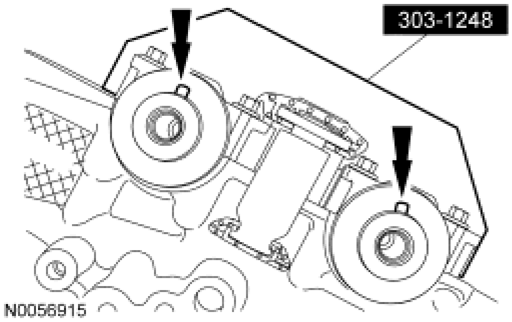

Fig. 849: Installing Special Tool (303-1248) On Flats Of Camshafts
Courtesy of FORD MOTOR CO.

8. Assemble the LH Variable Camshaft Timing (VCT) assembly, the LH exhaust camshaft sprocket and the LH secondary timing chain.
   - Align the colored links with the timing marks.

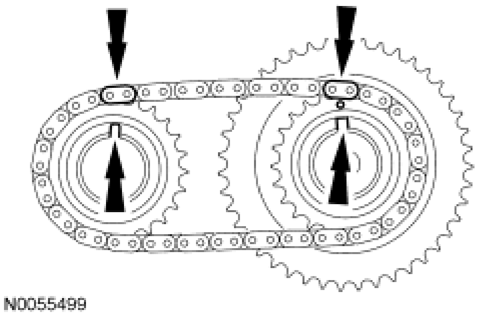

Fig. 850: Aligning LH Exhaust Camshaft Sprocket & LH Secondary Timing Chain Colored Links With Timing Marks
Courtesy of FORD MOTOR CO.

9. Position the LH secondary timing assembly onto the camshafts.

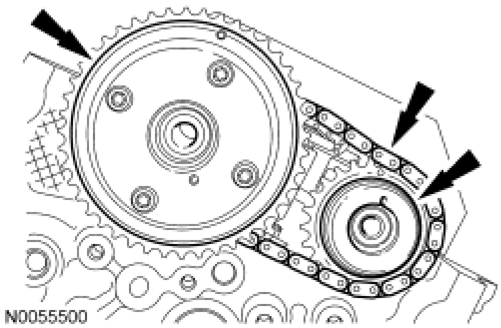

Fig. 851: Positioning LH Secondary Timing Assembly Onto Camshafts
Courtesy of FORD MOTOR CO.

10. Install 2 new bolts and the original washer. Tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 10 Nm (89 lb-in).
    - Stage 4: Tighten 90 degrees.

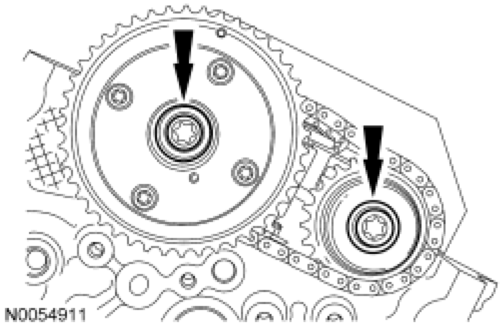

Fig. 852: Locating LH VCT Assembly Bolt & LH Exhaust Camshaft Sprocket Bolt
Courtesy of FORD MOTOR CO.

11. Remove the lock pin from the LH secondary timing chain tensioner.

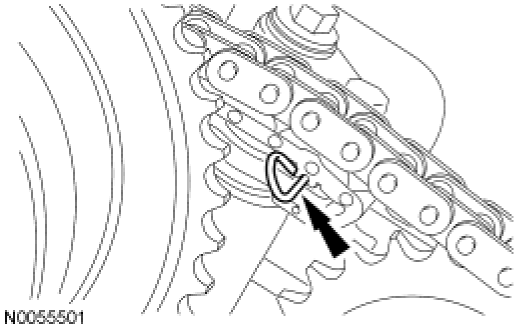

Fig. 853: Locating Lock Pin On LH Secondary Timing Chain Tensioner
Courtesy of FORD MOTOR CO.

RH camshafts

NOTE: Use a camshaft sprocket bolt to turn the camshafts.

12. Rotate the RH camshafts to the TDC position and install the Camshaft Holding Tool on the flats of the camshafts.

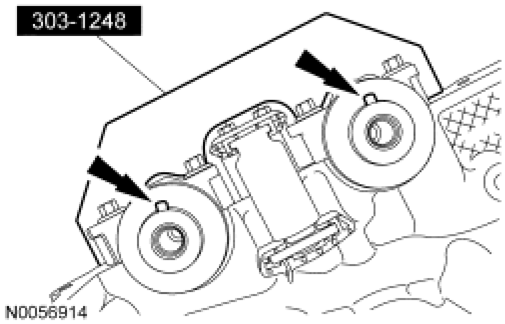

Fig. 854: Installing Special Tool (303-1248) On Flats Of Camshafts
Courtesy of FORD MOTOR CO.

13. Assemble the RH VCT assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
    - Align the colored links with the timing marks.

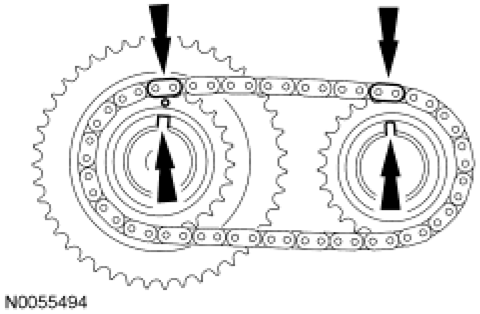

Fig. 855: Aligning RH Exhaust Camshaft Sprocket & RH Secondary Timing Chain Colored Links

With Timing Marks
Courtesy of FORD MOTOR CO.

14. Position the RH secondary timing assembly onto the camshafts.

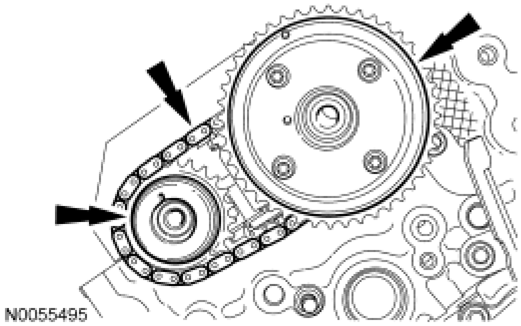

Fig. 856: Positioning RH Secondary Timing Assembly Onto Camshafts
Courtesy of FORD MOTOR CO.

15. Install 2 new bolts and the original washer. Tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 10 Nm (89 lb-in).
    - Stage 4: Tighten 90 degrees.

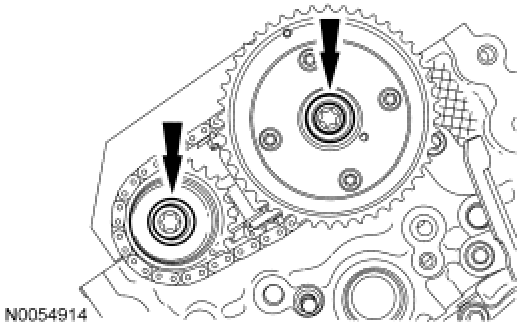

Fig. 857: Locating RH VCT Assembly Bolt & RH Exhaust Camshaft Sprocket Bolt
Courtesy of FORD MOTOR CO.

16. Remove the lock pin from the RH secondary timing chain tensioner.

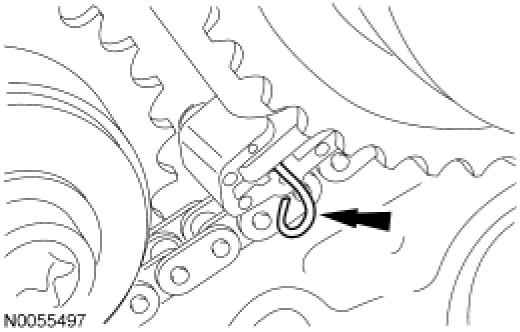

Fig. 858: Identifying Lock Pin On RH Secondary Timing Chain Tensioner
Courtesy of FORD MOTOR CO.

All camshafts

17. Rotate the crankshaft clockwise 60 degrees to the TDC position (crankshaft dowel pin at 11 o'clock).

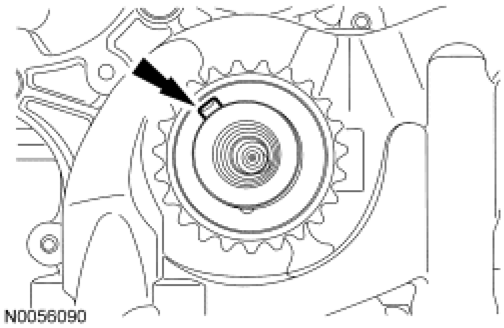

Fig. 859: Identifying Crankshaft Dowel Pin At 11 O'clock
Courtesy of FORD MOTOR CO.

18. Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.

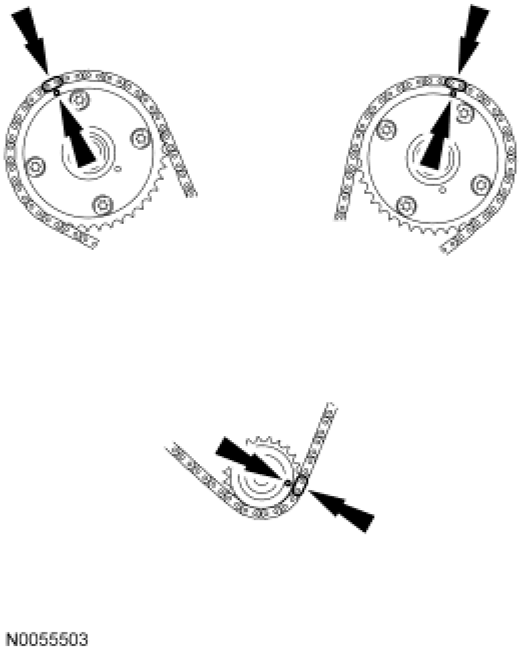

Fig. 860: Aligning Timing Marks On VCT Assemblies & Crankshaft Sprocket
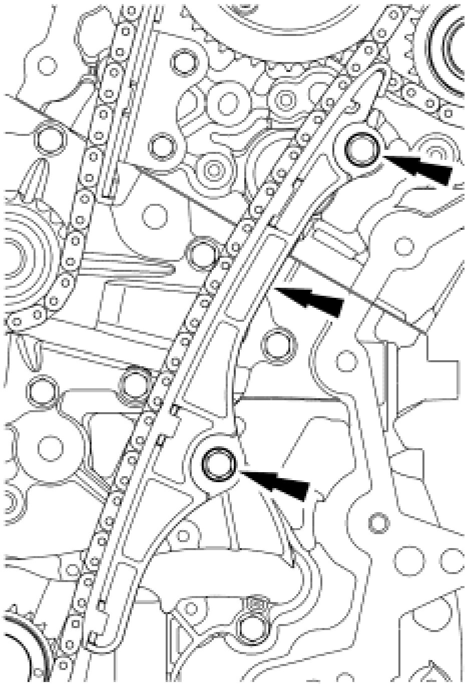
Courtesy of FORD MOTOR CO.

19. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).



N0081593

Fig. 861: Locating Lower LH Primary Timing Chain Guide & Bolts
Courtesy of FORD MOTOR CO.

20. Install the primary timing chain tensioner arm.

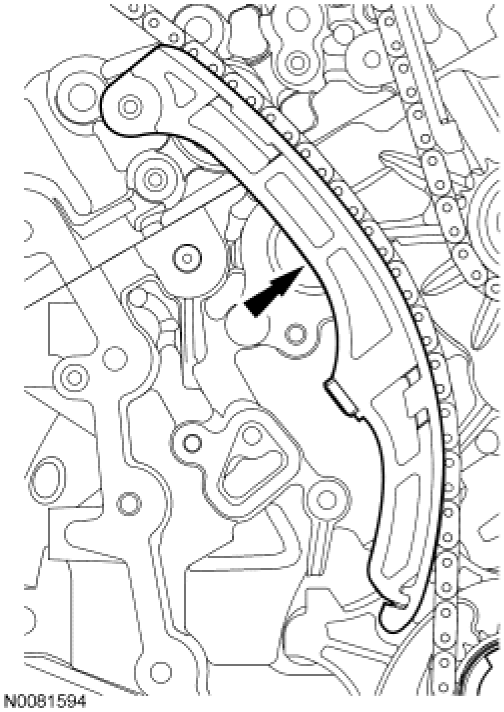


Fig. 862: Locating Primary Timing Chain Tensioner Arm
Courtesy of FORD MOTOR CO.

21. Reset the primary timing chain tensioner.
    - Rotate the lever counterclockwise.
    - Using a soft-jawed vise, compress the plunger.
    - Align the hole in the lever with the hole in the tensioner housing.
    - Install a suitable lock pin.

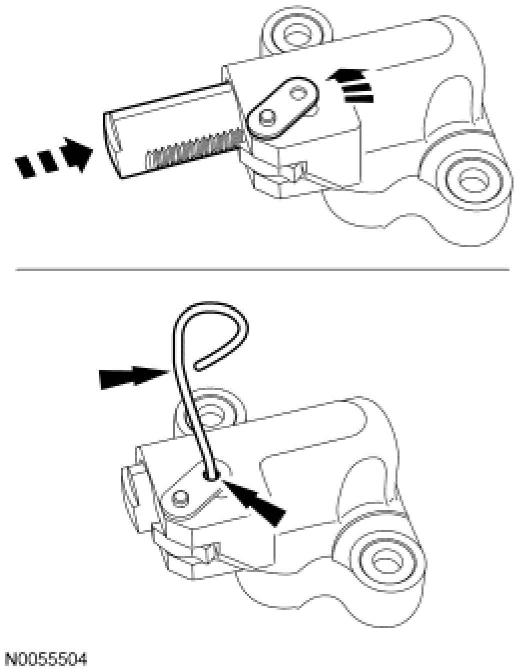

Fig. 863: Compressing Plunger Using A Soft-Jawed Vise
Courtesy of FORD MOTOR CO.

NOTE: It may be necessary to rotate the crankshaft slightly to remove slack from the timing chain and install the tensioner.

22. Install the primary tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the lock pin.

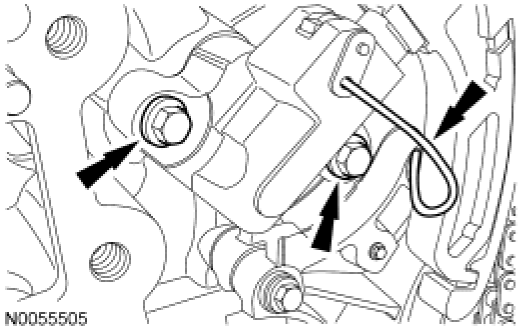

Fig. 864: Locating Primary Tensioner Bolts
Courtesy of FORD MOTOR CO.

23. As a post-check, verify correct alignment of all timing marks.

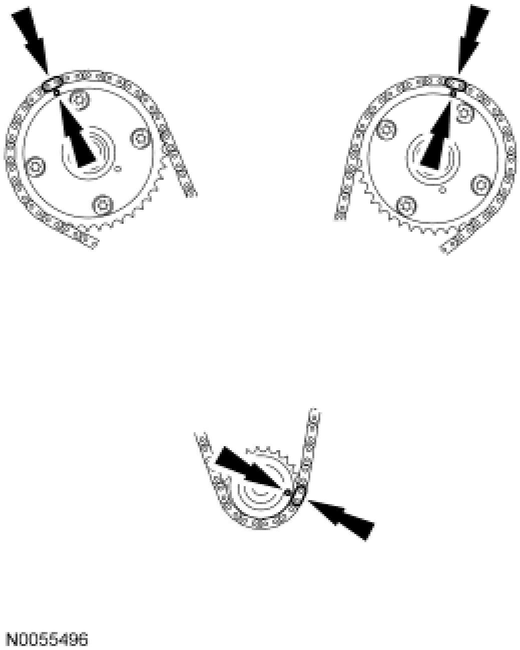

Fig. 865: Verifying Correct Alignment Of All Timing Marks
Courtesy of FORD MOTOR CO.

24. Install new VCT housing seals.

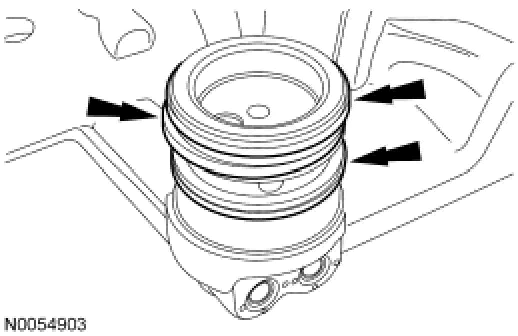

Fig. 866: Locating VCT Housing Seals
Courtesy of FORD MOTOR CO.

NOTE:	**Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

25. Install the LH VCT housing and the 3 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

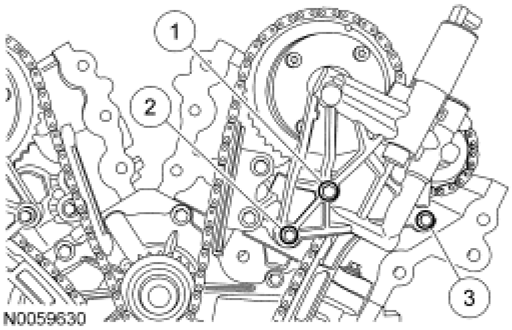

Fig. 867: Identifying LH VCT Housing Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

NOTE: Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.

26. Install the RH VCT housing and the 3 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

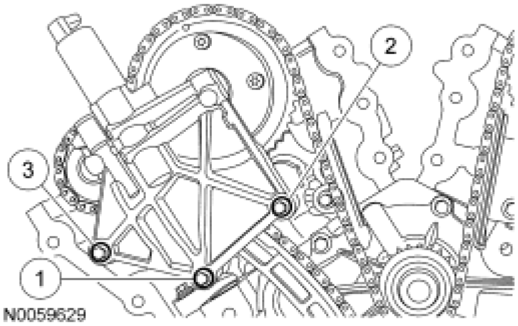

Fig. 868: Identifying RH VCT Housing Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

27. Install the engine front cover. For additional information, refer to **Engine Front Cover**.

VALVE TAPPETS

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

NOTE: During engine repair procedures, cleanliness is extremely important. Any

foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.

NOTE: The valve tappets must be installed in their original positions.

NOTE: Coat the valve tappets with clean engine oil prior to installation.

1. Install the valve tappets.

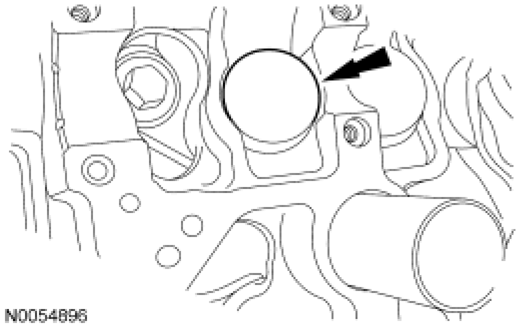

Fig. 869: Identifying Valve Tappets From Cylinder Head
Courtesy of FORD MOTOR CO.

2. Depending on the valve tappets being serviced, install the LH and/or the RH camshafts. For additional information, refer to **Camshaft**.

VALVE SPRING, RETAINER AND SEAL

Special Tools

Illustration	Tool Name	Tool Number
	Compressor, Valve Spring	303-300 (T87C-6565-A)
	Compressor, Valve Spring	303-350 (T89P-6565-A)

 ST1907-A		
 ST3028-A	Compressor, Valve Spring	303-1249
 ST1906-A	Installer, Valve Stem Oil Seal	303-470 (T94P-6510-CH)

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

NOTE: Lubricate the valve stem seal with clean engine oil prior to installation.

1. Using the Valve Stem Oil Seal Installer, install a new valve stem seal.

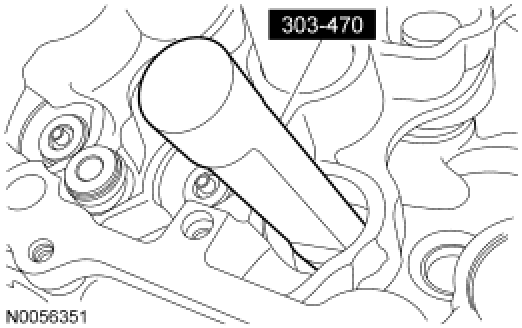

Fig. 870: Installing New Valve Stem Seal Using Special Tool (303-470)
Courtesy of FORD MOTOR CO.

2. Using the Valve Spring Compressors, install the valve spring, retainer and key.

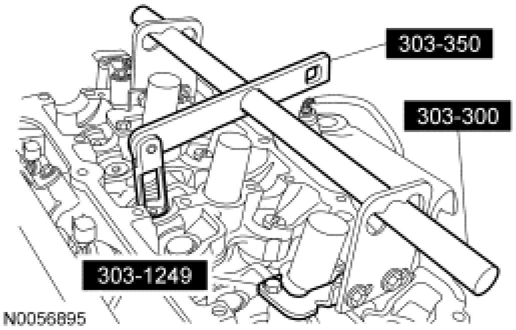

Fig. 871: Removing Keys, Retainer & Spring Using Special Tools (303-1249, 303-350, 303-300)
Courtesy of FORD MOTOR CO.

3. Install the valve tappets. For additional information, refer to **Valve Tappets**.

CYLINDER HEAD - RH

Material

Item	Specification

Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

All vehicles

1. Install a new gasket, the RH cylinder head and 8 new bolts. Tighten in the sequence shown in 5 stages:
   - Stage 1: Tighten to 20 Nm (15 lb-ft).
   - Stage 2: Tighten to 35 Nm (26 lb-ft).
   - Stage 3: Tighten 90 degrees.
   - Stage 4: Tighten 90 degrees.
   - Stage 5: Tighten 90 degrees.

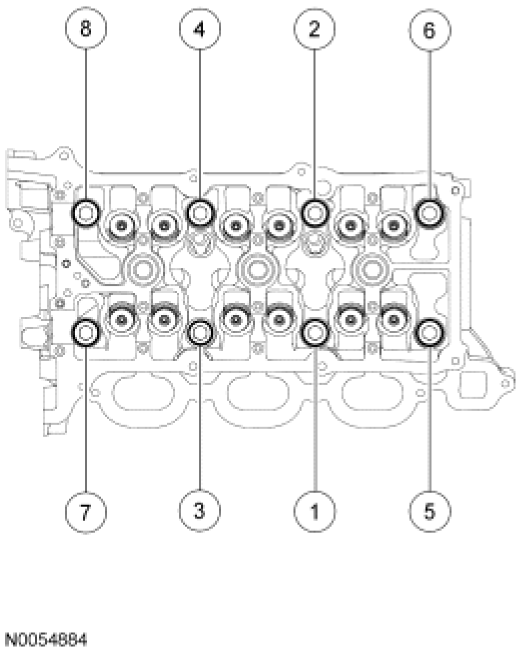

Fig. 872: Installing RH Cylinder Head Bolts In Sequence
Courtesy of FORD MOTOR CO.

2. Install the bolt.
   - Tighten to 10 Nm (89 lb-in).

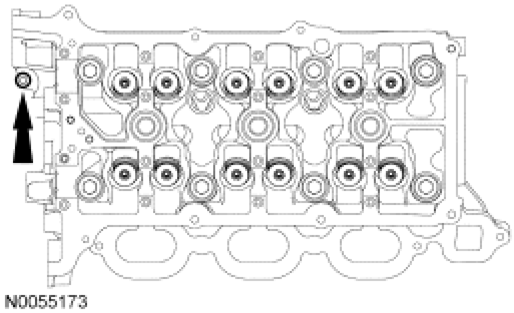

Fig. 873: Identifying M6 Bolt
Courtesy of FORD MOTOR CO.

NOTE:	**The valve tappets must be installed in their original positions.**

NOTE:	**Coat the valve tappets with clean engine oil prior to installation.**

3. Install the valve tappets.

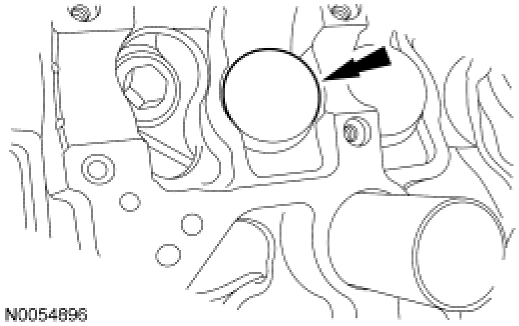

Fig. 874: Identifying Valve Tappets From Cylinder Head
Courtesy of FORD MOTOR CO.

4. Install and connect the cylinder head temperature (CHT) sensor jumper harness.

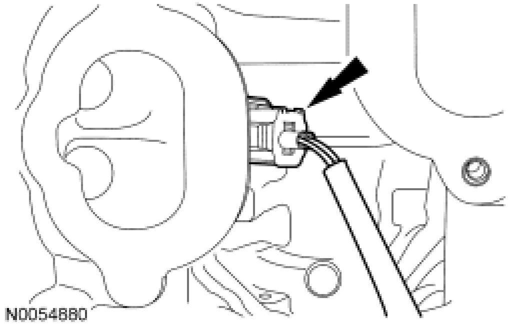

Fig. 875: Identifying CHT Sensor Jumper Harness
Courtesy of FORD MOTOR CO.

5. Using new gaskets, install the lower intake manifold and the 10 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

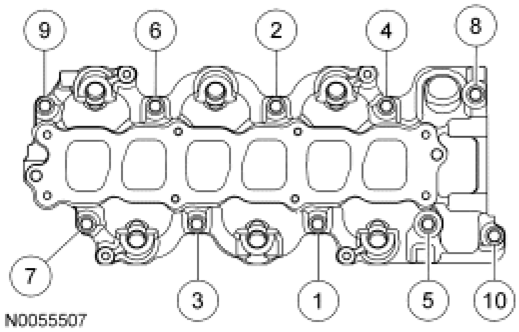

Fig. 876: Installing Lower Intake Manifold Bolts In Sequence
Courtesy of FORD MOTOR CO.

6. Using a new gasket and O-ring seal, install the thermostat housing and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

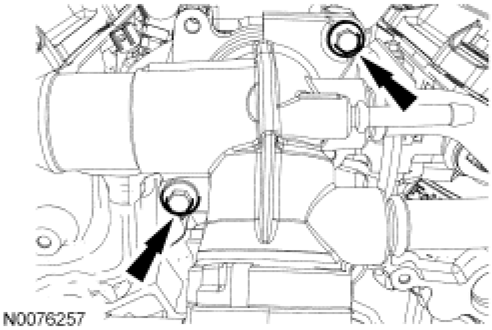

Fig. 877: Locating Thermostat Housing-To-Lower Intake Manifold Bolts
Courtesy of FORD MOTOR CO.

7. Connect the coolant bypass hose to the thermostat housing.

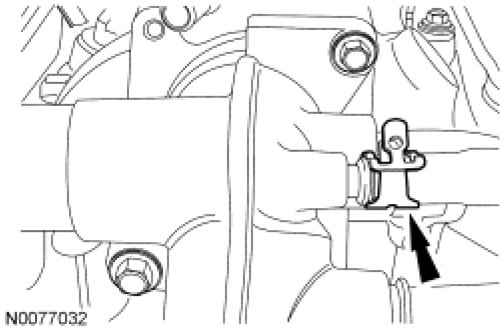

Fig. 878: Identifying Coolant Bypass Hose From Thermostat Housing
Courtesy of FORD MOTOR CO.

CAUTION: Use O-ring seals that are made of special fuel-resistant material. The use of ordinary O-rings can cause the fuel system to leak. Do not reuse the O-ring seals.

NOTE: The upper and lower O-ring seals are not interchangeable.

8. Install new fuel injector O-ring seals.
    - Remove the retaining clips and separate the fuel injectors from the fuel rail.
    - Remove and discard the O-ring seals.
    - Install new O-ring seals and lubricate with clean engine oil.
    - Install the fuel injectors and the retaining clips onto the fuel rail.

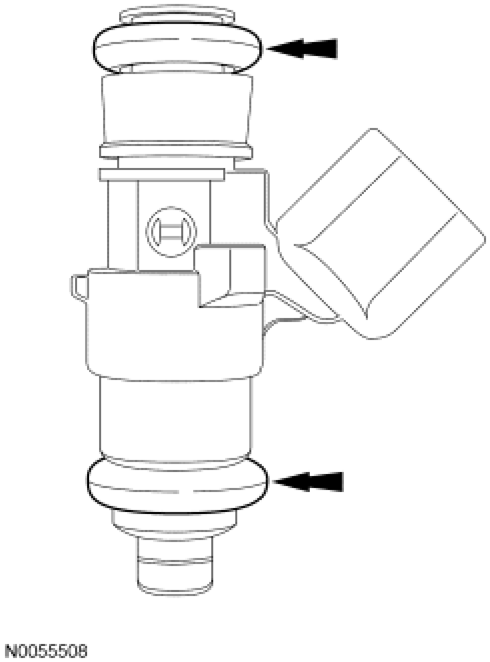

Fig. 879: Identifying Fuel Injector O-Ring Seals
Courtesy of FORD MOTOR CO.

9. Install the fuel rail and injectors as an assembly and install the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).

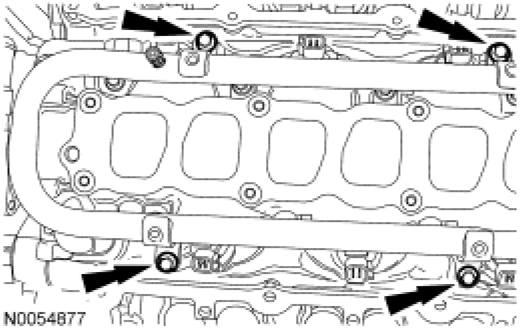

Fig. 880: Locating Fuel Rail And Injectors & Bolts
Courtesy of FORD MOTOR CO.

10. Install the RH camshaft position (CMP) sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).

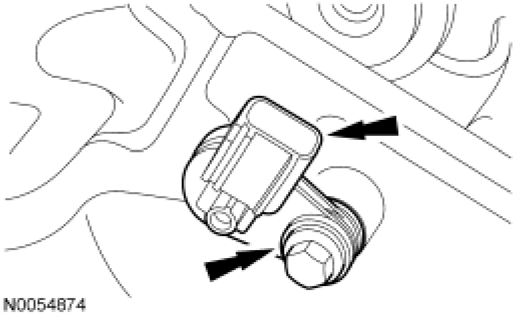

Fig. 881: Locating RH CMP Sensor & Bolt
Courtesy of FORD MOTOR CO.

NOTE: Align the bracket with the index mark made during removal.

11. Install the upper intake manifold short support bracket and the bolt.
    - Tighten to 10 Nm (89 lb-in).

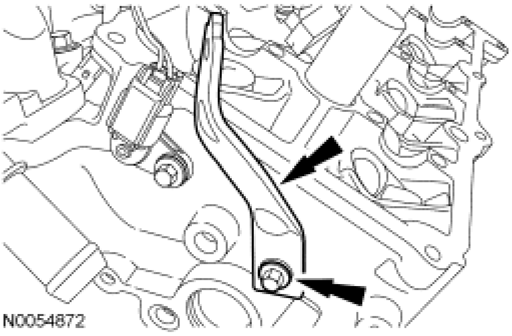

Fig. 882: Locating Upper Intake Manifold Bracket & Bolt
Courtesy of FORD MOTOR CO.

NOTE: Align the bracket with the index mark made during removal.

12. If equipped, install the upper intake manifold long support bracket and the bolt.
    - Tighten to 10 Nm (89 lb-in).

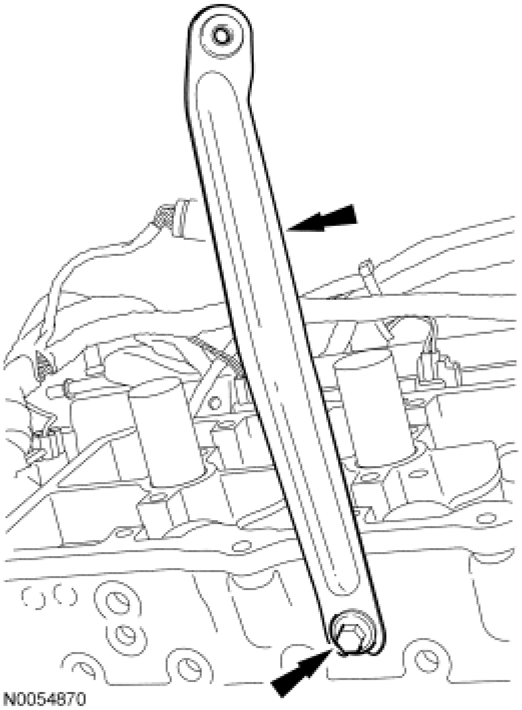

Fig. 883: Locating Upper Intake Manifold Bracket & Bolt
Courtesy of FORD MOTOR CO.

13. Install the engine lifting eye and the 2 bolts.
    - Tighten to 24 Nm (18 lb-ft).

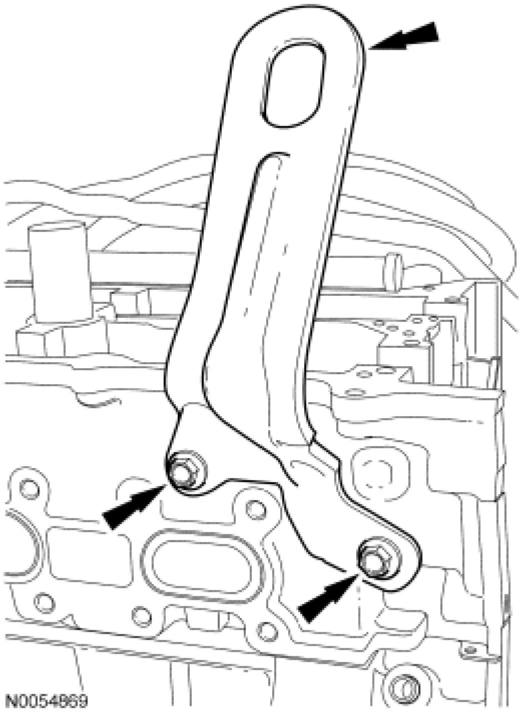

Fig. 884: Locating Engine Lifting Eye & Bolts
Courtesy of FORD MOTOR CO.

14. Install the RH secondary timing chain tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

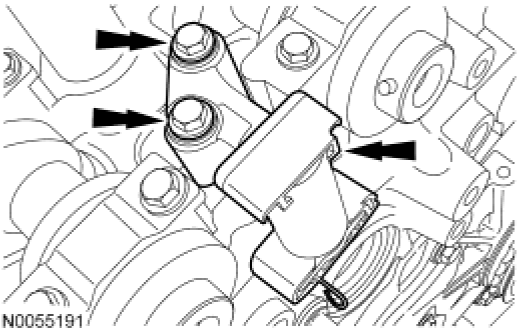

Fig. 885: Locating RH Secondary Timing Chain Tensioner & Bolts
Courtesy of FORD MOTOR CO.

15. Install the RH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

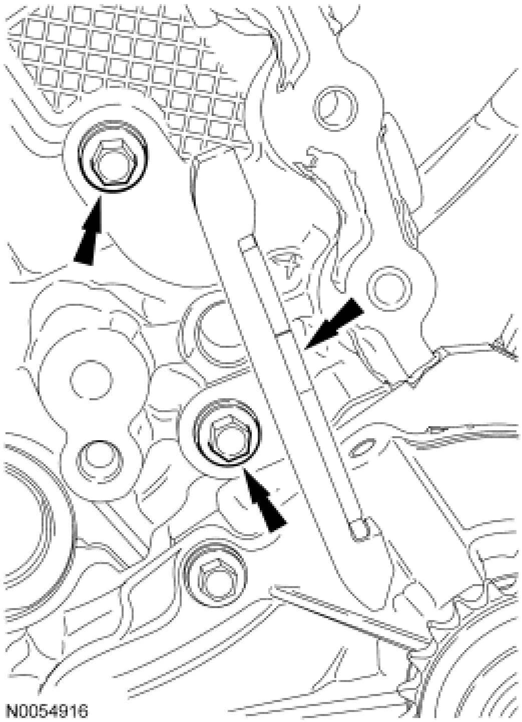

Fig. 886: Locating RH Primary Timing Chain Guide Lower Bolt
Courtesy of FORD MOTOR CO.

16. Install 6 new RH exhaust manifold studs.
    - Tighten to 12 Nm (9 lb-ft).

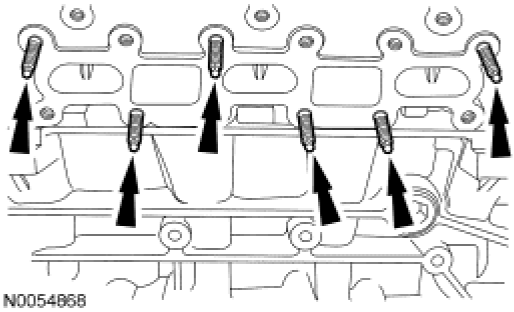

Fig. 887: Locating RH Exhaust Manifold Studs
Courtesy of FORD MOTOR CO.

CAUTION: Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.

17. Using a new gasket, install the RH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:
    - Stage 1: Tighten to 20 Nm (15 lb-ft).

- Stage 2: Tighten to 20 Nm (15 lb-ft).

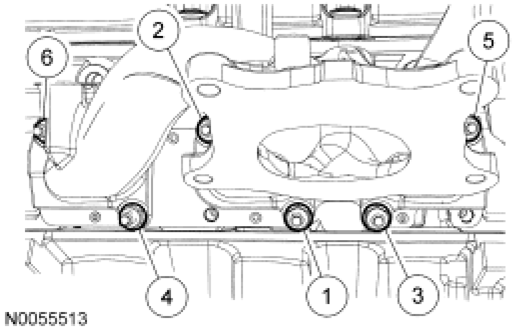

Fig. 888: Installing RH Exhaust Manifold Nuts In Sequence
Courtesy of FORD MOTOR CO.

18. Install the RH exhaust manifold heat shield and the 3 bolts.
    - Tighten to 14 Nm (10 lb-ft).

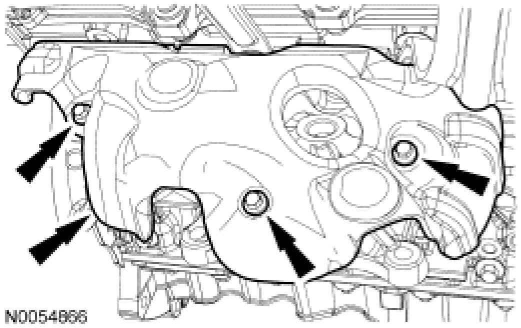

Fig. 889: Locating RH Exhaust Manifold Heat Shield & Nuts
Courtesy of FORD MOTOR CO.

19. Install the RH cylinder block drain plug or, if equipped, the block heater.
    - Tighten to 40 Nm (30 lb-ft).

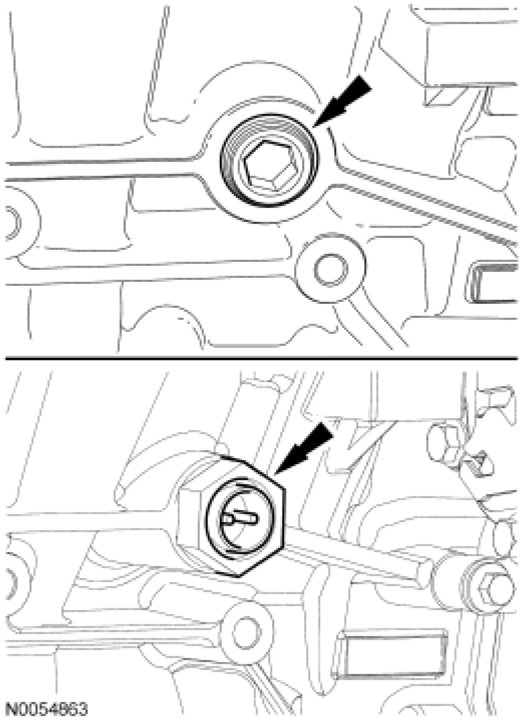

Fig. 890: Locating RH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

All wheel drive (AWD) vehicles

NOTE: Do not tighten the 4 catalytic converter nuts at this time.

20. Using a new gasket, install the RH catalytic converter and 4 new nuts.

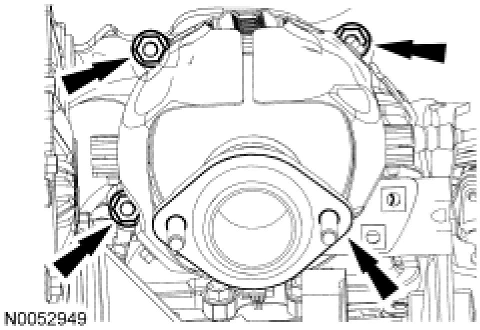

Fig. 891: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

21. Install the 2 RH catalytic converter bracket bolts.
    - Tighten the 4 catalytic converter nuts to 40 Nm (30 lb-ft).
    - Tighten the 2 catalytic converter brackets to 20 Nm (15 lb-ft).

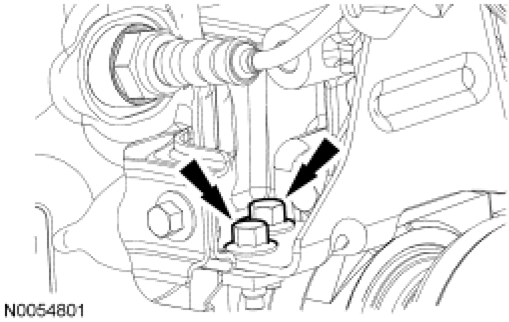

Fig. 892: Identifying RH Catalytic Converter Support Bracket Bolts
Courtesy of FORD MOTOR CO.

Front wheel drive (FWD) vehicles

22. Using a new gasket, install the RH catalytic converter and 4 new nuts.
    - Tighten to 40 Nm (30 lb-ft).

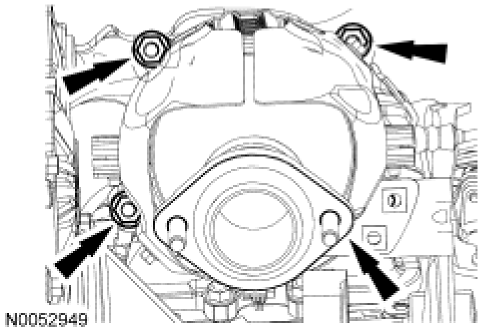

Fig. 893: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

All vehicles

23. Install the LH cylinder block drain plug.
    - Tighten to 20 Nm (15 lb-ft) plus an additional 180 degrees.

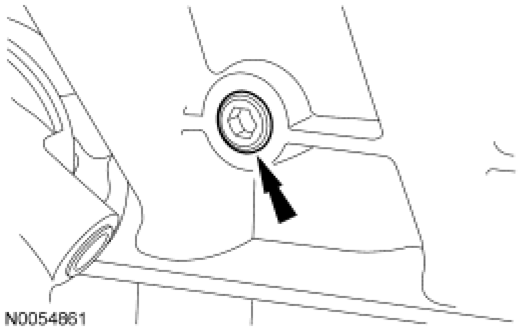

Fig. 894: Locating LH Cylinder Block Drain Plug

Courtesy of FORD MOTOR CO.

24. Using a new gasket, install the LH catalytic converter and 4 new nuts (3 shown).
    - Tighten to 40 Nm (30 lb-ft).

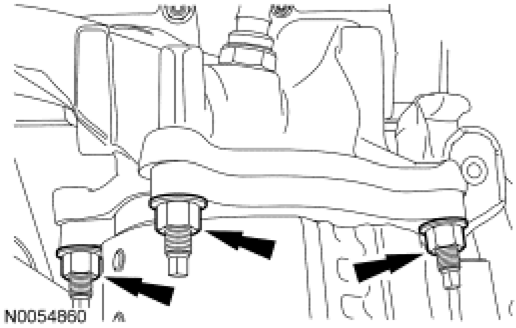

Fig. 895: Locating LH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

25. Install the 2 LH catalytic converter bracket bolts.
    - Tighten to 20 Nm (15 lb-ft).

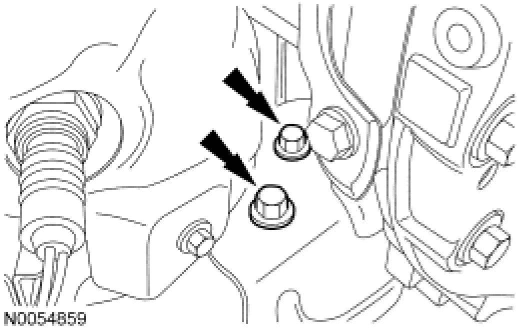

Fig. 896: Locating LH Catalytic Converter Bracket Bolts
Courtesy of FORD MOTOR CO.

26. Connect the LH catalyst monitor sensor electrical connector.

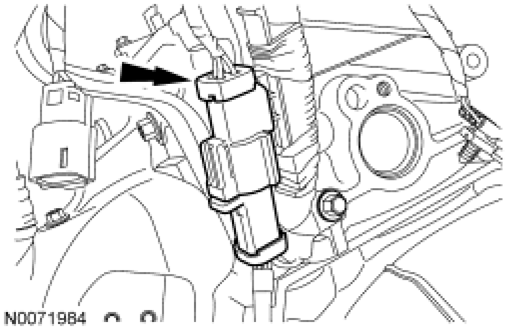

Fig. 897: Identifying LH Catalyst Monitor Sensor Electrical Connector

Courtesy of FORD MOTOR CO.

27. Connect the CHT sensor electrical connector.

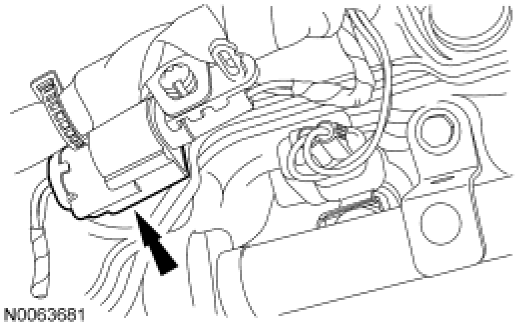

Fig. 898: Locating Cylinder Head Temperature (CHT) Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

28. Connect the 6 fuel injector electrical connectors (3 shown).

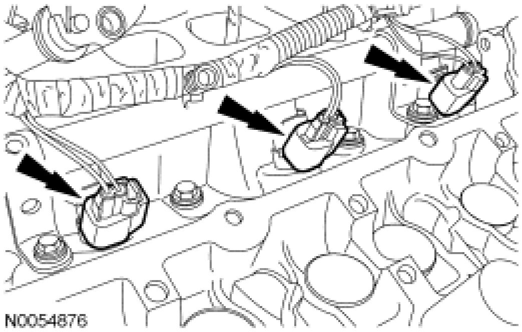

Fig. 899: Locating Fuel Injector Electrical Connectors
Courtesy of FORD MOTOR CO.

29. Install the power steering pressure (PSP) tube bracket and bolt.
    - Tighten to 10 Nm (89 lb-in).

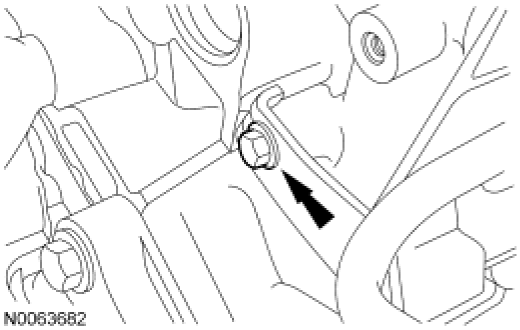

Fig. 900: Identifying Power Steering Pressure (PSP) Tube & Bracket Assembly
Courtesy of FORD MOTOR CO.

30. Connect the RH CMP sensor electrical connector.

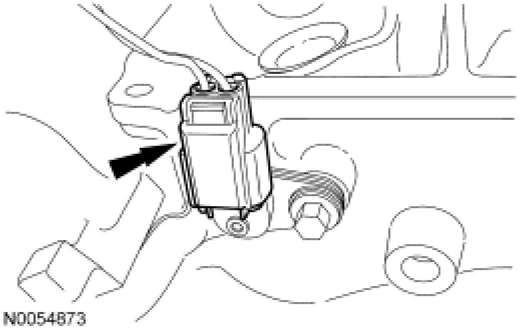

Fig. 901: Locating RH Camshaft Position (CMP) Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

31. Connect the RH HO2S electrical connector.

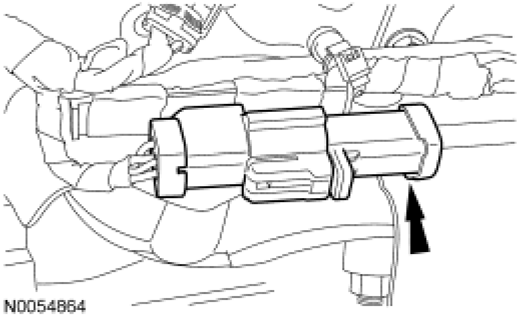

Fig. 902: Locating RH Heated Oxygen Sensor (HO2S) Electrical Connector
Courtesy of FORD MOTOR CO.

32. If equipped, install the block heater wiring harness onto the engine.
    - Connect the block heater electrical connector and install the heat shield.

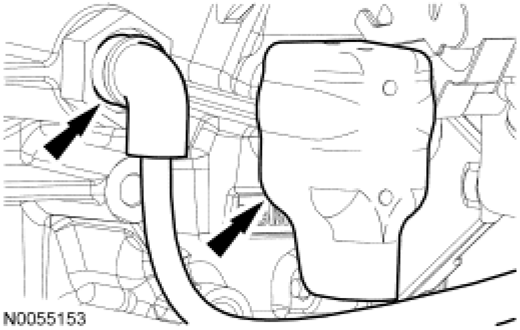

Fig. 903: Identifying Block Heater Wiring Harness
Courtesy of FORD MOTOR CO.

33. Install the RH camshafts. For additional information, refer to **Camshaft**.

CYLINDER HEAD - LH

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

All vehicles

1. Install a new gasket, the LH cylinder head and 8 new bolts. Tighten in the sequence shown in 5 stages:
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 35 Nm (26 lb-ft).
    - Stage 3: Tighten 90 degrees.
    - Stage 4: Tighten 90 degrees.
    - Stage 5: Tighten 90 degrees.

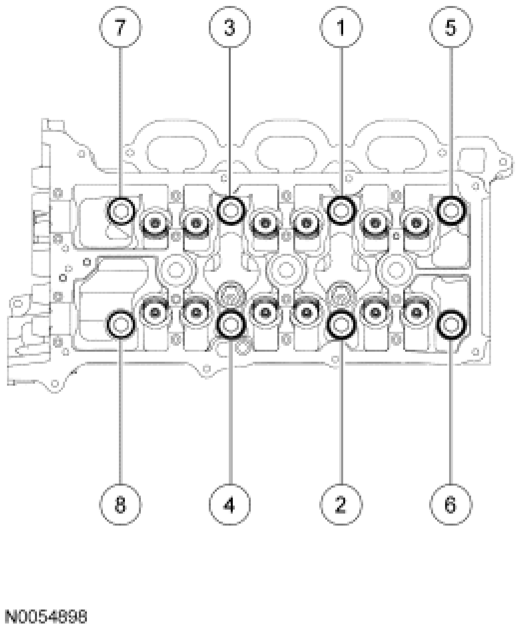

Fig. 904: Installing LH Cylinder Head Bolts In Sequence

Courtesy of FORD MOTOR CO.

2. Install the bolt.
   - Tighten to 10 Nm (89 lb-in).

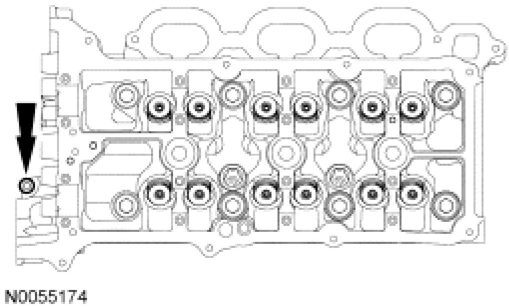

Fig. 905: Identifying M6 Bolt
Courtesy of FORD MOTOR CO.

NOTE: The valve tappets must be installed in their original positions.

NOTE: Coat the valve tappets with clean engine oil prior to installation.

3. Install the valve tappets.

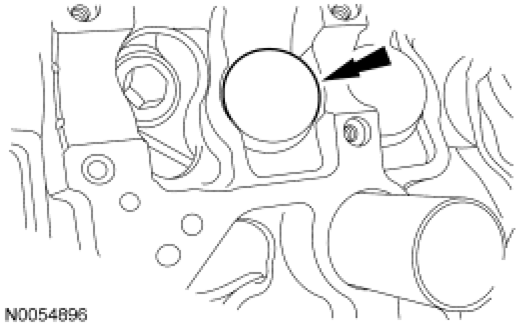

Fig. 906: Identifying Valve Tappets From Cylinder Head
Courtesy of FORD MOTOR CO.

4. Install the LH secondary timing chain tensioner and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

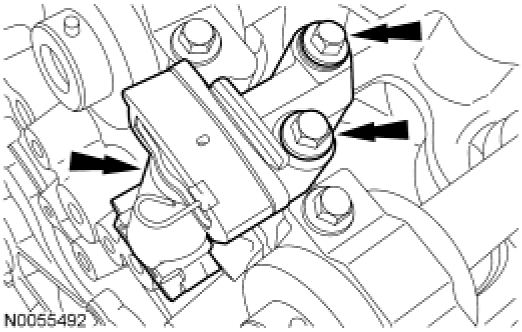

Fig. 907: Locating LH Secondary Timing Chain Tensioner & Bolt
Courtesy of FORD MOTOR CO.

5. Install the upper LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

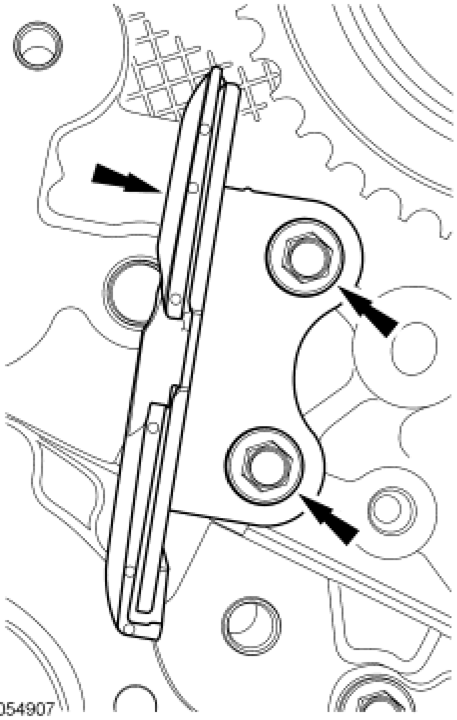

Fig. 908: Locating Upper LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

6. Install LH Camshaft Position (CMP) sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).

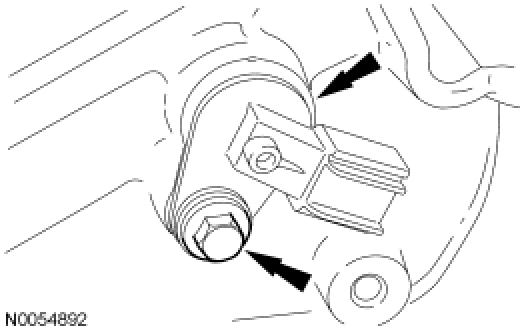

Fig. 909: Locating LH CMP Sensor & Bolt
Courtesy of FORD MOTOR CO.

7. Using new gaskets, install the lower intake manifold and the 10 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

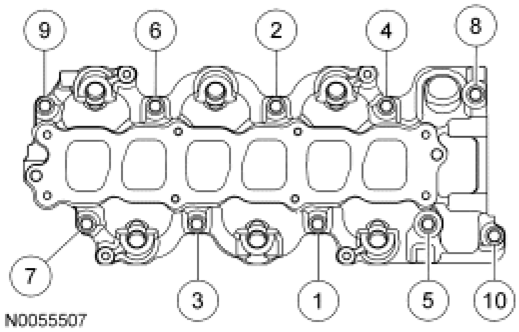

Fig. 910: Installing Lower Intake Manifold Bolts In Sequence
Courtesy of FORD MOTOR CO.

8. Using a new gasket and O-ring seal, install the thermostat housing and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

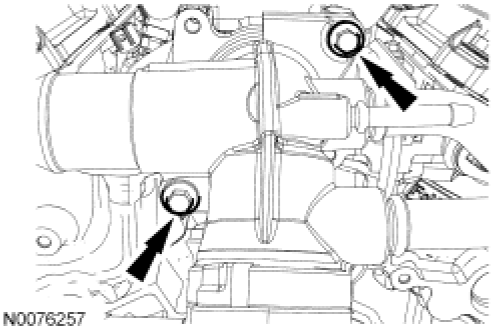

Fig. 911: Locating Thermostat Housing-To-Lower Intake Manifold Bolts
Courtesy of FORD MOTOR CO.

9. Connect the coolant bypass hose to the thermostat housing.

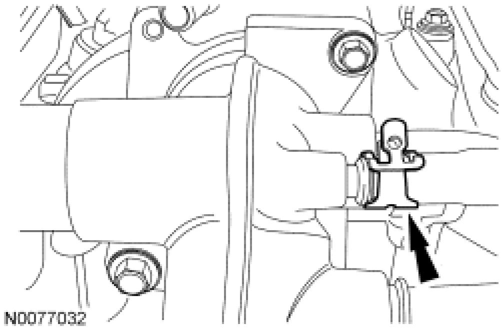

Fig. 912: Identifying Coolant Bypass Hose From Thermostat Housing
Courtesy of FORD MOTOR CO.

NOTE: **Use O-ring seals that are made of special fuel-resistant material. The use of ordinary O-rings can cause the fuel system to leak. Do not reuse the O-ring seals.**

NOTE: **The upper and lower O-ring seals are not interchangeable.**

10. Install new fuel injector O-ring seals.
    - Remove the retaining clips and separate the fuel injectors from the fuel rail.
    - Remove and discard the O-ring seals.
    - Install new O-ring seals and lubricate with clean engine oil.
    - Install the fuel injectors and the retaining clips onto the fuel rail.

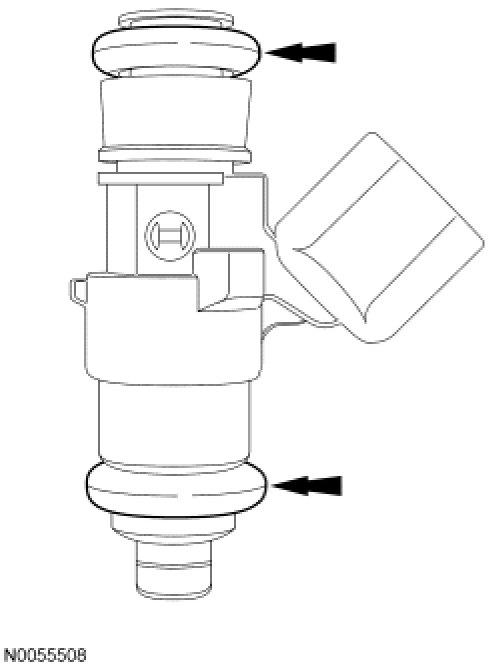

Fig. 913: Identifying Fuel Injector O-Ring Seals
Courtesy of FORD MOTOR CO.

11. Install the fuel rail and injectors as an assembly and install the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).

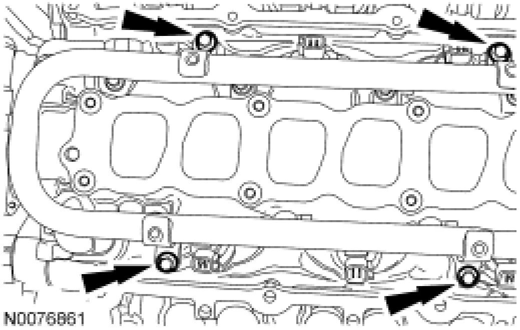

Fig. 914: Identifying Bolts & Fuel Rail
Courtesy of FORD MOTOR CO.

12. Install the RH cylinder block drain plug or, if equipped, the block heater.
    - Tighten to 40 Nm (30 lb-ft).

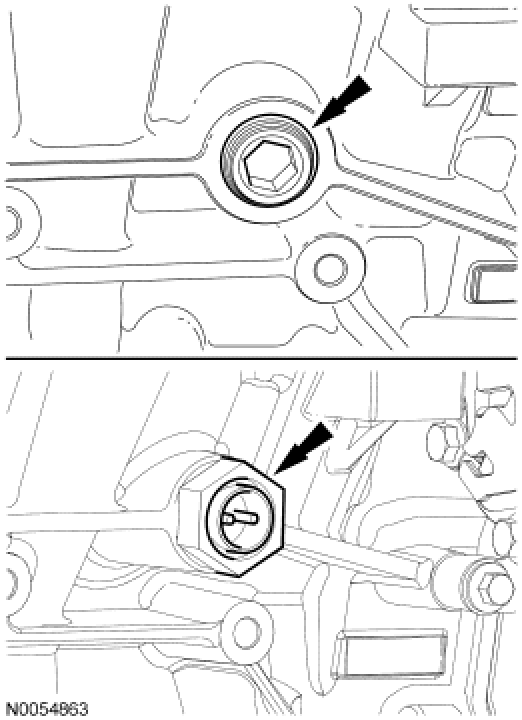

Fig. 915: Locating RH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

All-Wheel Drive (AWD) vehicles

NOTE: Do not tighten the 4 catalytic converter nuts at this time.

13. Using a new gasket, install the RH catalytic converter and 4 new nuts.

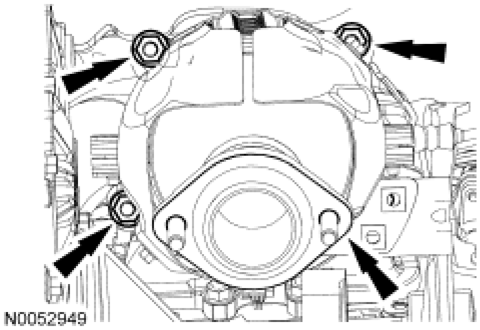

Fig. 916: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

14. Install the 2 RH catalytic converter bracket bolts.
    - Tighten the 4 catalytic converter nuts to 40 Nm (30 lb-ft).
    - Tighten the 2 catalytic converter brackets to 20 Nm (177 lb-in).

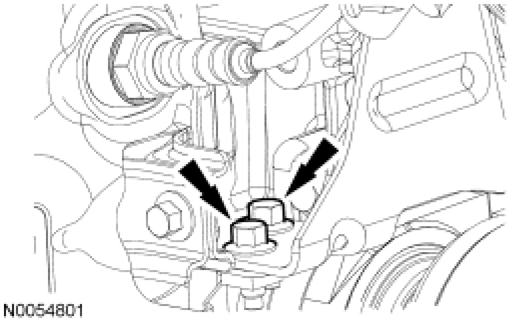

Fig. 917: Identifying RH Catalytic Converter Support Bracket Bolts
Courtesy of FORD MOTOR CO.

Front Wheel Drive (FWD) vehicles

15. Using a new gasket, install the RH catalytic converter and 4 new nuts.
    - Tighten to 40 Nm (30 lb-ft).

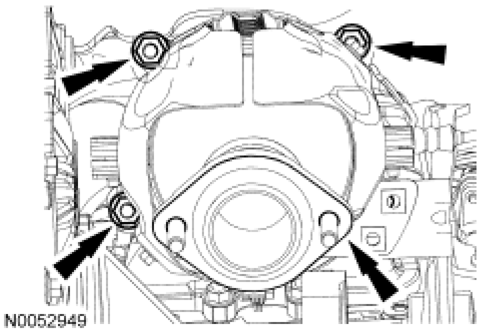

Fig. 918: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

All vehicles

16. Install the LH cylinder block drain plug.
    - Tighten to 20 Nm (177 lb-in) plus an additional 180 degrees.

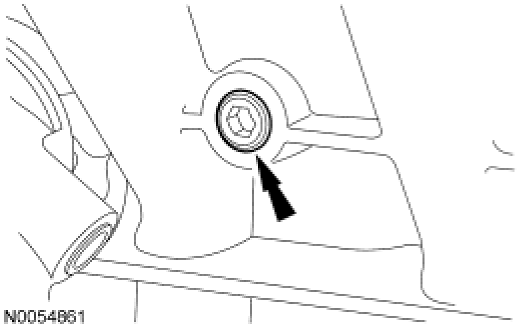

Fig. 919: Locating LH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

17. Install 6 new LH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).

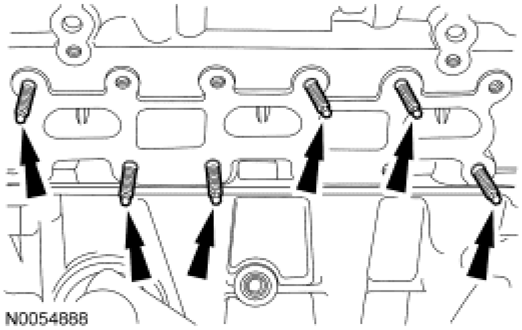

Fig. 920: Locating LH Exhaust Manifold Studs
Courtesy of FORD MOTOR CO.

NOTE: Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.

18. Using a new gasket, install the LH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).

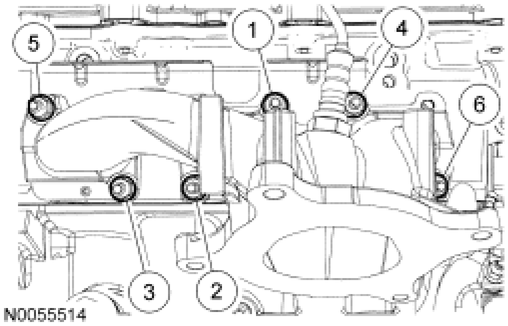

Fig. 921: Installing LH Exhaust Manifold Nuts In Sequence
Courtesy of FORD MOTOR CO.

19. Install the LH exhaust manifold heat shield and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

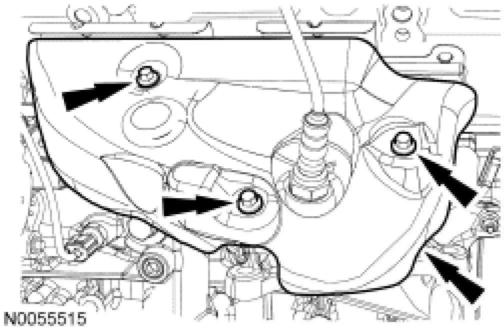

Fig. 922: Locating LH Exhaust Manifold Heat Shield & Nuts
Courtesy of FORD MOTOR CO.

20. Using a new gasket, install the LH catalytic converter and 4 new nuts (3 shown).
    - Tighten to 40 Nm (30 lb-ft).

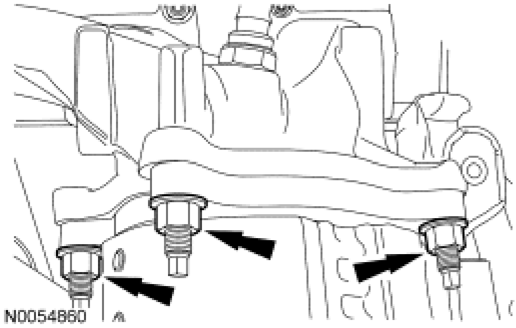

Fig. 923: Locating LH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

21. Install the 2 LH catalytic converter bracket bolts.
    - Tighten to 20 Nm (177 lb-in).

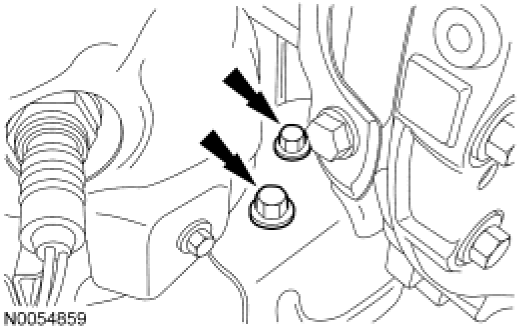

Fig. 924: Locating LH Catalytic Converter Bracket Bolts
Courtesy of FORD MOTOR CO.

22. Install the wiring harness retainer bolt on the rear of the LH cylinder head.
    - Tighten to 10 Nm (89 lb-in).

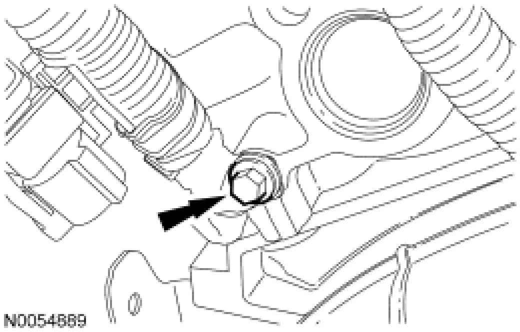

Fig. 925: Identifying Wiring Harness Retainer Bolt From Rear Of LH Cylinder Head
Courtesy of FORD MOTOR CO.

23. Connect the LH catalyst monitor sensor electrical connector.

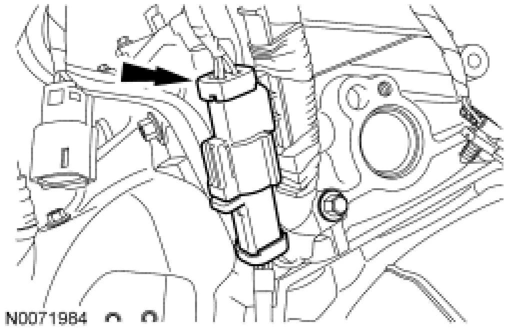

Fig. 926: Identifying LH Catalyst Monitor Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

24. Connect the LH Heated Oxygen Sensor (HO2S) electrical connector.

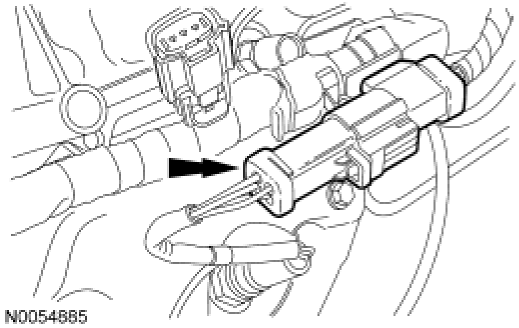

Fig. 927: Locating LH Heated Oxygen Sensor (HO2S) Electrical Connector
Courtesy of FORD MOTOR CO.

25. Connect the LH CMP sensor electrical connector.

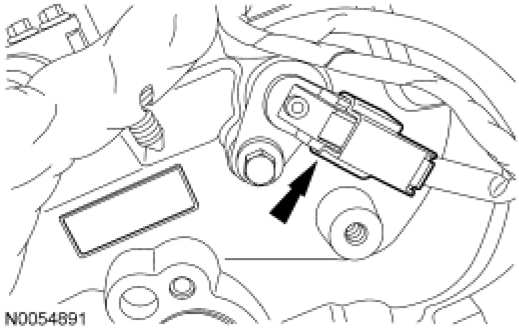

Fig. 928: Locating LH CMP Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

26. Connect the Cylinder Head Temperature (CHT) sensor electrical connector.

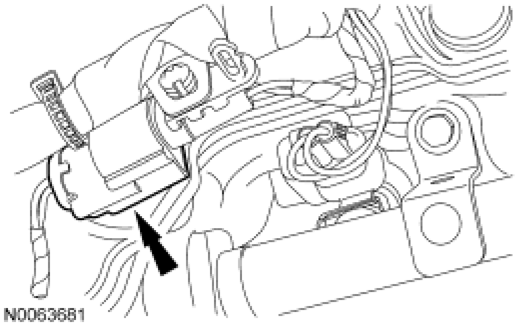

Fig. 929: Locating Cylinder Head Temperature (CHT) Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

27. Connect the 6 fuel injector electrical connectors (3 shown).

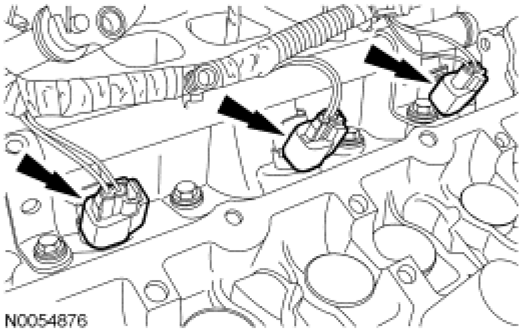

Fig. 930: Locating Fuel Injector Electrical Connectors
Courtesy of FORD MOTOR CO.

28. Attach the wiring harness pin-type retainer.

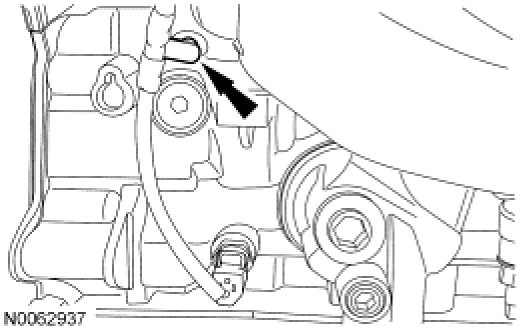

Fig. 931: Identifying Wiring Harness Pin-Type Retainer
Courtesy of FORD MOTOR CO.

29. Install the generator, the bolt and the nut.
    - Tighten to 48 Nm (35 lb-ft).

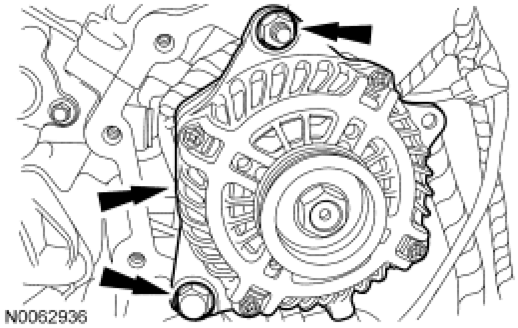

Fig. 932: Locating Generator, Bolts & Nuts
Courtesy of FORD MOTOR CO.

30. Attach the wiring harness retainer to the generator.

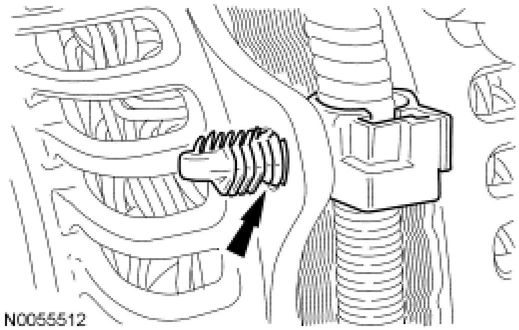

Fig. 933: Identifying Wiring Harness Retainer From Generator
Courtesy of FORD MOTOR CO.

31. Connect the generator electrical connector.

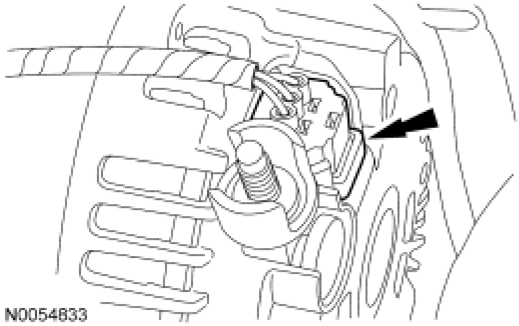

Fig. 934: Identifying Generator Electrical Connector
Courtesy of FORD MOTOR CO.

32. Connect the generator B+ cable and install the nut.
    - Tighten to 6 Nm (53 lb-in).

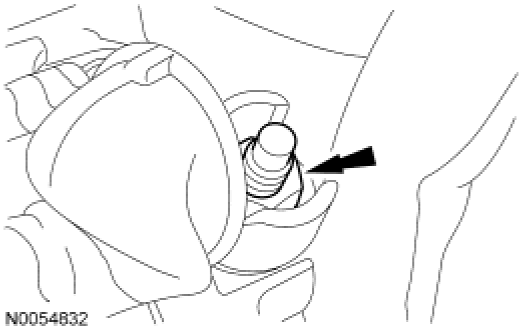

Fig. 935: Identifying Generator B+ Cable & Nut
Courtesy of FORD MOTOR CO.

33. Connect the A/C compressor electrical connector.

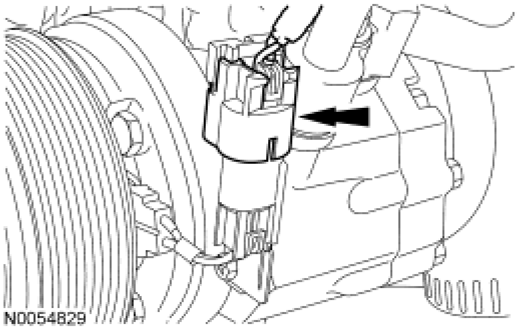

Fig. 936: Identifying A/C Compressor Electrical Connector
Courtesy of FORD MOTOR CO.

34. If equipped, install the block heater wiring harness onto the engine.
    - Connect the block heater electrical connector and install the heat shield.

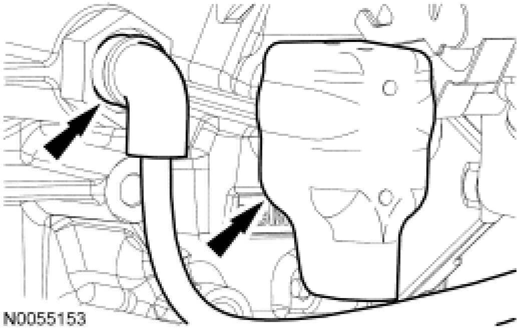

Fig. 937: Identifying Block Heater Wiring Harness
Courtesy of FORD MOTOR CO.

35. Install the LH camshafts. For additional information, refer to **Camshaft**.

Material

Item	Specification
Motorcraft High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft Metal Surface Prep ZC-31-A	-
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Silicone Gasket Remover ZC-30	-

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

All vehicles

CAUTION: Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: The oil pan and the 4 specified bolts must be installed and the oil pan aligned to the cylinder block and A/C compressor within 4 minutes of sealant application. Final tightening of the oil pan bolts must be carried out within 60 minutes of sealant application.

1. Apply a 3 mm (0.11 in) bead of Motorcraft High Performance Engine RTV Silicone to the sealing surface of the oil pan.
   - Apply a 5.5 mm (0.21 in) bead of Motorcraft High Performance Engine RTV Silicone to the 2 crankshaft seal retainer plate-to-cylinder block joint areas on the sealing surface of the oil pan.

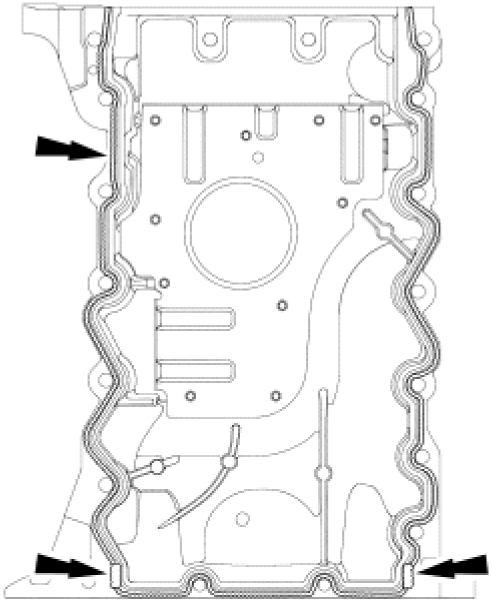

Fig. 938: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Crankshaft Seal Retainer Plate-To-Cylinder Block
Courtesy of FORD MOTOR CO.

NOTE: **The oil pan and the 4 specified bolts must be installed within 4 minutes of the start of sealant application.**

2. Install the oil pan and bolts 10, 11, 13 and 14.
   - Tighten the bolts in the sequence shown to 3 Nm (27 lb-in).
   - Loosen the bolts 180 degrees.

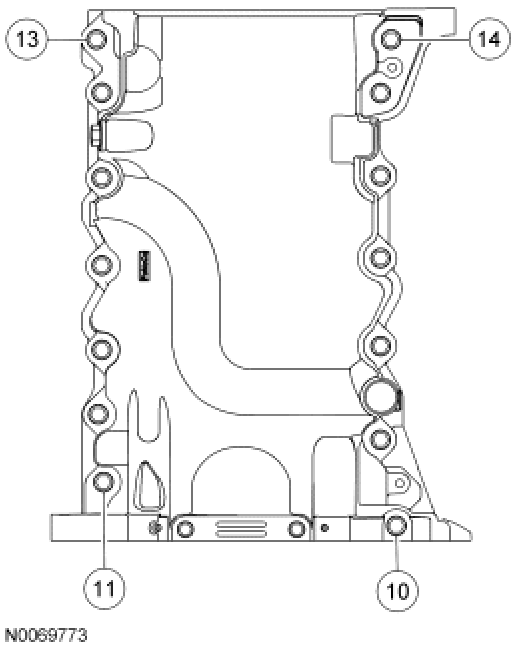

Fig. 939: Installing Oil Pan Bolts 10, 11, 13 & 14 In Sequence
Courtesy of FORD MOTOR CO.

3. Align the oil pan to the cylinder block and A/C compressor.
    - Position the oil pan so the mounting boss is against the A/C compressor and using a straightedge, align the oil pan flush with the rear of the cylinder block at the 2 areas shown.

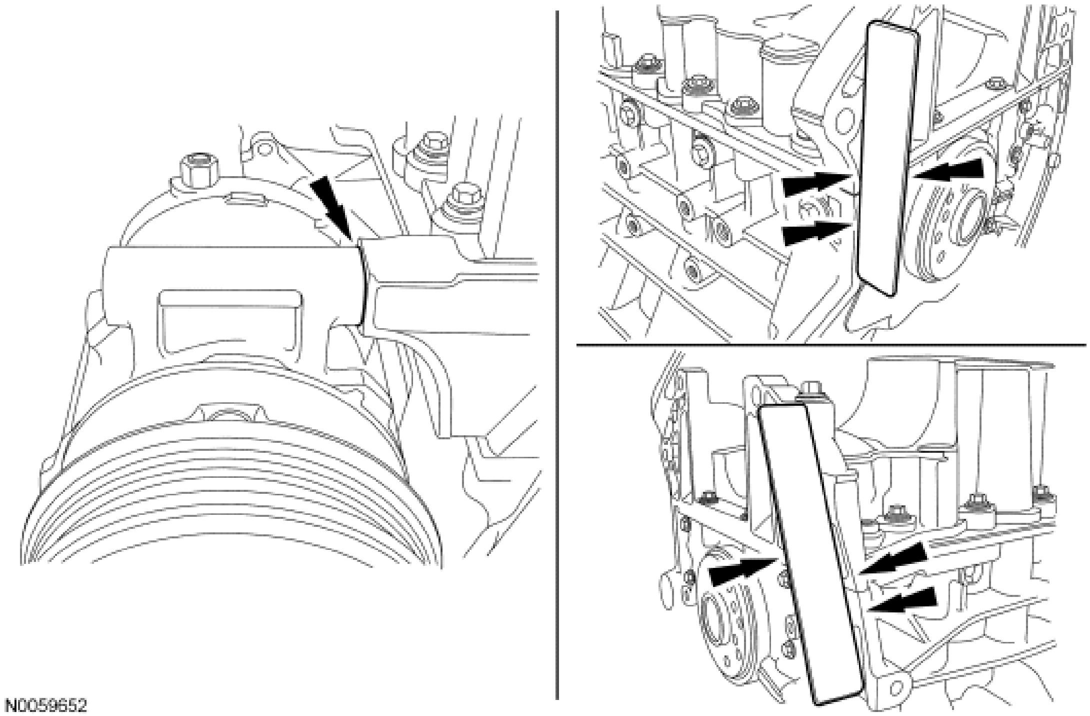

Fig. 940: Aligning Oil Pan Flush With Rear Of Cylinder Block
Courtesy of FORD MOTOR CO.

4. Tighten bolts 10, 11, 13 and 14 in the sequence shown, to 3 Nm (27 lb-in).

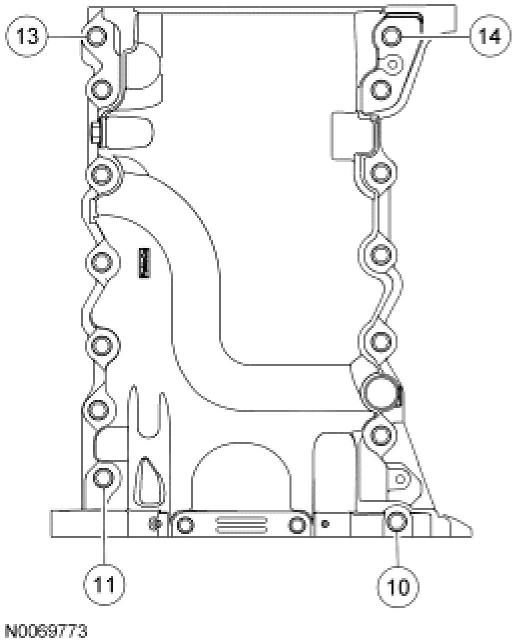

Fig. 941: Installing Oil Pan Bolts 10, 11, 13 & 14 In Sequence

Courtesy of FORD MOTOR CO.

5. Install the remaining oil pan bolts. Tighten all the oil pan bolts in the sequence shown.
   - Tighten the large bolts (1-14) to 24 Nm (18 lb-ft).
   - Tighten the small bolts (15 and 16) to 10 Nm (89 lb-in).

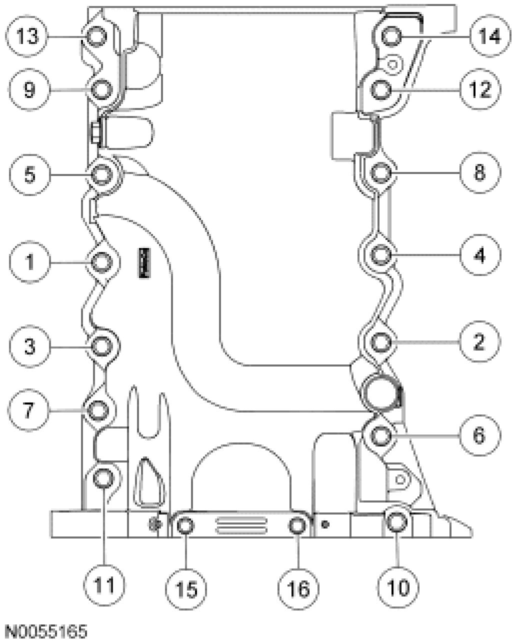

Fig. 942: Installing Remaining Oil Pan Bolts In Sequence
Courtesy of FORD MOTOR CO.

6. Install the A/C compressor mounting stud and nut.
   - Tighten the stud to 9 Nm (80 lb-in) and the nut to 25 Nm (18 lb-ft).

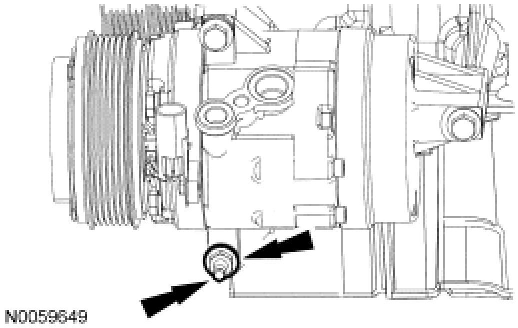

Fig. 943: Identifying A/C Compressor Nut & Stud
Courtesy of FORD MOTOR CO.

7. Install the special tools.

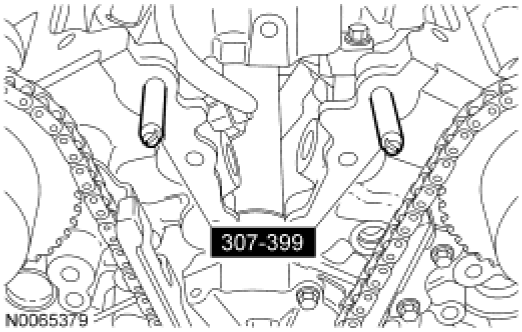

Fig. 944: Identifying Special Tool (307-399)
Courtesy of FORD MOTOR CO.

CAUTION: Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: The engine front cover and bolts 17, 18, 19 and 20 must be installed within 4 minutes of the initial sealant application. The remainder of the engine front cover bolts and the engine mount bracket bolts must be installed and tightened within 35 minutes of the initial sealant application. If the time limits are exceeded, the sealant must be removed, the sealing area cleaned and sealant reapplied. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

8. Apply a 3.0 mm (0.11 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover sealing surfaces including the 3 engine mount bracket bosses.
   - Apply a 5.5 mm (0.21 in) bead of Motorcraft High Performance Engine RTV Silicone to the oil pan-to-cylinder block joint and the cylinder head-to-cylinder block joint areas of the engine front cover in 5 places as indicated.

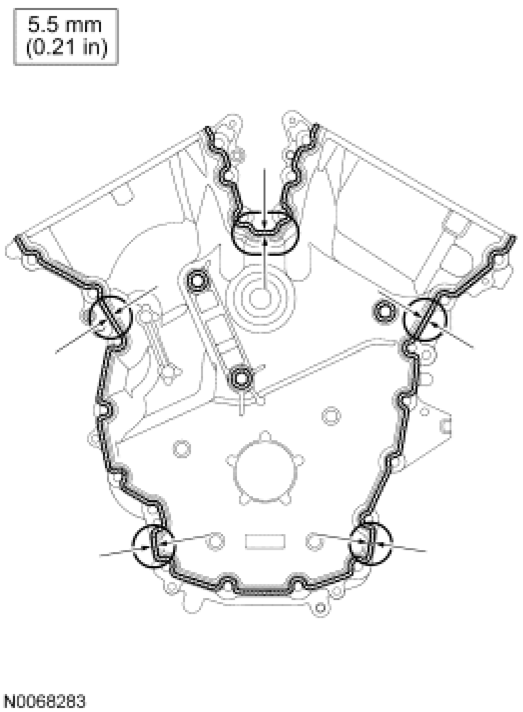

Fig. 945: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Engine Front Cover Sealing Surfaces
Courtesy of FORD MOTOR CO.

NOTE:	**Make sure the 2 locating dowel pins are seated correctly in the cylinder block.**

9. Install the engine front cover and bolts 17, 18, 19 and 20.
   - Tighten in sequence to 3 Nm (27 lb-in).

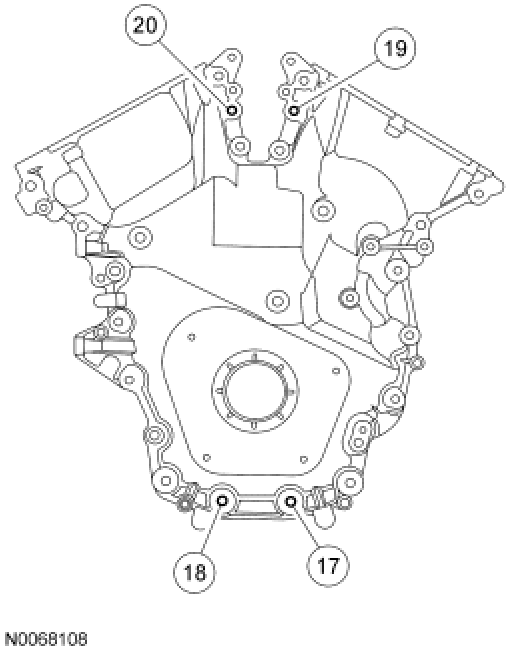

Fig. 946: Installing Engine Front Cover & Bolts In Sequence
Courtesy of FORD MOTOR CO.

10. Remove the special tools (alignment pins).

NOTE: Do not tighten the bolt at this time.

11. Install the engine mount bracket and the 3 bolts.

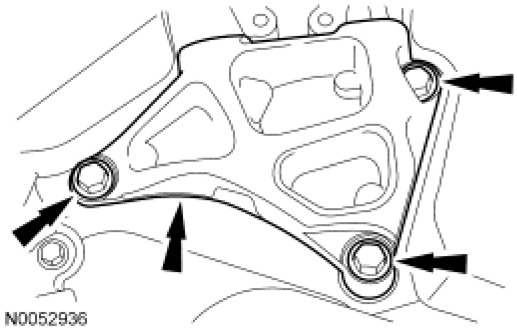

Fig. 947: Locating Engine Mount Bracket & Bolts
Courtesy of FORD MOTOR CO.

CAUTION: Do not expose the Motorcraft High Performance Engine RTV Silicone to engine oil for at least 90 minutes after installing the engine front cover. Failure to follow this instruction may cause oil leakage.

12. Install the remaining engine front cover bolts. Tighten all the engine front cover bolts and engine mount bracket bolts in the sequence shown in 2 stages:
    - Stage 1: Tighten bolts 1 thru 22 to 10 Nm (89 lb-in) and bolts 23, 24 and 25 to 15 Nm (11 lb-ft).
    - Stage 2: Tighten bolts 1 thru 22 to 24 Nm (18 lb-ft) and bolts 23, 24 and 25 to 75 Nm (55 lb-ft).

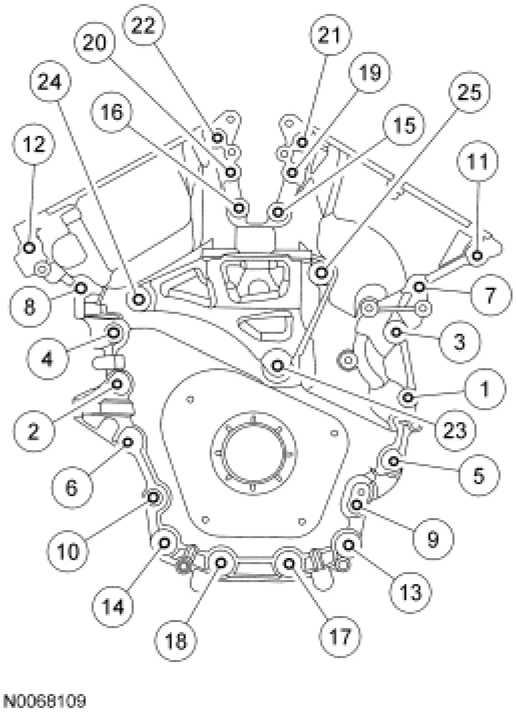

Fig. 948: Identifying Tightening Of Engine Front Cover Bolts & Engine Mount Bracket Bolts In Sequence
Courtesy of FORD MOTOR CO.

13. Install the 2 engine mount studs.
    - Tighten to 18 Nm (13 lb-ft).

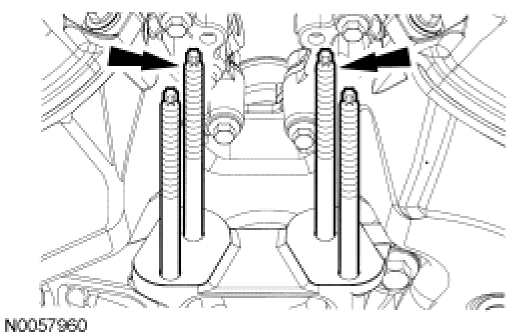

Fig. 949: Locating Engine Mount Studs
Courtesy of FORD MOTOR CO.

14. Install the engine mount bracket and the 2 bolts.

- Tighten to 24 Nm (18 lb-ft).

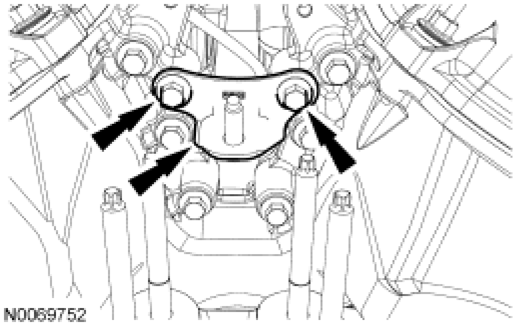

Fig. 950: Locating Engine Mount Bracket & Bolts
Courtesy of FORD MOTOR CO.

NOTE:	**Apply clean engine oil to the crankshaft front seal bore in the engine front cover.**

15. Using the special tools, install a new crankshaft front seal.

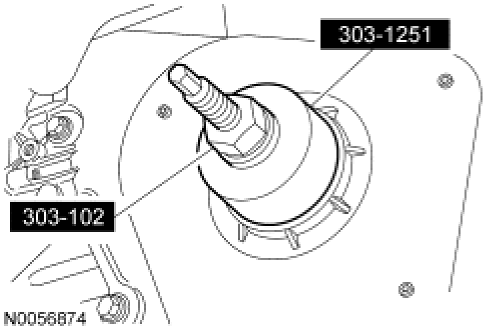

Fig. 951: Installing Crankshaft Front Seal Using Special Tools (303-102) & (303-1251)
Courtesy of FORD MOTOR CO.

NOTE:	**Lubricate the outside diameter sealing surfaces with clean engine oil.**

16. Using the special tools, install the crankshaft pulley.

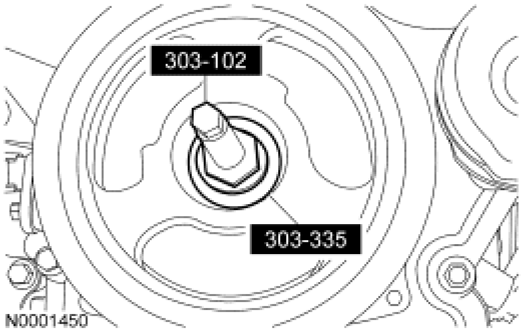

Fig. 952: Installing Crankshaft Pulley
Courtesy of FORD MOTOR CO.

17. Using the special tool, install the crankshaft pulley washer and new bolt and tighten in 4 stages.
    - Stage 1: Tighten to 120 Nm (89 (lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

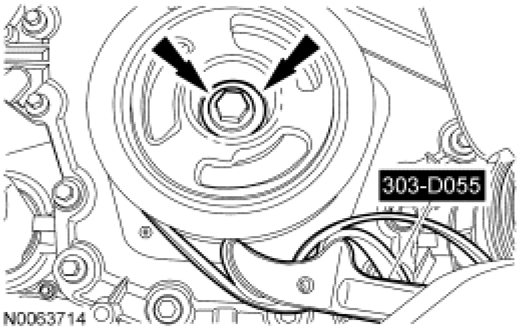

Fig. 953: Installing Crankshaft Pulley Washer & Bolt Using Special Tools (303-D055)
Courtesy of FORD MOTOR CO.

NOTE: Installation of new seals is only required if damaged seals were removed during disassembly of the engine.

NOTE: Spark plug tube seal installation shown, variable camshaft timing (VCT) seal installation similar.

18. Using the special tools, install new VCT solenoid and/or spark plug tube seals.

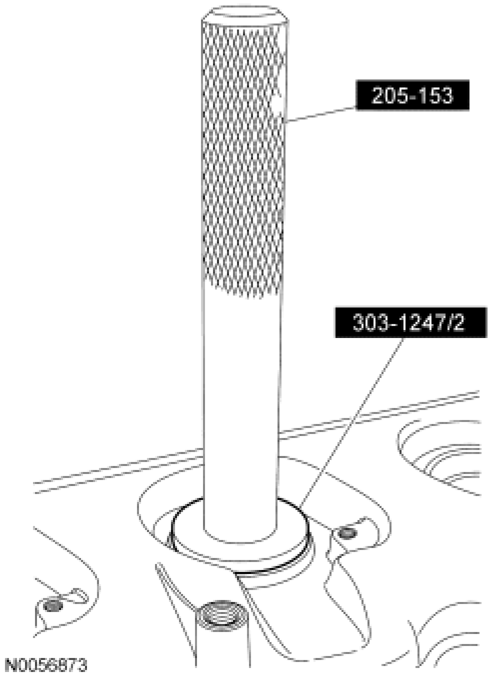

Fig. 954: Installing VCT Solenoid And/Or Spark Plug Tube Seals Using Special Tools (205-153) & (303-1247/2)
Courtesy of FORD MOTOR CO.

CAUTION: Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

19. Apply an 8 mm (0.31 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover-to-RH cylinder head joints.

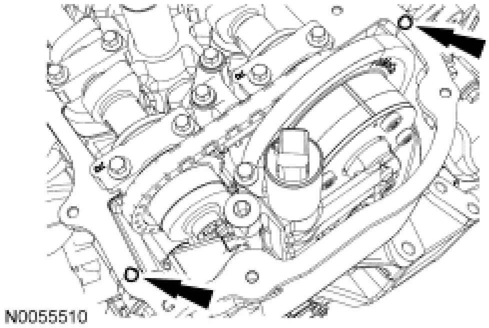

Fig. 955: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Engine Front Cover-To-RH Cylinder Head Joints
Courtesy of FORD MOTOR CO.

20. Using a new gasket, install the RH valve cover, bolt and the 10 stud bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

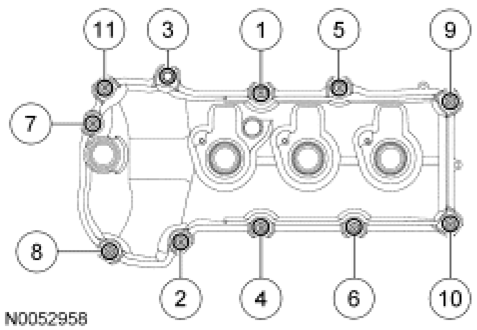

Fig. 956: Installing RH Valve Cover Stud Bolts In Sequence
Courtesy of FORD MOTOR CO.

CAUTION: Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

21. Apply an 8 mm (0.31 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover-to-LH cylinder head joints.

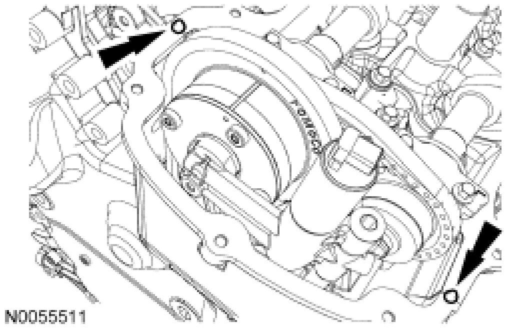

Fig. 957: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Engine Front Cover-To-LH Cylinder Head Joints
Courtesy of FORD MOTOR CO.

22. Using a new gasket, install the LH valve cover and 11 stud bolts.

- Tighten in the sequence shown to 10 Nm (89 lb-in).

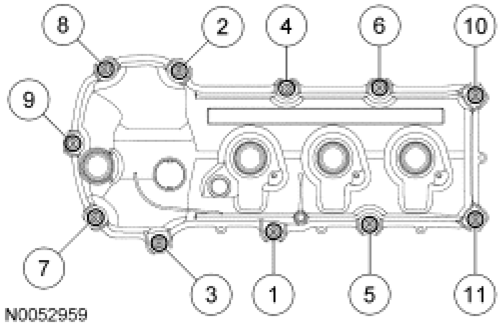

Fig. 958: Installing LH Valve Cover Stud Bolts In Sequence
Courtesy of FORD MOTOR CO.

23. Install the wiring harness retaining bracket and the 2 nuts.
    - Tighten to 9 Nm (80 lb-in).

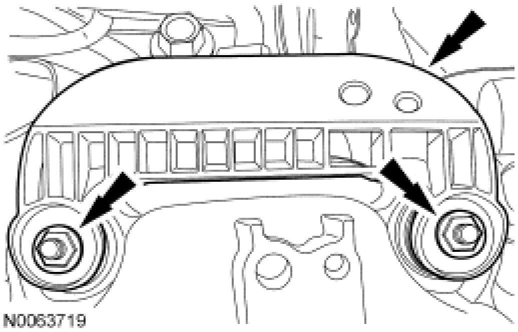

Fig. 959: Identifying Wiring Harness Retaining Bracket & Nuts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

24. Install the 6 coil-on-plug assemblies and the 6 bolts.
    - Tighten to 7 Nm (62 lb-in).

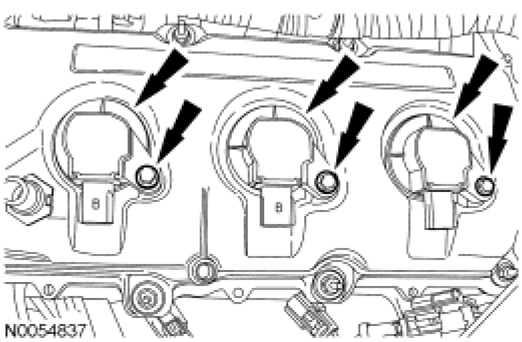

Fig. 960: Locating Coil-On-Plugs & Bolts

Courtesy of FORD MOTOR CO.

25. Install the LH cylinder block drain plug.
    - Tighten to 20 Nm (15 lb-ft) plus an additional 180 degrees.

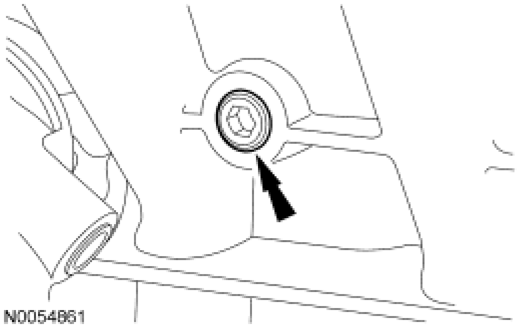

Fig. 961: Locating LH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

26. Install the RH cylinder block drain plug or, if equipped, the block heater.
    - Tighten to 40 Nm (30 lb-ft).

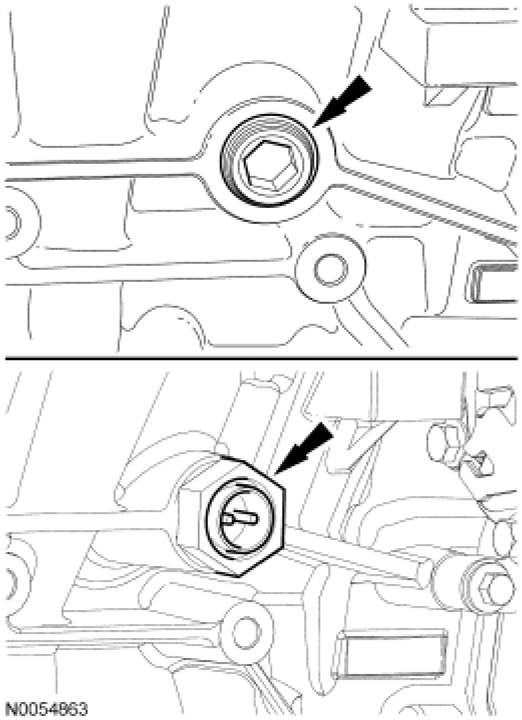

Fig. 962: Locating RH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

Front wheel drive (FWD) vehicles

27. Using a new gasket, install the RH catalytic converter and 4 new nuts.
    - Tighten to 40 Nm (30 lb-ft).

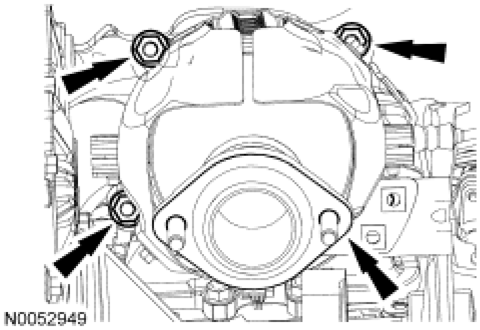

Fig. 963: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

All vehicles

28. Using a new gasket, install the LH catalytic converter and 4 new nuts (3 shown).
    - Tighten to 40 Nm (30 lb-ft).

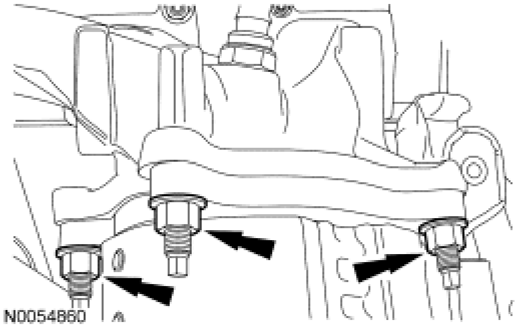

Fig. 964: Locating LH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

29. Install the accessory drive belt tensioner and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

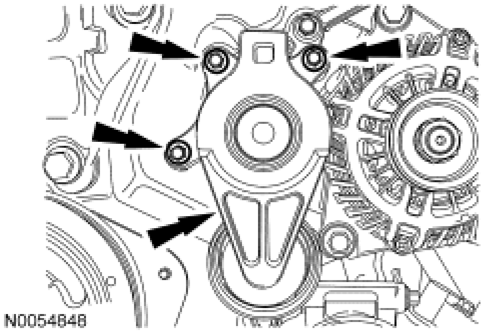

Fig. 965: Locating Accessory Drive Belt Tensioner Bolts
Courtesy of FORD MOTOR CO.

30. Install the power steering pump and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

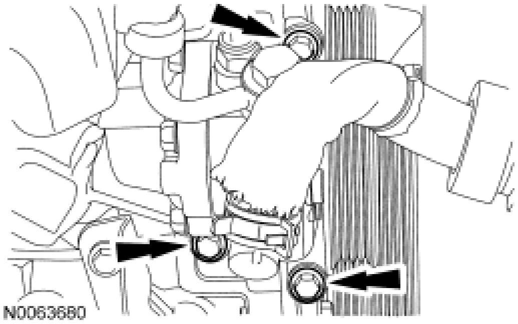

Fig. 966: Locating Power Steering Pump Bolts
Courtesy of FORD MOTOR CO.

31. Install the power steering pressure (PSP) hose bracket and nut.
    - Tighten to 9 Nm (80 lb-in).

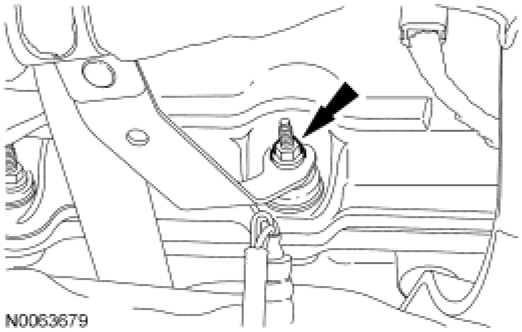

Fig. 967: Identifying PSP Hose Bracket Nut
Courtesy of FORD MOTOR CO.

32. Attach the PSP hose retainer to the engine lifting eye.

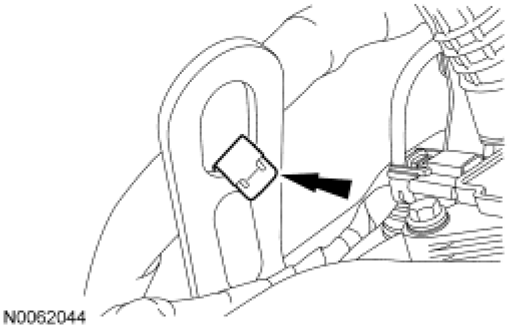

Fig. 968: Locating PSP Hose Retainer From Engine Lifting Eye
Courtesy of FORD MOTOR CO.

33. Attach all of the wiring harness retainers to the LH valve cover and stud bolts.
34. Connect the LH camshaft VCT solenoid electrical connector.

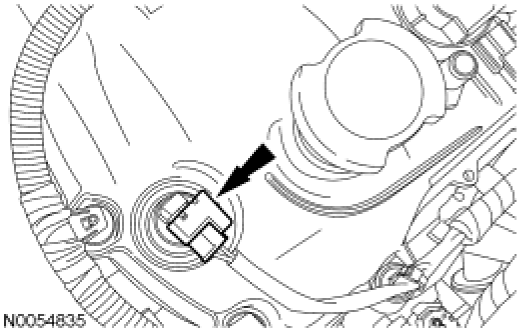

Fig. 969: Locating LH VCT Solenoid Electrical Connector
Courtesy of FORD MOTOR CO.

35. Connect the 3 LH coil-on-plug electrical connectors.

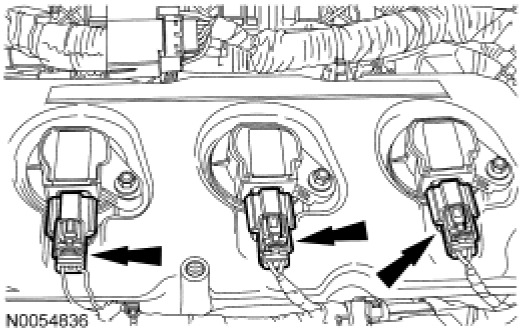

Fig. 970: Locating LH Coil-On-Plug Electrical Connectors
Courtesy of FORD MOTOR CO.

36. Connect the LH catalyst monitor sensor electrical connector.

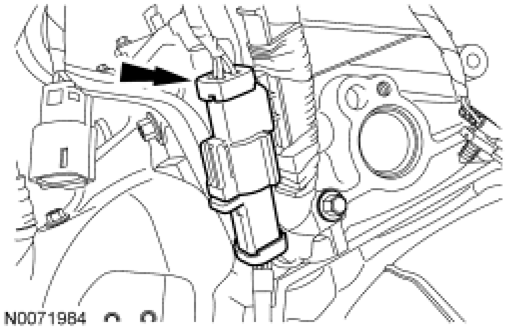

Fig. 971: Identifying LH Catalyst Monitor Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

37. Attach all of the wiring harness retainers to the RH valve cover and stud bolts.
38. If equipped, connect the heated PCV valve electrical connector.

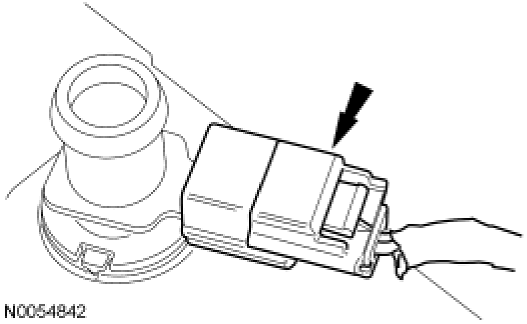

Fig. 972: Locating Heated PCV Valve Electrical Connector
Courtesy of FORD MOTOR CO.

39. Connect the 3 RH coil-on-plug electrical connectors.

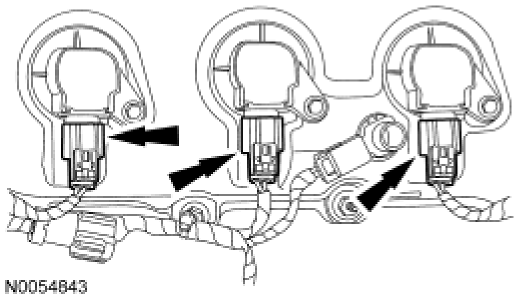

Fig. 973: Locating RH Coil-On-Plug Electrical Connectors
Courtesy of FORD MOTOR CO.

40. Connect the RH VCT solenoid electrical connector.

All vehicles

42. Connect the PSP switch electrical connector.

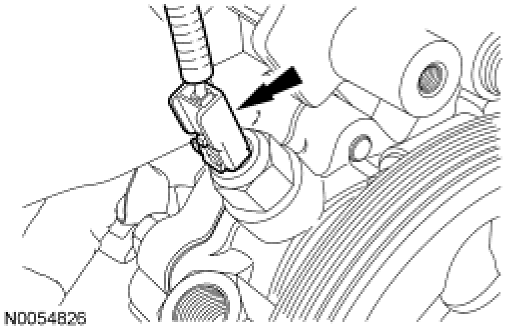

Fig. 976: Locating PSP Switch Electrical Connector
Courtesy of FORD MOTOR CO.

43. Using new gaskets, install the upper intake manifold and the 6 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

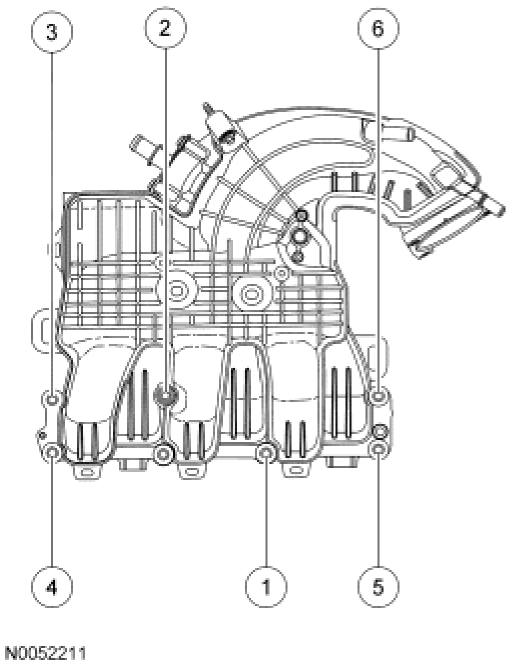

Fig. 977: Installing Upper Intake Manifold Bolts In Sequence
Courtesy of FORD MOTOR CO.

44. Install the upper intake manifold short support bracket bolt.
    - Tighten to 10 Nm (89 lb-in).

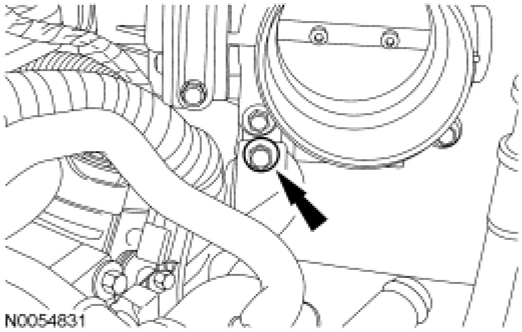

Fig. 978: Locating Upper Intake Manifold Support Bracket Bolt
Courtesy of FORD MOTOR CO.

45. If equipped, install the upper intake manifold long support bracket bolt.
    - Tighten to 10 Nm (89 lb-in).

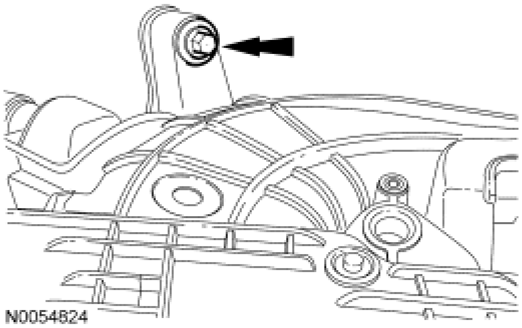

Fig. 979: Locating Upper Intake Manifold Support Bracket Bolt
Courtesy of FORD MOTOR CO.

46. Attach the wiring harness retainers to the upper intake manifold.

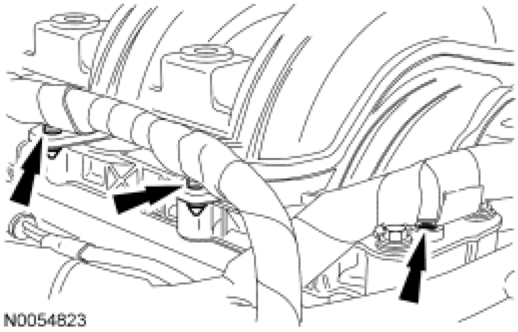

Fig. 980: Locating Wiring Harness Retainers From Upper Intake Manifold
Courtesy of FORD MOTOR CO.

47. Connect the throttle body (TB) electrical connector.

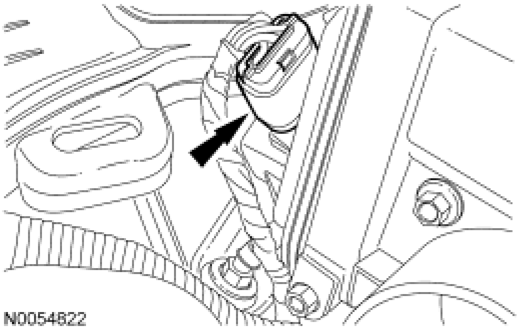

Fig. 981: Locating Throttle Body Electrical Connector
Courtesy of FORD MOTOR CO.

48. Connect the PCV hose to the PCV valve.

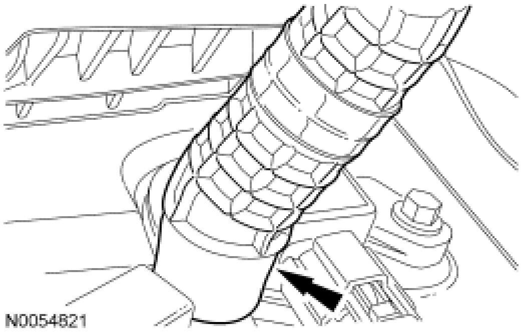

Fig. 982: Identifying PCV Hose From PCV Valve
Courtesy of FORD MOTOR CO.

49. If equipped, connect the heated PCV electrical connector.

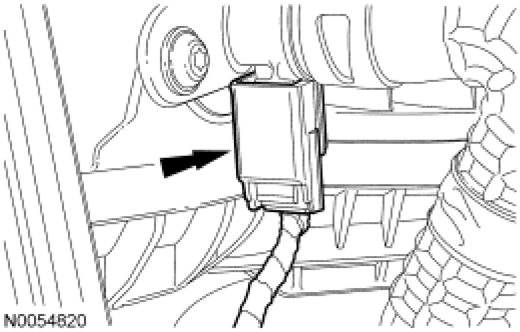

Fig. 983: Identifying Positive Crankcase Ventilation (PCV) Fitting Electrical Connector
Courtesy of FORD MOTOR CO.

50. If equipped, position the block heater wiring harness onto the engine.
    - Attach the block heater wiring harness retainer to the power steering reservoir hose and the PSP hose.

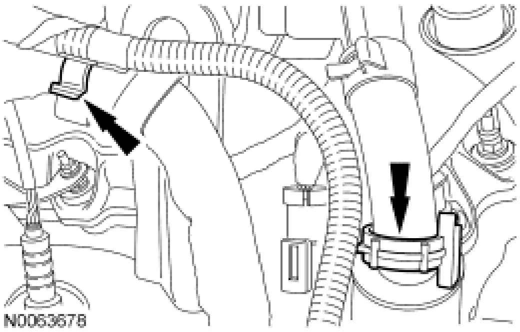

Fig. 984: Identifying Block Heater Wiring Harness From Engine
Courtesy of FORD MOTOR CO.

51. If equipped, connect the block heater electrical connector and install the heat shield.

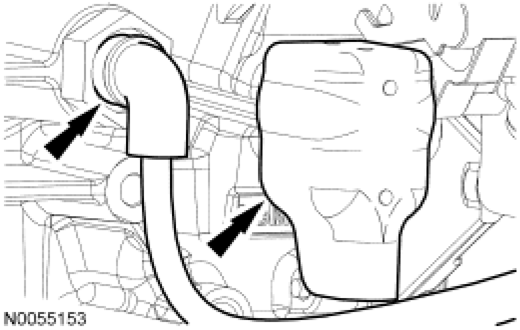

Fig. 985: Identifying Block Heater Wiring Harness
Courtesy of FORD MOTOR CO.

52. If equipped, attach the block heater wiring harness retainer to the upper intake manifold.

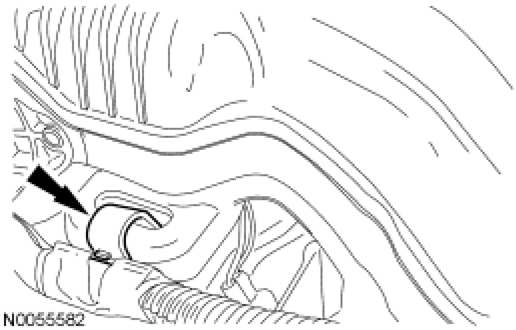

Fig. 986: Identifying Block Heater Wiring Harness Retainer From Upper Intake Manifold
Courtesy of FORD MOTOR CO.

53. Using the special tools, remove the engine from the stand.

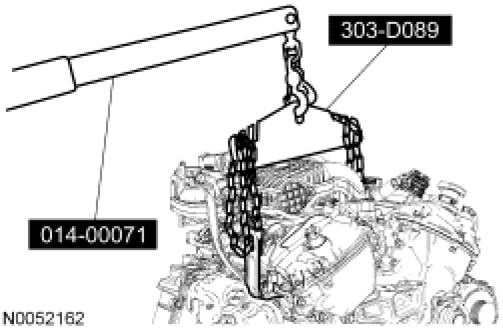

Fig. 987: Removing Engine & Transaxle From Lift Table Using Special Tools (303-D089, 014-00071) & Suitable Engine Crane
Courtesy of FORD MOTOR CO.

54. Install the crankshaft sensor ring.

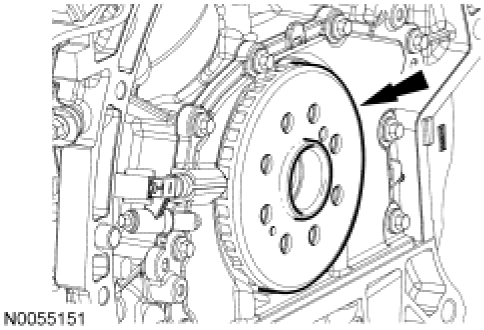

Fig. 988: Identifying Crankshaft Sensor Ring
Courtesy of FORD MOTOR CO.

55. Install the flexplate and the 8 bolts.
    - Tighten to 80 Nm (59 lb-ft).

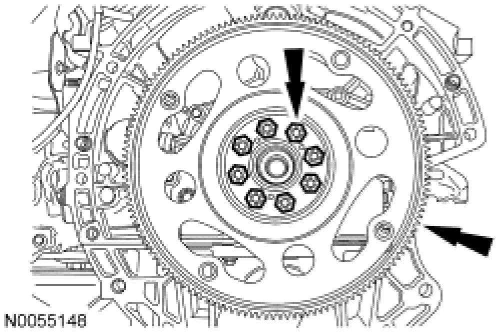

Fig. 989: Identifying Flexplate & Bolts
Courtesy of FORD MOTOR CO.

56. Install the engine in the vehicle. For additional information, refer to **Engine**.

OIL PUMP SCREEN AND PICKUP TUBE

NOTE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

1. Using a new O-ring seal, install the oil pump screen and pickup tube and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

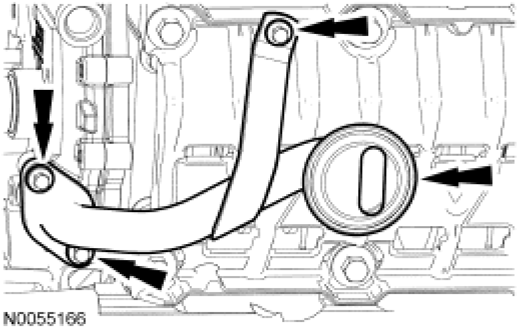

Fig. 990: Identifying Oil Pump Screen, Pickup Tube & Bolts
Courtesy of FORD MOTOR CO.

2. Install the oil pan. For additional information, refer to **Oil Pan**.

OIL PUMP

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

NOTE: Install a new oil pump screen and pickup tube O-ring seal prior to installing the oil pump.

1. Position the oil pump onto the crankshaft and rotate counterclockwise to position the pump onto the oil pump screen and pickup tube.
   - Install the 3 bolts and tighten to 10 Nm (89 lb-in).

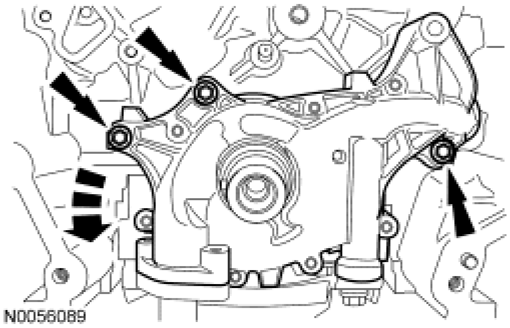

Fig. 991: Locating Oil Pump Screen & Pickup Tube Bolts & Rotating Oil Pump Counterclockwise
Courtesy of FORD MOTOR CO.

2. Install the 2 oil pump screen and pickup tube bolts.
   - Tighten to 10 Nm (89 lb-in).

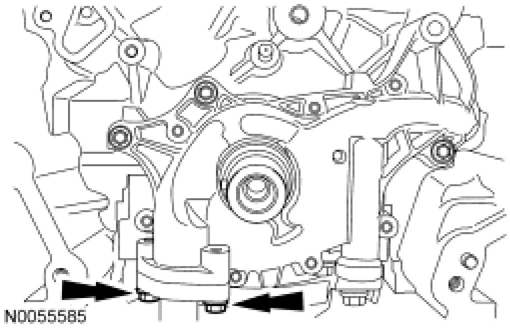

Fig. 992: Locating Oil Pump Bolts
Courtesy of FORD MOTOR CO.

3. Install the crankshaft timing chain sprocket.

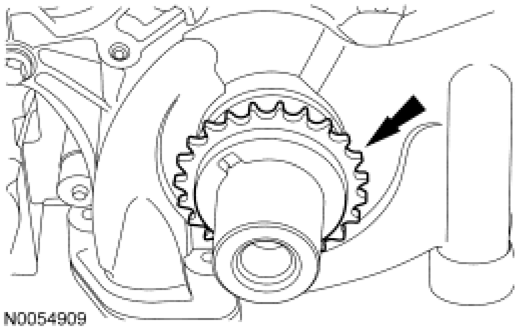

Fig. 993: Locating Crankshaft Timing Chain Sprocket
Courtesy of FORD MOTOR CO.

4. Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.

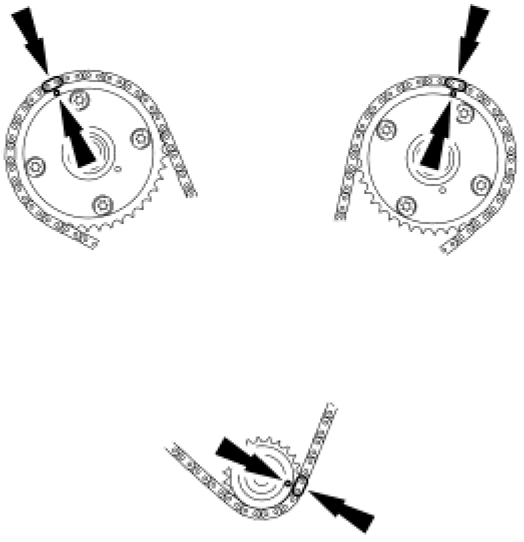

Fig. 994: Aligning Timing Marks On VCT Assemblies & Crankshaft Sprocket
Courtesy of FORD MOTOR CO.

5. Install the LH primary timing chain guide and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

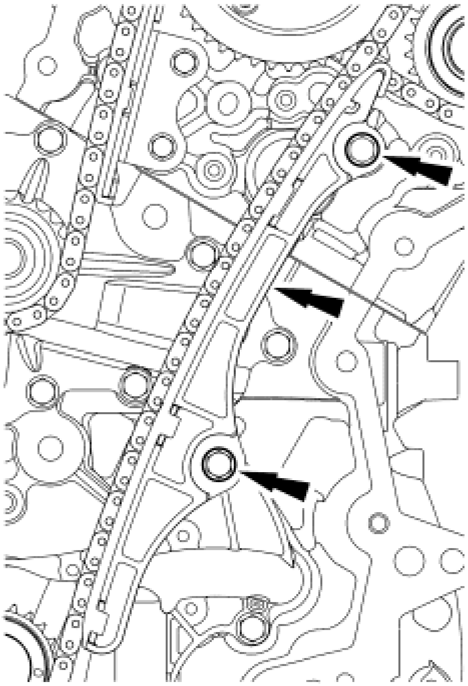

Fig. 995: Locating Lower LH Primary Timing Chain Guide & Bolts
Courtesy of FORD MOTOR CO.

6. Install the primary timing chain tensioner arm.

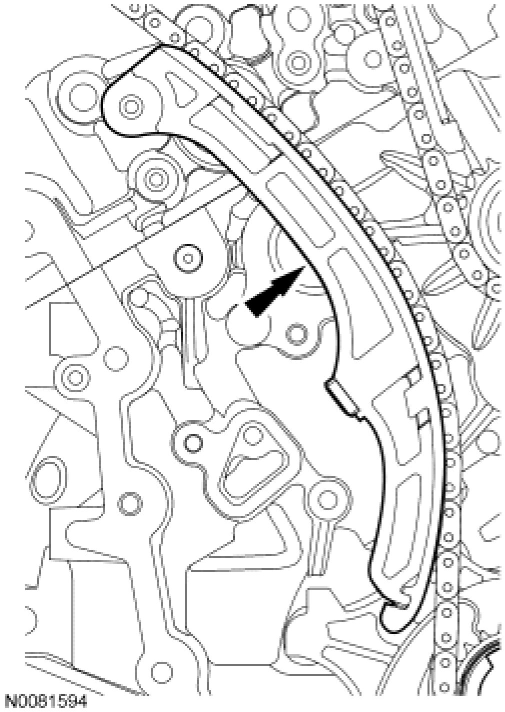

Fig. 996: Locating Primary Timing Chain Tensioner Arm
Courtesy of FORD MOTOR CO.

7. Reset the primary timing chain tensioner.
   - Rotate the lever counterclockwise.
   - Using a soft-jawed vise, compress the plunger.
   - Align the hole in the lever with the hole in the tensioner housing.
   - Install a suitable lock pin.

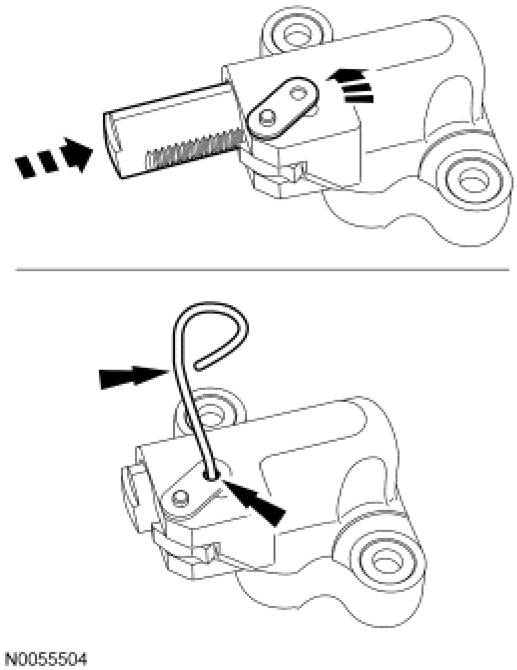

Fig. 997: Compressing Plunger Using A Soft-Jawed Vise
Courtesy of FORD MOTOR CO.

NOTE:	**It may be necessary to rotate the crankshaft slightly to remove slack from the timing chain and install the tensioner.**

8. Install the primary tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the lock pin.

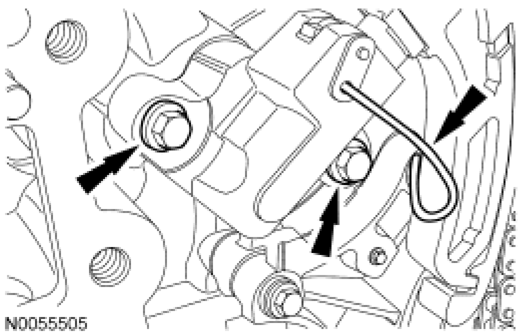

Fig. 998: Locating Primary Tensioner Bolts
Courtesy of FORD MOTOR CO.

9. As a post-check, verify correct alignment of all timing marks.

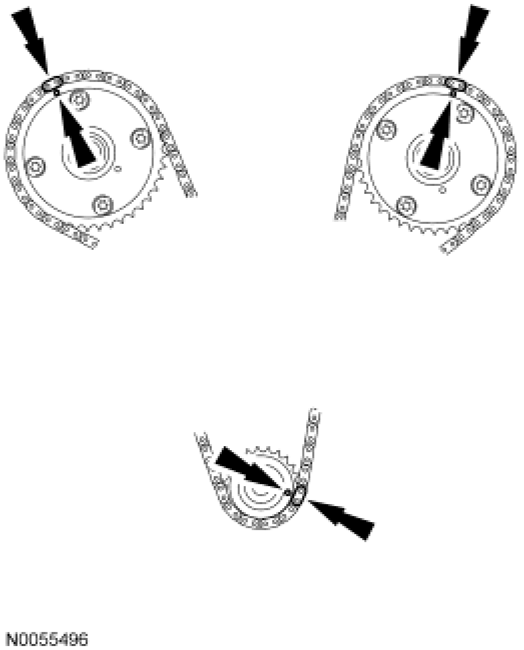

Fig. 999: Verifying Correct Alignment Of All Timing Marks
Courtesy of FORD MOTOR CO.

10. Install new VCT housing seals.

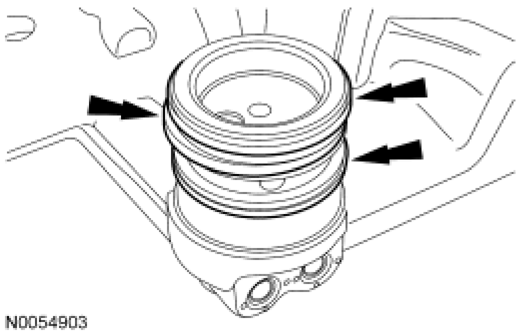

Fig. 1000: Locating VCT Housing Seals
Courtesy of FORD MOTOR CO.

NOTE: Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.

11. Install the LH VCT housing and the 3 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

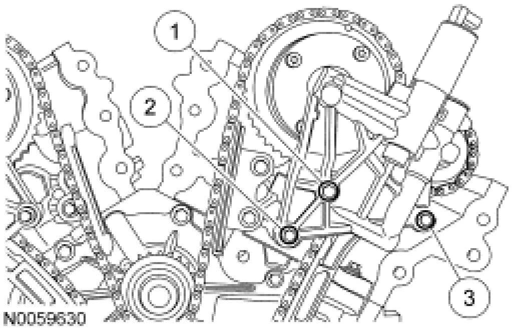

Fig. 1001: Identifying LH VCT Housing Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

NOTE: **Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

12. Install the RH VCT housing and the 3 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

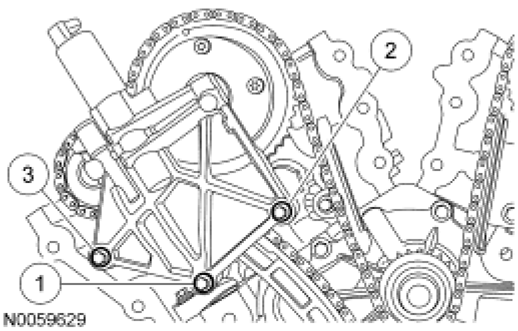

Fig. 1002: Identifying RH VCT Housing Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

13. Install the engine front cover. For additional information, refer to **Engine Front Cover**.

CRANKSHAFT REAR SEAL WITH RETAINER PLATE

Special Tools

Illustration	Tool Name	Tool Number

Material

Item	Specification
Motorcraft High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

NOTE: Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: The crankshaft rear seal retainer must be installed and the bolts tightened within 4 minutes of sealant application.

1. Apply a 3 mm (0.11 in) bead of Motorcraft High Performance Engine RTV Silicone to the sealing surface of the crankshaft rear seal retainer.

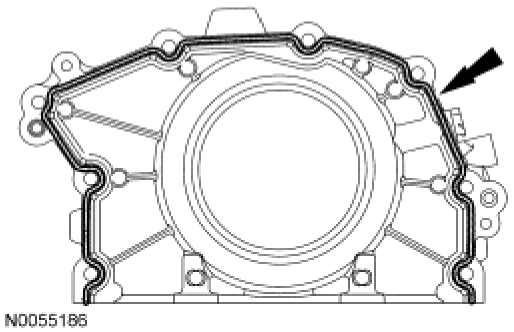

Fig. 1003: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Sealing Surface Of Crankshaft Rear Seal Retainer
Courtesy of FORD MOTOR CO.

2. Install the rear seal retainer and the 8 bolts in the sequence shown.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

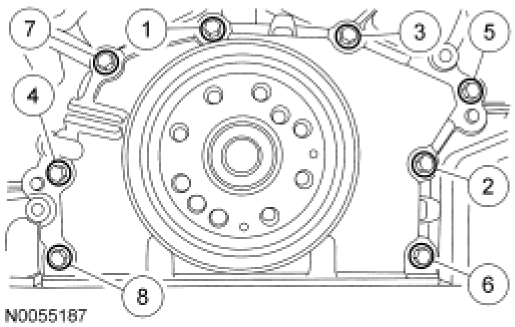

Fig. 1004: Installing Crankshaft Rear Seal Retainer Bolts In Sequence
Courtesy of FORD MOTOR CO.

NOTE: Lubricate the seal lips and bore with clean engine oil prior to installation.

3. Position the Rear Main Seal Installer onto the end of the crankshaft and slide a new crankshaft rear seal onto the tool.

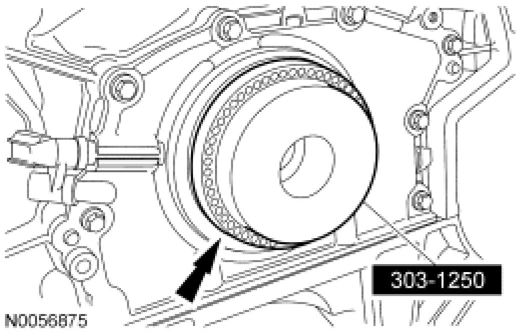

Fig. 1005: Positioning Special Tool (303-1250) Onto End Of Crankshaft
Courtesy of FORD MOTOR CO.

4. Using the Rear Main Seal Installer and Handle, install the new crankshaft rear seal.

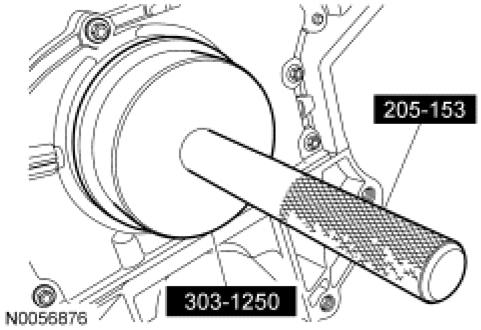

Fig. 1006: Installing New Crankshaft Rear Seal Using Special Tools (303-1250) & (205-153)
Courtesy of FORD MOTOR CO.

5. Install the Crankshaft Position (CKP) sensor and install the bolt.
   - Tighten to 10 Nm (89 lb-in).

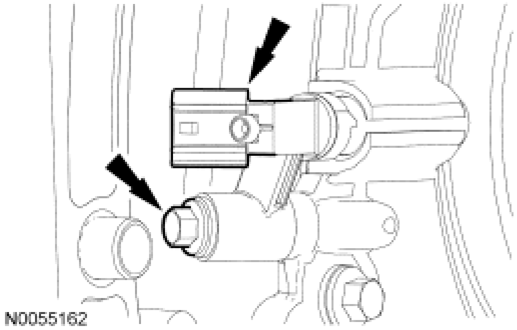

Fig. 1007: Identifying CKP Sensor & Bolt
Courtesy of FORD MOTOR CO.

6. Connect the CKP sensor electrical connector.

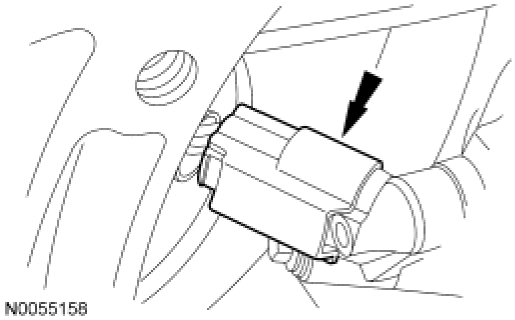

Fig. 1008: Identifying Crankshaft Position (CKP) Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

7. Using the Heavy Duty Floor Crane and Spreader Bar, install the engine onto the stand.

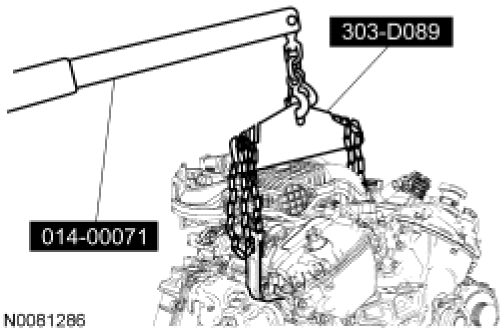

Fig. 1009: Identifying Heavy Duty Floor Crane and Spreader Bar

8. Install the oil pan. For additional information, refer to **Oil Pan**.

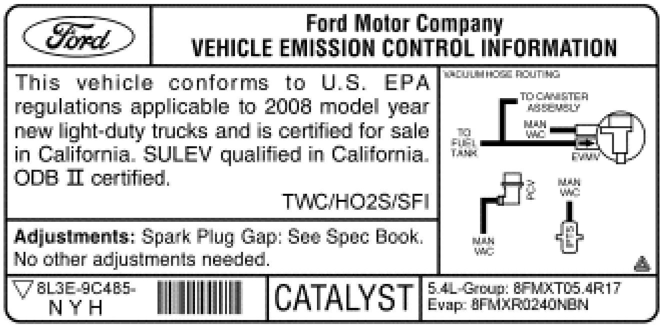
2008 ENGINE PERFORMANCE

Description & Operation - Gasoline Engines

VEHICLE EMISSION CONTROL INFORMATION (VECI)

VECI DECAL

Each vehicle has a VECI decal containing emission control information that applies specifically to the vehicle and engine. The specifications on the decal are critical to repairing the emissions systems.



N0048505

Fig. 1: Typical VECI Decal
Courtesy of FORD MOTOR CO.

VECI DECAL LOCATION

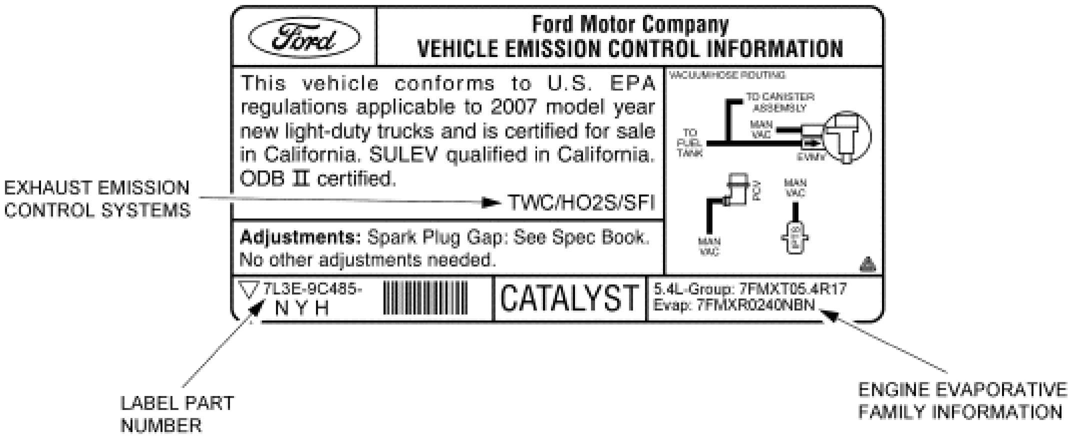
Typical location of the decal is on the underside of the hood or on the radiator support sight shield.

ENGINE/EVAPORATIVE EMISSION (EVAP) SYSTEM INFORMATION

Manufacturers must use a standardized system for identifying their individual engine families. The system described below was developed by the Environmental Protection Agency (EPA) in 1991 to meet new regulatory requirements for 1994 and later model years.

The engine family group and evaporative family name consists of 12 characters each.

Both the engine family group and the evaporative family name are listed in the box on the emission decal as indicated in the area marked as engine evaporative family information. The first line contains engine size and the 12-character engine family group. The second line contains the 12-character evaporative family name information. Both the engine family group and the evaporative family name are specific to the vehicle. Please refer to the Engine Family Group and the Evaporative Family Name worksheet for decoding information.



N0048171

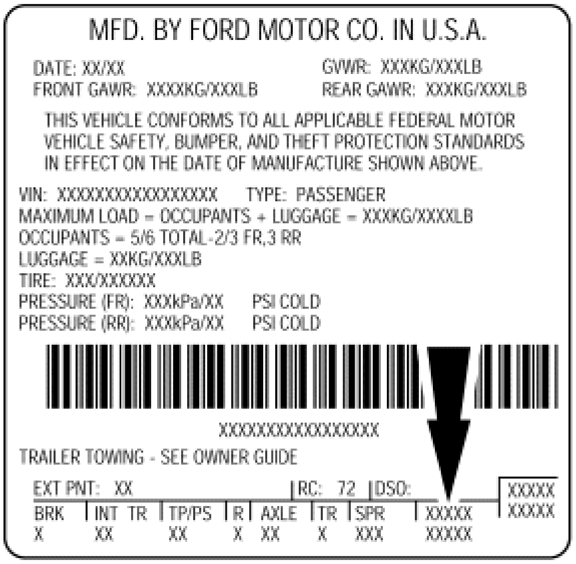
VEHICLE CERTIFICATION LABEL

BASE ENGINE CALIBRATION INFORMATION

Base engine calibration information, also sometimes referred to as the powertrain calibration, is located in the lower right corner of the vehicle certification label. Engine calibration information is limited to a maximum of 5 characters per line (2 lines maximum). Calibration information more than 5 characters long wrap to the second line of this field. Only the base calibration appears on this label. The revision level is no longer printed on the label, however, it can be found in the On-Line Automotive Service Information System (OASIS). For additional information on the vehicle certification label or engine calibration, refer to the **IDENTIFICATION CODES -- E-SERIES** .



N0009583

Fig. 5: Typical Car Vehicle Certification Label
Courtesy of FORD MOTOR CO.

N0012324

Fig. 6: Identifying Calibration Location On VC Label
Courtesy of FORD MOTOR CO.

VEHICLE CERTIFICATION LABEL LOCATION

Typical location of the vehicle certification label is on the LH door or door post pillar.

ENGINE CALIBRATION CODE

2008 MODEL YEAR EXAMPLE

Engine Calibration Code: 8B7 1 4D 0 A 00	
8	MODEL YEAR - Model year in which the calibration was first introduced. 8 equals 2008
B7	VEHICLE CODE - Vehicle line description. B7 equals Expedition
1	TRANSMISSION CODE - Transmission description. 1 equals automatic, 2 equals manual
4D	UNIQUE CALIBRATION - Identifications are assigned to cover similar vehicles to differentiate between tires, drive configurations, final drive ratios and other calibration-significant factors.
0	FLEET CODE - Describes which fleet the vehicle belongs to. 0 equals Certification (U.S. 4K)
A	CERTIFICATION REGION - Lead region code where multiple regions are included in one calibration. A equals U.S. Federal
00	REVISION LEVEL - Revision level of the calibration. 00 equals Job 1 production or initial calibration. (Not printed on vehicle certification label)

VEHICLE EMISSION CONTROL INFORMATION (VECI) ACRONYM DEFINITIONS

CARB: California Air Resource Board

CARB LEV: Low Emission Vehicle

CARB SULEV: Super Ultra Low Emission Vehicle

CARB TLEV: Transitional Low Emission Vehicle

CARB ULEV: Ultra Low Emission Vehicle

CARB ZEV: Zero Emission Vehicle

CI: Cylinder Injection

EPA: Environmental Protection Agency

EVAP: Evaporative Emissions

GVW: Gross Vehicle Weight

GVWR: Gross Vehicle Weight Rating, curb weight plus payload.

HHDDE: Heavy Heavy Duty Diesel Engine

HHDE: Heavy Heavy Duty Engine

ILEV: Inherently Low Emission Vehicle

LDDT: Light Duty Diesel Truck categories

LDT: Light Duty Truck (gasoline) categories based on weight as defined in the table.

LDV: Light Duty Vehicle, generally passenger cars and light trucks under 2,721.55 Kg (6,000 lb) GVWR.

LEV: Low Emission Vehicle

LEV-II: California regulations beginning in the 2004 model year.

LHDE: Light Heavy Duty Engine (several weight categories).

LVW: Loaded Vehicle Weight, curb weight plus 136.08 Kg (300 lb).

MDPV: Medium Duty Passenger Vehicle

MDT: Medium Duty Truck categories based on weight as defined in the table.

MDV: Medium Duty Vehicle

MHDDE: Medium Heavy Duty Diesel Engine

MHDE: Medium Heavy Duty Engine

MPI: Multi-Port Injection

MY: Model Year

NCP: Non-Compliance Penalty

OBD: On Board Diagnostic

ORVR: On-Board Refueling Vapor Recovery

PC: Passenger Car

PZEV: Partially Zero Emission Vehicle

SI: Sequential Injection

SULEV: Super Ultra Low Emission Vehicle

Tier 0: California and Federal regulations effective prior to Tier 1 phase in dates.

Tier 1: California regulations beginning in 1993 model year and Federal regulations beginning in 1994 model year.

Tier 2: Federal regulations beginning in the 2004 model year.

ULEV: Ultra Low Emission Vehicle

ZEV: Zero Emission Vehicle

ENGINE CONTROL COMPONENTS

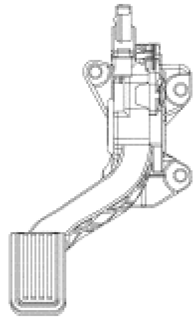
NOTE:	**Transmission inputs, which are not described are discussed in the applicable Workshop article transmission part.**

ACCELERATOR PEDAL POSITION (APP) SENSOR

The APP sensor is an input to the powertrain control module (PCM) and is used to determine the amount of torque requested by the operator. Depending on the application either a 2-track or 3-track APP sensor is used.

2-Track APP Sensor - There are 2 pedal position signals in the sensor. Both signals, APP1 and APP2, have a positive slope (increasing angle, increasing voltage), but are offset and increase at different rates. The 2 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other input is used. There are 2 reference voltage circuits, 2 signal return circuits, and 2 signal circuits (a total of 6 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor. The pedal position signal is

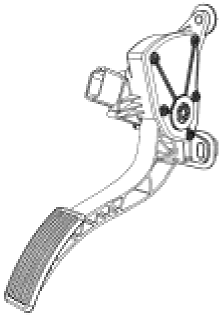
converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy. For additional information, refer to **TORQUE BASED ELECTRONIC THROTTLE CONTROL (ETC)**.



N0072972

Fig. 7: Identifying Accelerator Pedal Position (APP) 2-Track APP Sensor
Courtesy of FORD MOTOR CO.

3-Track APP Sensor - There are 3 pedal position signals in the sensor. Signal 1, APP1, has a negative slope (increasing angle, decreasing voltage) and signals 2 and 3, APP2 and APP3, both have a positive slope (increasing angle, increasing voltage). During normal operation APP1 is used as the indication of pedal position by the strategy. The 3 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other inputs are used. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy. There are 2 reference voltage circuits, 2 signal return circuits, and 3 signal circuits (a total of 7 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor. For additional information, refer to **TORQUE BASED ELECTRONIC THROTTLE CONTROL (ETC)**.



N0072973

Fig. 8: Identifying Accelerator Pedal Position (APP) Typical 3-Track APP Sensor
Courtesy of FORD MOTOR CO.

AIR CONDITIONING (A/C) CLUTCH RELAY (A/CCR)

NOTE:	**The PCM PIDs WAC and wide open throttle air conditioning cutoff fault (WACF) are used to monitor the A/CCR output.**

The A/CCR is wired normally open. There is no direct electrical connection between the A/C switch or

electronic automatic temperature control (EATC) module and the A/C clutch. The PCM receives a signal indicating that A/C is requested. For some applications, this message is sent through the communications network. When A/C is requested, the PCM checks other A/C related inputs that are available, such as A/C pressure switch and A/C cycling switch. If these inputs indicate A/C operation is OK, and the engine conditions are OK (coolant temperature, engine RPM, throttle position), the PCM grounds the A/CCR output, closing the relay contacts and sending voltage to the A/CCR.

AIR CONDITIONING (A/C) CYCLING SWITCH

The A/C cycling switch may be wired to either the ACCS or ACPSW PCM input. When the A/C cycling switch opens, the PCM turns off the A/C clutch. For information on the specific function of the A/C cycling switch, refer to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** . Also, refer to the applicable Wiring Diagrams article for vehicle specific wiring.

If the ACCS signal is not received by the PCM, the PCM circuit will not allow the A/C to operate. For additional information, refer to wide open throttle air conditioning cutoff (WAC).

Some applications do not have a dedicated (separate) input to the PCM indicating that A/C is requested. This information is received by the PCM through the communication link.

AIR CONDITIONING EVAPORATOR TEMPERATURE (ACET) SENSOR

The ACET sensor measures the evaporator air discharge temperature. The ACET sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The PCM sources a low current 5 volts on the ACET circuit. With SIG RTN also connected to the ACET sensor, the varying resistance changes the voltage drop across the sensor terminals. As A/C evaporator air temperature changes, the varying resistance of the ACET sensor changes the voltage the PCM detects.

The ACET sensor is used to more accurately control A/C clutch cycling, improve defrost/demist performance, and reduce A/C clutch cycling.

NOTE: **These values can vary 15% due to sensor and VREF variations. Voltage values were calculated for VREF equals 5.0 volts.**

A/C EVAPORATOR TEMPERATURE (ACET) SENSOR VOLTAGE AND RESISTANCE

°C	°F	Volts	Resistance (K ohms)
100	212	0.47	2.08
90	194	0.61	2.80
80	176	0.80	3.84
70	158	1.05	5.34
60	140	1.37	7.55
50	122	1.77	10.93
40	104	2.23	16.11
30	86	2.74	24.25
20	68	3.26	37.34

10	50	3.73	58.99
0	32	4.14	95.85
-10	14	4.45	160.31
-20	-4	4.66	276.96

AIR CONDITIONING (A/C) HIGH PRESSURE SWITCH

The A/C high pressure switch is used for additional A/C system pressure control. The A/C high pressure switch is either dual function for multiple speed, relay controlled electric fan applications, or single function for all others.

For refrigerant containment control, the normally closed high pressure contacts open at a predetermined A/C pressure. This results in the A/C turning off, preventing the A/C pressure from rising to a level that would open the A/C high pressure relief valve.

For fan control, the normally open medium pressure contacts close at a predetermined A/C pressure. This grounds the ACPSW circuit input to the PCM. The PCM then turns on the high speed fan to help reduce the pressure.

For additional information, refer to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** or the Wiring Diagrams article.

AIR CONDITIONING PRESSURE (ACP) TRANSDUCER SENSOR

The ACP transducer sensor is located in the high pressure (discharge) side of the A/C system. The ACP transducer sensor provides a voltage signal to the PCM that is proportional to the A/C pressure. The PCM uses this information for A/C clutch control, fan control and idle speed control.

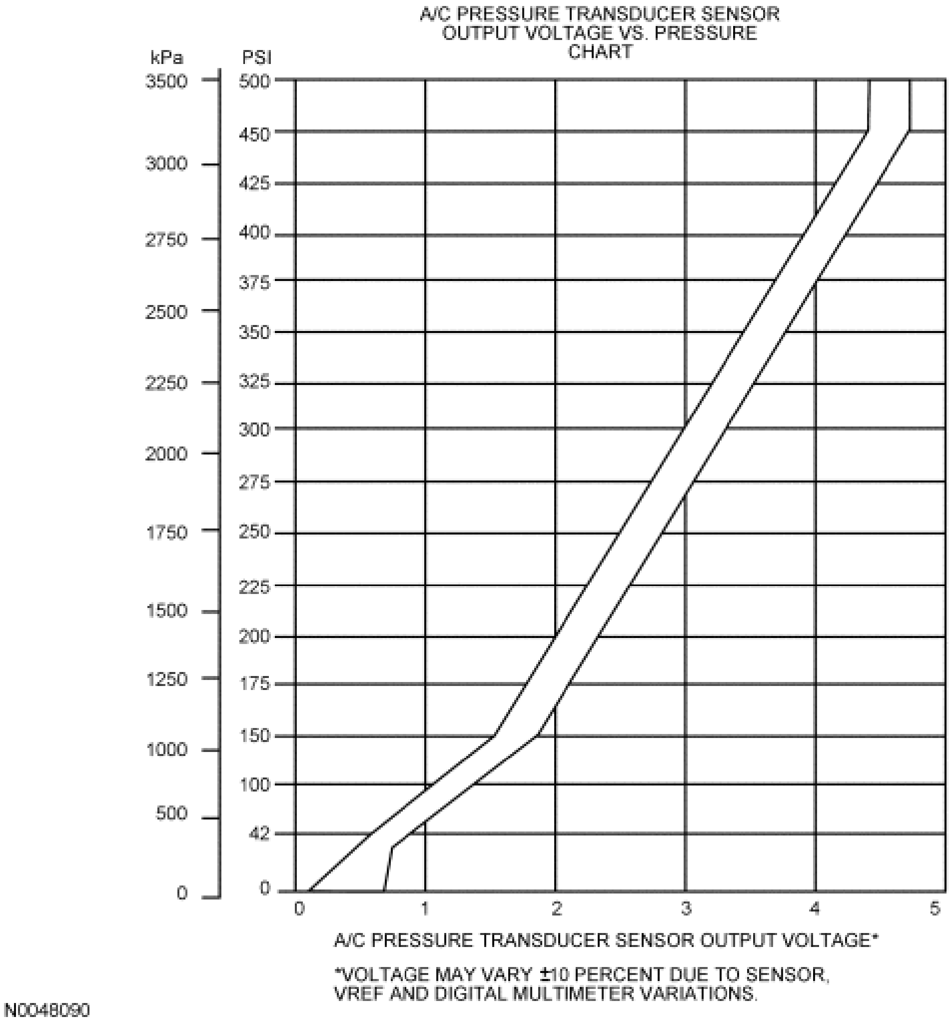


Fig. 9: A/C Pressure Transducer Sensor Output Voltage Vs. Pressure Chart
Courtesy of FORD MOTOR CO.

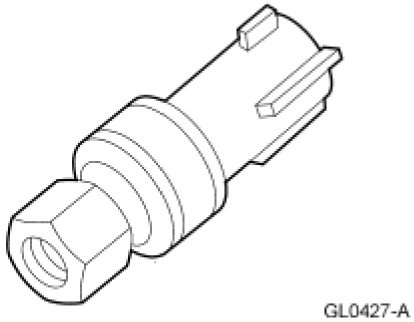

Fig. 10: Typical ACP Transducer Sensor
Courtesy of FORD MOTOR CO.

BRAKE PEDAL POSITION (BPP) SWITCH

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM

indicating that the brakes are applied. The BPP switch is normally open and is mounted on the brake pedal support. Depending on the vehicle application the BPP switch can be hardwired as follows:

- to the PCM supplying battery positive voltage (B+) when the vehicle brake pedal is applied.
- to the antilock brake system (ABS) module, or lighting control module (LCM), the BPP signal is then broadcast over the network to be received by the PCM.
- to the ABS traction control/stability assist module. The ABS module interprets the BPP switch input along with other ABS inputs and generates an output called the driver brake application (DBA) signal. The DBA signal is then sent to the PCM and to other BPP signal users.

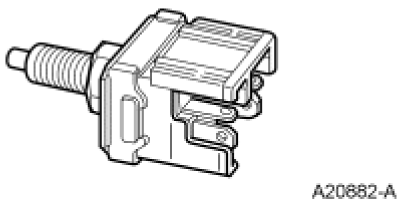

Fig. 11: Typical Brake Pedal Position Switch
Courtesy of FORD MOTOR CO.

BRAKE PEDAL SWITCH (BPS)/BRAKE DEACTIVATOR SWITCH

The BPS, also called the brake deactivator switch, is for vehicle speed control deactivation. A normally closed switch supplies battery positive voltage (B+) to the PCM when the brake pedal is not applied. When the brake pedal is applied, the normally closed switch opens and power is removed from the PCM.

On some applications the normally closed BPS, along with the normally open BPP switch, are used for a brake rationality test within the PCM. The PCM misfire monitor profile learn function may be disabled if a brake switch concern occurs. If one or both brake pedal inputs to the PCM is not changing states when they were expected to, a diagnostic trouble code (DTC) is set by the PCM strategy.

CAMSHAFT POSITION (CMP) SENSOR

The CMP sensor detects the position of the camshaft. The CMP sensor identifies when piston number 1 is on its compression stroke. A signal is then sent to the PCM and used for synchronizing the sequential firing of the fuel injectors. Coil on plug (COP) ignition applications use the CMP signal to select the correct ignition coil to fire.

Vehicles with 2 CMP sensors are equipped with variable camshaft timing (VCT). They use the second sensor to identify the position of the camshaft on bank 2 as an input to the PCM.

There are 2 types of CMP sensors: the 3-pin connector Hall-effect type sensor and the 2-pin connector variable reluctance type sensor.

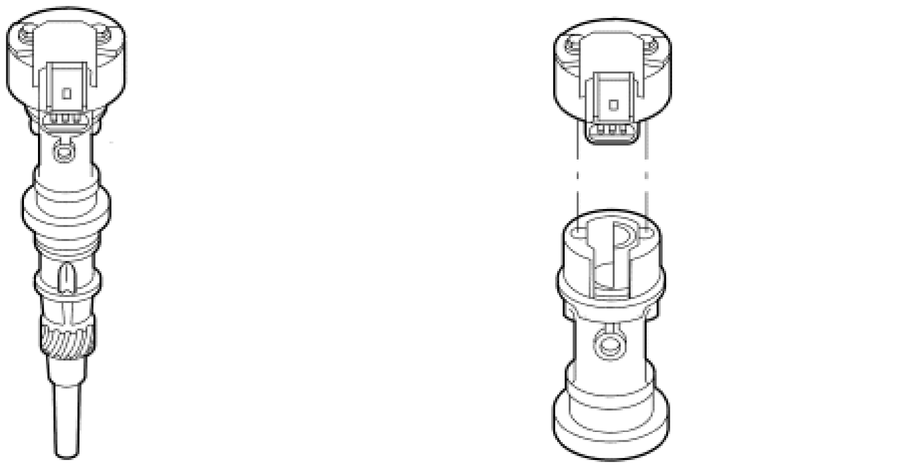

Fig. 12: Typical Synchronizer Hall-Effect CMP Sensor
Courtesy of FORD MOTOR CO.

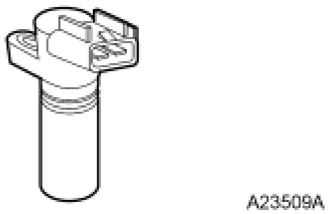

Fig. 13: Identifying Camshaft Position (CMP) Sensor
Courtesy of FORD MOTOR CO.

CANISTER VENT (CV) SOLENOID

During the evaporative emissions (EVAP) leak check monitor, the CV solenoid seals the EVAP canister from the atmospheric pressure. This allows the EVAP canister purge valve to obtain the target vacuum in the fuel tank during the EVAP leak check monitor.

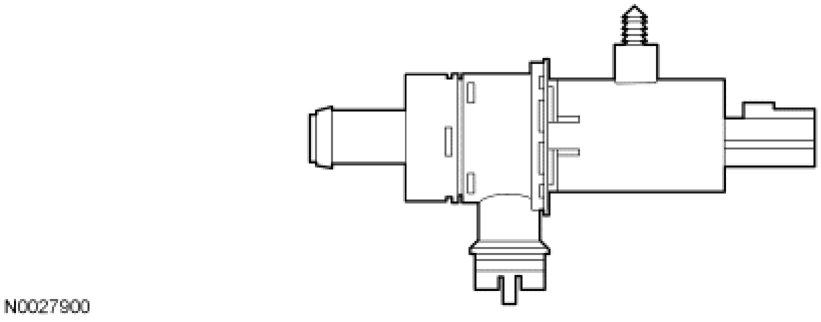

Fig. 14: Typical Canister Vent (CV) Solenoid
Courtesy of FORD MOTOR CO.

CHECK FUEL CAP INDICATOR

The check fuel cap indicator is a communications network message sent by the PCM. The PCM sends the

message to illuminate the lamp when the strategy determines there is a concern in the EVAP system due to the fuel filler cap or capless fuel tank filler pipe not being sealed correctly. This would be detected by the inability to pull vacuum in the fuel tank, after a fueling event.

CLUTCH PEDAL POSITION (CPP) SWITCH

The CPP switch is an input to the PCM indicating the clutch pedal position. The PCM provides a low current voltage on the CPP circuit. When the CPP switch is closed, this voltage is pulled low through the SIG RTN circuit. The CPP input to the PCM is used to detect a reduction in engine load. The PCM uses the load information for mass air flow and fuel calculations.

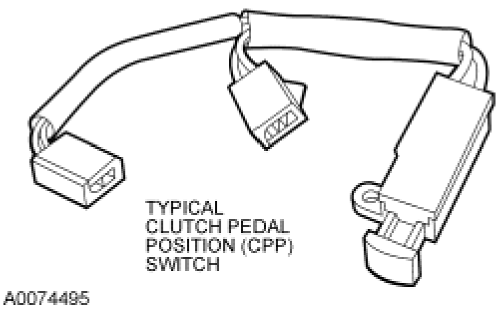

Fig. 15: Typical Clutch Pedal Position (CPP) Switch
Courtesy of FORD MOTOR CO.

COIL ON PLUG (COP)

The COP ignition operates similar to a standard coil pack ignition except each plug has one coil per plug. The COP has 3 different modes of operation: engine crank, engine running, and CMP failure mode effects management (FMEM). For additional information, refer to **IGNITION SYSTEMS**.

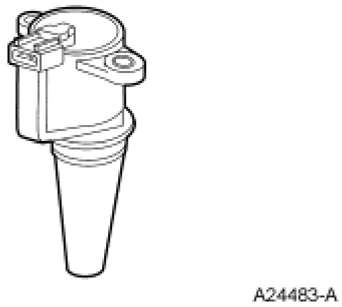

Fig. 16: Typical Coil On Plug (COP)
Courtesy of FORD MOTOR CO.

COIL PACK

The PCM provides a grounding switch for the coil primary circuit. When the switch is closed, voltage is applied to the coil primary circuit. This creates a magnetic field around the primary coil. The PCM opens the switch, causing the magnetic field to collapse, inducing the high voltage in the secondary coil windings and firing the spark plug. The spark plugs are paired so that as one spark plug fires on the compression stroke, the other spark

plug fires on the exhaust stroke. The next time the coil is fired the order is reversed. The next pair of spark plugs fire according to the engine firing order.

Coil packs come in 4-tower, 6-tower horizontal and series 5 6-tower models. Two adjacent coil towers share a common coil and are called a matched pair. For 6-tower coil pack (6 cylinder) applications, the matched pairs are 1 and 5, 2 and 6, and 3 and 4. For 4-tower coil pack (4 cylinder) applications, the matched pairs are 1 and 4, and 2 and 3.

When the coil is fired by the PCM, spark is delivered through the matched pair towers to their respective spark plugs. The spark plugs are fired simultaneously and are paired so that as one fires on the compression stroke, the other spark plug fires on the exhaust stroke. The next time the coil is fired, the situation is reversed. The next pair of spark plugs fire according to the engine firing order.

COOLING FAN CLUTCH

The cooling fan clutch is an electrically actuated viscous clutch that consists of 3 main elements:

- a working chamber
- a reservoir chamber
- a cooling fan clutch actuator valve and a fan speed sensor (FSS)

The cooling fan clutch actuator valve controls the fluid flow from the reservoir into the working chamber. Once viscous fluid is in the working chamber, shearing of the fluid results in fan rotation. The cooling fan clutch actuator valve is activated with a pulse width modulated (PWM) output signal from the PCM. By opening and closing the fluid port valve, the PCM can control the cooling fan clutch speed. The cooling fan clutch speed is measured by a Hall-effect sensor and is monitored by the PCM during closed loop operation.

The PCM optimizes fan speed based on engine coolant temperature (ECT), engine oil temperature (EOT), transmission fluid temperature (TFT), intake air temperature (IAT), or air conditioning requirements. When an increased demand for fan speed is requested for vehicle cooling, the PCM monitors the fan speed through the Hall-effect sensor. If a fan speed increase is required, the PCM outputs the PWM signal to the fluid port,

providing the required fan speed increase.

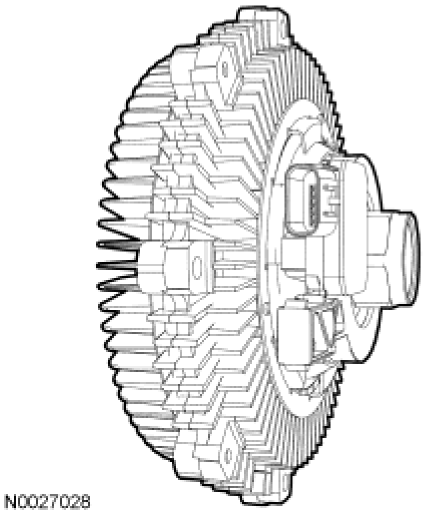

Fig. 19: Identifying Cooling Fan Clutch With Fan Speed Sensor (FSS)
Courtesy of FORD MOTOR CO.

CRANKSHAFT POSITION (CKP) SENSOR

The CKP sensor is a magnetic transducer mounted on the engine block adjacent to a pulse wheel located on the crankshaft. By monitoring the crankshaft mounted pulse wheel, the CKP is the primary sensor for ignition information to the PCM. The pulse wheel has a total of 35 teeth spaced 10 degrees apart with one empty space for a missing tooth. The 6.8L 10-cylinder pulse wheel has 39 teeth spaced 9 degrees apart and one 9 degree empty space for a missing tooth. By monitoring the pulse wheel, the CKP sensor signal indicates crankshaft position and speed information to the PCM. By monitoring the missing tooth, the CKP sensor is also able to identify piston travel in order to synchronize the ignition system and provide a way of tracking the angular position of the crankshaft relative to a fixed reference for the CKP sensor configuration. The PCM also uses the CKP signal to determine if a misfire has occurred by measuring rapid decelerations between teeth.

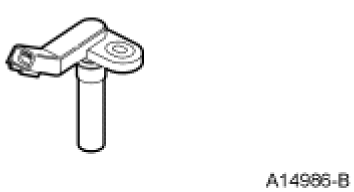

Fig. 20: Typical Crankshaft Position (CKP) Sensor
Courtesy of FORD MOTOR CO.

CYLINDER HEAD TEMPERATURE (CHT) SENSOR

The CHT sensor is a thermistor device in which resistance changes with the temperature. The electrical resistance of a thermistor decreases as temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

The CHT sensor is installed in the cylinder head and measures the metal temperature. The CHT sensor can provide complete engine temperature information and can be used to infer coolant temperature. If the CHT sensor conveys an overheating condition to the PCM, the PCM initiates a fail-safe cooling strategy based on information from the CHT sensor. A cooling system concern such as low coolant or coolant loss could cause an overheating condition. As a result, damage to major engine components could occur. Using both the CHT sensor and fail-safe cooling strategy, the PCM prevents damage by allowing air cooling of the engine and limp home capability. For additional information, refer to **POWERTRAIN CONTROL SOFTWARE** for Fail-Safe Cooling Strategy.

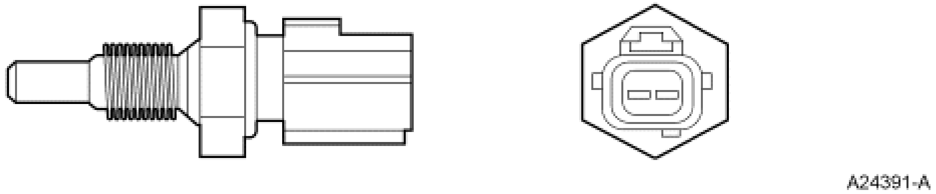

Fig. 21: Typical Cylinder Head Temperature Sensor
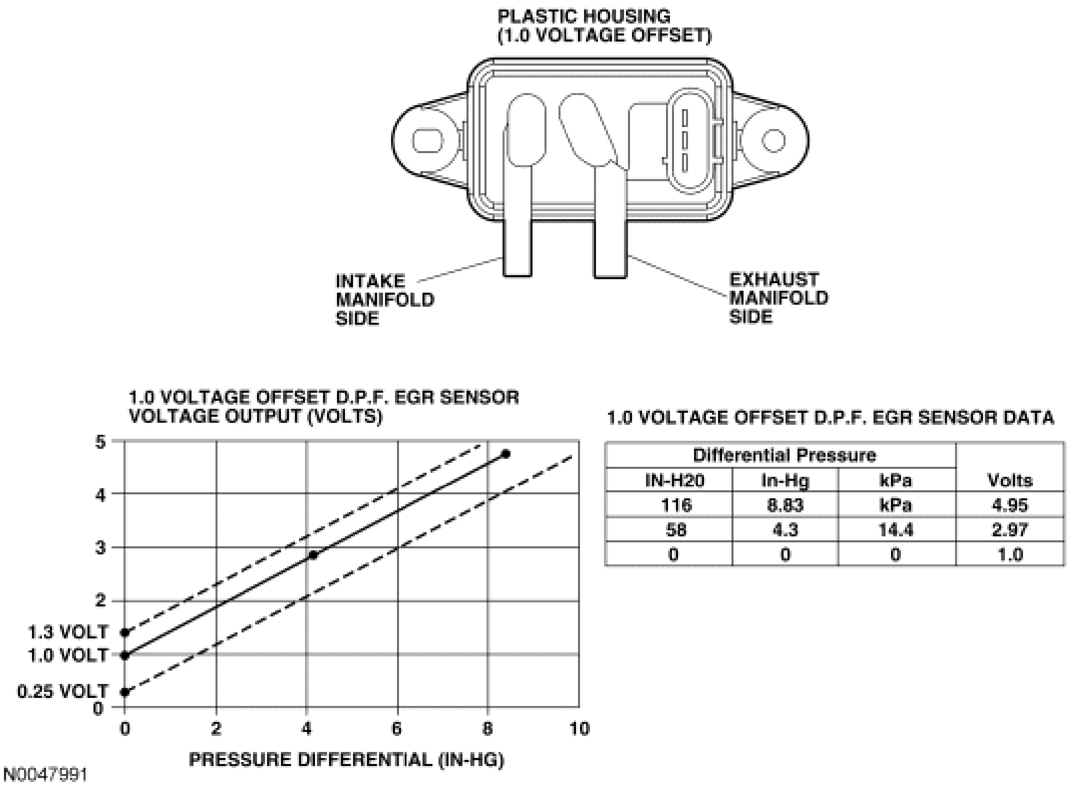
Courtesy of FORD MOTOR CO.

DIFFERENTIAL PRESSURE FEEDBACK EXHAUST GAS RECIRCULATION (EGR) SENSOR

The differential pressure feedback EGR sensor is a ceramic, capacitive-type pressure transducer that monitors the differential pressure across a metering orifice located in the orifice tube assembly. The differential pressure feedback EGR sensor receives this signal through 2 hoses referred to as the downstream pressure hose (REF SIGNAL) and upstream pressure hose (HI SIGNAL). The HI and REF hose connections are marked on the differential pressure feedback EGR sensor housing for identification (note that the HI signal uses a larger diameter hose). The differential pressure feedback EGR sensor outputs a voltage proportional to the pressure drop across the metering orifice and supplies it to the PCM as EGR flow rate feedback.



Differential Pressure			Volts
IN-H20	In-Hg	kPa	
116	8.83	kPa	4.95
58	4.3	14.4	2.97
0	0	0	1.0

Fig. 22: Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor
Courtesy of FORD MOTOR CO.

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

The tube mounted differential pressure feedback EGR sensor is identical in operation as the larger plastic differential pressure feedback EGR sensors and uses a 1.0 volt offset. The HI and REF hose connections are marked on the side of the sensor.

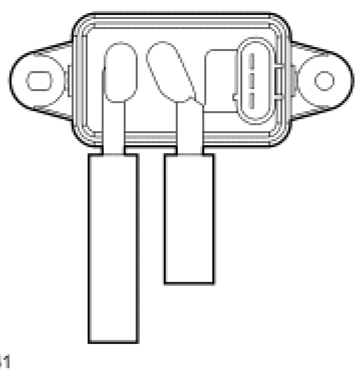


Fig. 23: Identifying DPFE Sensor - Tube Mounted
Courtesy of FORD MOTOR CO.

ELECTRIC EXHAUST GAS RECIRCULATION (EEGR) VALVE

Depending on the application, the EEGR valve is a water cooled or an air cooled motor/valve assembly. The motor is commanded to move in 52 discrete steps as it acts directly on the EEGR valve. The position of the valve determines the rate of EGR. The built-in spring works to close the valve (against the motor opening force).

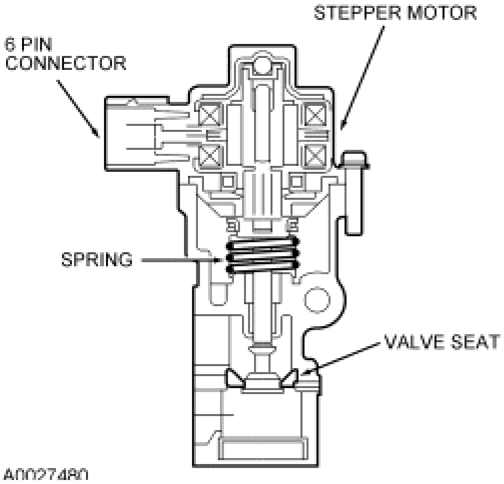

Fig. 24: Identifying EEGR Motor/Valve Assembly
Courtesy of FORD MOTOR CO.

ELECTRONIC THROTTLE ACTUATOR CONTROL (TAC)

The electronic TAC is a DC motor controlled by the PCM (requires 2 wires). There are 2 designs for the TAC, parallel and inline. The parallel design has the motor under the bore parallel to the plate shaft. The motor housing is integrated into the main housing. The inline design has a separate motor housing. An internal spring is used in both designs to return the throttle plate to a default position. The default position is typically a throttle angle of 7 to 8 degrees from the hard stop angle. The closed throttle plate hard stop is used to prevent the throttle from binding in the bore (approximately 0.75 degree). This hard stop setting is not adjustable and is set to result in less airflow than the minimum engine airflow required at idle. For additional information, refer to **TORQUE BASED ELECTRONIC THROTTLE CONTROL (ETC)**.

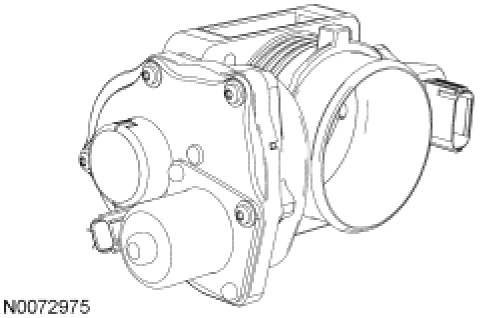

Fig. 25: Typical Inline TAC Design
Courtesy of FORD MOTOR CO.

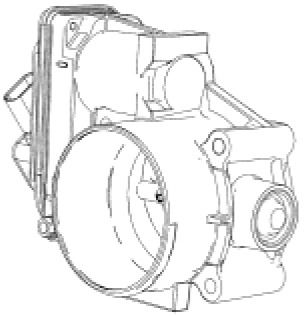

Fig. 26: Typical Parallel TAC Design
Courtesy of FORD MOTOR CO.

ELECTRONIC THROTTLE BODY (ETB) THROTTLE POSITION SENSOR

The ETB throttle position sensor has 2 signal circuits in the sensor for redundancy. The redundant ETB throttle position signals are required for increased monitoring. The first ETB throttle position sensor signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second signal (TP2) has a positive slope (increasing angle, increasing voltage). The 2 ETB throttle position sensor signals make sure the PCM receives a correct input even if 1 signal has a concern. There is 1 reference voltage circuit and 1 signal return circuit for the sensor. The reference voltage circuit and the signal return circuit is shared with the reference voltage circuits and signal return circuits used by the APP sensor. For additional information, refer to **TORQUE BASED ELECTRONIC THROTTLE CONTROL (ETC)**.

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

The ECT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The ECT measures the temperature of the engine coolant. The PCM uses the ECT input for fuel control and for cooling fan control. There are 3 types of ECT sensors, threaded, push-in, and twist-lock. The ECT sensor is located in an engine coolant passage.

Fig. 27: Typical Thread Type ECT Sensor
Courtesy of FORD MOTOR CO.

ENGINE OIL TEMPERATURE (EOT) SENSOR

The EOT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The EOT sensor measures the temperature of the engine oil. The sensor is typically threaded into the engine oil lubrication system. The PCM can use the EOT sensor input to determine the following:

- On variable camshaft timing (VCT) applications the EOT input is used to adjust the VCT control gains and logic for camshaft timing.
- The PCM can use EOT sensor input in conjunction with other PCM inputs to determine oil degradation.
- The PCM can use EOT sensor input to initiate a soft engine shutdown. To prevent engine damage from occurring as a result of high oil temperatures, the PCM has the ability to initiate a soft engine shutdown. Whenever engine RPM exceeds a calibrated level for a certain period of time, the PCM begins reducing power by disabling engine cylinders.

Fig. 28: Typical EOT Sensor
Courtesy of FORD MOTOR CO.

EVAPORATIVE EMISSION (EVAP) CANISTER PURGE VALVE

NOTE:	**The EVAP canister purge valve may also be referred to as a vapor management valve (VMV).**

The EVAP canister purge valve is part of the enhanced EVAP system that is controlled by the PCM. This valve controls the flow of vapors (purging) from the EVAP canister to the intake manifold during various engine operating modes. The EVAP canister purge valve is a normally closed valve. The EVAP canister purge valve controls the flow of vapors by way of a solenoid, eliminating the need for an electronic vacuum regulator and vacuum diaphragm. The PCM outputs a signal between 0 mA and 1,000 mA to control the EVAP canister purge valve.

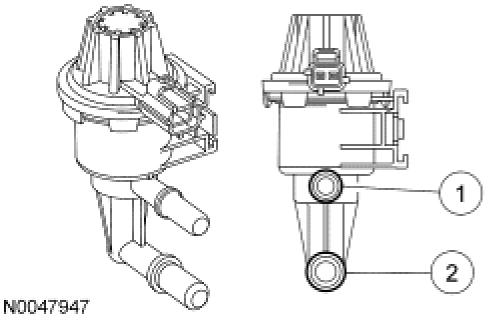

Fig. 29: Typical EVAP Canister Purge Valve

Item	Part Number	Description
1	-	Fuel Vapor to Intake Manifold
2	-	Fuel Vapor to EVAP Canister

EXHAUST GAS RECIRCULATION (EGR) ORIFICE TUBE ASSEMBLY

The orifice tube assembly is a section of tubing connecting the exhaust system to the intake manifold. The assembly provides the flow path for the EGR to the intake manifold and also contains the metering orifice and 2 pressure pick-up tubes. The internal metering orifice creates a measurable pressure drop across it as the EGR valve opens and closes. This pressure differential across the orifice is picked up by the differential pressure feedback EGR sensor which provides feedback to the PCM.

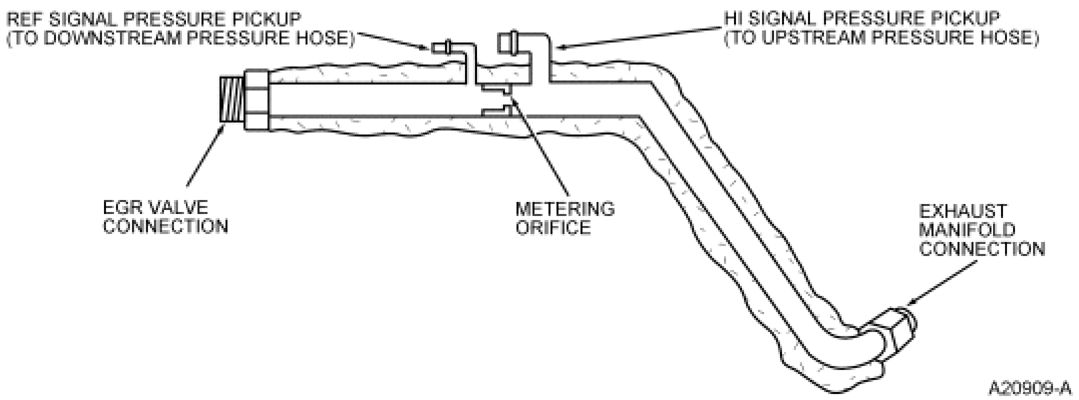

Fig. 30: EGR Orifice Tube Assembly
Courtesy of FORD MOTOR CO.

EXHAUST GAS RECIRCULATION (EGR) SYSTEM MODULE (ESM)

The ESM is an integrated differential pressure feedback EGR system that functions in the same manner as a conventional differential pressure feedback EGR system. The various system components have been integrated into a single component called the ESM. The flange of the valve portion of the ESM bolts directly to the intake manifold with a metal gasket that forms the metering orifice. This arrangement increases system reliability, response time, and system precision. By relocating the EGR orifice from the exhaust to the intake side of the EGR valve, the downstream pressure signal measures manifold absolute pressure (MAP). This MAP signal is used for EGR correction and inferred barometric pressure (BARO) at key on. The system provides the

powertrain control module (PCM) with a differential pressure feedback EGR signal, identical to a traditional differential pressure feedback EGR system.

EXHAUST GAS RECIRCULATION (EGR) VACUUM REGULATOR SOLENOID

The EGR vacuum regulator solenoid is an electromagnetic device used to regulate the vacuum supply to the EGR valve. The solenoid contains a coil which magnetically controls the position of a disc to regulate the vacuum. As the duty cycle to the coil increases, the vacuum signal passed through the solenoid to the EGR valve also increases. Vacuum not directed to the EGR valve is vented through the solenoid vent to atmosphere. Note that at 0% duty cycle (no electrical signal applied), the EGR vacuum regulator solenoid allows some vacuum to pass, but not enough to open the EGR valve.

33	0.55	1.86	1.3	4.39	2.05	6.9
90	5.69	19.2	6.32	21.3	6.95	23.47
EGR vacuum regulator resistance: 26-40 Ohms						

EXHAUST GAS RECIRCULATION (EGR) VALVE

The EGR valve in the differential pressure feedback EGR system is a conventional, vacuum-actuated. The valve increases or decreases the flow of EGR. As vacuum applied to the EGR valve diaphragm overcomes the spring force, the valve begins to open. As the vacuum signal weakens, at 5.4 kPa (1.6 in-Hg) or less, the spring force closes the valve. The EGR valve is fully open at about 15 kPa (4.5 in-Hg).

Since EGR flow requirement varies greatly, providing repair specifications on flow rate is impractical. The on board diagnostic (OBD) system monitors the EGR valve function and triggers a diagnostic trouble code (DTC) if the test criteria is not met. The EGR valve flow rate is not measured directly as part of the diagnostic procedures.

FAN CONTROL

The PCM monitors certain parameters (such as engine coolant temperature, vehicle speed, A/C on/off status, A/C pressure) to determine engine cooling fan needs.

For variable speed electric fan(s):

The PCM controls the fan speed and operation using a duty cycle output on the fan control variable (FCV) circuit. The fan controller (located at or integral to the engine cooling fan assembly) receives the FCV command and operates the cooling fan at the speed requested (by varying the power applied to the fan motor).

EDGE/MKX, TAURUS/TAURUS X/SABLE, FUSION/MILAN/MKZ, CROWN VICTORIA/GRAND

MARQUIS, TOWN CAR: FCV DUTY CYCLE OUTPUT FROM PCM (NEGATIVE DUTY CYCLE)

FCV Duty Cycle Command (NEGATIVE (-) duty cycle)	Cooling Fan Response/Speed
Greater than 0 but less than 5%	Fan off, controller inactive
Greater than 5% but less than 10%	Fan off, controller is in active/ready state
Edge/MKX, Crown Victoria/Grand Marquis, Town Car: 10% - 90%	Edge/MKX, Crown Victoria/Grand Marquis, Town Car: Linear speed increase from 30% to 100%
Taurus/Taurus X/Sable, Fusion/Milan/MKZ: 30% - 90%	Taurus/Taurus X/Sable, Fusion/Milan/MKZ: Linear speed increase from 50% to 100%
Greater than 90% but less than 95%	100%
Greater than 95% but less than 100%	Fan off

For relay controlled fans:

The PCM controls the fan operation through the fan control (FC) (single speed fan applications), low fan control (LFC), medium fan control (MFC), and high fan control (HFC) outputs. Some applications will have the xFC circuit wired to 2 separate relays.

For 3-speed fans, although the PCM output circuits are called low, medium, and high fan control (FC), cooling fan speed is controlled by a combination of these outputs. Refer to the following table.

2.0L FOCUS (WITH A/C): PCM FC OUTPUT STATE FOR COOLING FAN SPEEDS

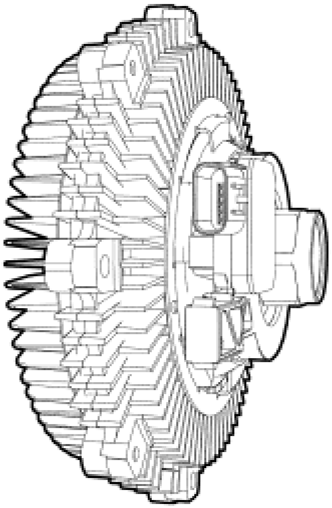
PCM OUTPUT	LOW SPEED	MEDIUM SPEED	HIGH SPEED	FAN OFF
LFC (FC1)	ON	ON	ON	OFF
MFC (FC2)	ON	OFF	ON	OFF
HFC (FC3)	ON	OFF	OFF	OFF

2.3L ESCAPE: PCM FC OUTPUT STATE FOR COOLING FAN SPEEDS

PCM OUTPUT	LOW SPEED	MEDIUM SPEED	HIGH SPEED	FAN OFF
LFC (FC1)	ON	ON	ON	OFF
MFC (FC2)	OFF	ON	OFF (or ON)	OFF
HFC (FC3)	OFF	OFF	ON	OFF

FAN SPEED SENSOR (FSS)

The FSS is a Hall-effect sensor that measures the cooling fan clutch speed by generating a waveform with a frequency proportional to the fan speed. If the cooling fan clutch is moving at a relatively low speed, the sensor produces a signal with a low frequency. As the cooling fan clutch speed increases, the sensor generates a signal with a higher frequency. The PCM uses the frequency signal generated by the FSS as a feedback for closed loop control of the cooling fan clutch. For additional information on the cooling fan clutch, refer to the Cooling Fan Clutch.



N0027028

Fig. 36: Identifying Cooling Fan Clutch With Fan Speed Sensor (FSS)
Courtesy of FORD MOTOR CO.

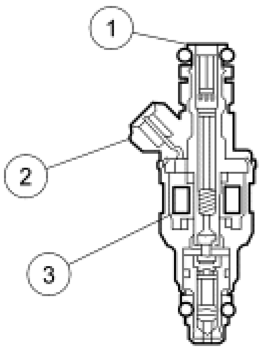
FUEL INJECTORS

NOTE:	**Do not apply battery positive voltage (B+) directly to the fuel injector electrical connector terminals. The solenoids may be damaged internally in a matter of seconds.**

The fuel injector is a solenoid-operated valve that meters fuel flow to the engine. The fuel injector is opened and closed a constant number of times per crankshaft revolution. The amount of fuel is controlled by the length of time the fuel injector is held open.

The fuel injector is normally closed, and is operated by a 12-volt source from either the electronic engine control (EEC) power relay or fuel pump relay. The ground signal is controlled by the PCM.

The injector is the deposit resistant injector (DRI) type and does not have to be cleaned. However, it can be flow checked and, if found outside of specification, a new fuel injector should be installed.



N0047964

Fig. 37: Typical Fuel Injector

Item	Part Number	Description
1	-	Fuel Filter Screen
2	-	Connector
3	-	Solenoid Coil

FUEL LEVEL INPUT (FLI)

The FLI is a communications network message. Most vehicle applications use a potentiometer type FLI sensor connected to a float in the FP module to determine fuel level.

FUEL PUMP (FP) MODULE

The FP module is a device that contains the fuel pump and sender assembly. The fuel pump is located inside the FP module reservoir and supplies fuel through the FP module manifold to the engine and FP module jet pump. The jet pump continuously refills the reservoir with fuel, and a check valve located in the manifold outlet maintains system pressure when the fuel pump is not energized. A flapper valve located in the bottom of the reservoir allows fuel to enter the reservoir and prime the fuel pump during the initial fill.

3	-	Fuel Supply
4	-	Fuel Return from Fuel Filter
5	-	Fuel Pressure Regulator

FUEL PUMP (FP) MODULE AND RESERVOIR

The FP module is mounted inside the fuel tank in a reservoir. The pump has a discharge check valve that maintains the system pressure after the key has been turned off to minimize starting concerns. The reservoir prevents fuel flow interruptions during extreme vehicle maneuvers with low tank fill levels.

FUEL RAIL PRESSURE TEMPERATURE (FRPT) SENSOR

The FRPT sensor measures the pressure and temperature of the fuel in the fuel rail and sends these signals to the PCM. The sensor uses the intake manifold vacuum as a reference to determine the pressure difference between the fuel rail and the intake manifold. The relationship between fuel pressure and fuel temperature is used to determine the possible presence of fuel vapor in the fuel rail.

The temperature sensing portion of the FRPT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of the thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Both the pressure and temperature signals are used to control the speed of the fuel pump. The speed of the fuel pump sustains fuel rail pressure which preserves fuel in its liquid state. The dynamic range of the fuel injectors increase because of the higher rail pressure, which allows the injector pulse width to decrease.

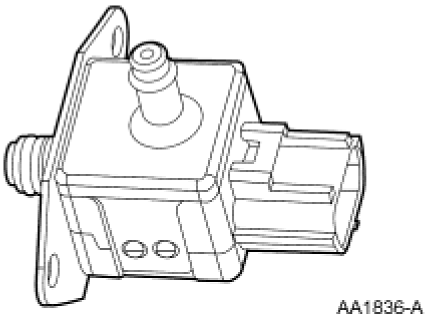

Fig. 40: Typical Fuel Rail Pressure Temperature (FRPT) Sensor
Courtesy of FORD MOTOR CO.

FUEL RAIL PULSE DAMPER

The fuel rail pulse damper is located on the fuel rail and reduces the fuel system noise caused by the pulsing of the fuel injectors. The vacuum port located on the damper is connected to manifold vacuum to avoid fuel spillage if the pulse damper diaphragm ruptures. The fuel rail pulse damper should not be confused with a fuel pressure regulator; it does not regulate the fuel rail pressure.

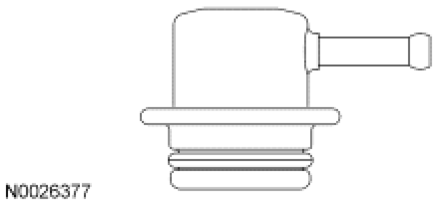

Fig. 41: Typical Fuel Rail Pulse Damper
Courtesy of FORD MOTOR CO.

FUEL TANK PRESSURE (FTP) SENSOR

The FTP sensor or inline FTP sensor is used to measure the fuel tank pressure.

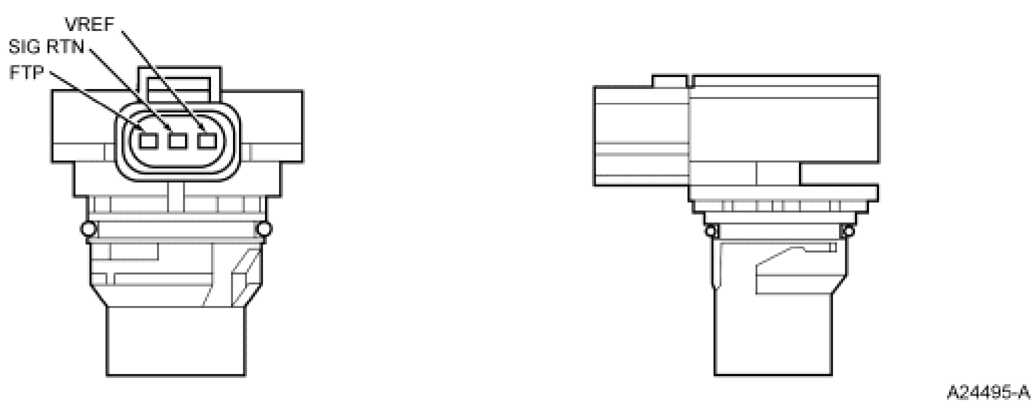

Fig. 42: Fuel Tank Pressure (FTP) Sensor
Courtesy of FORD MOTOR CO.

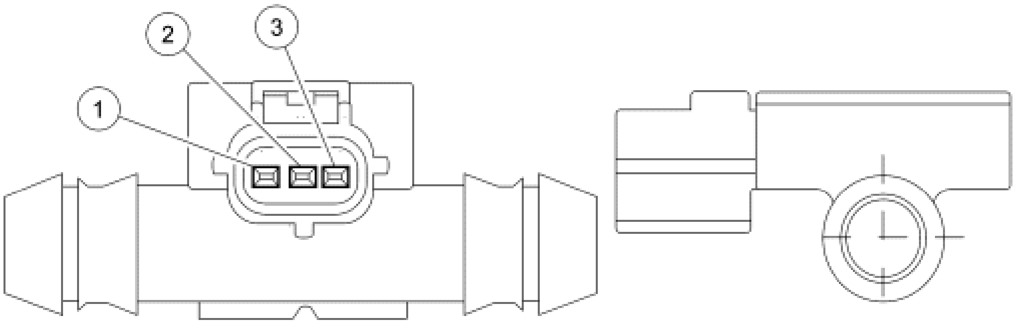

Fig. 43: In-Line Fuel Tank Pressure (FTP) Sensor

Item	Part Number	Description
1	-	VREF
2	-	SIG RTN
3	-	FTP

HEATED OXYGEN SENSOR (HO2S)

The HO2S detects the presence of oxygen in the exhaust and produces a variable voltage according to the amount of oxygen detected. A high concentration of oxygen (lean air/fuel ratio) in the exhaust produces a voltage signal less than 0.4 volt. A low concentration of oxygen (rich air/fuel ratio) produces a voltage signal greater than 0.6 volt. The HO2S provides feedback to the PCM indicating air/fuel ratio in order to achieve a near stoichiometric air/fuel ratio of 14.7:1 during closed loop engine operation. The HO2S generates a voltage between 0.0 and 1.1 volts.

Embedded with the sensing element is the HO2S heater. The heating element heats the sensor to a temperature of 800°C (1,472°F). At approximately 300°C (572°F) the engine can enter closed loop operation. The VPWR circuit supplies voltage to the heater. The PCM turns the heater on by providing the ground when the correct conditions occur. The heater allows the engine to enter closed loop operation sooner. The use of this heater requires the HO2S heater control to be duty cycled, to prevent damage to the heater.

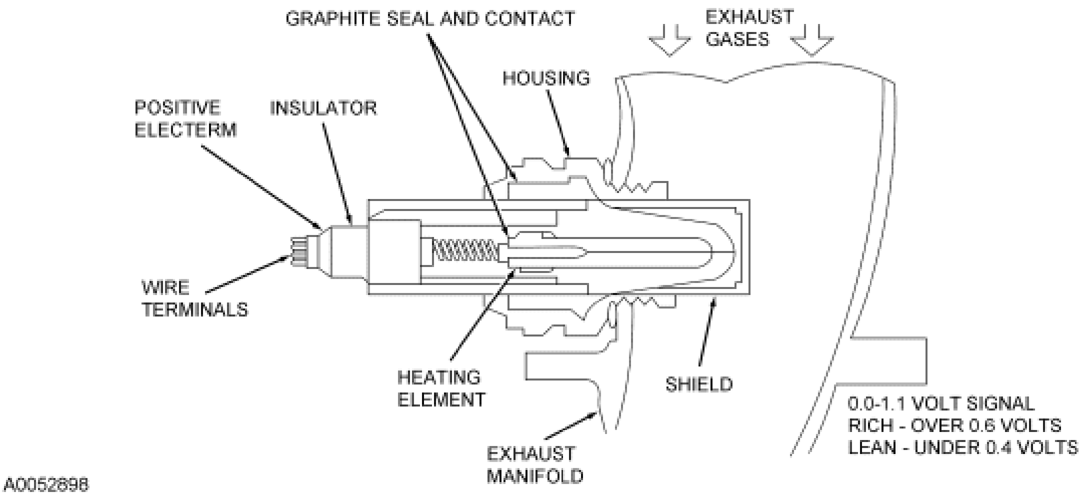

Fig. 44: Identifying Typical Heated Oxygen Sensor (HO2S)
Courtesy of FORD MOTOR CO.

IDLE AIR CONTROL (IAC) VALVE

NOTE: **The IAC valve assembly is not adjustable and cannot be cleaned, also some IAC valves are normally open and others are normally closed. Some IAC valves require engine vacuum to operate.**

The IAC valve assembly controls the engine idle speed and provides a dashpot function. The IAC valve assembly meters intake air around the throttle plate through a bypass within the IAC valve assembly and throttle body. The PCM determines the desired idle speed or bypass air and signals the IAC valve assembly through a specified duty cycle. The IAC valve responds by positioning the IAC valve to control the amount of bypassed air. The PCM monitors engine RPM and increases or decreases the IAC duty cycle in order to achieve the desired RPM.

The PCM uses the IAC valve assembly to control:

- no touch start
- cold engine fast idle for rapid warm-up
- idle (corrects for engine load)
- stumble or stalling on deceleration (provides a dashpot function)
- over-temperature idle boost

INERTIA FUEL SHUTOFF (IFS) SWITCH

The IFS switch is used in conjunction with the electric fuel pump. The purpose of the IFS switch is to shutoff the fuel pump if a collision occurs. It consists of a steel ball held in place by a magnet. When a sharp impact occurs, the ball breaks loose from the magnet, rolls up a conical ramp and strikes a target plate which opens the electrical contacts of the switch and shuts off the electric fuel pump. Once the switch is open, it must be manually reset before restarting the vehicle. Refer to the Owner's Literature, Roadside Emergencies for the location of the IFS switch.

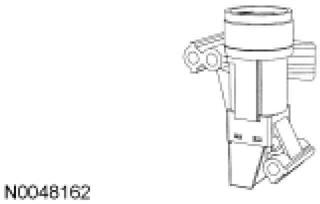

Fig. 45: Typical Inertia Fuel Shutoff (IFS) Switch
Courtesy of FORD MOTOR CO.

INTAKE AIR TEMPERATURE (IAT) SENSOR

The IAT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The IAT provides air temperature information to the PCM. The PCM uses the air temperature information as a correction factor in the calculation of fuel, spark, and air flow.

The IAT sensor provides a quicker temperature change response time than the ECT or CHT sensor.

Currently there are 2 design types of IAT sensors used, a stand-alone/non-integrated type and a integrated type. Both types function the same, however the integrated type is incorporated into the mass air flow (MAF) sensor instead of being a stand alone sensor.

Supercharged vehicles use 2 IAT sensors. Both sensors are thermistor type devices and operate as described above. One is located before the supercharger at the air cleaner for standard OBD/cold weather input, while a second sensor (IAT2) is located after the supercharger in the intake manifold. The IAT2 sensor located after the supercharger provides air temperature information to the PCM to control spark and to help determine charge air cooler (CAC) efficiency.

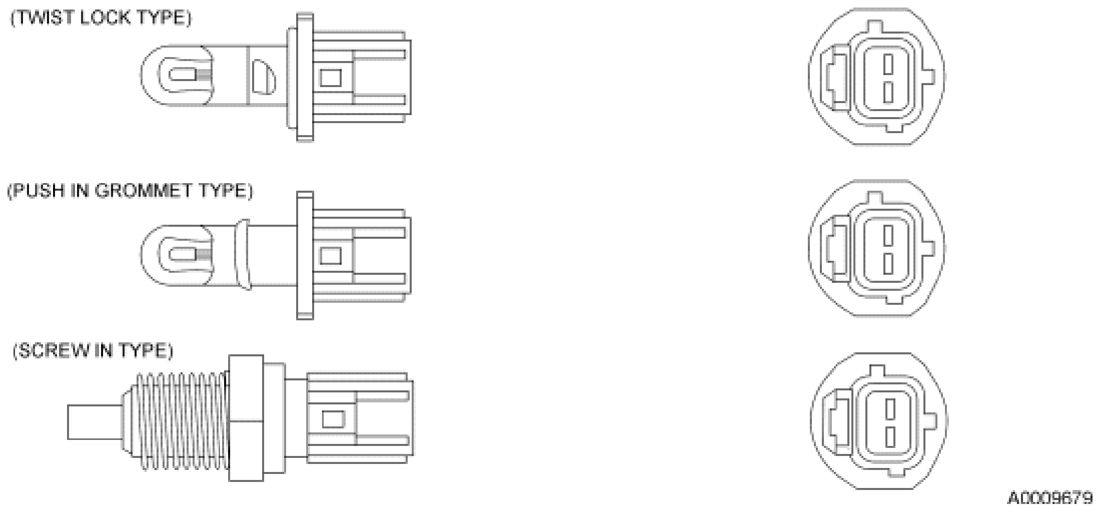

Fig. 46: Typical Stand-Alone/Non-Integrated Intake Air Temperature (IAT) Sensors
Courtesy of FORD MOTOR CO.

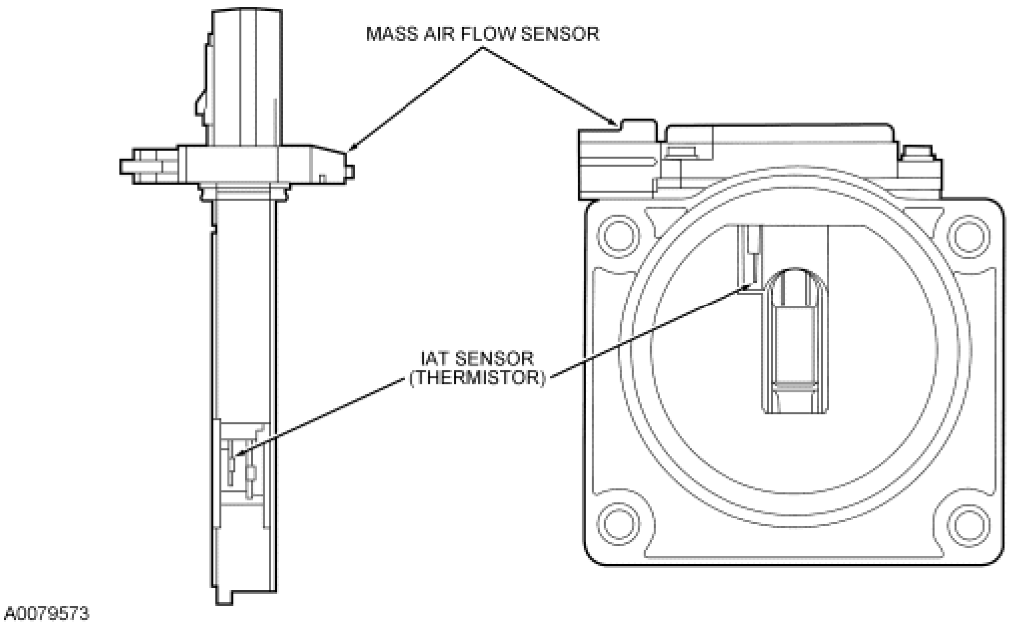

Fig. 47: Identifying Integrated Intake Air Temperature (IAT) Sensor Incorporated Into MAF Sensor
Courtesy of FORD MOTOR CO.

INTAKE MANIFOLD TUNING VALVE (IMTV)

WARNING: **Substantial opening and closing torque is applied by this system. To prevent injury, be careful to keep fingers away from lever mechanisms when actuated.**

The IMTV is a motorized actuated unit mounted directly to the intake manifold. The IMTV actuator controls a shutter device attached to the actuator shaft. There is no monitor input to the PCM with this system to indicate shutter position.

The motorized IMTV unit is not energized below approximately 2,600 RPM. The shutter is in the closed position not allowing airflow blend to occur in the intake manifold. The motorized unit is energized above approximately 2,600 RPM. The motorized unit is commanded on by the PCM initially at a 100 percent duty cycle to move the shutter to the open position, and then falling to approximately 50 percent to continue to hold the shutter open.

KNOCK SENSOR (KS)

The KS is a tuned accelerometer on the engine which converts engine vibration to an electrical signal. The PCM uses this signal to determine the presence of engine knock and to retard spark timing.

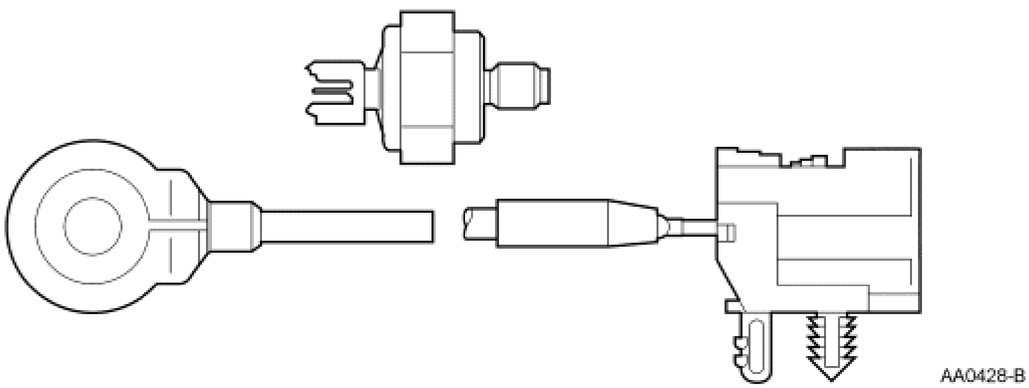

Fig. 48: Two Types of Knock Sensor (KS)
Courtesy of FORD MOTOR CO.

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

The MAP sensor measures intake manifold absolute pressure. The PCM uses information from the MAP sensor to measure how much exhaust gas is introduced into the intake manifold.

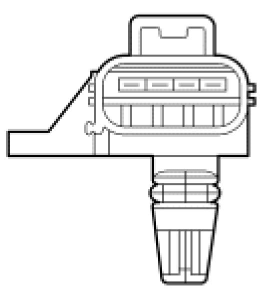

Fig. 49: Typical Manifold Absolute Pressure (MAP) Sensor
Courtesy of FORD MOTOR CO.

MASS AIR FLOW (MAF) SENSOR

The MAF sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above the ambient temperature as measured by a constant cold wire. The current required to maintain the temperature of the hot wire is

proportional to the mass air flow. The MAF sensor then outputs an analog voltage signal to the PCM proportional to the intake air mass. The PCM calculates the required fuel injector pulse width in order to provide the desired air/fuel ratio. This input is also used in determining transmission electronic pressure control (EPC), shift and torque converter clutch scheduling.

The MAF sensor is located between the air cleaner and the throttle body or inside the air cleaner assembly. Most MAF sensors have integrated bypass technology with an integrated intake air temperature (IAT) sensor. The hot wire electronic sensing element must be replaced as an assembly. Replacing only the element may change the air flow calibration.

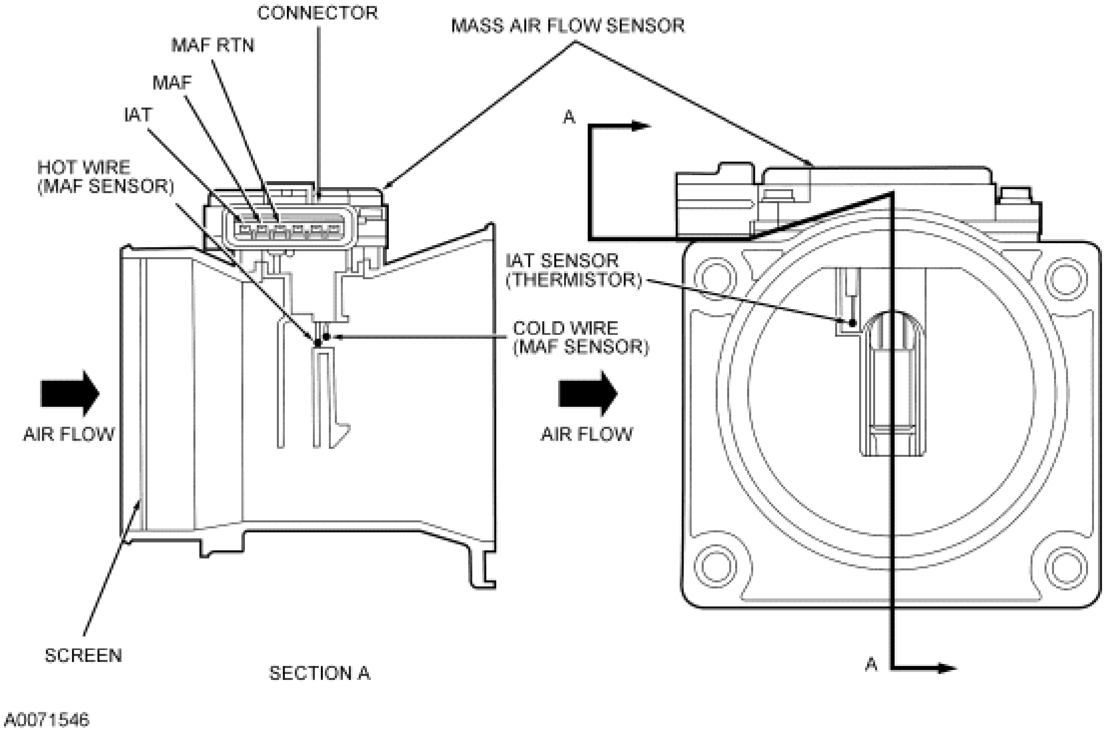

Fig. 50: Cutaway View Of MAF Sensor
Courtesy of FORD MOTOR CO.

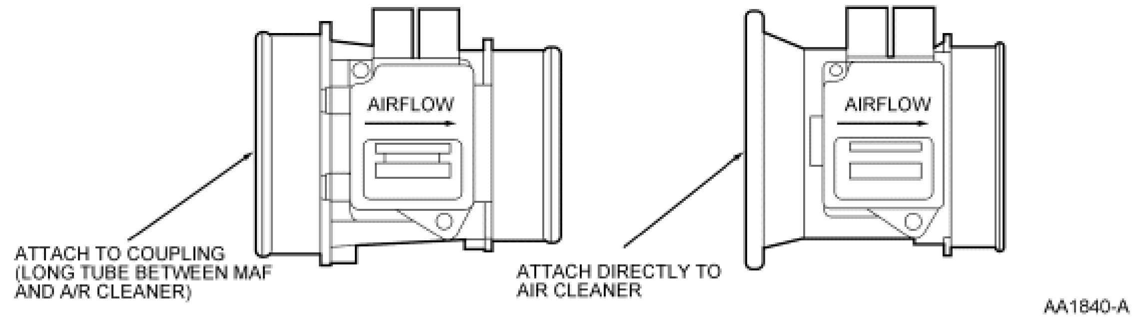

Fig. 51: Typical Mass Air Flow (MAF) Sensor
Courtesy of FORD MOTOR CO.

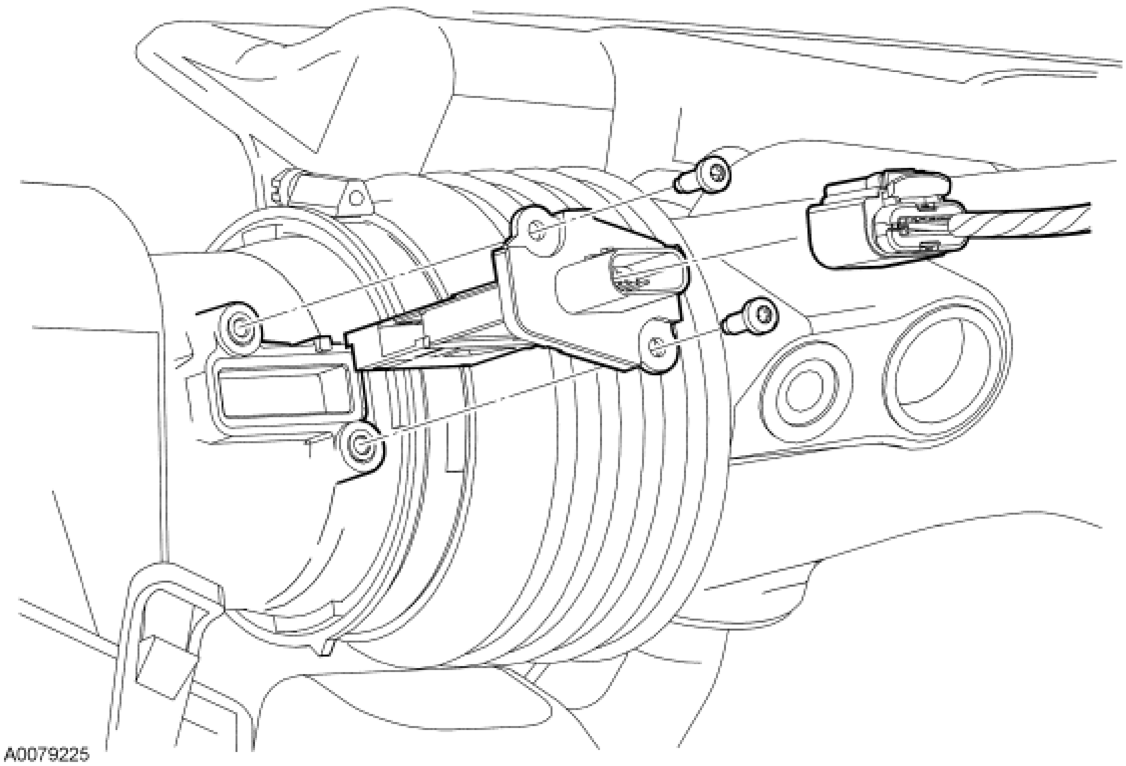

Fig. 52: Identifying Typical Drop-in Mass Air Flow (MAF) Sensor
Courtesy of FORD MOTOR CO.

OUTPUT SHAFT SPEED (OSS) SENSOR

The OSS sensor provides the PCM with information about the rotational speed of an output shaft. The PCM uses the information to control and diagnose powertrain behavior. In some applications, the sensor is also used as the source of vehicle speed. The sensor may be physically located in different places on the vehicle, depending upon the specific application. The design of each speed sensor is unique and depends on which powertrain control feature uses the information that is generated.

POWER STEERING PRESSURE (PSP) SENSOR

The PSP sensor monitors the hydraulic pressure within the power steering system. The PSP sensor voltage input to the PCM changes as the hydraulic pressure changes. The PCM uses the input signal from the PSP sensor to compensate for additional loads on the engine by adjusting the idle RPM and preventing engine stall during parking maneuvers. Also, the PSP sensor signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example, during parking maneuvers.

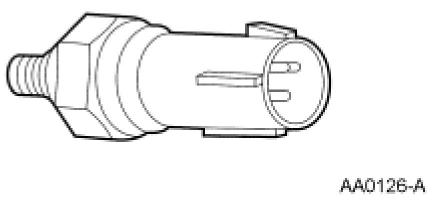

Fig. 53: Typical Power Steering Pressure (PSP) Sensor
Courtesy of FORD MOTOR CO.

POWER STEERING PRESSURE (PSP) SWITCH

The PSP switch monitors the hydraulic pressure within the power steering system. The PSP switch is a normally closed switch that opens as the hydraulic pressure increases. The PCM provides a low current voltage on the PSP circuit. When the PSP switch is closed, this voltage is pulled low through the SIG RTN circuit. The PCM uses the input signal from the PSP switch to compensate for additional loads on the engine by adjusting the idle RPM and preventing engine stall during parking maneuvers. Also, the PSP switch signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example during parking maneuvers.

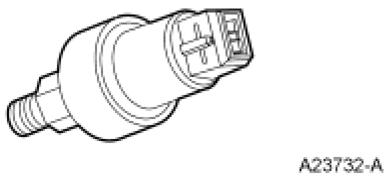

Fig. 54: Typical Power Steering Pressure (PSP) Switch
Courtesy of FORD MOTOR CO.

POWER TAKE-OFF (PTO) SWITCH AND CIRCUITS

The PTO circuit is used by the PCM to disable some of the on board diagnostics (OBD) monitors during PTO operation. The PTO switch is normally open. When the PTO unit is activated, the PTO switch is closed and battery voltage is supplied to the PTO input circuit. This indicates to the PCM that an additional load is being applied to the engine. The PTO indicator lamp illuminates when the PTO system is functioning correctly and flashes when the PTO system is damaged.

When the PTO unit is activated, the PCM disables some OBD monitors, which may not function reliably during PTO operation. Without the PTO circuit information to the PCM, false DTCs may be set during PTO operation. Prior to an Inspection/Maintenance test, operate the vehicle with the PTO disengaged long enough to successfully complete the OBD Monitors.

PTO Circuits Description - The 3 PTO input circuits are PTO mode, PTO engage, and PTO RPM.

The PTO engage circuit is used when the operator is requesting the PCM to check the needed inputs required to initiate the PTO engagement.

The PTO RPM circuit is used for the operator to request additional engine RPM for PTO operation.

POWERTRAIN CONTROL MODULE - VEHICLE SPEED OUTPUT (PCM-VSO)

The PCM-VSO speed signal subsystem generates vehicle speed information for distribution to the vehicle's electrical/electronic modules and subsystems that require vehicle speed data. This subsystem senses the transmission output shaft speed with a sensor. The data is processed by the PCM and distributed as a hardwired signal or as a message on the vehicle communication network.

The key features of the PCM-VSO system are to:

- infer vehicle movement from the output shaft speed (OSS) sensor signal.
- convert transmission output shaft rotational information to vehicle speed information.
- compensate for tire size and axle ratio with a programmed calibration variable.
- use a transfer case speed sensor (TCSS) for four wheel drive (4WD) applications.
- distribute vehicle speed information as a multiplexed message and/or an analog signal.

The signal from a non-contact shaft sensor OSS or TCSS mounted on the transmission (automatic, manual, or 4WD transfer case) is sensed directly by the PCM. The PCM converts the OSS or TCSS information to 8,000 pulses per mile, based on a tire and axle ratio conversion factor. This conversion factor is programmed into the PCM at the time the vehicle is assembled and can be reprogrammed in the field for servicing changes in the tire size and axle ratio. The PCM transmits the computed vehicle speed and distance traveled information to all the vehicle speed signal users on the vehicle. VSO information can be transmitted by a hardwired interface between the vehicle speed signal user and the PCM, or by a speed and odometer data message through the vehicle communication network data link.

The PCM-VSO hardwired signal wave form is a DC square wave with a voltage level of 0 to VBAT. Typical output operating range is 1.3808 Hz per 1 km/h (2.22 Hz per mph).

SECONDARY AIR INJECTION (AIR) BYPASS SOLENOID

The secondary AIR bypass solenoid is used by the PCM to control vacuum to the secondary air injection diverter (AIR diverter) valve. The secondary AIR bypass solenoid is a normally closed solenoid. The secondary AIR bypass solenoid also has a filtered vent feature to permit vacuum release.

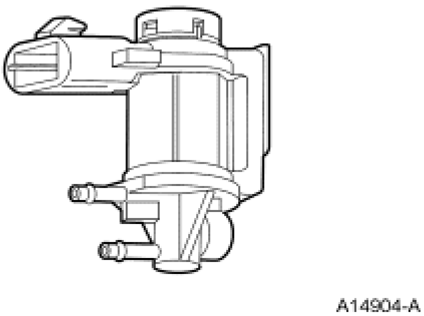

Fig. 55: Secondary AIR Bypass Solenoid
Courtesy of FORD MOTOR CO.

SECONDARY AIR DIVERTER VALVE

The secondary AIR diverter valve is used with the secondary AIR pump to provide on/off control of air to the exhaust manifold and catalytic converter. When the secondary AIR pump is on and vacuum is supplied to the AIR diverter valve, air passes the integral check valve disk. When the secondary AIR pump is off, and vacuum is removed from the AIR diverter valve, the integral check valve disk is held on the seat and stops air from being drawn into the exhaust system and prevents the back flow of the exhaust into the secondary AIR system.

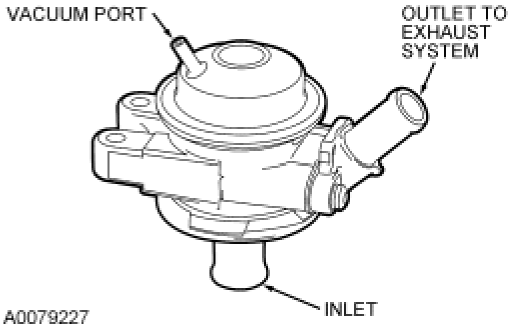

Fig. 56: Air Injection Diverter (AIR Diverter) Valve
Courtesy of FORD MOTOR CO.

SECONDARY AIR PUMP

The secondary AIR pump provides pressurized air to the secondary AIR system. The secondary AIR pump functions independently of RPM and is controlled by the PCM. The secondary AIR pump is only used for short periods of time. Delivery of air is dependent on the amount of system backpressure and system voltage. The secondary AIR pump draws dry filtered air from the intake air system downstream of the MAF/IAT sensor. For additional information on the secondary AIR injection system, refer to **SECONDARY AIR INJECTION (AIR) SYSTEM**.

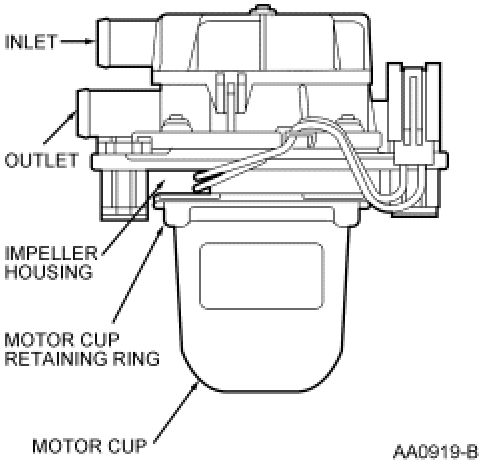

Fig. 57: Secondary Air Pump
Courtesy of FORD MOTOR CO.

STARTER MOTOR REQUEST (SMR) CIRCUIT

The SMR circuit provides the PCM with a signal from the ignition switch to the PCM. The input is pulled high when the key is in the START position and the transmission range sensor ignition lockout circuit allows the starter to engage.

THROTTLE POSITION (TP) SENSOR

The TP sensor is a rotary potentiometer sensor that provides a signal to the PCM that is linearly proportional to

the throttle plate/shaft position. The sensor housing has a 3-blade electrical connector that may be gold plated. The gold plating increases the corrosion resistance on the terminals and increases the connector durability. The TP sensor is mounted on the throttle body. As the TP sensor is rotated by the throttle shaft, 4 operating conditions are determined by the PCM from the TP. The operating conditions are:

- closed throttle (includes idle or deceleration)
- part throttle (includes cruise or moderate acceleration)
- wide open throttle (includes maximum acceleration or de-choke on crank)
- throttle angle rate

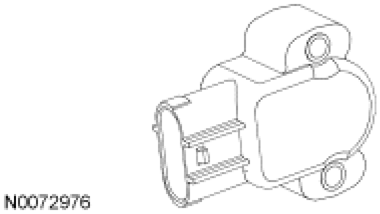

Fig. 58: Typical TP Sensor
Courtesy of FORD MOTOR CO.

TRANSMISSION CONTROL INDICATOR LAMP (TCIL)

The TCIL is an output signal from the PCM that controls the lamp on/off function depending on the engagement or disengagement of overdrive.

TRANSMISSION CONTROL SWITCH (TCS)

The TCS signals the PCM with VPWR whenever the TCS is pressed. On vehicles with this feature, the transmission control indicator lamp (TCIL) illuminates when the TCS is cycled to disengage overdrive.

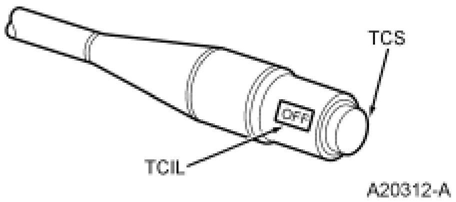

Fig. 59: Typical Transmission Control Switch (TCS)
Courtesy of FORD MOTOR CO.

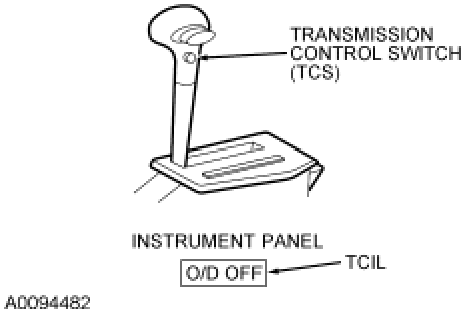

Fig. 60: Typical Transmission Control Switch (TCS)
Courtesy of FORD MOTOR CO.

UNIVERSAL HO2S

The universal HO2S, sometimes referred to as a wide band oxygen sensor, uses the typical HO2S combined with a current controller in the PCM to infer an air/fuel ratio relative to the stoichiometric air/fuel ratio. This is accomplished by balancing the amount of oxygen ions pumped in or out of a measurement chamber within the sensor. The typical HO2S within the universal HO2S is used to detect the oxygen content of the exhaust gas in the measurement chamber. The oxygen content inside the measurement chamber is maintained at the stoichiometric air/fuel ratio by pumping oxygen ions in and out of the measurement chamber. As the exhaust gasses get richer or leaner, the amount of oxygen that must be pumped in or out to maintain a stoichiometric air/fuel ratio in the measurement chamber varies in proportion to the air/fuel ratio. The amount of current required to pump the oxygen ions in or out of the measurement chamber is used to measure the air/fuel ratio. The measured air/fuel ratio is actually the output from the current controller in the PCM and not a signal that comes directly from the sensor.

The universal HO2S also uses a self-contained reference chamber to make sure an oxygen differential is always present. The oxygen for the reference chamber is supplied by pumping small amounts of oxygen ions from the measurement chamber into the reference chamber. The universal HO2S does not need access to outside air.

Part to part variance is compensated for by placing a resistor in the connector. This resistor is used to trim the current measured by the current controller in the PCM.

Embedded with the sensing element is the universal HO2S heater. The heater allows the engine to enter closed loop operation sooner. The heating element heats the sensor to a temperature of 780°C (1,436°F). The VPWR circuit supplies voltage to the heater. The PCM controls the heater on and off by providing the ground to maintain the sensor at the correct temperature for maximum accuracy.

VEHICLE SPEED SENSOR (VSS)

The VSS is a variable reluctance or Hall-effect sensor that generates a waveform with a frequency that is proportional to the speed of the vehicle. If the vehicle is moving at a relatively low velocity, the sensor produces a signal with a low frequency. As the vehicle velocity increases, the sensor generates a signal with a higher frequency. The PCM uses the frequency signal generated by the VSS (and other inputs) to control such parameters as fuel injection, ignition control, transmission/transaxle shift scheduling, and torque converter clutch scheduling.

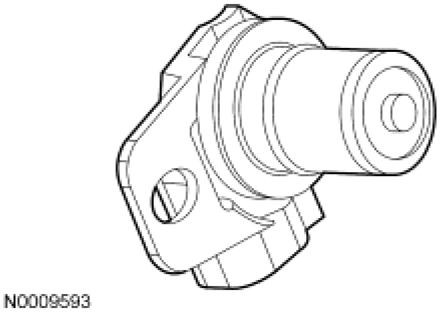

Fig. 61: Typical Vehicle Speed Sensor (VSS)

ELECTRONIC ENGINE CONTROL (EEC) SYSTEM

OVERVIEW

The EEC system provides optimum control of the engine and transmission through the enhanced capability of the powertrain control module (PCM). The EEC system also has an on board diagnostics (OBD) monitoring system with features and functions to meet federal regulations on exhaust emissions.

Some vehicle applications use a stand-alone transmission control module (TCM). Even though it is still part of the EEC system, the TCM communicates with the PCM, the antilock brake system (ABS) module, the instrument cluster, and the four-wheel drive (4WD) control modules using the high speed controller area network (CAN) communications network. The TCM incorporates a stand alone OBD-II system. The TCM independently processes and stores diagnostic trouble codes (DTCs), freeze frame, support PIDs as well as J1979 Mode 09 CALID and calibration verification number. The TCM does not directly illuminate the malfunction indicator lamp (MIL), but requests the PCM to do so. The TCM is located inside the transmission assembly. It is not repairable, with the exception of reprogramming.

Below is a list of transmissions that use a TCM:

- AWF21 (FWD) 6-speed automatic transmission
- FNR5 (FWD) transmission
- F21 (FWD) transmission
- ZF CFT30 (FWD) continuously variable transmission (CVT)
- ZF 6HP26 (RWD) transmission
- ZF 6R (RWD)
- 6R60 (RWD)

For additional information on these transmissions and TCM diagnostics, refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .

The EEC system has 2 major divisions: hardware and software. The hardware includes the PCM, sensors, switches, actuators, solenoids, and interconnecting terminals. The software in the PCM provides the strategy control for outputs (engine hardware) based on the values of the inputs to the PCM. The EEC hardware and software are discussed.

This part contains detailed descriptions of the operation of the EEC system input sensors and switches, output actuators, solenoids, relays and connector pins (including other power-ground signals). For additional information on the input sensors and output actuators, refer to **ENGINE CONTROL COMPONENTS**.

The PCM receives information from a variety of sensor and switch inputs. Based on the strategy and calibration stored within the memory chip, the PCM generates the appropriate output. The system is designed to minimize emissions and optimize fuel economy and driveability. The software strategy controls the basic operation of the engine and transmission, provides the OBD strategy, controls the MIL, communicates to the scan tool via the data link connector (DLC), allows for flash electrically erasable programmable read only memory (EEPROM),

provides idle air and fuel trim, and controls failure mode effects management (FMEM).

MODIFICATIONS TO OBD VEHICLES

Modifications or additions to the vehicle may cause incorrect operation of the OBD system. Install anti-theft systems, remote starters, cellular telephones and aftermarket radios carefully. **Do not install these devices by tapping into or running wires close to the powertrain control system wires or components.**

POWERTRAIN CONTROL HARDWARE

POWERTRAIN CONTROL MODULE (PCM)

The center of the electronic engine control (EEC) system is a microprocessor called the PCM. The PCM receives input from sensors and other electronic components (switches, relays). Based on the information received and programmed into its memory, the PCM generates output signals to control various relays, solenoids and actuators. There are several different types of PCMs in use for this model year. Refer to the Vehicle PCM Application Table below for PCM types and their applications.

VEHICLE PCM APPLICATION TABLE

PCM Type	Applications
140-Pin	Expedition, Fusion, Milan, MKZ, Navigator
150-Pin	Escape, Mariner
170-Pin	Crown Victoria, E-Series, Explorer, Explorer Sport Trac, F-Super Duty, Grand Marquis, Mountaineer, Mustang, Ranger, Town Car
190-Pin	Edge, F-Series, Focus, Mark LT, MKX, Sable, Taurus, Taurus X

PCM LOCATIONS

For PCM removal and installation procedures, refer to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** .

- Focus - engine compartment, driver side, front of battery.
- Taurus, Taurus X, Sable - engine compartment, passenger side, mounted to the cowl.
- Fusion, Milan, MKZ - engine compartment, driver side, under battery, mounted to the cowl.
- Mustang - front of engine compartment, passenger side, near fender, under the battery junction box (BJB).
- Crown Victoria, Grand Marquis, Town Car - engine compartment, driver side, fender mounted.
- Explorer, Explorer Sport Trac, Mountaineer - passenger side, near side cowl, behind the glove compartment.
- Escape, Mariner, Ranger - behind the instrument panel (cowl), center to both driver and passenger sides (access from the engine compartment).
- Edge, Expedition, Mark LT, MKX, Navigator, F-Series, F-Super Duty - passenger side of the engine compartment, mounted to the cowl.
- E-Series - engine compartment, driver side, near the cowl (access from the engine compartment).

140-PIN PCM - EXPEDITION/NAVIGATOR

FUEL PUMP DRIVER MODULE (FPDM)

NOTE: **The Mustang 5.4L uses 2 FPDMs to control fuel for the fuel delivery system. The PCM outputs only one fuel pump duty cycle on the fuel pump control (FPC) circuit. This circuit is used by both FPDMs. The PCM individually monitors the FPDMs through the fuel pump monitor (FPM) and FPM2 circuits. The FPDM located on the driver side of the luggage compartment is referred to as FPDM and the FPDM located on the passenger side of the luggage compartment, is referred to as FPDM2.**

The FPDM receives a duty cycle signal from the PCM and controls the fuel pump operation in relation to this duty cycle. This results in variable speed fuel pump operation. The FPDM sends diagnostic information to the PCM on the fuel pump monitor circuit. For additional information on the fuel pump control and the fuel pump monitor, refer to **FUEL SYSTEMS**.

KEEP ALIVE MEMORY (KAM)

The PCM stores information in KAM (a memory integrated circuit chip) about vehicle operating conditions and then uses this information to compensate for component variability. The KAM remains powered when the key is in the OFF position so that this information is not lost.

INTEGRATED ELECTRONIC IGNITION SYSTEM

The integrated electronic ignition system consists of a CKP sensor, coil pack(s), connecting wiring, and PCM. The coil on plug (COP) integrated electronic ignition system uses a separate coil for each spark plug and each coil is mounted directly onto the plug. The COP integrated electronic ignition system eliminates the need for spark plug wires but does require input from the camshaft position (CMP) sensor.

POWER AND GROUND SIGNALS

Electronic Throttle Control Reference Voltage (ETCREF)

ETCREF is a consistent positive voltage (5.0 volts ± 0.5) supplied by the PCM. ETCREF is internally bussed within the PCM and is specifically dedicated to the accelerator pedal position (APP) sensor and the electronic throttle body (ETB) throttle position (TP) sensor.

Electronic Throttle Control Return (ETCRTN)

ETCRTN is a return path for ETCREF and is internally bussed within the PCM. ETCRTN is specifically dedicated to the APP sensor and the ETB TP sensor.

Gold Plated Pins

NOTE: Gold plated terminals should only be replaced with new gold plated terminals.

Some engine control hardware has gold plated pins within the connectors and mating harness connectors to improve electrical stability for low current draw circuits and to enhance corrosion resistance. The electronic engine control (EEC) components equipped with gold terminals vary by vehicle application.

Keep Alive Power (KAPWR)

KAPWR provides a constant voltage input independent of ignition switch state to the PCM. This voltage is used by the PCM to maintain the keep alive memory (KAM).

Mass Air Flow (MAF) Return

The mass air flow return (MAF RTN) is a dedicated analog signal return from the MAF sensor. It serves as a ground offset for the analog voltage differential input by the MAF sensor to the PCM.

Power Ground (PWR GND)

The PWR GND circuit(s) is directly connected to the battery negative terminal. PWR GND provides a return path for the PCM vehicle power (VPWR) circuits.

Signal Return (SIG RTN)

SIG RTN is a dedicated return path for VREF applied components.

Variable Reluctance Sensor Return (VRSRTN)

The VRSRTN circuit is a dedicated return path for variable reluctance (VR) type sensors.

Vehicle Buffered Power (VBPWR)

VBPWR is a regulated voltage supplied by the PCM to vehicle sensors. These sensors require a constant 12 volts for operation and cannot withstand VPWR voltage variations. VBPWR is regulated to VPWR minus 1.5 volts and is also current limited to protect the sensors.

Vehicle Power (VPWR)

VPWR is the primary source of PCM power. VPWR is switched through the EEC power relay and is controlled by the ignition switch.

Vehicle Reference Voltage (VREF)

VREF is a consistent positive voltage (5.0 volts ± 0.5) provided by the PCM. VREF is typically used by 3-wire sensors and some digital input signals.

POWERTRAIN CONTROL SOFTWARE

ADAPTIVE AIRFLOW

Some vehicles equipped with electronic throttle control (ETC) have an adaptive airflow strategy that allows the powertrain control module (PCM) to correct for changes in the airflow. During idle, the PCM monitors the throttle angle and air flow. If the air flow is determined to be less than expected, the PCM adjusts the throttle angle to compensate.

The PCM only learns the adaptive airflow when the vehicle is at idle and normal operating temperature and the airflow is less than a calibrated limit. Whenever the battery is disconnected or the keep alive memory (KAM) is reset, it is necessary for the PCM to learn the new value and not use the default value. For additional information on a KAM reset, refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .

COMPUTER CONTROLLED SHUTDOWN

The PCM controls the PCM power relay when the key is turned to the ON or START position, by grounding the PCM relay control (PCMRC) circuit. After the key is turned to the OFF, ACC or LOCK position, the PCM stays powered up until the correct engine shutdown occurs.

The ignition switch position run (ISP-R) and the injector power monitor (INJPWRM) circuits provide the key state input to the PCM. Based on the ISP-R and INJPWRM signals the PCM determines when to power down the PCM power relay.

ENGINE RPM/VEHICLE SPEED LIMITER

The PCM disables some or all of the fuel injectors whenever an engine RPM or vehicle over speed condition is detected. The purpose of the engine RPM or vehicle speed limiter is to prevent damage to the powertrain. The vehicle exhibits a rough running engine condition, and the PCM stores one of the following continuous memory diagnostic trouble codes (DTCs): P0219, P0297, or P1270. Once the driver reduces the excessive speed, the engine returns to the normal operating mode. No repair is required. However, the technician should clear the DTCs and inform the customer of the reason for the DTC.

Excessive wheel slippage may be caused by sand, gravel, rain, mud, snow, ice, or excessive and sudden increase in RPM while in NEUTRAL or while driving.

FAIL-SAFE COOLING STRATEGY

NOTE: Not all vehicles with a cylinder head temperature (CHT) sensor have the fail-safe cooling strategy.

The fail-safe cooling strategy is activated by the PCM only in the event that an overheating condition has been identified. This strategy provides engine temperature control when the cylinder head temperature exceeds certain limits. The cylinder head temperature is measured by the CHT sensor. For additional information about the CHT sensor, refer to **ENGINE CONTROL COMPONENTS**.

A cooling system failure such as low coolant or coolant loss could cause an overheating condition. As a result, damage to major engine components could occur. Along with a CHT sensor, the fail-safe cooling strategy is used to prevent damage by allowing air cooling of the engine. This strategy allows the vehicle to be driven safely for a short time with some loss of performance when a overheat condition exist.

Engine temperature is controlled by varying and alternating the number of disabled fuel injectors. This allows all cylinders to cool. When the fuel injectors are disabled, the respective cylinders work as air pumps, and this air is used to cool the cylinders. The more fuel injectors that are disabled, the cooler the engine runs, but the engine has less power.

A wide open throttle (WOT) delay is incorporated if the CHT temperature is exceeded during WOT operation. At WOT, the injectors function for a limited amount of time allowing the customer to complete a passing maneuver.

Before injectors are disabled, the fail-safe cooling strategy alerts the customer to a cooling system problem by moving the instrument cluster temperature gauge to the hot zone and DTC P1285 is set. Depending on the vehicle, other indicators, such as an audible chime or warning lamp, can be used to alert the customer of fail-safe cooling. If overheating continues, the strategy begins to disable the fuel injectors, DTC P1299 is stored in the PCM memory, and a malfunction indicator lamp (MIL) illuminates. If the overheating condition continues and a critical temperature is reached, all fuel injectors are turned off and the engine is disabled.

FAILURE MODE EFFECTS MANAGEMENT (FMEM)

The FMEM is an alternate system strategy in the PCM designed to maintain engine operation if one or more sensor inputs fail.

When a sensor input is determined to be out-of-limits by the PCM, an alternative strategy is initiated. The PCM substitutes a fixed value for the incorrect input and continues to monitor the suspect sensor input. If the suspect sensor begins to operate within limits, the PCM returns to the normal engine operational strategy.

All FMEM sensors display a sequence error message on the scan tool. The message may or may not be followed by key on engine off (KOEO) or continuous memory DTCs when attempting key on engine running (KOER) self-test mode.

FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)

The flash EEPROM is an integrated circuit within the PCM. This integrated circuit contains the software code required by the PCM to control the powertrain. One feature of the EEPROM is that it can be electrically erased and then reprogrammed through the data link connector (DLC) without removing the PCM from the vehicle.

FUEL TRIM

Short Term Fuel Trim

If the oxygen sensors are warmed up and the PCM determines that the engine can operate near stoichiometric air/fuel ratio (14.7:1 for gasoline), the PCM enters closed loop fuel control mode. Since an oxygen sensor can only indicate rich or lean, the fuel control strategy continuously adjusts the desired air/fuel ratio between rich and lean causing the oxygen sensor to switch around the stoichiometric point. If the time between rich and lean switches are the same, then the system is actually operating at stoichiometric. The desired air/fuel control parameter is called short term fuel trim (SHRTFT1 and 2) where stoichiometric is represented by 0%. Richer (more fuel) is represented by a positive number and leaner (less fuel) is represented by a negative number. Normal operating range for short term fuel trim is +/- 25%. Some calibrations have time between switches and short term fuel trim excursions that are not equal. These unequal excursions are used to run the system slightly lean or rich of stoichiometric. This practice is referred to as using bias. For example, the fuel system can be biased slightly rich during closed loop fuel to help reduce oxides of nitrogen (NO_x).

Values for SHRTFT1 and 2 may change significantly on a scan tool as the engine is operated at different RPM and load points. This is because SHRTFT1 and 2 react to fuel delivery variability that changes as a function of engine RPM and load. Short term fuel trim values are not retained after the engine is turned off.

Long Term Fuel Trim

While the engine is operating in closed loop fuel control, the short term fuel trim corrections are learned by the PCM as long term fuel trim (LONGFT1 and 2) corrections. These corrections are stored in the keep alive memory (KAM) fuel trim tables. Fuel trim tables are based on engine speed and load and by bank for engines with 2 heated oxygen sensor (HO2S) forward of the catalyst. Learning the corrections in KAM improves both open loop and closed loop air/fuel ratio control. Advantages include:

- Short term fuel trim does not have to generate new corrections each time the engine goes into closed loop.
- Long term fuel trim corrections can be used both while in open loop and closed loop modes.

Long term fuel trim is represented as a percentage, similar to the short term fuel trim, however it is not a single parameter. A separate long term fuel trim value is used for each RPM/load point of engine operation. Long term fuel trim corrections may change depending on the operating conditions of the engine (RPM and load), ambient air temperature, and fuel quality (% alcohol, oxygenates). When viewing the LONGFT1/2 PID(s), the values may change a great deal as the engine is operated at different RPM and load points. The LONGFT1/2 PID(s) display the long term fuel trim correction that is currently being used at that RPM/load point.

HIGH SPEED CONTROLLER AREA NETWORK (CAN)

High speed CAN is a serial communication language protocol used to transfer messages (signals) between electronic modules or nodes. Two or more signals can be sent over one CAN communications network circuit allowing 2 or more electronic modules or nodes to communicate with each other. This communication or multiplexing network operates at 500kB/sec (kilobytes per second) and allows the electronic modules to share their information messages.

Included in these messages is diagnostic data that is outputted over the CAN + and CAN - lines to the DLC. PCM connection to the DLC is typically done with a 2-wire, twisted pair cable used for the network interconnection. The diagnostic data such as self-test or PIDs can be accessed with a scan tool. For additional information on scan tool equipment, refer to**DIAGNOSTIC METHODS** .

IDLE AIR TRIM

Idle air trim is designed to adjust the idle air control (IAC) calibration to correct for wear and aging of components. When the engine conditions meet the learning requirement, the strategy monitors the engine and determines the values required for ideal idle calibration. The idle air trim values are stored in a table for reference. This table is used by the PCM as a correction factor when controlling the idle speed. The table is stored in the KAM and retains the learned values even after the engine is shut off. A DTC is set if the idle air trim has reached its learning limits.

Whenever an IAC component is replaced, or a repair affecting idle is carried out, it is recommended that the KAM be reset. This is necessary so the idle strategy does not use the previously learned idle air trim values.

To reset the KAM, refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . It is important to note that erasing DTCs with a scan tool does not reset the idle air trim table.

Once the KAM has been reset, the engine must idle for 15 minutes (actual time varies between strategies) to learn new idle air trim values. Idle quality improves as the strategy adapts. Adaptation occurs in 4 separate modes as shown in the following table.

IDLE AIR TRIM LEARNING MODES

Transmission Range	Air Conditioning Mode
NEUTRAL	A/C ON
NEUTRAL	A/C OFF

DRIVE	A/C ON
DRIVE	A/C OFF

IDLE SPEED CONTROL CLOSED THROTTLE DETERMINATION - APPLICATIONS WITHOUT ELECTRONIC THROTTLE CONTROL (ETC)

One of the fundamental criteria for entering RPM control is an indication of closed throttle. Throttle mode is always calculated to the lowest learned throttle position (TP) voltage seen since engine start. This lowest learned value is called ratch, since the software acts like a one-way ratch. The ratch value (voltage) is displayed as the TPREL PID. The ratch value is relearned after every engine start. Ratch learns the lowest, steady TP voltage seen after the engine starts. In some cases, ratch can learn higher values of TP. The time to learn the higher values is significantly longer than the time to learn the lower values. The brakes must also be applied to learn the higher values.

All PCM functions are done using this ratch voltage, including idle speed control. The PCM goes into closed throttle mode when the TP voltage is at the ratch (TPREL PID) value. An increase in TP voltage, normally less than 0.05 volts, puts the PCM in part throttle mode. Throttle mode can be viewed by looking at the TP MODE PID. With the throttle closed, the PID must read C/T (closed throttle). Slightly corrupt values of ratch can prevent the PCM from entering closed throttle mode. An incorrect part throttle indication at idle prevents entry into closed throttle RPM control, and could result in a high idle. Ratch can be corrupted by a throttle position sensor or a circuit that drops out or is noisy, or by loose/worn throttle plates that close tight during a deceleration and spring back at a normal engine vacuum.

INTERNATIONAL STANDARDS ORGANIZATION (ISO) 14229 DIAGNOSTIC TROUBLE CODE (DTC) DESCRIPTIONS

The ISO 14229 is a global, diagnostic communication standard. The ISO 14229 is a set of standard diagnostic messages that can be used to diagnose any vehicle module in service, and at the assembly plant. The ISO 14229 is similar to the society of automotive engineers (SAE) J2190 diagnostic communication standard that was used by all original equipment manufacturers (OEMs) for previous communication protocols, like J1850 standard corporate protocol (SCP).

For the 2008 model year, the new ISO 14229 standard is standard on the Focus powertrain control module (PCM). The ISO 14229 changes the way PIDs, DTCs, and output state control is processed internally in the PCM and in the scan tool software. Most of the changes are to make data transfer between electronic modules more efficient, and the amount and type of information that is available for each DTC. This information may be helpful in diagnosing driveability concerns.

DTC Structure - Like all digital signals, DTCs are sent to the scan tool as a series of 1s and 0s. Each DTC is made up of 2 data bytes which each consist of 8 bits that can be set to 1 or 0. The data is decoded by the scan tool to display each set of 4 bits as a hexadecimal number (0 to F) in order to display the DTCs in the conventional format. For example, P0420 - Catalyst System Efficiency Below Threshold (Bank 1).

DTC Byte 1		DTC Byte 2	
0000	0100	0010	0000
P0	4	2	0

The table below shows how to decode the bits into hex digits.

Binary Bit Pattern	Hex Digit	Binary Bit Pattern	Hex Digit
0000	0	1000	8
0001	1	1001	9
0010	2	1010	A
0011	3	1011	B
0100	4	1100	C
0101	5	1101	D
0110	6	1110	E
0111	7	1111	F

The first 4 bits of a DTC do not convert directly into hex digits. The conversion into different types of DTCs (P, B, C and U) is defined by SAE J2012. This standard contains DTC definitions and formats.

Binary Bit Pattern	SAE DTC Type	Binary Bit Pattern	SAE DTC Type
0000	P0	1000	B0
0001	P1	1001	B1
0010	P2	1010	B2
0011	P3	1011	B3
0100	C0	1100	U0
0101	C1	1101	U1
0110	C2	1110	U2
0111	C3	1111	U3

ISO 14229 sends 2 additional bytes of information with each DTC, a failure type byte and a status byte.

DTC Byte 1		DTC Byte 2		Failure Type Byte		Status Byte	
0000	0100	0010	0000	0000	0000	1111	0101
P0	4	2	0	0	0	F	9

All ISO 14229 DTCs are 4 bytes long instead of 3 bytes or 2 bytes long. Additionally, the status byte for ISO 14229 DTCs is defined differently than the status byte for previous applications with 3 byte DTCs.

Failure Type Byte - The failure type byte is designed to describe the specific failure associated with the basic DTC. For example, an failure type byte of 1C means circuit voltage out of range, 73 means actuator stuck closed. When combined with a basic component DTC, it allows one basic DTC to describe many types of failures.

DTC Byte 1		DTC Byte 2		Failure Type Byte		Status Byte	
0000	0001	0001	0000	0001	1100	1010	1111
P0	1	1	0	1	C	A	F

For example, P0110:1C-AF means intake air temperature sensor circuit voltage out of range. The base DTC, P0110, means intake air temperature sensor circuit, while the failure type byte 1C means circuit voltage out of range. This DTC structure was designed to allow manufacturers to more precisely identify different kinds of faults without always having to define new DTC numbers.

The PCM does not use failure type bytes and always sends a failure type byte of 00 (no sub type information). This is because OBD-II regulations require manufacturers to use 2 byte DTCs for generic scan tool communications. Additionally, the OBD-II regulations require the 2 byte DTCs to be very specific, so there is no additional information that the failure type byte could provide.

A list of failure type bytes is defined by SAE J2012 but is not described here because the PCM does not use the failure type byte.

Status Byte - The status byte is designed to provide additional information about the DTC, such as when the DTC failed, when the DTC was last evaluated, and if any warning indication has been requested. Each of the 8 bits in the status byte has a precise meaning that is defined in ISO 14229.

The protocol is that bit 7 is the most significant bit and is the left-most bit while bit 0 is the least significant bit and is the right-most bit.

Most Significant Bits				**Least Significant Bit**			
Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

DTC Status Bit Definitions - Refer to the following status bit descriptions:

Bit 7

- 0 - The ECU is not requesting warning indicator to be active
- 1 - The ECU is requesting warning indicator to be active

Bit 6

- 0 - The DTC test completed this monitoring cycle
- 1 - The DTC test has not completed this monitoring cycle

Bit 5

- 0 - The DTC test never failed since last code clear
- 1 - The DTC test failed at least once since last code clear

Bit 4

- 0 - The DTC test completed since the last code clear
- 1 - The DTC test not completed since the last code clear

Bit 3

- 0 - The DTC is not confirmed at the time of the request
- 1 - The DTC is confirmed at the time of the request

Bit 2

- 0 - The DTC was not failed on the current or previous monitoring cycle
- 1 - The DTC failed on the current or previous monitoring cycle

Bit 1

- 0 - The DTC never failed on the current monitoring cycle
- 1 - The DTC failed on the current monitoring cycle

Bit 0

- 0 - The DTC is not failed at the time of request
- 1 - The DTC is failed at the time of request

For DTCs that illuminate the MIL, a confirmed DTC means the PCM has stored a DTC and has illuminated the MIL. If the fault has corrected itself, the MIL may no longer be illuminated but the DTC still shows a confirmed status for 40 warm up cycles at which time the DTC is erased. Bit 7 can be used to determine if the MIL is illuminated for the DTC.

For DTCs that do not illuminate the MIL, a confirmed DTC means the PCM has stored a DTC. If the fault has corrected itself, the DTC still shows a confirmed status for 40 warm up cycles at which time the DTC is erased.

To determine if a test has completed and passed, for example, after a repair, information can be combined from 2 bits as follows:

If bit 6 is 0 (the DTC test completed this monitoring cycle), and bit 1 is 0 (the DTC never failed on the current monitoring cycle), then the DTC has been evaluated at least once this drive cycle and was a pass.

If bit 6 is 0 (the DTC test completed this monitoring cycle) and bit 0 is 0 (the DTC is not failed at the time of request), then the most recent test result for that DTC was a pass.

The status byte bits can be decoded as a 2 digit hexadecimal number, and can be displayed as the last 2 digits of the DTC, for example for DTC P0110:1C-AF, AF represents the status byte info.

Status Byte							
A equals 1010				F equals 1111			
Bit 7 equals 1	Bit 6 equals 0	Bit 5 equals 1	Bit 4 equals 0	Bit 3 equals 1	Bit 2 equals 1	Bit 1 equals 1	Bit 0 equals 1

MULTIPLEXING

The increased number of modules on the vehicle necessitates a more efficient method of communication. Multiplexing is a method of sending 2 or more signals simultaneously over a single circuit. In an automotive application, multiplexing is used to allow 2 or more electronic modules to communicate simultaneously over a single media. Typically this media is a twisted pair of wires. The information or messages that can be communicated on these wires consists of commands, status or data. The advantage of using multiplexing is to reduce the weight of the vehicle by reducing the number of redundant components and electrical wiring.

MULTIPLEXING IMPLEMENTATION

Currently Ford Motor Company uses CAN communication language protocol to communicate with the PCM.

For additional information about the module communications network, refer to the **MODULE COMMUNICATIONS NETWORK -- E-SERIES** .

MALFUNCTION INDICATOR LAMP (MIL)

The MIL notifies the driver that the powertrain control module (PCM) has detected an on board diagnostic (OBD) emission-related component or system concern. When this occurs, an OBD diagnostic trouble code (DTC) sets.

- The MIL is located in the instrument cluster and is labeled CHECK ENGINE, SERVICE ENGINE SOON or the international standards organization (ISO) standard engine symbol.
- The MIL is illuminated during the instrument cluster prove out for approximately 4 seconds.
- The MIL remains illuminated after instrument cluster prove out if:
  - an emission-related concern and DTC exists.
  - the PCM does not send a control message to the instrument cluster (applications with the MIL controlled through the communication link).
  - the PCM is operating in the hardware limited operation strategy (HLOS).
- The MIL remains off during the instrument cluster prove out if an indicator or instrument cluster concern is present.
- To turn off the MIL after a repair, a reset command from the scan tool must be sent, or 3 consecutive drive cycles must be completed without a concern.
- For all MIL concerns, go to the **SYMPTOM CHARTS** article, Symptom Charts.
- If the MIL flashes at a steady rate, a severe misfire condition may exist.
- If the MIL flashes erratically, the PCM can reset while cranking if the battery voltage is low.
- The MIL flashes after a period of time with the key in the RUN position (engine not running) if DTC P1000 is set.

CATALYST AND EXHAUST SYSTEMS

OVERVIEW

The catalytic converter and exhaust systems work together to control the release of harmful engine exhaust emissions into the atmosphere. The engine exhaust gas consists mainly of nitrogen (N), carbon dioxide (CO_2) and water vapor (H_2O). However, it also contains carbon monoxide (CO), oxides of nitrogen (NO_x), hydrogen (H), and various unburned hydrocarbons (HCs). The major air pollutants of CO, NO_x, and HCs, and their emission into the atmosphere must be controlled.

The exhaust system generally consists of an exhaust manifold, front exhaust pipe, front heated oxygen sensor (HO2S), rear exhaust pipe, catalyst HO2S, a muffler, and an exhaust tailpipe. The catalytic converter is typically installed between the front and rear exhaust pipes. On some vehicle applications, more than one catalyst is used between the front and rear exhaust pipes. Catalytic converter efficiency is monitored by the on board diagnostic (OBD) system strategy in the powertrain control module (PCM). For information on the OBD catalyst monitor, refer to the description for the **CATALYST EFFICIENCY MONITOR**.

For most vehicles, only 2 HO2Ss are used in an exhaust stream. The front sensors (HO2S11/HO2S21) before the catalyst are used for primary fuel control while the ones after the catalyst (HO2S12/HO2S22) are used to monitor catalyst efficiency. However, some partial zero emission vehicles (PZEV) use 3 HO2Ss for each engine bank. The stream 1 sensors (HO2S11/HO2S21) located before the catalyst are used for primary fuel control, the stream 2 sensors (HO2S12/HO2S22) are used to monitor the light-off catalyst, and the stream 3 sensors (HO2S13/HO2S23) located after the catalyst are used for long term fuel trim control to optimize catalyst efficiency (fore aft oxygen sensor control).

Catalytic Converter

A catalyst is a material that remains unchanged when it initiates and increases the speed of a chemical reaction. A catalyst also enables a chemical reaction to occur at a lower temperature. The concentration of exhaust gas products released to the atmosphere must be controlled. The catalytic converter assists in this task. It contains a catalyst in the form of a specially treated ceramic honeycomb structure saturated with catalytically active precious metals. As the exhaust gases come in contact with the catalyst, they are changed into mostly harmless products. The catalyst initiates and speeds up heat producing chemical reactions of the exhaust gas components so they are used up as much as possible.

Light Off Catalyst

As the catalyst heats up, converter efficiency rises rapidly. The point at which conversion efficiency exceeds 50% is called catalyst light off. For most catalysts this point occurs at 246°C to 302°C (475°F to 575°F). A fast light catalyst is a 3-way catalyst (TWC) that is located as close to the exhaust manifold as possible. Because the light off catalyst is located close to the exhaust manifold it lights off faster and reduces emissions more quickly than the catalyst located under the body. Once the catalyst lights off, the catalyst quickly reaches the maximum conversion efficiency for that catalyst.

Three-Way Catalyst (TWC) Conversion Efficiency

A TWC requires a stoichiometric fuel ratio, 14.7 pounds of air to 1 pound of fuel (14.7:1), for high conversion efficiency. In order to achieve these high efficiencies, the air/fuel ratio must be tightly controlled with a narrow window of stoichiometric. Deviations outside of this window greatly decrease the conversion efficiency. For example a rich mixture decreases the HC and CO conversion efficiency while a lean mixture decreases the NO_x conversion efficiency.

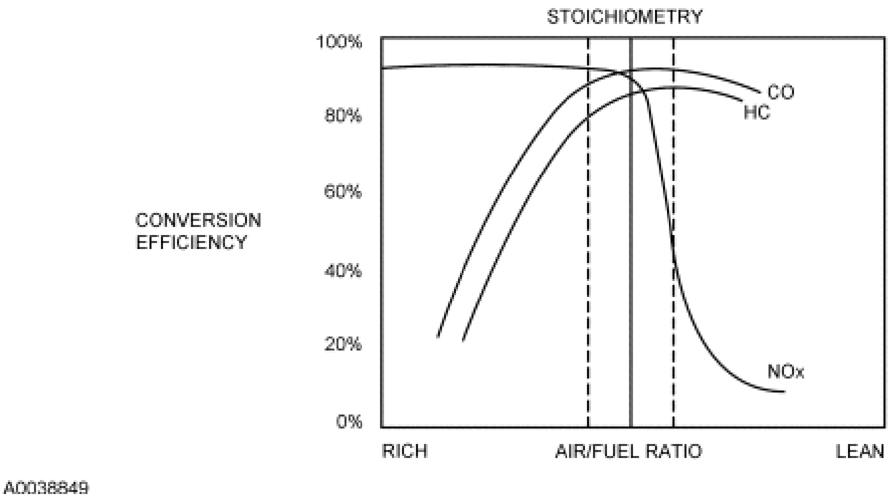

Fig. 70: TWC Conversion Efficiency Chart
Courtesy of FORD MOTOR CO.

Exhaust System

The purpose of the exhaust system is to convey engine emissions from the exhaust manifold to the atmosphere. Engine exhaust emissions are directed from the engine exhaust manifold to the catalytic converter through the front exhaust pipe. A HO2S is mounted on the front exhaust pipe before the catalyst. The catalytic converter reduces the concentration of CO, unburned HCs, and NO_x in the exhaust emissions to an acceptable level. The reduced exhaust emissions are directed from the catalytic converter past another HO2S mounted in the rear exhaust pipe and then on into the muffler. Finally, the exhaust emissions are directed to the atmosphere through an exhaust tailpipe.

On some PZEV, there is a total of 3 HO2S in the exhaust stream. One near the exhaust manifold (stream 1), one in the middle of the light-off catalyst (stream 2), and the third (stream 3) is mounted after the light-off catalyst.

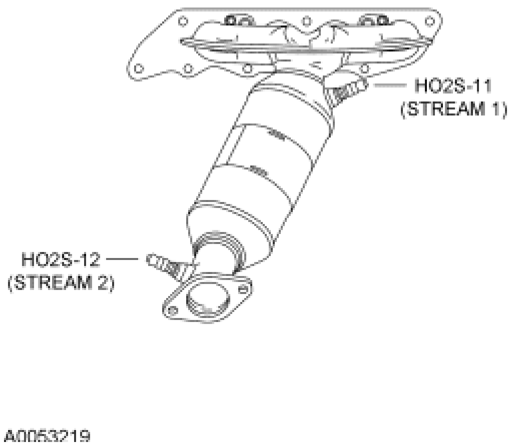

Fig. 71: Identifying Bank 1 Catalyst 2 HO2S Location
Courtesy of FORD MOTOR CO.

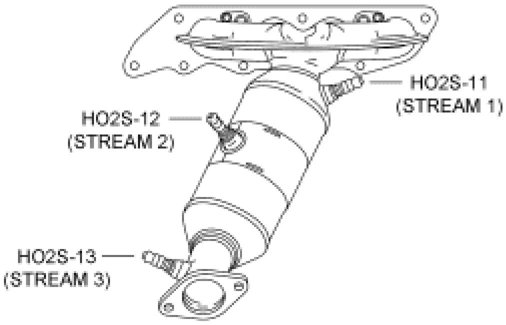

Fig. 72: Bank 1 Catalyst Three HO2S Configuration
Courtesy of FORD MOTOR CO.

UNDERBODY CATALYST

The underbody catalyst is located after the light off catalyst. The underbody catalyst may be in line with the light off catalyst, or the underbody catalyst may be common to 2 light off catalysts, forming a Y pipe configuration. For an exact configuration of the catalyst and exhaust system for a specific vehicle, refer to the **EXHAUST SYSTEM -- E-SERIES** .

Three-Way Catalytic (TWC) Converter

The TWC converter contains either platinum (Pt) and Rhodium (Rh) or palladium (Pd) and Rhodium (Rh). The TWC converter catalyzes the oxidation reactions of unburned HCs and CO and the reduction reaction of NO_x . The 3-way conversion can be best accomplished by always operating the engine air fuel/ratio at or close to stoichiometric.

Exhaust Manifold Runners

The exhaust manifold runners collect exhaust gases from engine cylinders. The number of exhaust manifolds and exhaust manifold runners depends on the engine configuration and number of cylinders.

Exhaust Pipes

Exhaust pipes are usually treated during manufacturing with an anti-corrosive coating agent to increase the life of the product. The pipes serve as guides for the flow of exhaust gases from the engine exhaust manifold through the catalytic converter and the muffler.

Heated Oxygen Sensor (HO2S)

The HO2Ss provide the PCM with information related to the oxygen content of the exhaust gas. For additional information on the HO2S, refer to **ENGINE CONTROL COMPONENTS**.

Muffler

Mufflers are usually treated during manufacturing with an anti-corrosive coating agent to increase the life of the product. The muffler reduces the level of noise produced by the engine, and also reduces the noise produced by exhaust gases as they travel from the catalytic converter to the atmosphere.

EVAPORATIVE EMISSION (EVAP) SYSTEMS

OVERVIEW

The EVAP system prevents fuel vapor build-up in the sealed fuel tank. Fuel vapors trapped in the sealed tank are vented through the vapor valve assembly on top of the tank. The vapors leave the valve assembly through a single vapor line and continue to the EVAP canister for storage until the vapors are purged to the engine for burning.

All applications required to meet on board diagnostics (OBD) regulations use the enhanced EVAP system. Some applications also incorporate an on-board refueling vapor recovery (ORVR) system. Refer to the **EVAPORATIVE EMISSIONS -- E-SERIES** for vehicle specific information on the description and operation of the evaporative emissions system.

Enhanced Evaporative Emission (EVAP) System

The enhanced EVAP system consists of a fuel tank, fuel filler cap or capless fuel tank filler pipe, fuel tank mounted or inline fuel vapor control valve, fuel vapor vent valve, EVAP canister, fuel tank mounted or fuel pump mounted or inline fuel tank pressure (FTP) sensor, EVAP canister purge valve or vapor management valve (VMV), intake manifold hose assembly, EVAP canister vent (CV) solenoid, powertrain control module (PCM) and connecting wires, and fuel vapor hoses. For additional information on the EVAP system components, refer to **ENGINE CONTROL COMPONENTS**.

1. The enhanced EVAP system uses inputs from the engine coolant temperature (ECT) sensor or cylinder head temperature (CHT) sensor, the intake air temperature (IAT) sensor, the mass air flow (MAF) sensor, the vehicle speed and the FTP sensor to provide information about engine operating conditions to the PCM. The fuel level input (FLI) and FTP sensor signals to the PCM are used by the PCM to determine activation of the EVAP leak check monitor based on the presence of vapor generation or fuel sloshing.
2. The PCM determines the desired amount of purge vapor flow to the intake manifold for a given engine condition. The PCM can then output the required signal to the EVAP canister purge valve or VMV. The PCM uses the enhanced EVAP system inputs to evacuate the system using the EVAP canister purge valve or VMV, seals the enhanced EVAP system from the atmosphere using the CV solenoid, and uses the FTP sensor to observe total vacuum lost for a period of time.
3. The CV solenoid seals the enhanced EVAP system to atmosphere during the EVAP leak check monitor.
4. The PCM outputs a variable current (between 0 mA and 1,000 mA) to the solenoid on the EVAP canister purge valve or VMV.
5. The FTP sensor monitors the fuel tank pressure during engine operation and continuously transmits an input signal to the PCM. During the EVAP monitor testing, the FTP sensor monitors the fuel tank pressure or vacuum bleed-up.
6. The fuel tank mounted fuel vapor vent valve assembly and the fuel tank mounted fuel vapor control valve

(or remote fuel vapor control valve) are used in the enhanced EVAP system to control the flow of fuel vapor entering the engine. All of these valves also prevent fuel tank overfilling during refueling operation and prevent liquid fuel from entering the EVAP canister and the EVAP canister purge valve or VMV under any vehicle altitude, handling, or rollover condition.

7. The enhanced EVAP system, including all the fuel vapor hoses, can be checked when a leak is detected by the PCM.

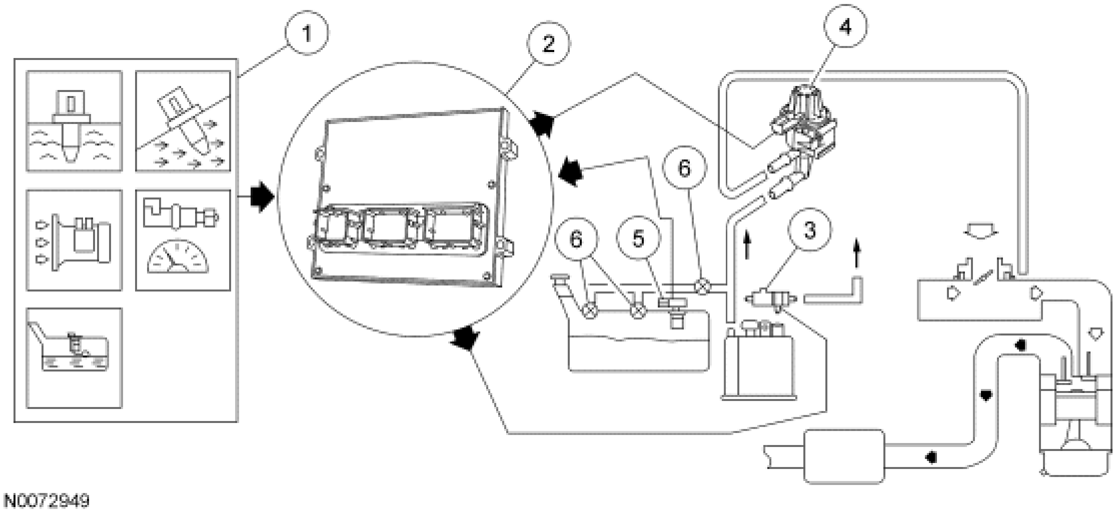

Fig. 73: Enhanced Evaporative Emission System

EXHAUST GAS RECIRCULATION (EGR) SYSTEMS

OVERVIEW

The EGR system controls the oxides of nitrogen (NO_x) emissions. Small amounts of exhaust gases are recirculated back into the combustion chamber to mix with the air/fuel charge. The combustion chamber temperature is reduced, lowering NO_x emissions.

DIFFERENTIAL PRESSURE FEEDBACK EXHAUST GAS RECIRCULATION (EGR) SYSTEM

The differential pressure feedback EGR system consists of a differential pressure feedback EGR sensor, EGR vacuum regulator solenoid, EGR valve, orifice tube assembly, powertrain control module (PCM), and connecting wires and vacuum hoses. For additional information on the differential pressure feedback EGR system, refer to **ENGINE CONTROL COMPONENTS**. Operation of the system is as follows:

1. The differential pressure feedback EGR system receives signals from the engine coolant temperature (ECT) sensor or cylinder head temperature (CHT) sensor, intake air temperature (IAT) sensor, throttle position (TP) sensor, mass air flow (MAF) sensor, and crankshaft position (CKP) sensor to provide information on engine operating conditions to the PCM. The engine must be warm, stable, and running at a moderate load and RPM before the EGR system is activated. The PCM deactivates EGR during idle, extended wide open throttle, or whenever a concern is detected in an EGR component or EGR required input.

2. The PCM calculates the desired amount of EGR flow for a given engine condition. It then determines the desired pressure drop across the metering orifice required to achieve that flow and outputs the corresponding signal to the EGR vacuum regulator solenoid.
3. The EGR vacuum regulator solenoid receives a variable duty cycle signal (0 to 90%). The higher the duty cycle the more vacuum the solenoid diverts to the EGR valve.
4. The increase in vacuum acting on the EGR valve diaphragm overcomes the valve spring and begins to lift the EGR valve pintle off its seat, causing exhaust gas to flow into the intake manifold.
5. Exhaust gas flowing through the EGR valve must first pass through the EGR metering orifice. With one side of the orifice exposed to exhaust backpressure and the other downstream of the metering orifice, a pressure drop is created across the orifice whenever there is EGR flow. When the EGR valve closes, there is no longer flow across the metering orifice and pressure on both sides of the orifice is the same. The PCM constantly targets a desired pressure drop across the metering orifice to achieve the desired EGR flow.
6. The differential pressure feedback EGR sensor measures the actual pressure drop across the metering orifice and relays a proportional voltage signal (0 to 5 volts) to the PCM. The PCM uses this feedback signal to correct for any errors in achieving the desired EGR flow.

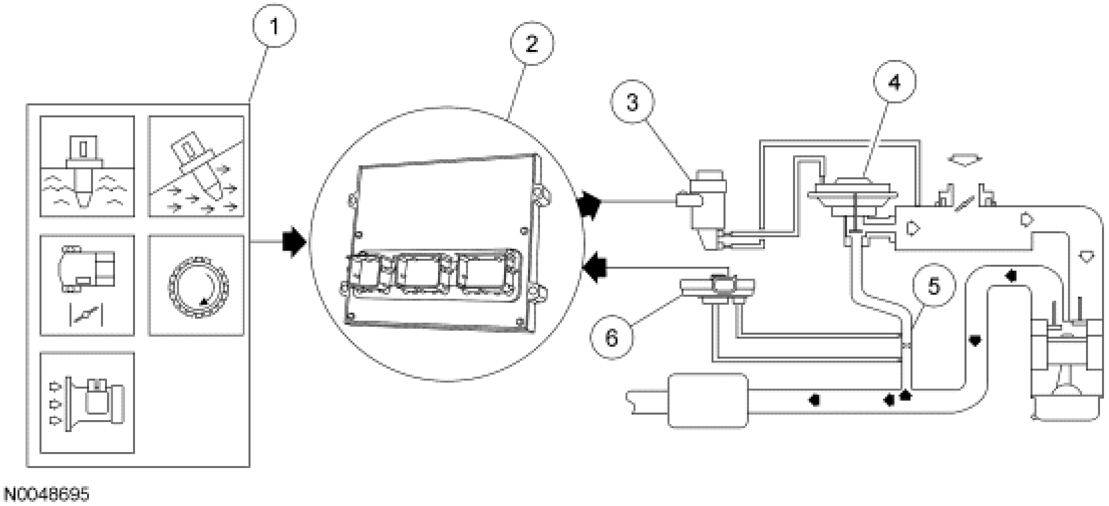

Fig. 74: Differential Pressure Feedback EGR System Operation
Courtesy of FORD MOTOR CO.

ELECTRIC EXHAUST GAS RECIRCULATION (EEGR) SYSTEM

Highlights of the EEGR System

- The EEGR valve is activated by an electric stepper motor and does not use vacuum to control the physical movement of the valve.
- No vacuum diaphragm is used.
- No differential pressure feedback EGR sensor is used.
- No orifice tube/assembly is used.
- No EGR vacuum regulator solenoid is used.
- Engine coolant is routed through the assembly on some vehicle applications. Some vehicle applications

are air cooled.

Overview

The EEGR system uses exhaust gas recirculation to control the oxides of nitrogen (NO_x) emissions just like vacuum operated systems. The only difference is the way in which the exhaust gas is controlled.

The EEGR system consists of an electric motor/EGR valve integrated assembly, a PCM, and connecting wiring. Additionally a manifold absolute pressure (MAP) sensor is also required. For additional information on the EGR system components, refer to **ENGINE CONTROL COMPONENTS**. Operation of the system is as follows:

1. The EEGR system receives signals from the ECT or CHT sensor, TP sensor, MAF sensor, CKP sensor, and the MAP sensor to provide information on engine operating conditions to the PCM. The engine must be warm, stable, and running at a moderate load and RPM before the EEGR system is activated. The PCM deactivates the EEGR during idle, extended wide open throttle (WOT), or whenever a concern is detected in an EEGR component or EGR required input.
2. The PCM calculates the desired amount of EGR for a given set of engine operating conditions.
3. The PCM in turn outputs signals the EEGR motor to move (advance or retract) a calibrated number of discrete steps. The electric stepper motor directly actuates the EEGR valve, independent of engine vacuum. The EEGR valve is commanded from 0 to 52 discrete steps to get the EGR valve from a fully closed to fully open position. The position of the EGR valve determines the EGR flow.
4. A MAP sensor is used to measure variations in manifold pressure as exhaust gas recirculation is introduced into the intake manifold. Variations in EGR being used correlate to the MAP signal (increasing EGR increases manifold pressure values).

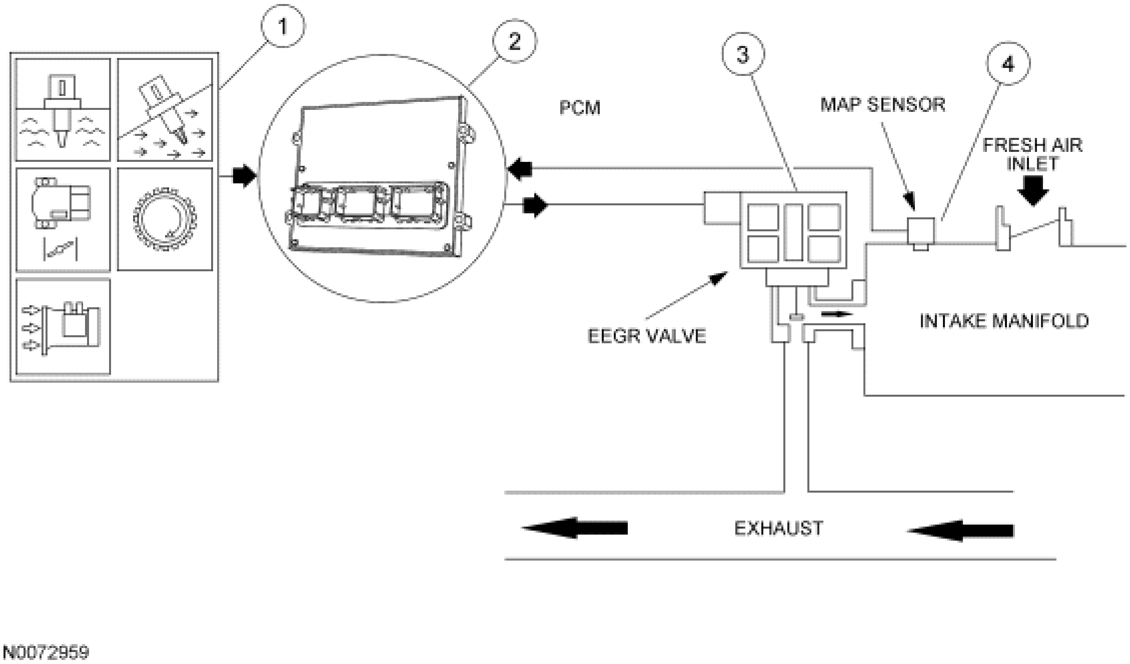

Fig. 75: EEGR System
Courtesy of FORD MOTOR CO.

EXHAUST GAS RECIRCULATION (EGR) SYSTEM MODULE (ESM)

Overview

The ESM is an updated differential pressure feedback EGR system. It functions in the same manner as the conventional differential pressure feedback EGR system, however the various system components have been integrated into a single component called the ESM. For additional information on the ESM system components, refer to **ENGINE CONTROL COMPONENTS**. The flange of the valve portion of the ESM bolts directly to the intake manifold or cold tube with a metal gasket that forms the metering orifice. This arrangement increases system reliability, response time, and system precision. By relocating the EGR orifice from the exhaust to the intake side of the EGR valve, the downstream pressure signal measures MAP. This MAP signal is used for EGR correction and inferred barometric pressure (BARO) at key on. The system provides the PCM with a differential pressure feedback EGR signal, identical to a traditional differential pressure feedback EGR system.

First, the differential pressure feedback EGR sensor input circuit is checked for out of range values (DTCs P0405 or P0406). The EGR vacuum regulator output circuit is checked for opens and shorts (DTC P0403).

The EGR system normally has large amounts of water vapor that are the result of the engine combustion process. During cold ambient temperatures, under some circumstances, water vapor can freeze in the differential pressure feedback EGR sensor, hoses, as well as other components in the EGR system. In order to prevent malfunction indicator lamp (MIL) illumination for temporary freezing, the following logic is used.

If an EGR system concern is detected below 0°C (32°F), only the EGR system is disabled for the current driving cycle. A diagnostic trouble code (DTC) is not stored and the I/M readiness status for the EGR monitor does not change. The EGR monitor, however, continues to operate. If the EGR monitor determines that the concern is no longer present, the EGR system is enabled and normal system operation is restored.

If an EGR system concern is detected above 0°C (32°F), the EGR system and the EGR monitor is disabled for the current driving cycle. A DTC is stored and the MIL is illuminated if the concern has been detected on 2 consecutive driving cycles.

After the vehicle has warmed up and normal EGR rates are being commanded by the PCM, the low flow check is carried out. Since the EGR system is a closed loop system, the EGR system delivers the requested EGR flow as long as it has the capability to do so. If the EGR vacuum regulator duty cycle is at maximum (90% duty cycle), the differential pressure indicated by the differential pressure feedback EGR sensor is evaluated to determine the amount of EGR system restriction. If the differential pressure is below a calibrated threshold, a low flow concern is indicated (DTCs P0401/P0406).

Finally, the differential pressure indicated by the differential pressure feedback EGR sensor is also checked at idle with zero requested EGR flow to carry out the high flow check. If the differential pressure exceeds a calibrated limit, it indicates a stuck open EGR valve or debris temporarily lodged under the EGR valve seat (DTC P0402).

If the inferred ambient temperature is less than 0°C (32°F), or greater than 60°C (140°F), or the altitude is greater than 8,000 feet (BARO less than 22.5 in-Hg), the EGR monitor cannot be run reliably. In these conditions, a timer starts to accumulate the time in these conditions. If the vehicle leaves these extreme conditions, the timer starts to decrement, and, if conditions permit, attempts to complete the EGR flow monitor. If the timer reaches 800 seconds, the EGR monitor is disabled for the remainder of the current driving cycle and the EGR monitor I/M readiness bit is set to a ready condition after one such driving cycle. Vehicles require 2 such driving cycles for the EGR monitor to be set to a ready condition.

FUEL SYSTEMS

OVERVIEW

The fuel system supplies the sequential multiport fuel injection (SFI) fuel injectors with clean fuel at a controlled pressure. The powertrain control module (PCM) controls the fuel pump and monitors the fuel pump circuit. The PCM controls the fuel injector on/off cycle duration and determines the correct timing and amount of fuel delivered. When a new fuel injector is installed it is necessary to reset the learned values contained in the keep alive memory (KAM) in the PCM. Refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .

The 2 types of fuel systems used are:

- electronic returnless fuel
- mechanical returnless fuel

ELECTRONIC RETURNLESS FUEL SYSTEM (ERFS)

The ERFS consists of a fuel tank with reservoir, the fuel pump, the fuel rail pressure temperature (FRPT)

sensor, the fuel filter, the fuel supply line, the fuel rail, and the fuel injectors. For additional information on the fuel system components, refer to **ENGINE CONTROL COMPONENTS**. Operation of the system is as follows:

1. The fuel delivery system is enabled during key ON, engine OFF for 1 second and during crank or running mode once the PCM receives a crankshaft position (CKP) sensor signal.
2. The fuel pump logic is defined in the fuel system control strategy and is executed by the PCM.
3. The PCM commands a duty cycle to the fuel pump driver module (FPDM).
4. The FPDM modulates the voltage to the fuel pump (FP) required to achieve the correct fuel pressure. Voltage for the fuel pump is supplied by the power relay or FPDM power supply relay. For additional information refer to Fuel Pump Control and Fuel Pump Monitor.
5. The FRPT sensor measures the pressure and temperature of the fuel in the fuel rail. The PCM uses this information to vary the duty cycle output to the FPDM, which changes the fuel pressure, to compensate for varying loads and to avoid fuel system vaporization.
6. The fuel injector is a solenoid-operated valve that meters the fuel flow to each combustion cylinder. The fuel injector is opened and closed a constant number of times per crankshaft revolution. The amount of fuel is controlled by the length of time the fuel injector is held open. The fuel injector is normally closed, and is operated by a 12-volt source from either the electronic engine control (EEC) power relay or the fuel pump relay. The ground signal is controlled by the PCM.
7. There are 3 filtering or screening devices in the fuel delivery system. The intake filter is a fine, nylon mesh screen mounted on the intake side of the fuel pump. There is a fuel filter screen located at the fuel rail side of the fuel injector. The fuel filter assembly is located between the fuel pump and the fuel rail.
8. The fuel pump (FP) module is a device that contains the fuel pump and the fuel sender assembly. The fuel pump is located inside the reservoir and supplies fuel through the fuel pump module manifold to the engine and the fuel pump module jet pump.
9. The inertia fuel shut-off (IFS) switch is used to de-energize the fuel delivery secondary circuit in the event of a collision. The IFS switch is a safety device that should only be reset after a thorough inspection of the vehicle following a collision.

FUEL PUMP CONTROL - ERFS

NOTE: **The Mustang 5.4L uses 2 FPDMs to control fuel for the fuel delivery system. The PCM sends one FP duty cycle on the fuel pump control (FPC) circuit. This circuit is used by both FPDMs.**

The FP signal is a duty cycle command sent from the PCM to the FPDM. The FPDM uses the FP command to operate the fuel pump at the speed requested by the PCM or to turn the pump off. When the key is turned on,

the electric fuel pump runs for about 1 second and is requested off by the PCM if engine rotation is not detected

FUEL PUMP DUTY CYCLE OUTPUT FROM PCM

FP Duty Cycle Command	PCM Status	FPDM Actions
0-4%	The PCM does not output this duty cycle.	Invalid FP duty cycle. The FPDM sends 25% duty cycle signal on the fuel pump monitor (FPM) circuit. The fuel pump is off.
4-5%	Dead band range for transitions between FPDM states.	-
5-45%	Normal operation.	The FPDM operates the fuel pump at the speed requested. "FP duty cycle" x 2 equals pump speed % of full on. (for example, FP duty cycle equals 42%. 42x2 equals 84. Pump is run at 84% of full on). The FPDM sends 50% duty cycle signal on FPM circuit.
45-48%	Normal operation. An open circuit cannot be detected in this range.	The FPDM operates the fuel pump at the speed requested. "FP duty cycle" x 2 equals pump speed % of full on. The FPDM sends 50% duty cycle signal on FPM circuit.
48-51%	Normal operation.	The FPDM operates the fuel pump at full on. The FPDM sends 50% duty cycle signal on FPM circuit.
51-52%	Dead band range for transitions between FPDM states.	-
52-68%	The PCM does not output this duty cycle.	Invalid FP duty cycle. The FPDM sends 25% duty cycle signal on the FPM circuit. The fuel pump is off.
68-70%	Dead band range for transitions between FPDM states.	-
70-81%	To request the fuel pump off, the PCM outputs this duty cycle.	Valid fuel pump off command from the PCM. The FPDM does not operate the fuel pump. The FPDM sends a 50% duty cycle signal on the FPM circuit.
81-83%	Dead band range for transitions between FPDM states.	-
83-100%	The PCM does not output this duty cycle.	Invalid FP duty cycle. The FPDM sends 25% duty cycle signal on the FPM circuit. The fuel pump is off.

For additional information, refer to **POWERTRAIN CONTROL HARDWARE**, Fuel Pump Driver Module (FPDM).

FUEL PUMP MONITOR (FPM) - ERFS

NOTE: The Mustang 5.4L uses 2 FPDMs to control fuel for the fuel delivery system. The PCM individually monitors both FPDMs through the FPM and FPM2 circuits.

The FPDM communicates diagnostic information to the PCM through the FPM circuit. This information is sent by the FPDM as a duty cycle signal. The 3 duty cycle signals that may be sent are listed in the following table.

FUEL PUMP DRIVER MODULE DUTY CYCLE SIGNALS

Duty Cycle	Comments	FP_M PID[a]
50%	This duty cycle indicates that the FPDM is functioning normally.	80-125%
25%	This duty cycle indicates that the FPDM either did not receive a fuel pump (FP) duty cycle command from the PCM or did not receive a valid FP duty cycle command from the PCM.	15-60%
75%	This duty cycle indicates that the FPDM detects a concern in the circuits between the fuel pump and FPDM.	250-400%

[a] Some scan tools display the FP_M PID as the duty cycle in column 1. Other scan tools display the FP_M PID as a value shown in the FP_M PID column. This value fluctuates randomly. It is OK for the value to briefly go outside this range, then return.

For additional information, refer to **POWERTRAIN CONTROL HARDWARE**, Fuel Pump Driver Module (FPDM).

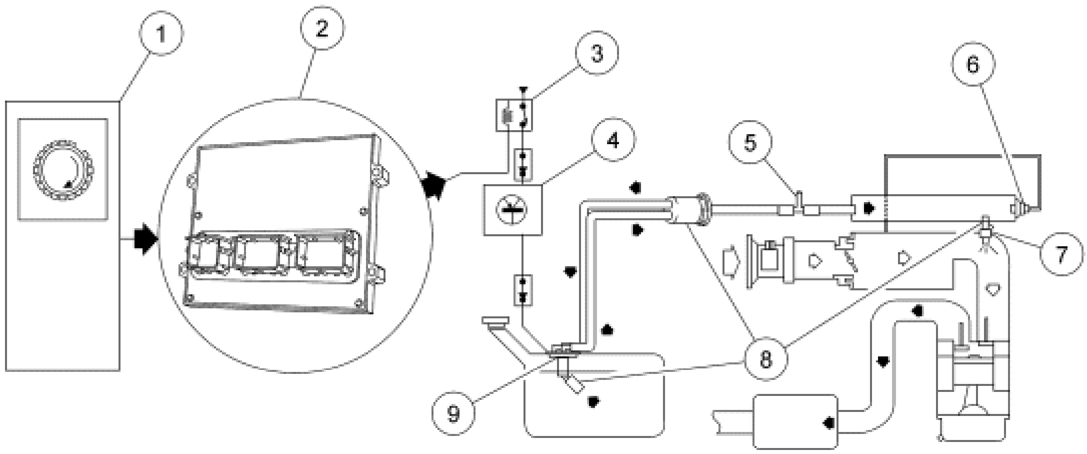
MECHANICAL RETURNLESS FUEL SYSTEM (MRFS)

The MRFS consists of a fuel tank with reservoir, the fuel pump, the fuel pressure regulator, the fuel filter, the fuel supply line, the fuel rail, the fuel rail pulse damper (if equipped), fuel injectors, and a Schrader valve/pressure test point. For additional information on the fuel system components, refer to **ENGINE CONTROL COMPONENTS**. Operation of the system is as follows:

1. The fuel delivery system is enabled during key ON, engine OFF for 1 second and during crank or running mode once the PCM receives a CKP sensor signal.
2. The fuel pump logic is defined in the fuel system control strategy and is executed by the PCM.
3. The PCM grounds the fuel pump relay, which provides power to the fuel pump.
4. The IFS switch is used to de-energize the fuel delivery secondary circuit in the event of collision. The IFS switch is a safety device that should only be reset after a thorough inspection of the vehicle following a collision.
5. A pressure test point valve, Schrader valve, is located on the fuel rail and is used to measure the fuel injector supply pressure for diagnostic procedures and repairs. On vehicles not equipped with a Schrader valve, use the Rotunda Fuel Pressure Test Kit 134-R0087 or equivalent.
6. A pulse damper is located on the fuel rail (if equipped). The pulse damper reduces the fuel system noise

caused by the pulsing of the fuel injectors. The vacuum port located on the damper is connected to manifold vacuum to avoid fuel spillage if the pulse damper diaphragm ruptures. The pulse damper should not be confused with a fuel pressure regulator.

7. The fuel injector is a solenoid-operated valve that meters the fuel flow to each combustion cylinder. The fuel injector is opened and closed a constant number of times per crankshaft revolution. The amount of fuel is controlled by the length of time the fuel injector is held open. The fuel injector is normally closed, and is operated by a 12-volt source from either the EEC power relay or the fuel pump relay. The ground signal is controlled by the PCM.
8. There are 3-5 filtering or screening devices in the fuel delivery system. For additional information refer to Fuel Filters.
9. The fuel pump (FP) module contains the fuel pump, the fuel pressure regulator, and the fuel sender assembly. The fuel pressure regulator is attached to the FP module and regulates the pressure of the fuel supplied to the fuel injectors. The fuel pressure regulator controls the pressure of the clean fuel as the fuel returns from the fuel filter. The fuel pressure regulator is a diaphragm-operated relief valve. Fuel pressure is established by a spring preload applied to the diaphragm. The FP module is located in the fuel tank.



N0072951

Fig. 78: Typical Mechanical Returnless Fuel System with External Fuel Filter
Courtesy of FORD MOTOR CO.

FUEL PUMP CONTROL - MRFS

The output signal from the PCM, FP, is used to control the electric fuel pump. With the EEC power relay contacts closed, vehicle power (VPWR) is sent to the coil of the fuel pump relay. For electric fuel pump operation, the PCM grounds the FP circuit, which is connected to the coil of the fuel pump relay. This energizes the coil and closes the contacts of the relay, sending B+ through the FP PWR circuit to the electric fuel pump. When the key is turned on, the electric fuel pump runs for about 1 second and is turned off by the PCM if engine rotation is not detected.

FUEL PUMP MONITOR (FPM) - MRFS

The FPM circuit is spliced into the fuel pump power (FP PWR) circuit and is used by the PCM for diagnostic purposes. The PCM sources a low current voltage down the FPM circuit. With the fuel pump off, this voltage is pulled low by the path to ground through the fuel pump. With the fuel pump off and the FPM circuit low, the

PCM can verify that the FPM circuit and the FP PWR circuit are complete from the FPM splice through the fuel pump to ground. This also confirms that the FP PWR or FPM circuits are not short to power. With the fuel pump on, voltage is now being supplied from the fuel pump relay to the FP PWR and FPM circuits. With the fuel pump on and the FPM circuit high, the PCM can verify that the FP PWR circuit from the fuel pump relay to the FPM splice is complete. It can also verify that the fuel pump relay contacts are closed and there is a B+ supply to the fuel pump relay.

FUEL FILTERS

The system contains 3-5 filtering or screening devices. Refer to **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** for the individual component locations.

1. The fuel intake filter or screen is a fine nylon mesh filter mounted on the intake side of the fuel pump. It is part of the assembly and cannot be repaired separately.
2. The filter/screen at the fuel rail port of the injectors is part of the fuel injector assembly and cannot be repaired separately.
3. The filter/screen at fuel inlet side of the fuel pressure regulator is part of the regulator assembly and cannot be repaired separately.
4. The fuel filter assembly is located between the fuel pump and the pressure test point (Schrader valve) or injectors. This filter may be a lifetime fuel filter located in the fuel pump module or an external 3-port inline filter that allows clean fuel to return to the fuel tank. A new filter may be installed for the external filter.
5. The fuel filter sock is located on the fuel pump module between the reservoir and the fuel tank.

PRESSURE TEST POINT

On some applications there is a pressure test point with a Schrader fitting in the fuel rail that relieves the fuel pressure and measures the fuel injector supply pressure for repair and diagnostic procedures. Before repairing or diagnosing the fuel system, read any WARNING, CAUTION, and HANDLING information. On vehicles not equipped with a Schrader valve, use the Rotunda Fuel Pressure Test Kit 134-R0087 or equivalent.

IGNITION SYSTEMS

OVERVIEW

The ignition system is designed to ignite the compressed air/fuel mixture in an internal combustion engine by a high voltage spark delivered from an ignition coil controlled by the powertrain control module (PCM).

INTEGRATED ELECTRONIC IGNITION SYSTEM

NOTE: **Electronic ignition engine timing is entirely controlled by the PCM. Electronic ignition engine timing is not adjustable. Do not attempt to check base timing. You will receive false readings.**

The integrated electronic ignition system consists of a crankshaft position (CKP) sensor, coil pack(s), connecting wiring, and a PCM. For additional information on the ignition system components, refer to

ENGINE CONTROL COMPONENTS. The coil on plug (COP) integrated electronic ignition system uses a separate coil per spark plug, and each coil is mounted directly onto the plug. The COP integrated electronic ignition system eliminates the need for spark plug wires, but does require input from the camshaft position (CMP) sensor. Operation of the components are as follows:

1. The CKP sensor is used to indicate the crankshaft position and speed by sensing a missing tooth on a pulse wheel mounted to the crankshaft. The CMP sensor is used by the COP integrated electronic ignition system to identify the compression stroke of cylinder 1 and to synchronize the firing of the individual coils.
2. The PCM uses the CKP signal to calculate a spark target and then fires the coil pack(s) to that target shown. The PCM uses the CMP sensor to identify the compression stroke of cylinder 1, and to synchronize the firing of the individual coils.
3. The PCM controls the ignition coils after it calculates the spark target. The COP system fires only one spark plug per coil upon synchronization during the compression stroke. For the coil pack ignition system, each coil within a pack fires 2 spark plugs at the same time. The plugs are paired so that as one fires during the compression stroke the other fires during the exhaust stroke. The next time the coil is fired the situation is reversed.

   The current flow, or dwell, through the primary ignition coil is controlled by the PCM by providing a switched ground path through the ignition coil driver to ground. When the ignition coil driver is switched on, current rapidly builds up to a maximum value, determined by the coil inductance and resistance. When the current is switched off, the magnetic field collapses which induces a secondary high voltage surge and the spark plug is fired. This high voltage surge creates a fly back voltage which the PCM uses as a feedback during the ignition diagnostics. The PCM uses the charge current dwell time characteristics to carry out the ignition diagnostics.

4. The PCM processes the CKP signal and uses it to drive the tachometer as the clean tach out (CTO) signal.

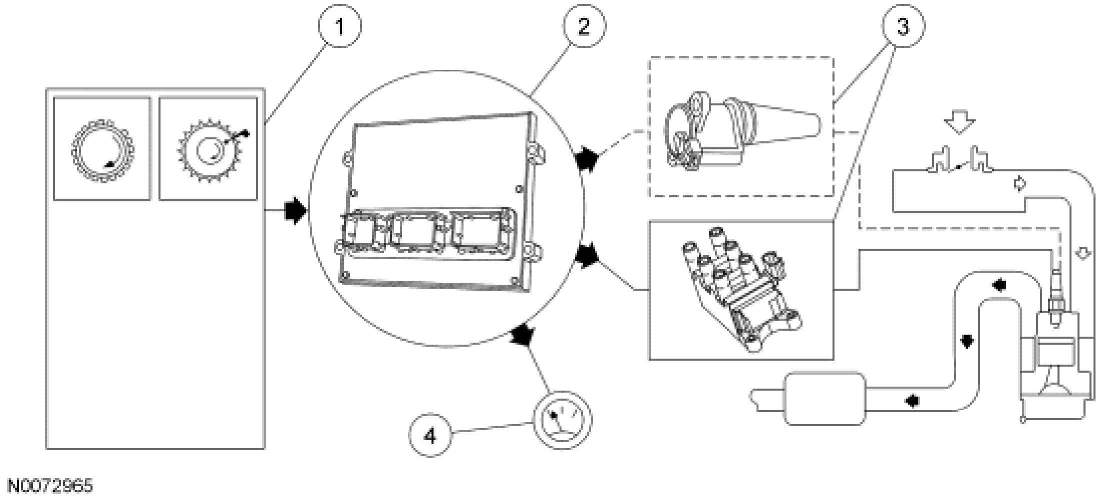


Fig. 79: Integrated Electronic Ignition System
Courtesy of FORD MOTOR CO.

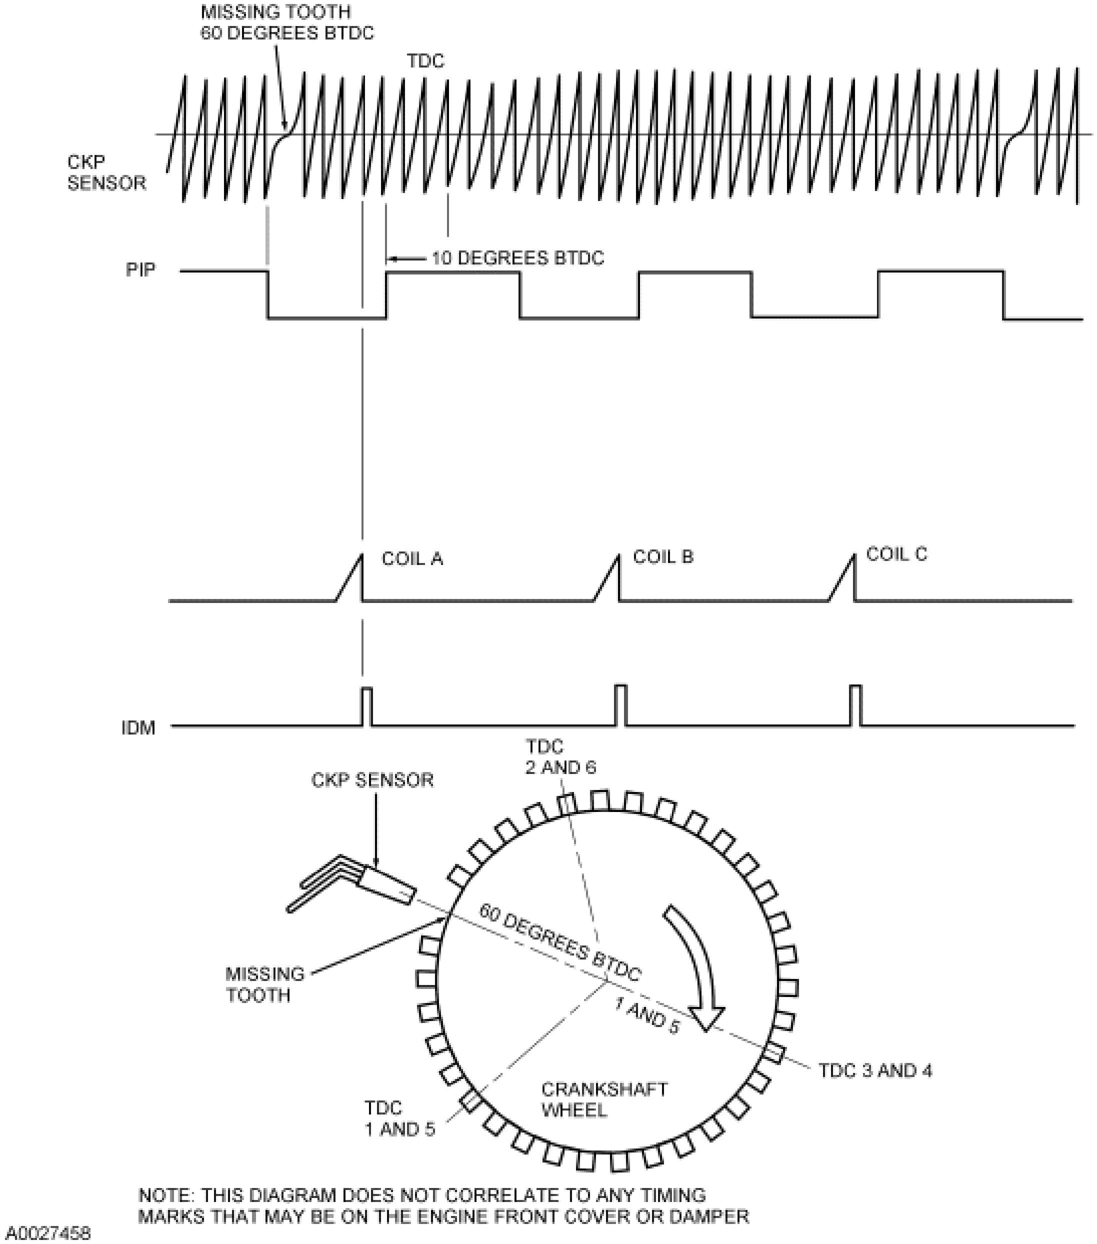

Fig. 80: Six Cylinder Integrated Electronic Ignition Waveforms (4, 8, And 10-Cylinder Are Similar)
Courtesy of FORD MOTOR CO.

ENGINE CRANK/ENGINE RUNNING

During engine crank the PCM fires 2 spark plugs simultaneously. Of the 2 plugs simultaneously fired one will be under compression the other will be on the exhaust stroke. Both plugs fire until camshaft position is identified by a successful CMP sensor signal. Once camshaft position is identified only the cylinder under compression is fired.

CMP FMEM

During CMP FMEM the COP ignition works the same as during engine crank. This allows the engine to operate without the PCM knowing if cylinder one is under compression or exhaust.

INTAKE AIR SYSTEMS

OVERVIEW

The intake air system provides clean air to the engine, optimizes air flow, and reduces unwanted induction noise. The intake air system consists of an air cleaner assembly, resonator assemblies, and hoses. Some vehicles use a hydrocarbon filter trap to help reduce emissions by preventing fuel vapor from escaping into the atmosphere from the intake when the engine is off. It is typically located inside the air intake system. The mass air flow (MAF) sensor is attached to the air cleaner assembly and measures the volume of air delivered to the engine. The hydrocarbon trap is part of the EVAP system. For more information on the EVAP system, refer to **EVAPORATIVE EMISSION (EVAP) SYSTEMS**. The MAF sensor can be replaced as an individual component. The intake air system also contains a sensor that measures the intake air temperature (IAT), which is also integrated with the MAF sensor. For additional information on the intake air system components, refer to **ENGINE CONTROL COMPONENTS**. Intake air components can be separate components or part of the intake air housing. The function of a resonator is to reduce induction noise. The intake air components are connected to each other and to the throttle body assembly with hoses.

THROTTLE BODY SYSTEM OVERVIEW

NOTE: This overview is for applications without electronic throttle control (ETC). For ETC applications, refer to TORQUE BASED ELECTRONIC THROTTLE CONTROL (ETC).

NOTE: The traditional idle air adjust procedure and the throttle return screw are no longer used on OBD applications.

The throttle body system meters air to the engine during idle, part throttle, and wide open throttle (WOT) conditions. The throttle body system consists of an idle air control (IAC) valve assembly, an idle air orifice, single or dual bores with butterfly valve throttle plates, and a throttle position (TP) sensor. One other source of idle air flow is the positive crankcase ventilation (PCV) system. The combined idle air flow (from idle air orifice IAC flow and PCV flow) is measured by the MAF sensor on all applications.

During idle, the throttle body assembly provides a set amount of air flow to the engine through the idle air passage and the PCV valve. The IAC valve assembly provides additional air when commanded by the powertrain control module (PCM) to maintain the correct engine idle speed under varying conditions. The IAC valve assembly mounts directly to the intake manifold assembly in most applications. Idle speed is controlled by the PCM and cannot be adjusted.

Throttle rotation is controlled by a cam/cable linkage to slow the initial opening rate of the throttle plate. The TP sensor monitors the throttle position and provides a signal to the PCM. Some throttle body applications provide an air supply channel upstream of the throttle plate to provide fresh air to the PCV or IAC systems. Other throttle body applications provide individual vacuum taps downstream of the throttle plate for PCV return, exhaust gas recirculation (EGR), evaporative emission (EVAP), and miscellaneous control signals.

Throttle Body System Hardware - The major components of the throttle body assembly include the TP sensor, the IAC valve assembly, and the throttle body housing assembly. For additional information on the intake air system components, refer to **ENGINE CONTROL COMPONENTS**.

Throttle Body Housing - The throttle body housing assembly is a single piece aluminum or plastic casting with an air passage and a butterfly throttle plate with linkage mechanisms. When the throttle plate is in the idle (or closed) position, the throttle lever arm should be in contact with the throttle return stop. The throttle return stop prevents the throttle plate from contacting the bore and sticking closed. The setting also establishes the amount

of air flow between the throttle plate and bore. To minimize the closed plate air flow, a special coating is applied to the throttle plate and bore to help seal this area. This sealant/coating also makes the throttle body resistant to engine intake sludge accumulation.

Features of the Throttle Body Assembly include:

1. IAC valve assembly mounted directly to the throttle body assembly (some vehicles).
2. A pre-set stop to locate the WOT position.
3. An air supply channel upstream of the throttle plate to provide fresh air to the PCV system (some vehicles only).
4. Individual vacuum taps for PCV, EGR, EVAP and miscellaneous control signals (some vehicles only).
5. PCV air return (if applicable).
6. A throttle body-mounted TP sensor.
7. A sealant/coating on the throttle bore and throttle plate makes the throttle body air flow tolerant to engine intake sludge accumulation. These throttle body assemblies must not be cleaned and have a white/black attention decal advising not to clean.
8. A non-adjustable stop screw for close plate idle air flow.

OVERVIEW OF THE INTAKE MANIFOLD RUNNER CONTROL (IMRC) AND INTAKE MANIFOLD TUNING VALVE (IMTV) SYSTEMS

There are 3 basic types of intake air sub-systems:

- IMRC electric actuated system
- IMRC vacuum actuated system
- IMTV

There are several different styles of hardware used to control airflow within the engine air intake system. In general, the devices are defined based on whether they control in-cylinder motion (charge motion) or manifold dynamics (tuning).

The IMRC is a charge motion device that modifies the air charge motion in the manifold. The IMRC control valve is located close to the intake valve/cylinder head. The IMRC actuator can be either electric or vacuum controlled. The IMRC system must have a monitor feedback system in order to meet OBD-II regulations.

The IMTV is a manifold tuning device that effects the air flow volume of the manifold by connecting multiple plenums or inlets within the manifold system. The IMTV control valve is located in the center of the intake manifold away from the intake valve or cylinder head. The IMTV actuator can be either electric or vacuum controlled. The IMTV system does not have to be monitored for OBD-II regulations.

Some vehicles may use both systems.

These subsystems are used to provide increased intake airflow to improve torque, emissions and performance. The overall volume of air metered to the engine is controlled by the throttle body. Vehicles equipped with electronic throttle control (ETC) do not use idle air control (IAC).

INTAKE MANIFOLD RUNNER CONTROL (IMRC) ELECTRIC ACTUATED SYSTEM

WARNING: Substantial opening and closing torque is applied by this system. To prevent injury, be careful to keep fingers away from lever mechanisms when actuated. Failure to follow these instructions may result in personal injury.

The IMRC electric actuated system consists of a remote mounted motorized actuator with an attaching linkage for each housing on each bank. For additional information on IMRC components, refer to **ENGINE CONTROL COMPONENTS**. The linkage attaches to the housing butterfly plate levers. Some variations can have either 2 intake air passages for each cylinder with one passageway that is always open and the other is opened and closed with a butterfly valve plate. The other type has a butterfly valve with a small passageway that opens up into a larger size orifice when the butterfly plates are opened. The butterfly valve plates are opened and closed by an electric motor and the motorized actuator houses an internal switch or switches, depending on the application, to provide feedback to PCM indicating the butterfly valve plate position. If the IMRC system is not working correctly then a DTC is set.

Below approximately 3,000 RPM, the motorized actuator is not energized. This allows the linkage to fully extend and the butterfly valve plates to remain closed. Above approximately 3,000 RPM the motorized actuator is energized. The attaching linkage pulls the butterfly valve plates into the open position. Some vehicles activate the IMRC near 1,500 RPM.

1. The PCM uses the TP sensor and CKP signals to determine activation of the IMRC system. There must be a positive change in voltage from the TP sensor along with the increase in RPM to open the valve plates.
2. The PCM uses the information from the input signals to control the IMRC motorized actuator based upon RPM and changes in the throttle position.
3. The PCM energizes the actuator to open the butterfly plates.
4. The IMRC housing contains butterfly plates to allow increased air flow.

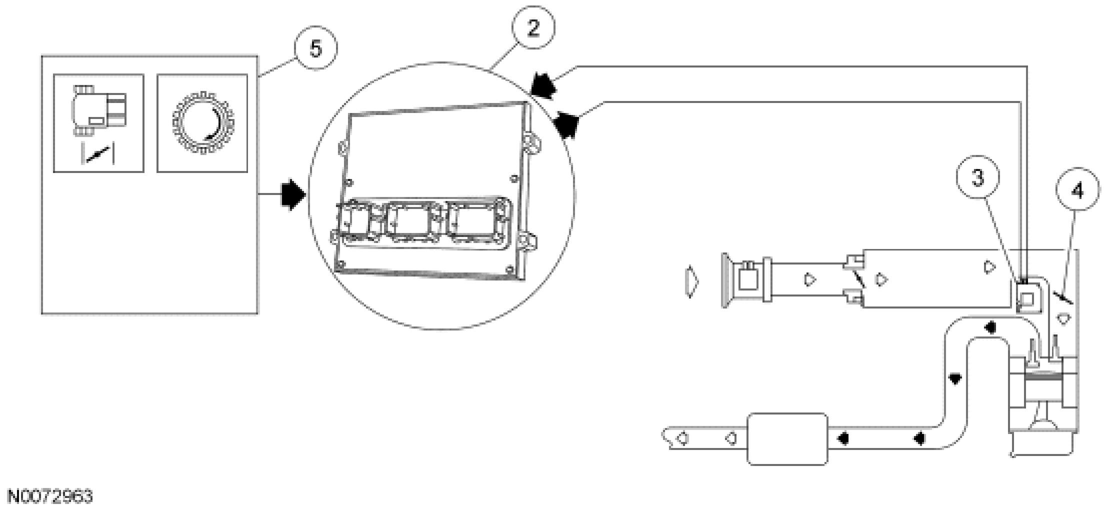

Fig. 82: Intake Manifold Runner Control (IMRC) Electric Actuated System
Courtesy of FORD MOTOR CO.

INTAKE MANIFOLD RUNNER CONTROL (IMRC) VACUUM ACTUATED SYSTEM

WARNING: **Substantial opening and closing torque is applied by this system. To prevent injury, be careful to keep fingers away from lever mechanisms when actuated. Failure to follow these instructions may result in personal injury.**

The IMRC vacuum actuated system consists of a manifold mounted vacuum actuator and a PCM controlled electric solenoid. For additional information on IMRC vacuum actuated components, refer to **ENGINE CONTROL COMPONENTS**. The linkage from the actuator attaches to the manifold butterfly plate lever. The IMRC actuator and manifold are composite/plastic with a single intake air passage for each cylinder. The passage has a butterfly valve plate that blocks a large percentage of the opening when actuated, leaving the top of the passage open to generate turbulence. The housing uses a return spring to hold the butterfly valve plates open. The vacuum actuator houses an internal monitor circuit to provide feedback to the PCM indicating the butterfly valve plate position.

Below approximately 3,000 RPM, the vacuum solenoid is energized. This allows manifold vacuum to be applied and the butterfly valve plates to remain closed. Above approximately 3,000 RPM, the vacuum solenoid is de-energized. This allows vacuum to vent from the actuator and the butterfly valve plates to open.

1. The PCM monitors the TP sensor, CHT, and CKP signals to determine activation of the IMRC system. There must be a positive change in voltage from the TP sensor along with the increase in RPM at the correct engine temperature to open the valve plates.
2. The PCM uses the information from the input signals to control the IMRC electric solenoid based upon changes in the throttle position, the engine temperature, and the RPM.
3. The PCM energizes the solenoid with the key on and the engine running. Vacuum is then applied to the actuator to pull the butterfly plates closed.

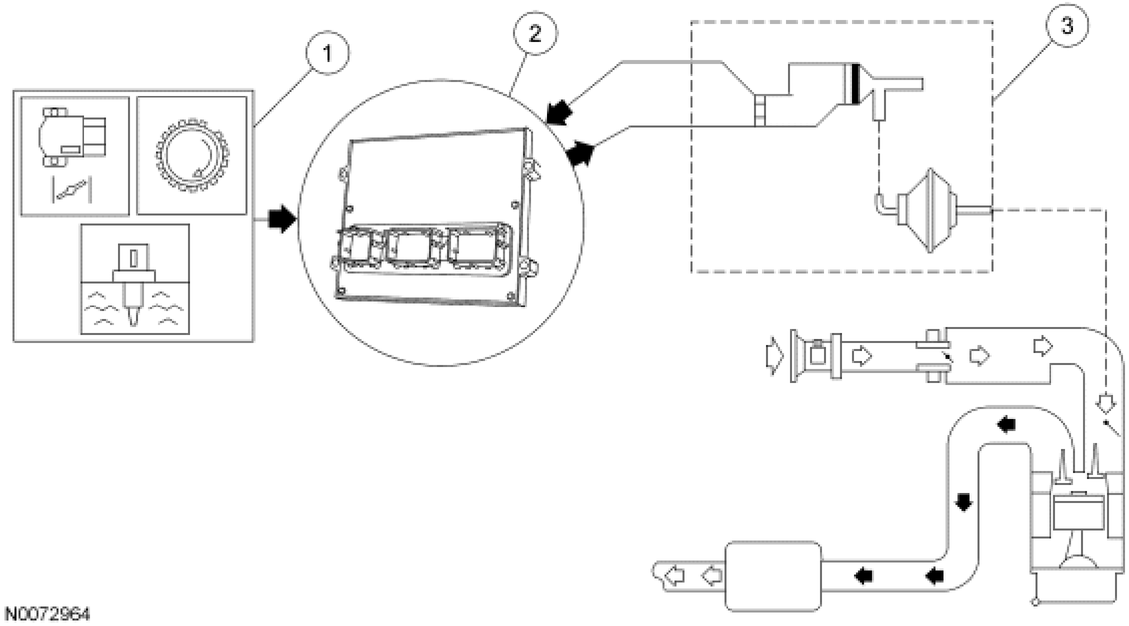

Fig. 83: Intake Manifold Runner Control (IMRC) Vacuum Actuated System

Courtesy of FORD MOTOR CO.

INTAKE MANIFOLD TUNING VALVE (IMTV) SYSTEM

WARNING: **Substantial opening and closing torque is applied by this system. To prevent injury, be careful to keep fingers away from lever mechanisms when actuated. Failure to follow these instructions may result in personal injury.**

The IMTV is a motorized actuated unit mounted directly to the intake manifold. For additional information on IMTV components, refer to **ENGINE CONTROL COMPONENTS**.

The motorized IMTV unit is not energized below approximately 2,600 RPM. The shutter is in the closed position not allowing airflow blend to occur in the intake manifold. Above approximately 2,600 RPM the motorized unit is energized. The motorized unit is commanded on by the PCM initially at a 100 percent duty cycle to move the shutter to the open position, and then falling to approximately 50 percent to continue to hold the shutter open.

1. The PCM uses the TP sensor and CKP signals to determine activation of the IMTV system. There must be a positive change in voltage from the TP sensor along with the increase in RPM to open the shutter.
2. The PCM uses the information from the input signals to control the IMTV.
3. When commanded on by the PCM, the motorized actuator shutter opens up the end of the vertical separating wall at high engine speeds to allow both sides of the manifold to blend together.

POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM

OVERVIEW

The PCV system cycles crankcase gases back through the intake air system into the engine where they are

burned. The PCV valve regulates the amount of ventilated air and blow-by gases to the intake manifold.

Currently, both heated and non-heated PCV systems are used. The heated systems use either a water heated valve, an electrically heated valve, or an electrically heated tube. Engine coolant flows around the water heated valve to prevent it from freezing. Electrically heated systems use a heating element enclosed in the PCV valve, PCV fitting or the PCV tube to prevent the valve or tube from freezing. The valve or the tube heater can be controlled by either the powertrain control module (PCM) or the thermal harness.

- Thermal harness controlled heater - On vehicle applications that are equipped with a thermal harness to the PCV valve or tube. The thermal harness only provides electrical continuity to the heating element when temperatures are less than 5°C +/- 4°C (40°F +/- 7°F). Typically this harness is located close to the PCV valve or tube.
- PCM controlled heater - On these applications the PCV heater is turned on by the PCM. When the intake air temperature is less than 0°C (32°F) the PCM grounds the positive crankcase ventilation valve heater control (PCVHC) circuit and turns the heater ON. When the intake air temperature exceeds 9°C (48°F) the heater is turned OFF. The PCV heater is also OFF when the engine is not running to prevent unnecessary battery drain. The heater is also OFF if the vehicle charging system is greater than 16 volts. This minimizes heater element overload.

PCV systems that comply with OBD PCV monitoring requirements use a quarter-turn cam-lock thread design at one end to prevent accidental disconnection from the valve cover. For more information about the PCV monitor refer to **POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM MONITOR**.

PCV Types

Heated Tubes

- PCM-controlled (no thermistor in harness)
- non-PCM controlled (thermistor in harness)

PCV Valves

- water heated
- non-heated
- PCM-controlled
- non-PCM controlled electrically heated thermistor in harness

Refer to the following figures for examples of these types of PCV valves.

POWERTRAIN CONTROL MODULE (PCM) CONTROLLED CHARGING SYSTEM

OVERVIEW

NOTE:	**When the battery (or PCM) is disconnected and connected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The charging system set point may also vary. The vehicle may need to be driven to relearn its strategy.**

The PCM-controlled charging system provides many additional benefits over the current integral generator regulator system. The first benefit is improved battery life. In a PCM-controlled charging system, the regulator voltage set point is determined by the PCM and communicated to the regulator through the generator regulator control (GENRC) circuit. The PCM uses an algorithm to estimate battery temperature. Improving battery temperature estimates reduces battery damage caused by over- and undercharging.

The second benefit is improved engine performance. Whenever the PCM senses a wide open throttle (WOT) condition, the PCM momentarily lowers the regulator voltage set point. This reduces the torque load of the generator on the engine and improves acceleration. The PCM has a calibratable time limit on this reduced voltage feature. This is to prevent the generator output from being cut back for an extended WOT period, which could cause battery discharge.

The third benefit is improved idle stability. In response to the PCM GENRC signal, the regulator uses a generator load input (GENLI) signal to provide feedback to the PCM. The GENLI signal provides the PCM with charging system information. Specifically, it lets the PCM know when the charging system receives a transient electrical load which would normally affect idle stability. Because the PCM can anticipate additional loads, actions can be taken to minimize idle sag. The PCM can choose to either reduce the regulator set point or increase engine idle speed, both of which are calibratable features. In order to establish whether the regulator is accurately maintaining the desired voltage set point, the regulator uses a charging system voltage line to sense battery voltage.

The fourth benefit is reduced cranking efforts. The PCM can reduce the mechanical load on the starter by initially commanding a low voltage set point. This may improve start times.

If the PCM detects a charging system error, it broadcasts a low voltage telltale (ON) network communication message which tells the cluster to illuminate the charge indicator. The charge indicator is illuminated if the PCM does not see a signal on the GENLI circuit for a time period greater than 500 milliseconds. This telltale command is also used to indicate over-voltage conditions detected by the PCM-controlled generator.

Each time the ignition switch is cycled to the run position, the instrument cluster initiates a bulb check by illuminating the charge indicator. It is the responsibility of the PCM to issue a low voltage telltale (OFF) command if the charging system is functioning correctly. This message should be sent during the network initialization in the voluntary phase (250 milliseconds to 450 milliseconds after the ignition switch is cycled to the run position). If a low voltage telltale (OFF) communications network message is not received, the instrument cluster continues to illuminate the charge indicator indefinitely.

SECONDARY AIR INJECTION (AIR) SYSTEM

OVERVIEW

The secondary AIR system controls emissions during the first few seconds of engine operation by forcing air downstream into the exhaust manifolds to oxidize the hydrocarbons and carbon monoxide created by running rich at start up.

SECONDARY AIR SYSTEM

The secondary AIR system consists of an secondary AIR pump, check air injection diverter (AIR diverter)

valve, an secondary AIR bypass solenoid, an AIR relay, a powertrain control module (PCM) and connecting wires, and vacuum hoses. For additional information on the secondary AIR system components, refer to **ENGINE CONTROL COMPONENTS**.

1. The PCM requires engine coolant temperature (ECT) or cylinder head temperature (CHT), mass air flow/intake air temperature (MAF/IAT), and crankshaft position (CKP) sensor inputs to initiate the secondary air injection function.
2. When the engine is started, the strategy determines when to enable the secondary AIR pump. The PCM signals the AIR relay and the AIR bypass solenoid, after a 5 to 15 second delay, to begin system operation. Once the catalyst is lit-off, the PCM then signals the AIR relay to stop secondary AIR pump operation and to close the AIR bypass solenoid from supplying vacuum to the AIR diverter valve.
3. The AIR relay provides the start-up signal and switches the high current required to operate the secondary AIR pump.
4. The AIR bypass solenoid applies a vacuum to the AIR diverter valve(s) causing it to open and to allow air to flow into the exhaust manifolds.
5. The secondary AIR pump draws dry filtered air from the intake air system downstream of the MAF/IAT sensor.
6. The secondary AIR pump delivers the required amount of air to control emissions during engine operation. Air is forced into the exhaust manifolds to oxidize the hydrocarbons and carbon monoxide created by running rich at start up.

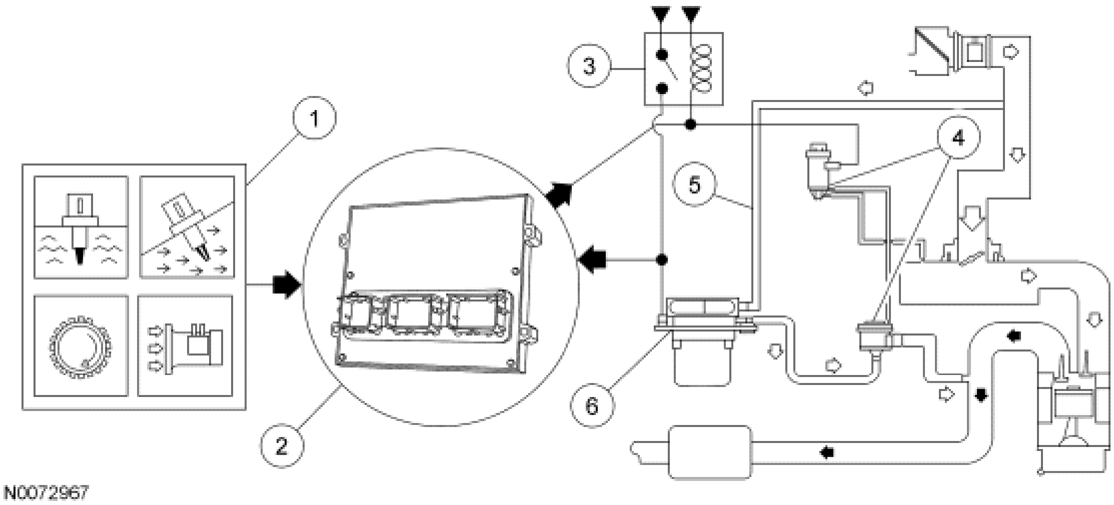

Fig. 91: Secondary Air Injection (AIR) System
Courtesy of FORD MOTOR CO.

SUPERCHARGER AND CHARGE AIR COOLER (CAC) SYSTEMS

SUPERCHARGER ASSEMBLY

The supercharger assembly is a positive displacement pump. The supercharger will supply an excess volume of intake air to the engine by increasing air pressure and density in the intake manifold. The supercharger assembly incorporates the bypass system to reduce air handling losses when boost is not required, resulting in better fuel economy. When integrated on the engine the supercharger increases torque across the entire engine operating

range from 25 to 50 percent without compromising driveability or emissions. The supercharger is matched to the engine by its displacement, and belt ratio and can provide excess airflow at any engine speed. It contains 2 screw-type 3-lobed rotors. The helical shape of the rotors and specialized porting provide a smooth discharge flow and a low level of noise during operation. The rotors are supported by ball bearings in front and needle bearings at the rear.

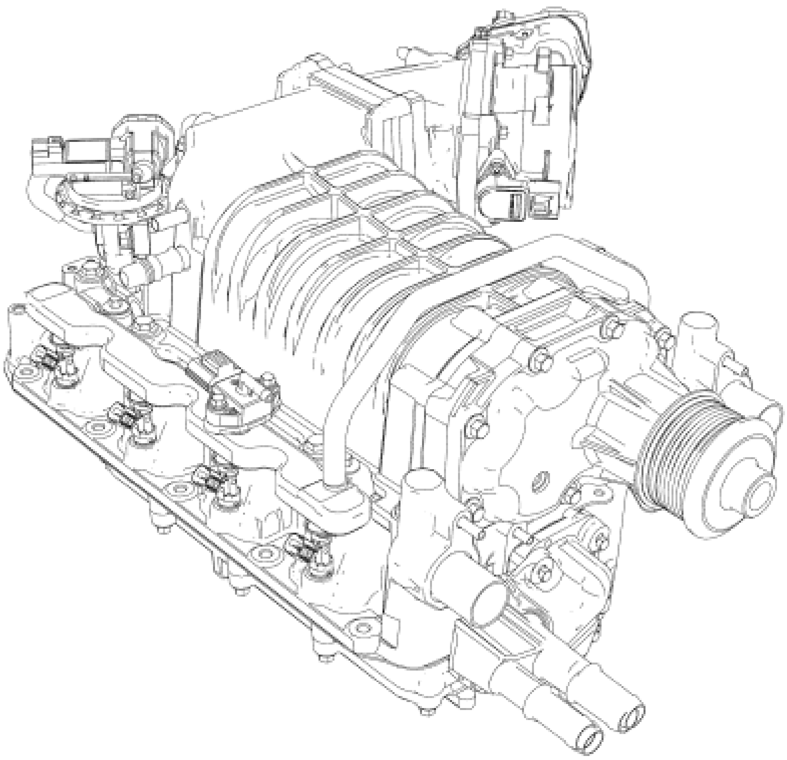

Fig. 92: 5.4L Supercharger Assembly
Courtesy of FORD MOTOR CO.

SUPERCHARGER BYPASS (SCB) SYSTEM

The SCB system allows the high pressure air at the outlet of the supercharger to vent back into the inlet of the supercharger, equalizing the pressure. This eliminates the boost (increased pressure that the supercharger produces) for times when supercharger function is undesirable. The system uses a vacuum bypass actuator, which controls the bypass valve inside the supercharger. The system normally operates with engine vacuum applied to the upper port of the vacuum bypass actuator, while the lower port references the air pressure in the clean air tube to cancel out any pressure difference in the intake air system. The actuator is set to open (bypassing the supercharger) during high vacuum engine conditions. As the throttle is opened and engine vacuum decreases, the actuator closes to allow the supercharger to pressurize the air in the manifold.

CHARGE AIR COOLER (CAC) SYSTEM

The CAC system is designed to cool the intake air which has been heated by the supercharger. The removal of heat from the pressurized air going into the CAC increases the air density which improves combustion efficiency, engine horsepower, and torque. The system consists of an additional CAC radiator in the grille, a reservoir (independent from the engine cooling system), an electric water pump, the CAC located in the lower

intake manifold, and tubing to interconnect these components. The CAC is positioned after the supercharger directly in the flow of the intake air. As the heated air flows through the CAC, heat is transferred to the coolant which is circulated back to the CAC radiator to be cooled by the airflow through the grille. The CAC pump is controlled by the powertrain control module (PCM). The PCM maintains a desirable intake air temperature by monitoring a second intake air temperature (IAT2) sensor in the lower intake manifold.

TORQUE BASED ELECTRONIC THROTTLE CONTROL (ETC)

OVERVIEW

The torque based ETC is a hardware and software strategy that delivers an engine output torque (via throttle angle) based on driver demand (pedal position). It uses an electronic throttle body, the powertrain control module (PCM), and an accelerator pedal assembly to control the throttle opening and engine torque.

Torque based ETC enables aggressive automatic transmission shift schedules (earlier upshifts and later downshifts). This is possible by adjusting the throttle angle to achieve the same wheel torque during shifts, and by calculating this desired torque, the system prevents engine lugging (low RPM and low manifold vacuum) while still delivering the performance and torque requested by the driver. It also enables many fuel economy/emission improvement technologies such as variable camshaft timing (VCT) (deliver same torque during transitions).

Torque based ETC also results in less intrusive vehicle and engine speed limiting, along with smoother traction control.

Other benefits of ETC are:

- eliminate cruise control actuators
- eliminate idle air control (IAC) valve
- better airflow range
- packaging (no cable)
- more responsive powertrain at altitude and improved shift quality

The ETC system illuminates a powertrain malfunction indicator (wrench) on the instrument cluster when a concern is present. Concerns are accompanied by diagnostic trouble codes (DTCs) and may also illuminate the malfunction indicator lamp (MIL).

ELECTRONIC THROTTLE BODY (ETB)

The ETB has the following characteristics:

- The throttle actuator control (TAC) motor is a DC motor controlled by the PCM (requires 2-wires).
- There are 2 designs: parallel and inline. The parallel design has the motor under the bore parallel to the plate shaft. The motor housing is integrated into the main housing. The inline design has a separate motor housing.
- An internal spring is used in both designs to return the throttle plate to a default position. The default position is typically a throttle angle of 7 to 8 degrees from the hard stop angle.
- The closed throttle plate hard stop is used to prevent the throttle from binding in the bore (approximately 0.75 degree). This hard stop setting is not adjustable and is set to result in less airflow than the minimum engine airflow required at idle.
- The required idle airflow is provided by the plate angle in the throttle body assembly. This plate angle controls idle, idle quality, and eliminates the need for an IAC valve.
- There is 1 reference voltage and 1 signal return circuit between the PCM and the ETB. The reference voltage circuit and the signal return circuit is shared with the reference voltage circuits and signal return circuits used by the APP sensor. There are also 2 TP signal circuits for redundancy. The redundant TP signals are required for increased monitoring reasons. The first TP signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second signal (TP2) has a positive slope (increasing angle, increasing voltage). The TP2 signal reaches a limit of approximately 4.5 volts at approximately 45 degrees of throttle angle.

ACCELERATOR PEDAL POSITION (APP) SENSOR

Depending on the application either a 2-track or 3-track APP sensor is used. For additional information on the APP sensor, refer to **ENGINE CONTROL COMPONENTS**.

ELECTRONIC THROTTLE CONTROL (ETC) SYSTEM STRATEGY

The torque based ETC strategy was developed to improve fuel economy and to accommodate variable camshaft timing (VCT). This is possible by not coupling the throttle angle to the driver pedal position. Uncoupling the throttle angle (produce engine torque) from the pedal position (driver demand) allows the powertrain control strategy to optimize fuel control and transmission shift schedules while delivering the requested wheel torque.

The ETC monitor system is distributed across 2 processors within the PCM: the main powertrain control processor unit (CPU) and a separate monitoring processor. The primary monitoring function is carried out by the independent plausibility check (IPC) software, which resides on the main processor. It is responsible for determining the driver-demanded torque and comparing it to an estimate of the actual torque delivered. If the generated torque exceeds driver demand by a specified amount, appropriate corrective action is taken.

ETC SYSTEM WITH A 3-TRACK APP SENSOR FAILURE MODE AND EFFECTS MANAGEMENT:

Effect	Failure Mode [a]
	A loss of redundancy or loss of a non-critical input could result in a concern that does not affect

No Effect on Driveability	driveability. The powertrain malfunction indicator (wrench) illuminates, but the throttle control and torque control systems function normally. A DTC is set to indicate the component or circuit with the concern.
Disable Speed Control	If certain concerns are detected, speed control is disabled. Throttle control and torque control continue to function normally.
RPM Guard with Pedal Follower	In this mode, torque control is disabled due to the loss of a critical sensor or PCM concern. The throttle is controlled in pedal-follower mode as a function of the pedal position sensor input only. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values.
RPM Guard with Default Throttle	In this mode, the throttle plate control is disabled due to the loss of throttle position, the throttle plate position controller, or other major electronic throttle body concern. Depending on the concern detected, the throttle plate is either commanded to the default (limp home) position or the motor is disabled and the spring returns the throttle plate to the default (limp home) position. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC P2110 is set. EGR, VCT, and IMRC outputs are set to default values.
RPM Guard with High Forced Idle	This mode is caused by the loss of 2 or 3 pedal position sensor inputs due to sensor, wiring, or PCM concerns. The system is unable to determine driver demand, and the throttle is controlled to a fixed high idle airflow. There is no response to the driver input. The maximum allowed RPM is a fixed value (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC P2104 is set. EGR, VCT, and IMRC outputs are set to default values.

Shutdown	If a significant processor concern is detected, the monitor forces vehicle shutdown by disabling all fuel injectors. The powertrain malfunction indicator (wrench) illuminates in this mode and a DTC P2105 is set.

[a] ETC illuminates or displays a message on the message center immediately; MIL illuminates after 2 driving cycles

ETC SYSTEM WITH A 2-TRACK APP SENSOR FAILURE MODE AND EFFECTS MANAGEMENT:

Effect	Failure Mode
No Effect on Driveability	A loss of redundancy or loss of a non-critical input could result in a concern that does not affect driveability. The powertrain malfunction indicator (wrench) and the MIL do not illuminate. However, speed control and power take off (PTO) may be disabled. A DTC is set to indicate the component or circuit with the concern.
Delayed APP Sensor Response with Brake Override	This mode is caused by the loss of 1 APP sensor input due to sensor, wiring, or PCM concerns. The system is unable to verify the APP sensor input and driver demand. The throttle plate response to the APP sensor input is delayed as the accelerator pedal is applied. The engine returns to idle RPM whenever the brake pedal is applied. The powertrain malfunction indicator (wrench) illuminates, but the MIL does not illuminate in this mode. An APP sensor related DTC is set.
Time-Based Driver Demand with Brake Override	This mode is caused by the loss of one brake pedal position (BPP) and one APP sensor input or both APP sensor inputs due to sensor, wiring, or PCM concerns. The system is unable to determine driver demand. There is no response when the accelerator pedal is applied. The engine returns to idle RPM whenever the brake pedal is applied. When the brake pedal is released, the PCM slowly increases the APP signal to a fixed value. The powertrain malfunction indicator (wrench) illuminates, but the MIL does not illuminate in this mode. An APP or BPP sensor related DTC is set.
	In this mode, torque control is disabled due to the loss of a critical sensor or PCM concern. The throttle is controlled in pedal-follower mode as a function of the APP sensor input only. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual

RPM Guard with Pedal Follower	RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values and speed control is disabled.
RPM Guard with Default Throttle	In this mode, the throttle plate control is disabled due to the loss of both TP sensor inputs, loss of throttle plate control, stuck throttle plate, significant processor concerns, or other major electronic throttle body concern. The spring returns the throttle plate to the default (limp home) position. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values and speed control is disabled.

ELECTRONIC THROTTLE MONITOR OPERATION:

DTCs [a]	
P060X, P061X	PCM processor concern (MIL, powertrain malfunction indicator [wrench])
P2104 (ETC system with a 3-track APP sensor)	ETC FMEM - forced idle, 2 or 3 pedal sensor concerns (MIL, powertrain malfunction indicator [wrench])
P2105 (ETC system with a 3-track APP sensor)	ETC FMEM - forced engine shutdown; PCM concern (MIL, powertrain malfunction indicator [wrench])
P2110 (ETC system with a 3-track APP sensor)	ETC FMEM - forced limited RPM; Concern with both TP sensors; throttle plate position control concern (MIL, powertrain malfunction indicator [wrench])
U0300	ETC software version mismatch between processors internal to the PCM (non-MIL, powertrain malfunction indicator [wrench])

[a] Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern.

APP AND TP SENSOR INPUTS

ACCELERATOR PEDAL POSITION (APP) SENSOR CHECK:

DTCs[a]	
P1575 (ETC system with a 2-track APP sensor)	APP sensor out of self-test range

P2122, P2123, P2127, P2128, P2132, P2133	APP sensor circuit continuity test (powertrain malfunction indicator [wrench], non-MIL)
P2121, P2126, P2131 (ETC system with a 3-track APP sensor)	APP range/performance (powertrain malfunction indicator [wrench], non-MIL)
P2138 (ETC system with a 2-track APP sensor)	APP to APP signal correlation (powertrain malfunction indicator [wrench], non-MIL)

[a] Correlation and range/performance - sensor disagreement between processors internal to the PCM. Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern. Refer to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** for additional DTC information.

THROTTLE POSITION (TP) SENSOR CHECK:

DTCs [a]	
P0122, P0123, P0222, P0223	TP circuit continuity test (MIL, powertrain malfunction indicator [wrench])
P0121, P0221 (ETC system with a 3-track APP sensor)	TP range/performance (non-MIL)
P1124 (ETC system with a 2-track APP sensor)	TP sensor out of self-test range
P2135	TP to TP sensor correlation test (powertrain malfunction indicator [wrench], non-MIL)

[a] Correlation and range/performance - sensor disagreement between processors internal to the PCM, TP inconsistent with requested throttle plate position. Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern. Refer to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** for additional DTC information.

ELECTRONIC THROTTLE ACTUATOR CONTROL (TAC) OUTPUT

ELECTRONIC TAC OPERATION CHECK:

DTCs [a]	
P115E	Throttle actuator airflow trim at maximum limit (non-MIL)
P2072 (ETC system with a 3-track APP sensor)	Throttle body ice blockage (non-MIL)
P2100 (ETC system with a 3-track APP sensor)	Throttle actuator circuit open, short to power, short to ground (MIL)
P2101	Throttle actuator range/performance test (MIL)
P2107	Processor and TAC motor circuit test (MIL)
P2111	Throttle actuator system stuck open (MIL)
P2112	Throttle actuator system stuck closed (MIL)

[a] Note: For all DTCs, in addition to the MIL, the powertrain malfunction indicator (wrench) is on for the concern that caused the FMEM action. Monitor execution is continuous. Monitor false detection duration is less

than 5 seconds to register a concern.

VARIABLE CAMSHAFT TIMING (VCT) SYSTEM

OVERVIEW

The VCT enables rotation of the camshaft(s) relative to the crankshaft rotation as a function of engine operating conditions. There are 4 types of VCT systems.

- Exhaust phase shifting (EPS) system - the exhaust cam is the active cam being retarded.
- Intake phase shifting (IPS) system - the intake cam is the active cam being advanced.
- Dual equal phase shifting (DEPS) system - both intake and exhaust cams are phase shifted and equally advanced or retarded.
- Dual independent phase shifting (DIPS) system - where both the intake and exhaust cams are shifted independently.

All systems have 4 operational modes: idle, part throttle, wide open throttle (WOT), and default mode. At idle and low engine speeds with closed throttle, the powertrain control module (PCM) determines the phase angle based on air flow, engine oil temperature and engine coolant temperature. At part and wide open throttle the PCM determines the phase angle based on engine RPM, load, and throttle position. VCT systems provide reduced emissions and enhanced engine power, fuel economy and idle quality. IPS systems also have the added benefit of improved torque. In addition, some VCT system applications can eliminate the need for an external exhaust gas recirculation (EGR) system. The elimination of the EGR system is accomplished by controlling the overlap time between the intake valve opening and exhaust valve closing. Currently, both the IPS and DEPS systems are used.

VARIABLE CAMSHAFT TIMING (VCT) SYSTEM

The VCT system consists of an electric hydraulic positioning control solenoid, a camshaft position (CMP) sensor, and a trigger wheel. The CMP trigger wheel has a number of equally spaced teeth equal to the number (n) of cylinders on a bank plus one extra tooth (n+1). Four cylinder and V8 engines use a CMP 4+1 tooth trigger wheel. V6 engines use a CMP 3+1 tooth trigger wheel. The extra tooth placed between the equally spaced teeth represents the CMP signal for that bank. A crankshaft position (CKP) sensor provides the PCM with crankshaft positioning information in 10 degree increments.

1. The PCM receives input signals from the intake air temperature (IAT) sensor, engine coolant temperature (ECT) sensor, engine oil temperature (EOT) sensor, CMP, throttle position (TP) sensor, mass air flow (MAF) sensor, and CKP to determine the operating conditions of the engine. At idle and low engine speeds with closed throttle, the PCM controls the camshaft position based on ECT, EOT, IAT, and MAF. During part and wide open throttle, the camshaft position is determined by engine RPM, load and throttle position. The VCT system does not operate until the engine is at normal operating temperature.
2. The VCT system is enabled by the PCM when the correct conditions are met.
3. The CKP signal is used as a reference for CMP positioning.
4. The VCT solenoid valve is an integral part of the VCT system. The solenoid valve controls the flow of engine oil in the VCT actuator assembly. As the PCM controls the duty cycle of the solenoid valve, oil pressure/flow advances or retards the cam timing. Duty cycles near 0% or 100% represent rapid

movement of the camshaft. Retaining a fixed camshaft position is accomplished by dithering (oscillating) the solenoid valve duty cycle.

The PCM calculates and determines the desired camshaft position. It continually updates the VCT solenoid duty cycle until the desired position is achieved. A difference between the desired and actual camshaft position represents a position error in the PCM VCT control loop. The PCM disables the VCT and places the camshaft in a default position if a concern is detected. A related DTC is also set when the concern is detected.

5. When the VCT solenoid is energized, engine oil is allowed to flow to the VCT actuator assembly which advances or retards the camshaft timing. One half of the VCT actuator is coupled to the camshaft and the other half is connected to the timing chain. Oil chambers between the 2 halves couple the camshaft to the timing chain. When the flow of oil is shifted from one side of the chamber to the other, the differential change in oil pressure forces the camshaft to rotate in either an advance or retard position depending on the oil flow.

ON BOARD DIAGNOSTICS (OBD) MONITORS

OBD-I, OBD-II AND ENGINE MANUFACTURER DIAGNOSTICS (EMD) OVERVIEW

The California Air Resources Board (CARB) began regulating OBD systems for vehicles sold in California beginning with the 1988 model year. The initial requirements, known as OBD-I, required identifying the likely area of malfunction with regard to the fuel metering system, exhaust gas recirculation (EGR) system, emission-related components and the powertrain control module (PCM). A malfunction indicator lamp (MIL) was required to illuminate and alert the driver of the malfunction and the need to repair the emission control system. A diagnostic trouble code (DTC) was required to assist in identifying the system or component associated with the malfunction.

Starting with the 1994 model year, both CARB and the Environmental Protection Agency (EPA) mandated enhanced OBD systems, commonly known as OBD-II. The objectives of the OBD-II system are to improve air

quality by reducing high in-use emissions caused by emission-related malfunctions, reducing the time between the occurrence of a malfunction and its detection and repair, and assisting in the diagnosis and repair of emission-related problems.

OBD-II Systems - The OBD-II system monitors virtually all emission control systems and components that can affect tailpipe or evaporative emissions. In most cases, malfunctions must be detected before emissions exceed 1.5 times the applicable 120,000 or 150,000 mile emission standards. Partial zero emission vehicles (PZEV) and super ultra low emission vehicles (SULEV-II) can use 2.5 times the standard in place of the 1.5 times the standard. If a system or component exceeds emission thresholds or does not operate within a manufacturer's specifications, a DTC is stored and the MIL is illuminated within 2 drive cycles.

The OBD-II system monitors for malfunctions either continuously, (regardless of driving mode), or non-continuously (once per drive cycle during specific drive modes). A pending DTC is stored in the PCM keep alive memory (KAM) when a malfunction is initially detected. Pending DTCs are displayed as long as the malfunction is present. Note that OBD regulations required a complete malfunction-free monitoring cycle to occur before erasing a pending DTC. This means that a pending DTC is erased on the next power-up after a malfunction-free monitoring cycle. However, if the malfunction is still present after 2 consecutive drive cycles, the MIL is illuminated. Once the MIL is illuminated, 3 consecutive drive cycles without a malfunction detected are required to extinguish the MIL. The DTC is erased after 40 engine warm-up cycles once the MIL is extinguished.

In addition to specifying and standardizing much of the diagnostics and MIL operation, OBD requires the use of a standard data link connector (DLC), standard communication links and messages, standardized DTCs and terminology. Examples of standard diagnostic information are freeze frame data and inspection maintenance (IM) readiness indicators.

Freeze frame data describes data stored in KAM at the point the malfunction is initially detected and the pending DTC is stored. Freeze frame data consists of parameters such as engine RPM, engine load, vehicle speed or throttle position. Freeze frame data is updated when the malfunction is detected again on a subsequent drive cycle and a confirmed DTC is stored; however, a previously stored freeze frame is overwritten if a higher priority fuel or misfire malfunction is detected. This data is accessible with the scan tool to allow duplicating the conditions when the malfunction occurred in order to assist in repairing the vehicle.

OBD I/M readiness indicators show whether all of the OBD monitors have been completed since the last time the KAM or the PCM DTC(s) have been cleared. Ford stores a DTC P1000 and blinks the MIL after 15 seconds of key-on engine-off time to indicate that some monitors have not completed. In some states, it may be necessary to carry out an OBD check in order to renew a vehicle registration. The IM readiness indicators must show that all monitors have been completed prior to the OBD check.

OBD-II was required on all California and California State gasoline engine vehicles up to 14,000 lbs. Gross vehicle weight rating (GVWR) starting in the 1996 MY and all diesel engine vehicles up to 14,000 lbs. GVWR starting in the 1997 MY.

California States are ones that have adopted California emission regulations, starting in the 1998 MY. For example, Massachusetts, New York, Vermont and Maine have adopted California's emission regulations. These States receive California-certified vehicles for passenger cars and light trucks, and medium-duty vehicles, up to 14,000 lbs GVWR.

OBD-II was also required on all Federal gasoline engine vehicles up to 8,500 lbs. GVWR starting in the 1996 MY and all diesel engine vehicles up to 8,500 lbs. GVWR starting in the 1997 MY.

Starting in the 2004 MY, Federal vehicle over 8,500 lbs. were required to phase in OBD-II. By the 2006 MY, all of Ford's Federal vehicles from 8,500 to 14,000 lbs GVWR have been phased into OBD-II and OBD-I systems are no longer utilized in vehicles up to 14,000 lbs GVWR.

EMD Systems - EMD was required on all 2007 MY and beyond California gasoline-fueled and diesel fueled on-road heavy duty engines used in vehicles over 14,000 lbs GVWR. EMD systems are required to functionally monitor the fuel delivery system, exhaust gas recirculation system, particulate matter trap, as well as emission related PCM inputs for circuit continuity and rationality, and emission-related outputs for circuit continuity and functionality. For gasoline engines, which have no PM trap, EMD requirements are very similar to current OBD-I system requirements. As such, OBD-I system philosophy is employed, the only change being the addition of some comprehensive component monitor (CCM) rationality and functionality checks.

EMD vehicles use that same PCM, CAN serial data communication link, J1962 DLC, and PCM software as the corresponding OBD-II vehicle. The only difference is the possible removal of the rear oxygen sensor(s), fuel tank pressure sensor, canister vent solenoid, and a different PCM calibration.

The following list indicates what monitors and functions have been altered from OBD-II for gasoline engine EMD calibrations:

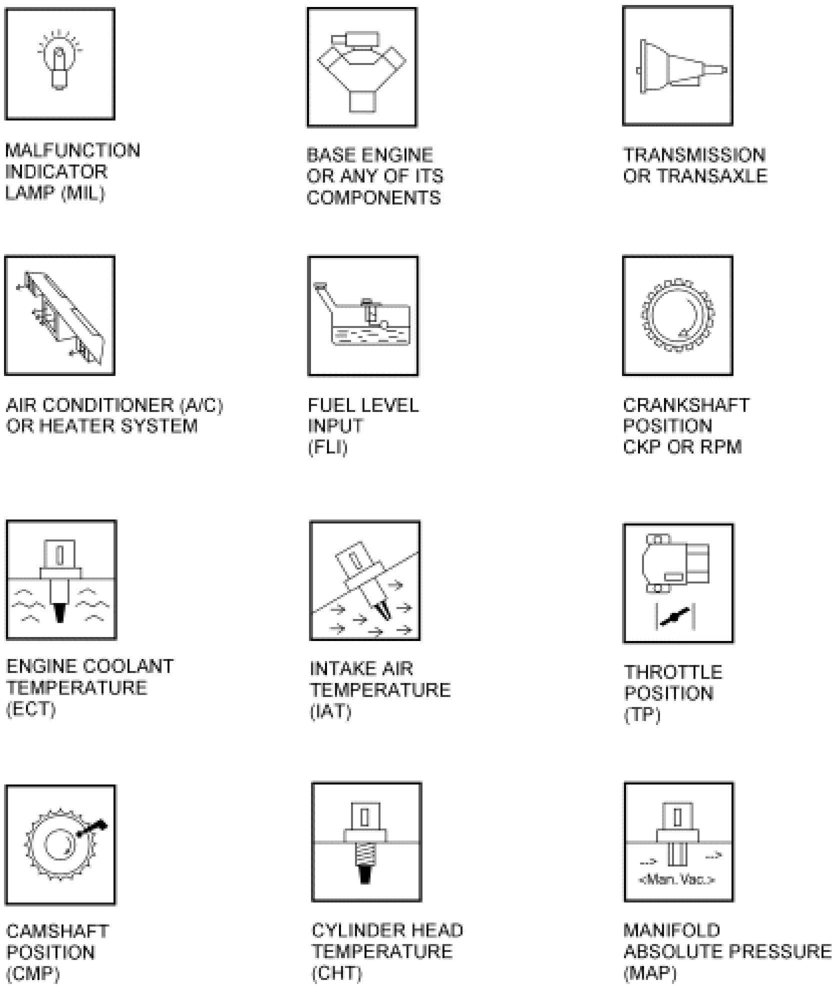
Monitor/Feature	Calibration for Gasoline Engines
Catalyst Monitor	Not required, monitor calibrated out, rear O2 sensors may be deleted.
Misfire Monitor	Calibrated in for repair, all DTC are non-MIL. Catalyst damage misfire criteria calibrated out, emission threshold criteria set to 4%, enabled between 66°C (150°F) and 104°C (220°F), 254 second start-up delay.
Oxygen Sensor Monitor	Rear heated oxygen sensor (HO2S) test calibrated out, rear HO2S may be deleted, front HO2S response test calibrated out.
EGR Monitor	Same as OBD-II calibration except that DTC P0402 test uses a higher threshold.
Fuel System Monitor	Same as OBD-II calibration.
Secondary Air Monitor	Functional (low flow) test calibrated out, circuit codes are same as OBD-II calibration.
Evaporative Emission (EVAP) System Monitor	EVAP system leak check calibrated out, fuel level input circuit checks retained as non-MIL. Fuel tank pressure sensor and canister vent solenoid may be deleted.
PCV Monitor	Same hardware and function as OBD-II
Thermostat Monitor	Thermostat monitor calibrated out.

Comprehensive Component Monitor (CCM)	All circuit checks, rationality and functional tests are the same as OBD-II.
Communication Protocol and DLC	Same as OBD-II, all generic and enhanced scan tool modes work the same as OBD-II, but reflect the EMD calibration that contains fewer supported monitors. OBD supported PID indicates.
MIL Control	Same as OBD-II, it takes 2 drive cycles to illuminate the MIL.

The following monitor descriptions provide a general description of each OBD monitor. In these descriptions, the monitor strategy, hardware, testing requirements, and methods are presented to provide an overall understanding of monitor operation. An illustration of each monitor may also be provided. These illustrations should be used as typical examples and are not intended to represent all possible vehicle configurations.

Each illustration depicts the PCM as the main focus with primary inputs and outputs for each monitor. The icons to the left of the PCM represent the inputs used by each of the monitor strategies to enable or activate the monitor. The components and subsystems to the right of the PCM represent the hardware and signals used while carrying out the tests and the systems being tested. The CCM illustration has numerous components and signals involved which are shown generically. When referring to the illustrations, match the numbers to the corresponding numbers in the monitor descriptions for a better comprehension of the monitor and associated DTCs.

These icons are used in the illustrations of the OBD monitors and throughout this part.



N0012075

CATALYST EFFICIENCY MONITOR

The catalyst efficiency monitor uses an oxygen sensor before and after the catalyst to infer the hydrocarbon (HC) efficiency based on the oxygen storage capacity of the catalyst. During monitor operation the powertrain control module (PCM) calculates the length of the signal while the sensors are switching. Under normal closed-loop fuel conditions, high efficiency catalysts have significant oxygen storage. This makes the switching frequency of the rear heated oxygen sensor (HO2S) very slow and reduces the amplitude, which provides for a shorter signal length. The front HO2S switches more frequently with greater amplitude, which provides for a longer signal length. As the catalyst efficiency deteriorates due to thermal and chemical deterioration, its ability to store oxygen declines. The post-catalyst or downstream HO2S signal begins to switch more rapidly with increasing amplitude and signal length, approaching the switching frequency, amplitude, and signal length of the pre-catalyst or upstream HO2S. The predominant failure mode for high mileage catalysts is chemical deterioration (phosphorus deposits on the front brick of the catalyst), not thermal deterioration.

For the typical HO2S, the catalyst monitor counts the number of front HO2S switches during part-throttle,

closed-loop fuel conditions after the engine is warmed-up and the inferred catalyst temperature is within limits. The number of front switches are accumulated, depending on the calibration, in up to 3 different air mass regions or cells. While catalyst monitoring entry conditions are being met, the front and rear HO2S signal lengths are continually being calculated. When the required number of front switches has accumulated in each cell, the total signal length of the rear HO2S is divided by the total signal length of the front HO2S to compute a catalyst index ratio. An index ratio near 0.0 indicates high oxygen storage capacity, hence high HC efficiency. An index ratio near 1.0 indicates low oxygen storage capacity, hence low HC efficiency. If the actual index ratio exceeds the threshold index ratio, the catalyst is considered failed.

For the universal HO2S, the catalyst monitor calculates the rear HO2S signal lengths for 10-20 seconds during part-throttle, closed-loop fuel conditions after the engine is warmed-up, the inferred catalyst temperature is within limits, and fuel tank vapor purge is disabled. The catalyst monitor is enabled for 10-20 seconds per drive cycle. When the catalyst monitor is active, the PCM commands a fixed fuel control routine. The fixed fuel control routine is the same for every vehicle with universal HO2Ss. During monitor operation the rear HO2S signal lengths are continually calculated. The calculated rear HO2S signal length is then divided by a calibrated signal length, which has compensation for mass air flow. The calibrated signal length is based on the signal length of an HO2S placed after a catalyst without a wash coat. An index ratio near 0.0 indicates high oxygen storage capacity, hence high HC efficiency. An index ratio near 1.0 indicates low oxygen storage capacity, hence low HC efficiency. If the actual index ratio exceeds the threshold index ratio, the catalyst is considered failed.

Inputs from engine coolant temperature (ECT) or cylinder head temperature (CHT), intake air temperature (IAT), mass air flow (MAF), crankshaft position (CKP), throttle position (TP), and vehicle speed sensors are required to enable the Catalyst Efficiency Monitor.

Typical Monitor Entry Conditions:

- Minimum 330 seconds since start-up at 21°C (70°F)
- Engine coolant temperature is between 76.6°C - 110°C (170°F - 230°F)
- Intake air temperature is between -7°C - 82°C (20°F - 180°F)
- Time since entering closed-loop is 30 seconds
- Inferred rear HO2S sensor temperature of 482°C (900°F)
- EGR is between 1% and 12%
- Part throttle, maximum rate of change is 0.2 volts/0.050 sec
- Vehicle speed is between 8 and 112 km/h (5 and 70 mph)
- Fuel level is greater than 15%
- First Air Flow Cell
    - Engine RPM 1,000 to 1,300 RPM
    - Engine load 15 to 35%
    - Inferred catalyst temperature 454°C - 649°C (850°F - 1,200°F)
    - Number of front HO2S switches is 50
- Second Air Flow Cell
    - Engine RPM 1,200 to 1,500 RPM
    - Engine load 20 to 35%

  - Inferred catalyst temperature 482°C - 677°C (900°F - 1,250°F)
  - Number of front HO2S switches: 70
- Third Air Flow Cell
  - Engine RPM 1,300 to 1,600 RPM
  - Engine load 20 to 40%
  - Inferred catalyst temperature 510°C - 704°C (950°F - 1,300°F)
  - Number of front HO2S switches is 30

The DTCs associated with this test are DTC P0420 (Bank 1 or Y-pipe system) and P0430 (Bank 2). Because an exponentially weighted moving average algorithm is used to determine a concern, up to 6 driving cycles may be required to illuminate the MIL during normal customer driving. If the KAM is reset or the battery is disconnected, a concern illuminates the MIL in 2 drive cycles.

GENERAL CATALYST MONITOR OPERATION

Monitor execution is once per drive cycle. The typical monitor duration is 700 seconds or 10-20 seconds for the universal HO2S. In order for the catalyst monitor to run, the HO2S monitor must be complete and the secondary AIR and EVAP system functional with no stored DTCs. If the catalyst monitor does not complete during a particular driving cycle, the already accumulated switch/signal data is retained in the KAM and is used during the next driving cycle to allow the catalyst monitor a better opportunity to complete.

Rear HO2S can be located in various configurations to monitor different kinds of exhaust systems. Inline engines and many V-engines are monitored by their individual bank. A rear HO2S is used along with the front, fuel control HO2S for each bank. Two sensors are used on an inline engine and 4 sensors are used on a V-engine. Some V-engines have exhaust banks that combine into a single underbody catalyst. These systems are referred to as Y-pipe systems. They use only 1 rear HO2S along with the 2 front, fuel-control HO2S. The Y-pipe system uses 3 sensors in all. For Y-piped systems, the 2 front HO2S signals are combined by the PCM software to infer what the HO2S signal would have been in front of the monitored catalyst. The inferred front HO2S signal and the actual single, rear HO2S signal is then used to calculate the index ratio.

Exhaust systems that use an underbody catalyst without a downstream/rear HO2S are not monitored by the catalyst efficiency monitor.

Most vehicles that are part of the low emission vehicle (LEV) catalyst monitor phase-in, monitor less than 100% of the catalyst volume. Often this is the first catalyst brick of the catalyst system. Partial volume monitoring is done on LEV and ultra low emission vehicle (ULEV) vehicles in order to meet the 1.75 emission standard. The rationale for this strategy is that the catalyst nearest the engine deteriorate first, allowing the catalyst monitor to be more sensitive and illuminate the MIL correctly at lower emission standards.

Most applications use partial-volume monitoring, where the rear HO2S is located after the first light-off catalyst can or after the second catalyst can in a 3-can per bank system. (A few applications placed the HO2S in the middle of the catalyst can, between the first and second bricks).

Some partial zero emission vehicles (PZEV) use 3 HO2S per engine bank. The front sensors or stream 1 (HO2S11/HO2S21) are the primary fuel control sensors. The next sensors downstream or stream 2 in the exhaust are used to monitor the light-off catalyst (HO2S12/HO2S22). The last sensors downstream or stream 3

in the exhaust (HO2S13/HO2S23) are used for very long term fuel trim in order to optimize catalyst efficiency (fore aft oxygen sensor control). For additional heated oxygen sensor information, refer to the **HEATED OXYGEN SENSOR (HO2S) MONITOR**.

Index ratios for ethanol (flex fuel) vehicles vary based on the changing concentration of alcohol in the fuel. The threshold to determine a concern typically increases as the percent of alcohol increases. For example, a threshold of 0.5 may be used at E10 (10% ethanol) and 0.9 may be used at E85 (85% ethanol). The thresholds are adjusted based on the percentage of alcohol in the fuel. Standard fuel may contain up to 10% ethanol.

COLD START EMISSION REDUCTION MONITOR

OVERVIEW

The cold start emission reduction monitor is an on-board strategy designed for vehicles that meet the low emissions vehicle-II (LEV-II) emissions standards. The monitor works by validating the operation of the components of the system required to achieve the cold start emission reduction strategy. There are 2 types of monitors:

- cold start emission reduction component monitor
- cold start emission reduction system monitor

COLD START EMISSION REDUCTION COMPONENT MONITOR

Two different tests are carried out during the cold start emission reduction component monitor. The low idle airflow test which checks the performance of the idle air control strategy and the spark timing monitor test which checks the spark timing strategy.

Low Idle Air Flow Test - When the cold start emission reduction monitor is enabled, the powertrain control module (PCM) commands the idle air control system to increase the RPM, which elevates engine air flow. While this cold start emission reduction elevated air flow is requested, the low idle air flow test compares the

measured idle air flow from the mass air flow (MAF) sensor to the commanded idle air control strategy. For the purpose of detecting low air flow concerns, the low air flow test uses the measured air flow and the commanded air flow to create a low air flow index.

Low idle air flow test operation: -

- DTC: P050A cold start idle air control system performance
- Monitor execution: Once per driving cycle, from start up with the cold start emissions reduction active
- Monitor sequence: none
- Monitoring duration: 7 seconds

Low idle air flow test entry conditions: -

- Engine coolant temperature is between 4.4°C (40°F) and 82.2°C (180°F)
- Barometric pressure is between 76.2 kPa (22.5 in-Hg) and 105 kPa (31 in-Hg)
- Engine off soak time is at least 50 minutes
- Throttle is at closed position

Spark Timing Monitor Test - The PCM is equipped with a spark conduction capture circuit which measures the timing and duration of the spark delivered by processing the fly back voltage signal from the primary side of the ignition coil. When the cold start emission reduction monitor is enabled, the spark control strategy in the PCM commands the spark timing strategy to retard the spark timing. While retarded spark timing is requested, the spark timing monitor compares the measured spark timing from the spark conduction capture circuit to the commanded spark timing from the spark control strategy. For the purpose of detecting spark timing failures, the spark timing monitor increments a fault filter if the measured spark timing is advanced by more than 5 degrees from the commanded spark timing. A failure is indicated if the fault filter exceeds a value of 200, equivalent to a failure duration of approximately 4 seconds.

Spark timing monitor test operation: -

- DTC: P050B cold start ignition timing performance
- Monitor execution: once per driving cycle, from start up with the cold start emission reduction monitor active
- Monitor sequence: none
- Monitoring duration: 7 seconds

Spark timing monitor test entry conditions: -

- Engine speed is between 400 RPM and 2,000 RPM
- Engine position and cylinder identification are synchronized
- There is no concerns with the ignition coils primary circuits

COLD START EMISSION REDUCTION SYSTEM MONITOR

The PCM uses the cold start emission reduction system monitor to calculate the actual catalyst warm up

temperature during a cold start. The actual catalyst warm up temperature calculation uses measured engine speed, measured air mass and commanded spark timing inputs to the PCM. The PCM then compares the actual temperature to the expected catalyst temperature model. The expected catalyst temperature model calculation uses desired engine speed, desired air mass and desired spark timing inputs to the PCM. The difference between the actual and expected temperatures is reflected in a ratio. This ratio is a measure of how much loss of catalyst heating occurred over the period of time and when compared with a calibrated threshold it helps the PCM to determine if the cold start emission reduction system is working properly. This ratio correlates to tailpipe emissions, and a malfunction indicator lamp (MIL) illuminates when the calibrated threshold is exceeded. The monitor is disabled if a concern is present in any of the sensors or systems used for expected catalyst temperature model calculation.

Cold start emission reduction system monitor test operation: -

- DTC: P050E cold start engine exhaust temperature out of range
- Monitor execution: once per driving cycle, from start up with the cold start emission reduction monitor active
- Monitor sequence: the monitor collects data during first 15 seconds of the cold start
- Monitoring duration: the monitor completes 300 seconds after initial engine start

Cold start emission reduction system monitor entry conditions: -

- Engine coolant temperature at the start of the monitor is between 1.67°C (35°F) and 37.78°C (100°F)
- Barometric pressure is above 74.5 kPa (22 in-Hg)
- Catalyst temperature at the start of the monitor is between 1.67°C (35°F) and 51.67°C (125°F)
- Fuel level is above 15%
- Power take-off operation is disabled

COMPREHENSIVE COMPONENT MONITOR (CCM)

The CCM monitors for concerns in any powertrain electronic component or circuit that provides input or output signals to the powertrain control module (PCM) that can affect emissions and is not monitored by another on board diagnostics (OBD) monitor. Inputs and outputs are, at a minimum, monitored for circuit continuity or correct range of values. Where feasible, inputs are also checked for rationality, and outputs are also checked for correct functionality.

The CCM covers many components and circuits and tests them in various ways depending on the hardware, function, and type of signal. For example, analog inputs such as throttle position or engine coolant temperature are typically checked for opens, shorts, and out-of-range values. This type of monitoring is carried out continuously. Some digital inputs like brake switch or crankshaft position rely on rationality checks - checking to see if the input value makes sense at the current engine operating conditions. These types of tests may require monitoring several components and can only be carried out under the appropriate test conditions.

Outputs such as coil drivers are checked for opens and shorts by monitoring a feedback circuit or smart driver associated with the output. Other outputs, such as relays, require additional feedback circuits to monitor the secondary side of the relay. Some outputs are also monitored for correct function by observing the reaction of the control system to a given change in the output command. An idle air control solenoid can be functionally

tested by monitoring the idle RPM relative to the target idle RPM. Some tests can only be carried out under the appropriate test conditions. For example, the transmission shift solenoids can only be tested when the PCM commands a shift.

The following is an example of some of the input and output components monitored by the CCM. The component monitor may belong to the engine, ignition, transmission, air conditioning, or any other PCM supported subsystem.

1. Inputs:

   Air conditioning pressure (ACP) transducer sensor, camshaft position (CMP) sensor, crankshaft position (CKP) sensor, engine coolant temperature (ECT) sensor, engine oil temperature (EOT) sensor, fuel rail pressure temperature (FRPT) sensor, fuel tank pressure (FTP) sensor, intake air temperature (IAT) sensor, mass air flow (MAF) sensor, throttle position (TP) sensor.

2. Outputs:

   EVAP canister purge valve, EVAP canister vent (CV) solenoid, fuel injector, fuel pump (FP), idle air control (IAC), intake manifold runner control (IMRC), shift solenoid, torque converter clutch (TCC) solenoid, variable camshaft timing (VCT) actuator, wide open throttle A/C cutout (WAC).

3. The CCM is enabled after the engine starts and is running. A diagnostic trouble code (DTC) is stored in keep alive memory (KAM) and the malfunction indicator lamp (MIL) is illuminated after 2 driving cycles when a concern is detected. Many of the CCM tests are also carried out during an on-demand self-test.

ELECTRIC EXHAUST GAS RECIRCULATION (EEGR) SYSTEM MONITOR

The EEGR system monitor is an on-board strategy designed to test the integrity and flow characteristics of the EGR system. The monitor is activated during EGR system operation and after certain base engine conditions are satisfied. Inputs from the engine coolant temperature (ECT) or cylinder head temperature (CHT), intake air

temperature (IAT), throttle position (TP), crankshaft position (CKP), mass air flow (MAF), and manifold absolute pressure (MAP) sensors are required to activate the EGR system monitor. Once activated, the EGR system monitor carries out each of the tests described below during the engine modes and conditions indicated. Some of the EGR system monitor tests are also carried out during a key on engine off (KOEO) or key on engine running (KOER) self-test.

The EEGR monitor consists of an electrical and functional test that checks the stepper motor and the EEGR system for correct flow. The powertrain control module (PCM) controls the EEGR valve by commanding from 0 to 52 discreet increments or steps to get the valve from fully closed to fully open respectively. The stepper motor electrical test is a continuous check of the 4 electric stepper motor coils and circuits to the PCM. A concern is indicated if an open circuit, short to voltage, or short to ground has occurred in 1 or more of the stepper motor coils or circuits for a calibrated period of time. If a concern has been detected, the EEGR system is disabled, setting diagnostic trouble code (DTC) P0403. Additional monitoring is suspended for the remainder of the drive cycle, or until the next engine startup.

After the vehicle has warmed up and normal EEGR flow rates are being commanded by the PCM, the EEGR flow check is carried out. The flow test is carried out once per drive cycle when a minimum amount of exhaust gas is requested and the remaining entry conditions required to initiate the test are satisfied. If a concern is detected, the EEGR system, as well as the EEGR monitor, is disabled until the next engine startup.

An EGR flow concern is indicated by either a no flow condition or a low flow condition prior to exceeding 1.5 times the applicable emission standard. The criteria used to determine which flow concern threshold applies is based upon whether or not the applicable emission standards are exceeded on the federal test procedure test cycle without EGR delivery.

The EGR flow test is done by observing the behavior of 2 different values of MAP - the analog MAP sensor reading, and inferred MAP, (MAP calculated from the MAF, throttle position, RPM, barometric pressure (BARO) and other sensors). Due to the location of the MAF sensor, the calculation of inferred MAP is not compensated for EGR flow. Therefore, it does not account for the effects of EGR flow whereas measured MAP does respond to the effects of EGR flow. The amount of EGR flow can therefore be calculated by looking at the difference between measured MAP and inferred MAP under the correct engine operating conditions.

Some differences always exist between measured MAP and inferred MAP due to hardware variations. These variations are learned during steady engine operating conditions without EGR flow and the estimated EGR flow is compensated for these differences. The result of this compensation is values of measured MAP and inferred MAP that are equal under conditions where no EGR is flowing. Hence, when EGR is flowing the increased pressure in measured MAP over inferred MAP represents the pressure change due to EGR flow. This pressure change is normalized to a value between 0 and 1 representing the ratio of measured EGR flow to the scheduled EGR flow and is referred as the EGR flow degradation index. A value near 1 indicates the system is functioning correctly whereas a value near 0 reflects EGR severe flow degradation.

The EGR flow degradation index is compared to a calibrated threshold to determine if a low flow concern has occurred. If an EGR flow concern has occurred, the P0400 DTC flow concern is registered.

If the inferred ambient temperature is less than -7°C (20°F), greater than 54°C (130°F), or the altitude is greater than 8,000 feet (BARO less than 22.5 in-Hg), the EEGR flow test cannot be reliably done. In these conditions, the EEGR flow test is suspended and a timer starts to accumulate the time in these conditions. When the vehicle leaves these extreme conditions, the timer starts to decrement, and if conditions permit, attempts to complete the

EGR flow monitor. If the timer reaches 800 seconds, the EEGR flow test is disabled for the remainder of the current driving cycle and the EGR monitor is set to a ready condition.

Note: BARO is inferred at engine startup using the KOEO MAP sensor reading. It is updated during high, part-throttle, engine operation.

A DTC P1408, like the P0400, indicates an EGR flow concern (outside the minimum or maximum limits) but is only set during the KOER self-test. The P0400 and P0403 are MIL codes. P1408 is a non-MIL code.

EVAPORATIVE EMISSION (EVAP) LEAK CHECK MONITOR

The EVAP leak check monitor is an on-board strategy designed to detect a leak from a hole (opening) equal to or greater than 0.508 mm (0.020 inch) in the enhanced EVAP system. The correct function of the individual components of the enhanced EVAP system, as well as its ability to flow fuel vapor to the engine, is also examined. The EVAP leak check monitor relies on the individual components of the enhanced EVAP system to either allow a natural vacuum to occur in the fuel tank or apply engine vacuum to the fuel tank and then seal the entire enhanced EVAP system from the atmosphere. The fuel tank pressure is then monitored to determine the total vacuum lost (bleed-up) for a calibrated period of time. Inputs from the engine coolant temperature (ECT) sensor or cylinder head temperature (CHT) sensor, intake air temperature (IAT) sensor, mass air flow (MAF) sensor, vehicle speed, fuel level input (FLI) and fuel tank pressure (FTP) sensor are required to enable the EVAP leak check monitor.

During the EVAP leak check monitor repair verification drive cycle, clearing the continuous diagnostic trouble codes (DTCs) and resetting the emission monitors information in the powertrain control module (PCM) bypasses the minimum soak time required to complete the monitor. The EVAP leak check monitor does not run if the key is turned off after clearing the continuous DTCs and resetting the emission monitors information in the PCM. The EVAP leak check monitor does not run if a MAF sensor concern is present. The EVAP leak

check monitor does not initiate until the heated oxygen sensor (HO2S) monitor is complete.

If the vapor generation is high on some vehicle enhanced EVAP systems, where the monitor does not pass, the result is treated as a no test. Therefore, the test is complete for the day.

Some vehicle applications have an engine off natural vacuum (EONV) check as part of the EVAP leak check monitor.

ENGINE ON EVAP LEAK CHECK MONITOR

The engine on EVAP leak check monitor is executed by the individual components of the enhanced EVAP system as follows:

1. The EVAP canister purge valve, also known as the vapor management valve (VMV), is used to control the flow of vacuum from the engine and create a target vacuum on the fuel tank.
2. The canister vent (CV) solenoid is used to seal the EVAP system from the atmosphere. It is closed by the PCM (100% duty cycle) to allow the EVAP canister purge valve to obtain the target vacuum on the fuel tank.
3. The FTP sensor is used by the engine on EVAP leak check monitor to determine if the target vacuum necessary to carry out the leak check on the fuel tank is reached. Some vehicle applications with the engine on EVAP leak check monitor use a remote inline FTP sensor. Once the target vacuum on the fuel tank is achieved, the change in fuel tank vacuum over a calibrated period of time determines if a leak exists.
4. If the initial target vacuum cannot be reached, DTC P0455 (gross leak detected) is set. The engine on EVAP leak check monitor aborts and does not continue with the leak check portion of the test.

   For some vehicle applications, if the initial target vacuum cannot be reached after a refueling event and the purge vapor flow is excessive, DTC P0457 (fuel cap off) is set. If the initial target vacuum cannot be reached and the purge flow is too small, DTC P1443 (no purge flow condition) is set.

   If the initial target vacuum is exceeded, a system flow concern exists and DTC P1450 (unable to bleed-up fuel tank vacuum) is set. The engine on EVAP leak check monitor aborts and does not continue with the leak check portion of the test.

   If the vacuum increase is quicker than expected, a blocked fuel vapor tube is suspected and if confirmed after an intrusive test, DTC P144A is set.

   If the target vacuum is obtained on the fuel tank, the change in the fuel tank vacuum (bleed-up) is calculated for a calibrated period of time. The calculated change in fuel tank vacuum is compared to a calibrated threshold for a leak from a hole (opening) of 1.016 mm (0.040 inch) in the enhanced EVAP system. If the calculated bleed-up is less than the calibrated threshold, the enhanced EVAP system passes. If the calibrated bleed-up exceeds the calibrated threshold, the test aborts. The test can be repeated up to 3 times.

   If the bleed-up threshold is still being exceeded after 3 tests, a vapor generation test must be carried out before DTC P0442 (small leak detected) is set. This is accomplished by returning the enhanced EVAP system to atmospheric pressure by closing the EVAP canister purge valve and opening the CV solenoid.

Once the FTP sensor observes the fuel tank is at atmospheric pressure, the CV solenoid closes and seals the enhanced EVAP system.

The fuel tank pressure build-up, over a calibrated period of time is compared to a calibrated threshold for pressure build-up due to vapor generation.

If the fuel tank pressure build-up exceeds the threshold, the leak test results are invalid due to vapor generation. The engine on EVAP leak check monitor attempts to repeat the test again.

If the fuel tank pressure build-up does not exceed the threshold, the leak test results are valid and DTC P0442 is set.

5. If the 1.016 mm (0.40 inch) test passes, the test time is extended to allow the 0.508 mm (0.020 inch) test to run.

   The calculated change in fuel vacuum over the extended time is compared to a calibrated threshold for a leak from a 0.508 mm (0.020 inch) hole (opening).

   If the calculated bleed-up exceeds the calibrated threshold, the vapor generation test is run. If the vapor generation test passes (no vapor generation), an internal flag is set in the PCM to run a 0.508 mm (0.020 inch) test at idle (vehicle stopped).

   On the next start following a long engine off period, the enhanced EVAP system is sealed and evacuated for the first 10 minutes of operation.

   If the appropriate conditions are met, a 0.508 mm (0.020 inch) leak check is conducted at idle.

   If the test at idle fails, a DTC P0456 is set. There is no vapor generation test with the idle test.

6. The MIL is activated for DTCs P0442, P0455, P0456, P0457, P1443, and P1450 (or P0446) after 2 occurrences of the same concern and for DTC P144A after a sufficient number of completions. The MIL can also be activated for any enhanced EVAP system component DTCs in the same manner. The enhanced EVAP system component DTCs P0443, P0452, P0453, and P1451 are tested as part of the CCM.

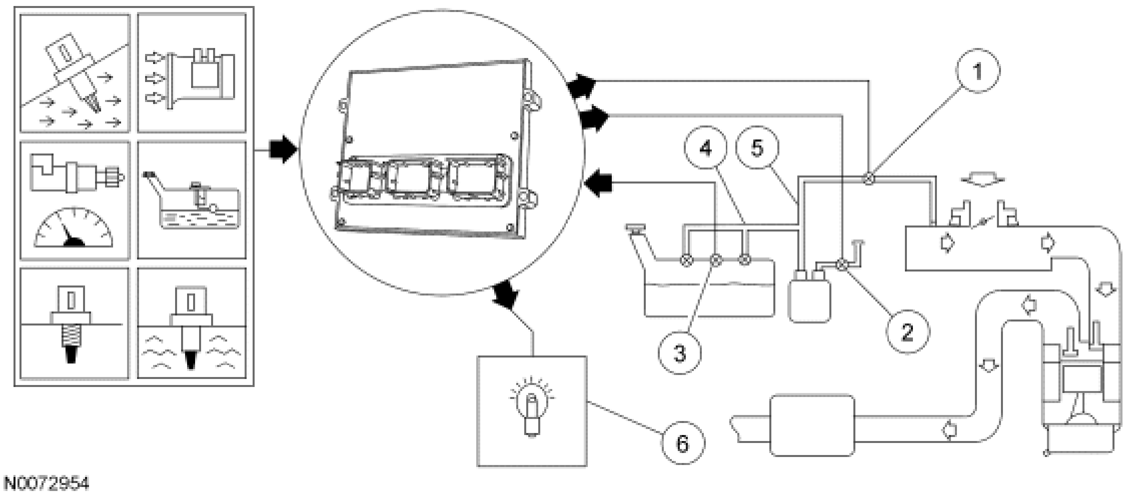

Fig. 101: Evaporative Emission (EVAP) Leak Check Monitor
Courtesy of FORD MOTOR CO.

ENGINE OFF NATURAL VACUUM (EONV) EVAP LEAK CHECK MONITOR

The EONV EVAP leak check monitor is executed during key off, after the engine on EVAP leak check monitor is completed. The EONV EVAP leak check monitor determines a leak is present when the naturally occurring change in fuel tank pressure or vacuum does not exceed a calibrated limit during a calibrated amount of time. A separate, low power consuming, microprocessor in the PCM manages the EONV leak check. The engine off EVAP leak check monitor is executed by the individual components of the enhanced EVAP system as follows:

1. The EVAP canister purge valve, also known as the vapor management valve (VMV), is normally closed at key off.
2. The normally open canister vent (CV) remains open for a calibrated amount of time to allow the fuel tank pressure to stabilize with the atmosphere. During this time period the FTP sensor is monitored for an increase in pressure. If pressure remains below a calibrated limit the CV is closed by the PCM (100% duty cycle) and seals the EVAP system from the atmosphere.
3. The FTP sensor is used by the EONV EVAP leak check monitor to determine if the target pressure or vacuum necessary to complete the EONV EVAP leak check monitor on the fuel tank is reached. Some vehicle applications with the EONV EVAP leak check monitor use a remote inline FTP sensor. If the target pressure or vacuum on the fuel tank is achieved within the calibrated amount of time, the test is complete.
4. The EONV EVAP leak check monitor uses the naturally occurring change in fuel tank pressure as a means to detect a leak in the EVAP system. At key off, a target pressure and vacuum is determined by the PCM. These target values are based on the fuel level and the ambient temperature at key off. As the fuel tank temperature increases, the pressure in the tank increases and as the temperature decreases a vacuum develops. If a leak is present in the EVAP system the fuel tank pressure or vacuum does not exceed the target value during the testing time period. The EONV EVAP leak check monitor begins at key off.

   After key off the normally open canister vent (CV) remains open for a calibrated amount of time to allow the fuel tank pressure to stabilize with the atmosphere. During this time period the FTP sensor is monitored for an increase in pressure. If pressure remains below a calibrated limit the CV is closed by the PCM (100% duty cycle) and seals the EVAP system from the atmosphere.

If the pressure on the fuel tank decreases after the EVAP system is sealed, the EONV EVAP leak check monitor begins to monitor the fuel tank pressure. When the target vacuum is exceeded within the calibrated amount of time the test completes and the fuel tank pressure and time since key off information is stored. If the target vacuum is not reached in the calibrated amount of time, a leak is suspected and the fuel tank pressure and time since key off information is stored.

If the pressure on the fuel tank increases after the EVAP system is sealed, but does not exceed the target pressure within a calibrated amount of time the CV is opened to allow the fuel tank pressure to again stabilize with the atmosphere. After a calibrated amount of time the CV is closed by the PCM and seals the EVAP system. When the fuel tank pressure exceeds either the target pressure or vacuum within the calibrated amount of time the test completes and the fuel tank pressure and time since key off information is stored. If the target pressure or vacuum is not reached in the calibrated amount of time, a leak is suspected and the fuel tank pressure and time since key off information is stored.

When a leak is suspected, the PCM uses the stored fuel tank pressure and time since key off information from an average run of 4 tests to suspect a leak. Some vehicles use an alternative method of a single run of 5 tests to determine the presence of a leak. If a leak is still suspected after 2 consecutive runs of 4 tests, (8 total tests) or 1 run of 5 tests, DTC P0456 is set and the MIL is illuminated.

5. The EONV EVAP leak check monitor is controlled by a separate low power consuming microprocessor inside the PCM. The fuel level indicator, fuel tank pressure, and battery voltage are inputs to the microprocessor. The microprocessor outputs are the CV solenoid and the stored test information. If the separate microprocessor is unable to control the CV solenoid or communicate with other processors DTC P260F is set.
6. The MIL is activated for DTCs P0456 and P260F. The MIL can also be activated for any enhanced EVAP system component DTCs in the same manner. The enhanced EVAP system component DTCs P0443, P0446, P0452, P0453, and P1451 are tested as part of the CCM.

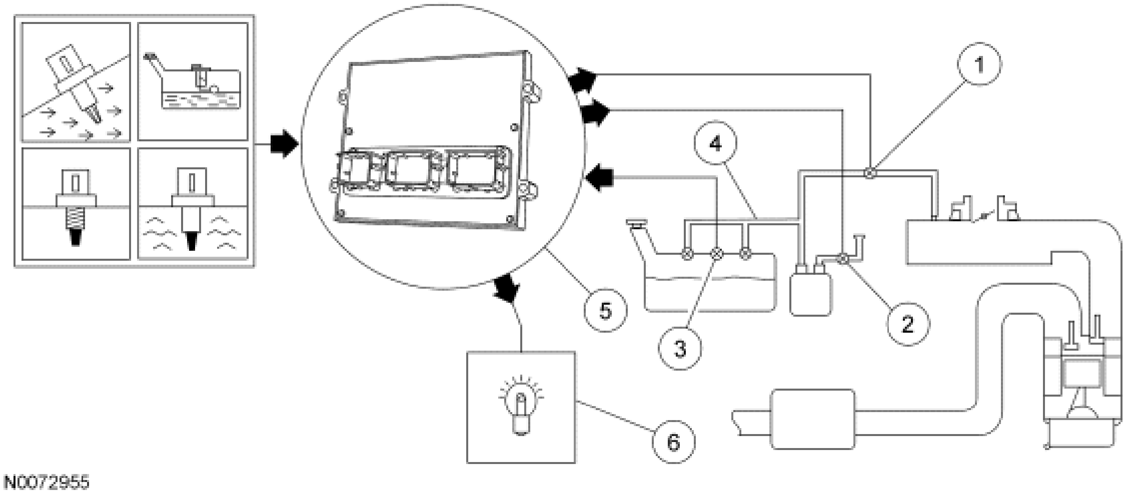

Fig. 102: EONV EVAP Leak Check Monitor

EXHAUST GAS RECIRCULATION (EGR) SYSTEM MONITOR - DIFFERENTIAL PRESSURE FEEDBACK EGR AND EGR SYSTEM MODULE

(ESM)

The EGR system monitor is an on-board strategy designed to test the integrity and flow characteristics of the EGR system. The monitor is activated during EGR system operation and after certain base engine conditions are satisfied. Input from the engine coolant temperature (ECT) or cylinder head temperature (CHT), intake air temperature (IAT), throttle position (TP), and crankshaft position (CKP) sensors is required to activate the monitor. Once activated, the EGR system monitor carries out each of the tests described below during the engine modes and conditions indicated. Some of the EGR system monitor tests are also carried out during an on-demand self-test.

1. The differential pressure feedback EGR sensor and circuit are continuously tested for opens and shorts. The monitor checks for the differential pressure feedback EGR circuit voltage to exceed the maximum or minimum allowable limits.

   The diagnostic trouble codes (DTCs) associated with this test are P0405 and P0406.

2. The EGR vacuum regulator solenoid is continuously tested for opens and shorts. The monitor looks for an EVR circuit voltage that is inconsistent with the EVR circuit commanded output state.

   The DTC associated with this test is P0403.

3. The test for a stuck open EGR valve or EGR flow at idle is continuously carried out at idle (TP sensor indicating closed throttle). The monitor compares the differential pressure feedback EGR circuit voltage at idle to the differential pressure feedback EGR circuit voltage stored during key on engine off (KOEO) to determine if EGR flow is present at idle.

   The DTC associated with this test is P0402.

4. The differential pressure feedback EGR sensor hoses are tested once per drive cycle for disconnect and plugging. The test is carried out with the EGR valve closed and during a period of acceleration. The powertrain control module (PCM) momentarily commands the EGR valve closed. The monitor looks for the differential pressure feedback EGR sensor voltage to be inconsistent for a no flow voltage. A voltage increase or decrease during acceleration while the EGR valve is closed may indicate a concern with a signal hose during this test.

   The DTCs associated with this test are P1405 and P1406 (differential pressure feedback EGR systems only).

5. The EGR flow rate test is carried out during a steady state when the engine speed and load are moderate and the EGR vacuum regulator duty cycle is high. The monitor compares the actual differential pressure feedback EGR circuit voltage to a desired EGR flow voltage for that state to determine if the EGR flow rate is acceptable or insufficient. This is a system test and may trigger a DTC for any concern causing the EGR system to not operate correctly.

   The DTC associated with this test is P0401. DTC P1408 is similar to P0401 but is carried out during key on engine running (KOER) self-test conditions.

6. The MIL is activated after one of the above tests fails on 2 consecutive drive cycles.

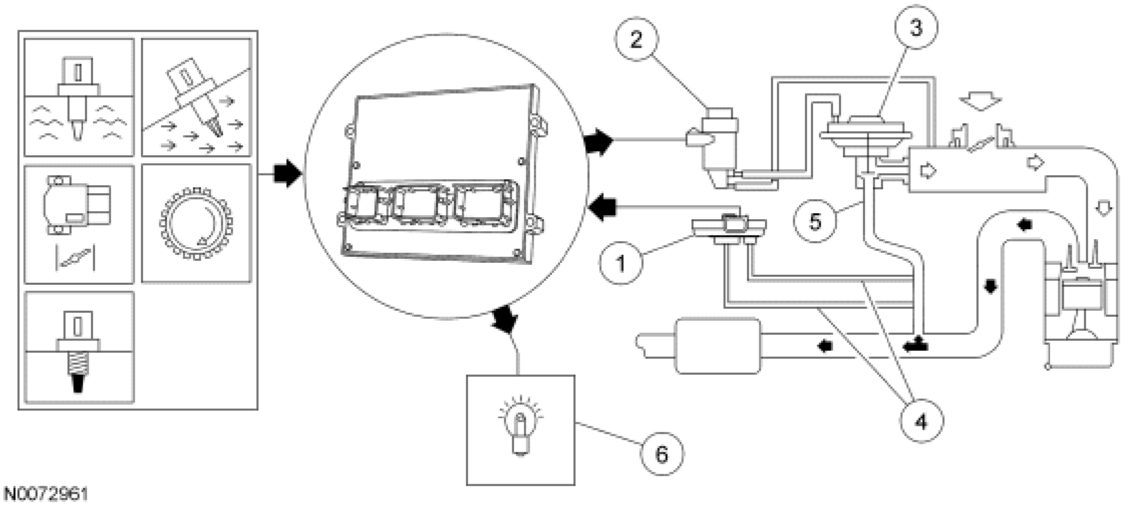

Fig. 103: EGR System Monitor - Differential Pressure Feedback EGR
Courtesy of FORD MOTOR CO.

FUEL SYSTEM MONITOR

The fuel system monitor is an on-board strategy designed to monitor the fuel control system. The fuel control system uses fuel trim tables stored in the powertrain control module (PCM) keep alive memory (KAM) to compensate for the variability that occurs in fuel system components due to normal wear and aging. Fuel trim tables are based on air mass. During closed-loop fuel control, the fuel trim strategy learns the corrections needed to correct a biased rich or lean fuel system. The correction is stored in the fuel trim tables. The fuel trim has 2 means of adapting: long term fuel trim and a short term fuel trim. Refer to **POWERTRAIN CONTROL SOFTWARE**, Fuel Trim. Long term fuel trim relies on the fuel trim tables and short term fuel trim refers to the desired air/fuel ratio parameter called LAMBSE. LAMBSE is calculated by the PCM from the heated oxygen sensor (HO2S) inputs and helps maintain a 14.7:1 air/fuel ratio during closed-loop operation. Short term fuel trim and long term fuel trim work together. If the HO2S indicates the engine is running rich, the PCM corrects the rich condition by moving the short term fuel trim into the negative range, less fuel to correct for a rich combustion. If after a certain amount of time the short term fuel trim is still compensating for a rich condition, the PCM learns this and moves the long term fuel trim into the negative range to compensate and allow the short term fuel trim to return to a value near 0%. Inputs from the engine coolant temperature (ECT) or cylinder head temperature (CHT), intake air temperature (IAT), mass air flow (MAF) sensors are required to activate the fuel trim system, which in turn activates the fuel system monitor. Once activated, the fuel system monitor looks for the fuel trim tables to reach the adaptive clip (adaptive limit) and LAMBSE to exceed a calibrated limit. The fuel system monitor stores the appropriate DTC when a concern is detected as described below.

1. The HO2S detects the presence of oxygen in the exhaust and provides the PCM with feedback indicating air/fuel ratio.
2. A correction factor is added to the fuel injector pulse width calculation and the mass air flow calculation, according to the long and short term fuel trims as needed to compensate for variations in the fuel system.
3. When deviation in the LAMBSE parameter increases, air/fuel control suffers and emissions increase. When LAMBSE exceeds a calibrated limit and the fuel trim table has clipped, the fuel system monitor

sets a DTC as follows:

The DTCs associated with the monitor detecting a lean shift in fuel system operation are P0171 (Bank 1) and P0174 (Bank 2).

The DTCs associated with the monitor detecting a rich shift in fuel system operation are P0172 (Bank 1) and P0175 (Bank 2).

4. The MIL is activated after a concern is detected on 2 consecutive drive cycles.

Typical fuel system monitor entry conditions:

- RPM range greater than idle
- Air mass range greater than 5.67 g/sec (0.75 lb/min)
- Purge duty cycle of 0%

Typical fuel monitor thresholds:

- Lean Condition Concern: LONGFT greater than 25%, SHRTFT greater than 5%
- Rich Condition Concern: LONGFT less than 25%, SHRTFT less than 10%

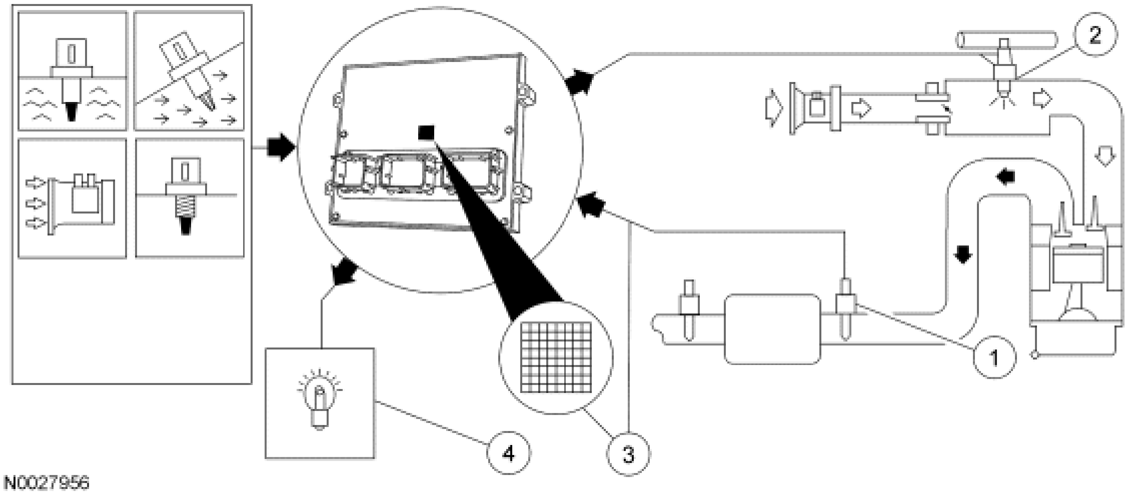

Fig. 104: Fuel System Monitor
Courtesy of FORD MOTOR CO.

HEATED OXYGEN SENSOR (HO2S) MONITOR

The HO2S monitor is an on-board strategy designed to monitor the HO2Ss for concerns or deterioration which can affect emissions. The fuel control or stream 1 HO2S are checked for correct output voltage and response rate. Response rate is the time it takes to switch from lean to rich or rich to lean. Stream 2 HO2Ss are used for catalyst monitoring, and stream 3 HO2Ss used for fore-aft oxygen sensor (FAOS) control are also monitored for correct output voltage. A stream 3 HO2S is only available on the Focus PZEV and Fusion/Milan 2.3L PZEV. Vehicles with universal HO2Ss use the stream 2 sensors for FAOS control. Input is required from the camshaft

position (CMP), crankshaft position (CKP), engine coolant temperature (ECT) or cylinder head temperature (CHT), fuel rail pressure temperature (FRPT), fuel tank pressure (FTP), intake air temperature (IAT), mass air flow (MAF), manifold absolute pressure (MAP), and throttle position (TP) sensors and the vehicle speed sensor (VSS) to activate the HO2S monitor. The fuel system monitor and misfire detection monitor must also have completed successfully before the HO2S monitor is enabled.

1. The HO2S senses the oxygen content in the exhaust flow. The typical HO2S outputs a voltage between 0 and 1.0 volt. Lean of stoichiometric, air/fuel ratio of approximately 14.7:1, the HO2S generates a voltage between 0 and 0.45 volt. Rich of stoichiometric, the HO2S generates a voltage between 0.45 and 1.0 volt. The current required to maintain the universal HO2S at 0.45 volt is used by the PCM to calculate the air/fuel ratio. The HO2S monitor evaluates the HO2Ss for correct function.
2. The time between HO2S switches is monitored after vehicle startup and during closed loop fuel conditions. Excessive time between switches or no switches since startup indicates a concern. Since lack of switching concerns can be caused by HO2S concerns or by shifts in the fuel system, DTCs are stored that provide additional information for the lack of switching concern. Different DTCs indicate whether the sensor always indicates lean, rich, or disconnected. The HO2S signal is also monitored for high voltage, in excess of 1.1 volts. An over-voltage condition is caused by a HO2S heater or battery power short to the HO2S signal line.

   A functional test of the rear HO2Ss (Stream 2 or Stream 3 [Focus PZEV, Fusion/Milan 2.3L PZEV]) is done during normal vehicle operation. The peak rich and lean voltages are continuously monitored. Voltages that exceed the calibrated rich and lean thresholds indicate a functional sensor. If the voltages have not exceeded the thresholds after a long period of vehicle operation, the air/fuel ratio may be forced rich or lean in an attempt to get the rear sensor to switch. This situation normally occurs only with a green, less than 804.7 km (500 mi), catalyst. If the sensor does not exceed the rich and lean peak thresholds, a concern is indicated.
3. The MIL is activated after a concern is detected on 2 consecutive drive cycles.
4. Some partial zero emission vehicles (PZEV) use 3 HO2Ss. The front sensor (HO2S11) is the primary fuel control sensor. The next sensor downstream in the exhaust is used to monitor the light-off catalyst (HO2S12). The last sensor downstream in the exhaust (HO2S13) is used for very long term fuel trim in order to optimize catalyst efficiency (FAOS control).

The HO2S monitor DTCs can be categorized as follows:

- P0030, P0050 - HO2S heater control (universal HO2S)
- P0040, P0041 - Swapped HO2S connectors
- P0053, P0054, P0055, P0059, P0060 - HO2S heater resistance
- P0130, P0150 - HO2S circuit concerns (universal HO2S)
- P0132, P0138, P0144, P0152, P0158 - HO2S circuit high voltage
- P0133, P0139, P0153, P0159 - HO2S slow response rate
- P0134, P0154 - HO2S circuit no activity detected (universal HO2S)
- P0135, P0141, P0155, P0161, P0147 - HO2S heater circuit
- P1127 - Downstream HO2S not running in on-demand self-test
- P2096, P2097, P2098, P2099 - Post catalyst fuel trim (universal HO2S)

- P2195, P2196, P2197, P2198, P2270, P2271, P2272, P2273, P2274, P2275 - HO2S lack of switching

MISFIRE DETECTION MONITOR

The misfire detection monitor is an on-board strategy designed to monitor engine misfire and identify the specific cylinder in which the misfire has occurred. Misfire is defined as lack of combustion in a cylinder due to absence of spark, poor fuel metering, poor compression, or any other cause. The misfire detection monitor is enabled only when certain base engine conditions are first satisfied. Input from the engine coolant temperature (ECT) or cylinder head temperature (CHT), intake air temperature (IAT), mass air flow (MAF) sensors is required to enable the monitor. The misfire detection monitor is also carried out during an on-demand self-test.

1. The powertrain control module (PCM) synchronized ignition spark is based on information received from

the crankshaft position (CKP) sensor. The CKP signal generated is also the main input used in determining cylinder misfire.

2. The input signal generated by the CKP sensor is derived by sensing the passage of teeth from the crankshaft position wheel mounted on the end of the crankshaft.
3. The input signal to the PCM is then used to calculate the time between CKP edges and the crankshaft rotational velocity and acceleration. By comparing the accelerations of each cylinder event, the power loss of each cylinder is determined. When the power loss of a particular cylinder is sufficiently less than a calibrated value and other criteria are met, then the suspect cylinder is determined to have misfired.
4. The malfunction indicator lamp (MIL) is activated after one of the above tests fail on 2 consecutive drive cycles.

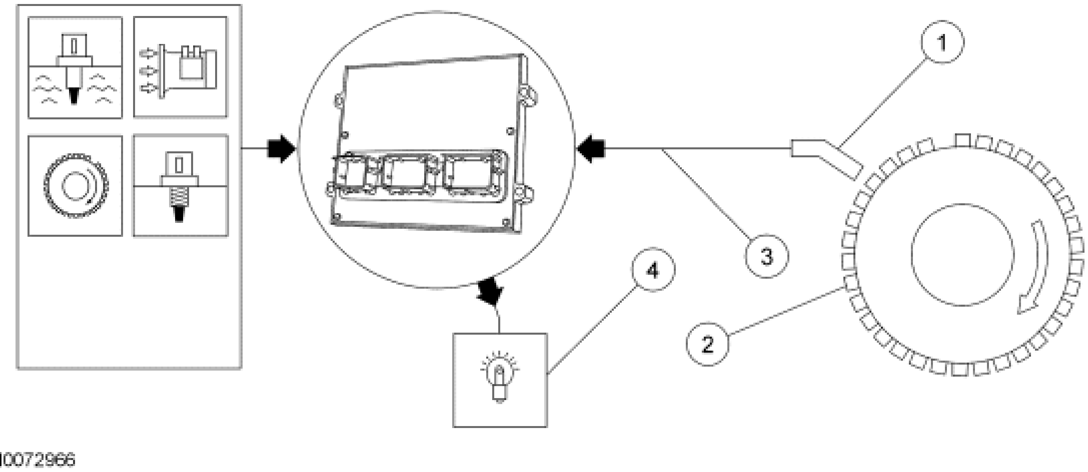

Fig. 107: Misfire Detection Monitor
Courtesy of FORD MOTOR CO.

Misfire Monitor Operation - There are 2 different misfire monitoring systems used: a low data rate (LDR) and a high data rate (HDR). The LDR system is capable of meeting the federal test procedure monitoring requirements on most engines and is capable of meeting the full-range of misfire monitoring requirements on 4-cylinder engines. The HDR system is capable of meeting the full-range of misfire monitoring requirements on 6-cyliner and 8-cylinder engines. The HDR on these engines meets the full-range of misfire phase-in requirements specified in the OBD regulations. The PCM software allows for detection of any misfires that occur 6 engine revolutions after initially cranking the engine. This meets the OBD requirement to identify misfires within 2 engine revolutions after exceeding the warm drive, idle RPM.

Low Data Rate System (LDR) - The LDR misfire monitor uses a low data rate CKP signal which indicates one position reference at 10 degrees before top dead center (BTDC) for each cylinder event. The PCM uses the CKP signal to calculate the crankshaft speed and acceleration for each cylinder. The crankshaft acceleration is then processed to detect a sporadic, single-cylider misfire patterns or multi-cylinder misfire patterns. The changes in overall engine RPM are removed by subtracting the median engine acceleration over a complete engine cycle. The resulting deviant cylinder acceleration values are used in evaluating misfire. Refer to the Generic Misfire Processing for more information.

High Data Rate System (HDR) - The HDR misfire monitor uses a high data rate CKP signal which

indicates18 position references per crankshaft revolution. This high resolution signal is processed using 2 different algorithms. The first algorithm is optimized to detect hard misfires on one or more continuously misfiring cylinders. The low pass filter filters the high-resolution crankshaft velocity signal to remove some of the crankshaft torsional vibrations that degrade signal to noise. Two low pass filters are used to enhance detection capability - a base filter and a more aggressive filter to enhance single-cylinder capability at higher RPM. This significantly improves detection capability for continuous misfires on single cylinders up to red line. The second algorithm, called pattern cancellation, is optimized to detect low rates of misfire. The algorithm learns the normal pattern of cylinder accelerations from the mostly good firing events and is then able to accurately detect deviations from that pattern. Both the hard misfire algorithm and the pattern cancellation algorithm produce a deviant cylinder acceleration value, which is used in evaluating misfire in the General Misfire Algorithm Processing part below. Due to the high data processing requirements, the HDR algorithms could not be implemented in the PCM microprocessor. They are implemented in a separate chip in the PCM called an AICE chip. The PCM microprocessor communicates with the AICE chip using a dedicated serial communication link. The AICE chip sends the cylinder acceleration values back to the PCM microprocessor for additional processing as described below. Lack of serial communication between the AICE chip and the PCM microprocessor, or an inability to synchronize the crankshaft or camshaft sensors inputs sets a DTC. DTC P0606 is set if there is a lack of serial communication between the AICE chip and the PCM microprocessor. DTC P1336 is set if there is an inability to synchronize the crank or camshaft sensor inputs. This change was made to improve diagnosis. DTC P0606 generally results in PCM replacement while DTC P1336 points to a lack of synchronization between the camshaft position (CMP) and CKP sensors. Profile correction software is used to learn and correct for mechanical inaccuracies in crankshaft tooth spacing under de-fueled engine conditions (requires 3 decelerations from 97 to 64 km/h (60 to 40 mph) with no-braking after the keep alive memory (KAM) has been reset). If the KAM has been reset, the PCM microprocessor initiates a special routine which computes correction factors for each of the 18 (or 20) position references and sends these correction factors back to the AICE chip to be used for subsequent misfire signal processing. These learned corrections improve the high RPM capability of the monitor. The misfire monitor is not active until a profile has been learned.

Generic Misfire Processing - The acceleration that a piston undergoes during a normal firing event is directly related to the amount of torque that cylinder produces. The calculated piston/cylinder acceleration value(s) are compared to a misfire threshold that is continuously adjusted based on inferred engine torque. Deviant accelerations exceeding the threshold are conditionally labeled as misfires. The calculated deviant acceleration value(s) are also evaluated for noise. Normally, misfire results in a nonsymmetrical loss of cylinder acceleration. Mechanical noise, such as rough roads at high RPM with light load conditions, will produce symmetrical acceleration variations. Cylinder events that indicate excessive deviant accelerations of this type are considered noise. Noise-free deviant acceleration exceeding a given threshold is labeled a misfire. The number of misfires are counted over a continuous 200 revolution and 1,000 revolution period. The revolution counters are not reset if the misfire monitor is temporarily disabled such as for negative torque mode. At the end of the evaluation period, the total misfire rate and the misfire rate for each individual cylinder is computed. The misfire rate is evaluated every 200 revolution period (Type A) and compared to a threshold value obtained from an engine speed/load table. This misfire threshold is designed to prevent damage to the catalyst due to sustained excessive temperature 871°C (1,600°F) for Pt/Pd/Rh conventional wash coat, 899°C (1,650°F) for Pt/Pd/Rh advanced wash coat and 982°C (1,800°F) for Pd-only high tech wash coat. If the misfire threshold is exceeded and the catalyst temperature model calculates a catalyst mid-bed temperature that exceeds the catalyst damage threshold, the MIL blinks at a 1 Hz rate while the misfire is present. If the threshold is again exceeded on a subsequent driving cycle, the MIL is illuminated. If a single cylinder is indicated to

be consistently misfiring in excess of the catalyst damage criteria, the fuel injector to that cylinder may be shut off for a period of time to prevent catalyst damage. Up to 2 cylinders may be disabled at the same time. This fuel shut-off feature is used on many 8-cylinder engines and some 6-cylinder engines. It is never used on a 4-cylinder engine. The misfire rate is also evaluated every 1,000 revolution period and compared to a single (type B) threshold value to indicate if the emission-threshold exceeded, which can be either a single 1,000 over-rev event from startup or 4 subsequent 1,000 over-rev events on a drive cycle after start-up. Many vehicles will set DTC P0316 if the type B threshold is exceeded during the first 1,000 revolutions after engine startup. This DTC is stored in addition to the normal P03xx DTC that indicates the misfiring cylinder. If the misfire is detected but it can not be attributed to a specific cylinder, a P0300 is stored.

Profile Correction - Profile correction software is used to learn and correct for mechanical inaccuracies in the crankshaft position wheel tooth spacing. Since the sum of all the angles between the crankshaft teeth must equal 360 degrees, a correction factor can be calculated for each misfire sample interval that makes all the angles between individual teeth equal. To prevent any fueling or combustion differences from affecting the correction factors, learning is done during deceleration-fuel cutout. The correction factors are learned during closed-throttle, non-braking, de-fueled decelerations in the 97 to 64 km/h (60 to 40 mph) range after exceeding 97 km/h (60 mph) (likely to correspond to a freeway exit condition). In order to minimize the learning time for the correction factors, a more aggressive deceleration-fuel cutout strategy may be used when the conditions for learning are present. The corrections are typically learned in a single deceleration, but can be learned during up to 3 such decelerations. The mature correction factors are the average of a selected number of samples. A low data rate misfire system will typically learn 4 such corrections in this interval, while a high data rate system will learn 36 or 40 in the same interval (data is actually processed in the AICE chip). In order to assure the accuracy of these corrections, a tolerance is placed on the incoming values such that an individual correction factor must be repeatable within the tolerance during learning. This is to reduce the possibility of learning corrections on rough road conditions which could limit misfire detection capability and to help isolate misfire diagnoses from other crankshaft velocity disturbances. Since inaccuracies in the wheel tooth spacing can produce a false indication of misfire, the misfire monitor is not active until the corrections are learned. In the event of battery disconnection or loss of keep alive memory (KAM), the correction factors are lost and must be relearned. If the software is unable to learn a profile after three, 97 to 64 km/h (60 to 40 mph) deceleration cycles, DTC P0315 is set.

Misfire Monitor Specifications - Misfire monitor operation: DTCs P0300 to P0310 (random and specific cylinder misfire), P1336 (crankshaft/camshaft sensor range/performance), P0606 (control module processor), P0315 (crankshaft position system variation not learned), P0316 (misfire detected on startup [first 1000 revolutions]). The monitor execution is continuous, misfire rate calculated every 200 or 1,000 revolutions. The monitor does not have a specific sequence. The CKP and CMP sensors have to be operating correctly to run the monitor. The monitoring duration is the entire driving cycle (see disablement conditions below).

Typical misfire monitor entry conditions: Entry condition minimum/maximum time since engine start-up is 0 seconds, engine coolant temperature is -7°C to 121°C (20°F to 250°F), RPM range is (full-range misfire certified, with 2 revolution delay) 2 revolutions after exceeding 150 RPM below drive idle RPM to red line on tach or fuel cutoff, profile correction factors are learned in KAM, and the fuel tank level is greater than 15%.

Typical misfire temporary disablement conditions: Closed throttle deceleration (negative torque, engine

being driven), Fuel shut-off due to vehicle-speed limiting or engine-RPM limiting mode, and a high rate of change of torque (heavy throttle tip-in or tip out)

The profile learning operation includes DTC P0315 - unable to learn profile in three, 97 to 64 km/h (60 to 40 mph) decelerations; monitor execution is once per KAM reset; The monitor sequence: profile must be learned before the misfire monitor is active; The CKP and CMP sensors are required to be OK; no AICE communication errors, CKP/CMP signals must be synchronized. The monitoring duration is 10 cumulative seconds in conditions (a maximum of three, 97 to 64 km/h (60 to 40 mph) de-fueled decelerations).

Typical profile learning entry conditions: Entry conditions from minimum to maximum: Engine in deceleration-fuel cutout mode for 4 engine cycles, the brakes are not applied, the engine RPM is 1,300 to 3,700 RPM, the change is less than 600 RPM, the vehicle speed is 48 to 112 km/h (30 to 70 mph), and the learning tolerance is 1%.

POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM MONITOR

The PCV monitor consists of a modified PCV system design. The PCV valve is installed into the rocker cover using a quarter-turn cam-lock design to prevent accidental disconnection. High retention force molded plastic lines are used from the PCV valve to the intake manifold. The diameter of the lines and the intake manifold entry fitting are increased so that inadvertent disconnection of the lines after a vehicle is repaired causes either an immediate engine stall or does not allow the engine to be restarted. In the event that the vehicle does not stall if the line between the intake manifold and PCV valve is inadvertently disconnected, the vehicle has a large vacuum leak that causes the vehicle to run lean at idle. This illuminates the MIL after 2 consecutive driving cycles and stores one or more of the following DTCs: Lack of HO2S sensor switches, bank 1 (P2195), Lack of HO2S sensor switches bank 2 (P2197), fuel system lean, bank 1 (P0171) or fuel system lean, bank 2 (P0174).

For additional PCV information, refer to **POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM**.

SECONDARY AIR INJECTION (AIR) SYSTEM MONITOR

The secondary air injection (AIR) system monitor is an on-board strategy designed to monitor the correct function of the secondary air injection system. The AIR monitor for the secondary air injection pump system consists of 2 monitor circuits: an AIR circuit to diagnose concerns with the primary circuit side of the AIR relay, and an AIR monitor circuit to diagnose concerns with the secondary circuit side of the AIR relay. A functional check is also carried out that tests the ability of the AIR system to inject air into the exhaust. The functional flow test relies on the mass air flow (MAF) sensor to determine the presence of air flow. The monitor check for specific changes in MAF input with the secondary AIR pump ON compared to secondary AIR pump OFF for failure detection. The integrity of the secondary AIR pump, inlet house, outlet house and related secondary AIR mechanical components are all checked during the functional flow test. The monitor is enabled during AIR system operation and only after certain base engine conditions are first satisfied. Input is required from the engine coolant temperature (ECT) or cylinder head temperature (CHT), mass air flow / intake air temperature (MAF/IAT), crankshaft position (CKP) sensors and the HO2S monitor test must also have passed without a fault detection to enable the AIR monitor. The AIR monitor is also activated during on-demand self-test.

1. On the primary side of the AIR relay, open and short circuit concerns are detected during normal

operation by the PCM output driver. This circuit energizes the relay and the vacuum-operated check and solenoid control valves.

The DTC associated with this test is P0412.

2. On the secondary side of the AIR relay, the AIR monitor circuit is held low by the resistance path through the secondary AIR pump when the secondary AIR pump is off. If the AIR monitor circuit is high there is either an open circuit to the PCM from the pump or there is power supplied to the secondary AIR pump. If the AIR monitor is low when the secondary AIR pump is commanded on, there is either an open circuit from the AIR relay or the AIR relay has failed to supply power to the secondary AIR pump.

   The DTCs associated with this test are P2257 and P2258.

3. The functional flow test is done when the secondary AIR pump is normally commanded on. The flow test relies on the MAF sensor for air meter flow changes during secondary AIR pump transitions and the heated oxygen sensor for exhaust rich/lean information. The flow test consist of three diagnostic tests:
   - Secondary AIR pump flow test - Compares the change in the air meter flow during secondary AIR pump transitions (ON/OFF) to a calibrated (expected) air flow table within the PCM. Associated DTC P0491 (Bank 1) and P0492 (Bank 2).
   - Inlet hose test - When the inlet hose is off, the secondary AIR pump still flows the same amount of air into the exhaust, but it is drawing air from the atmosphere instead of through the MAF sensor. This lack of expected air flow through the MAF fails the secondary AIR pump flow test. The engine fuel control system is still fueling for the air meter, therefore the excess air that is going into the exhaust causes the exhaust air fuel ratio to be lean. To set an inlet hose concern DTC P0410, the pump flow test must fail and the exhaust air fuel ratio must indicate too lean.
   - Outlet hose test - When the outlet hose is off, the secondary AIR pump flows more air than anticipated, since the exhaust back pressure is no longer impacting the secondary AIR pump air flow. The MAF sensor indicates excess air is drawn through the system. During this failure mode, engine air fuel ratio is reduced to protect the engine from running too rich. But since the outlet hose is disconnected, secondary air is not delivered to the exhaust system, causing the exhaust air fuel ratio to be rich at idle. To set the outlet hose concern DTC P2448 (Bank 1) and P2449 (Bank 2), the secondary AIR pump on flow test must indicate excess air flow and exhaust air fuel ratio too rich.
4. The MIL is activated after one of the above tests fail on 2 consecutive drive cycles.

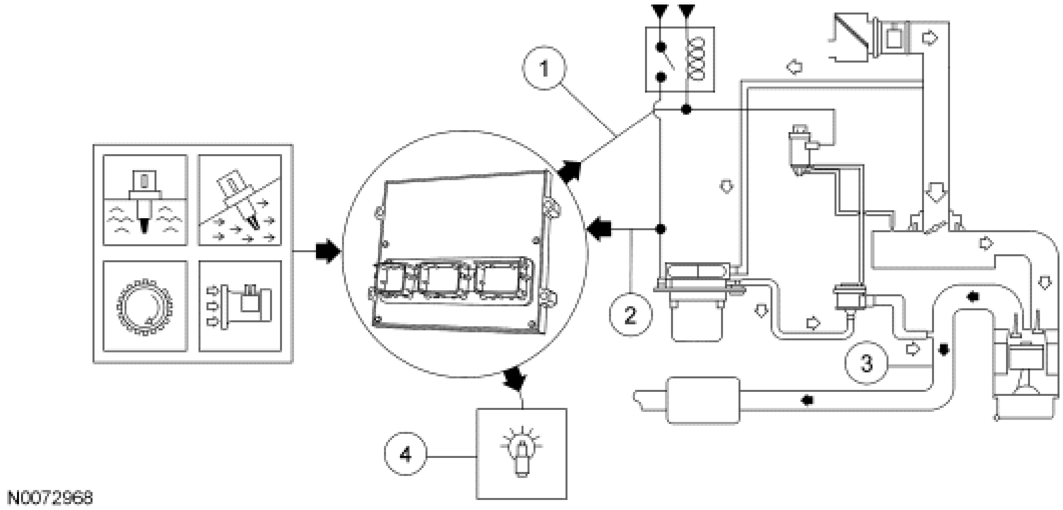

Fig. 108: Secondary AIR System Monitor
Courtesy of FORD MOTOR CO.

THERMOSTAT MONITOR

The thermostat monitor is designed to verify correct thermostat operation. This monitor is executed once per drive cycle and has a monitor run duration of 300-800 seconds. If a concern is present, DTC P0125 or P0128 is set and the malfunction indicator lamp (MIL) is illuminated.

The monitor checks the engine coolant temperature (ECT) or cylinder head temperature (CHT) sensor to warm up in a predictable manner when the engine is generating sufficient heat. A timer is initialized while the engine is at moderate load and the vehicle speed is above a calibrated limit. The target timer value is based on ambient air temperature at start-up. If the timer exceeds the target time and ECT or CHT has not warmed up to the target temperature, a concern is indicated. The test runs if the start-up intake air temperature from the intake air temperature (IAT) sensor is at, or below the target temperature. A 2-hour engine off soak time is also required to enable the monitor and to prevent erasing of any pending DTCs during a hot soak. This soak time feature also prevents false-passes of the monitor when the engine coolant temperature rises after the engine is turned off during a short engine off soak period.

The target temperature is calibrated to -11°C (20°F) the thermostat regulating temperature. For a typical 90°C (195°F) thermostat, the target temperature would be calibrated to 79°C (175°F). Some vehicle calibrations may lower the target temperature to less than 27°C (50°F) for vehicles that do not warm-up to thermostat regulating temperatures in the 11°C (20°F) to 27°C (50°F) ambient temperature range.

1. Inputs: ECT or CHT, IAT, engine LOAD (from MAF sensor) and vehicle speed input.

   Typical monitor entry conditions:

   - vehicle speed greater than 24 km/h (15 mph)
   - intake air temperature at start-up is between -7°C (20°F) and target thermostat temperature
   - engine load greater than 30%
   - engine off (soak) time greater than 2 hours

2. Output: MIL.

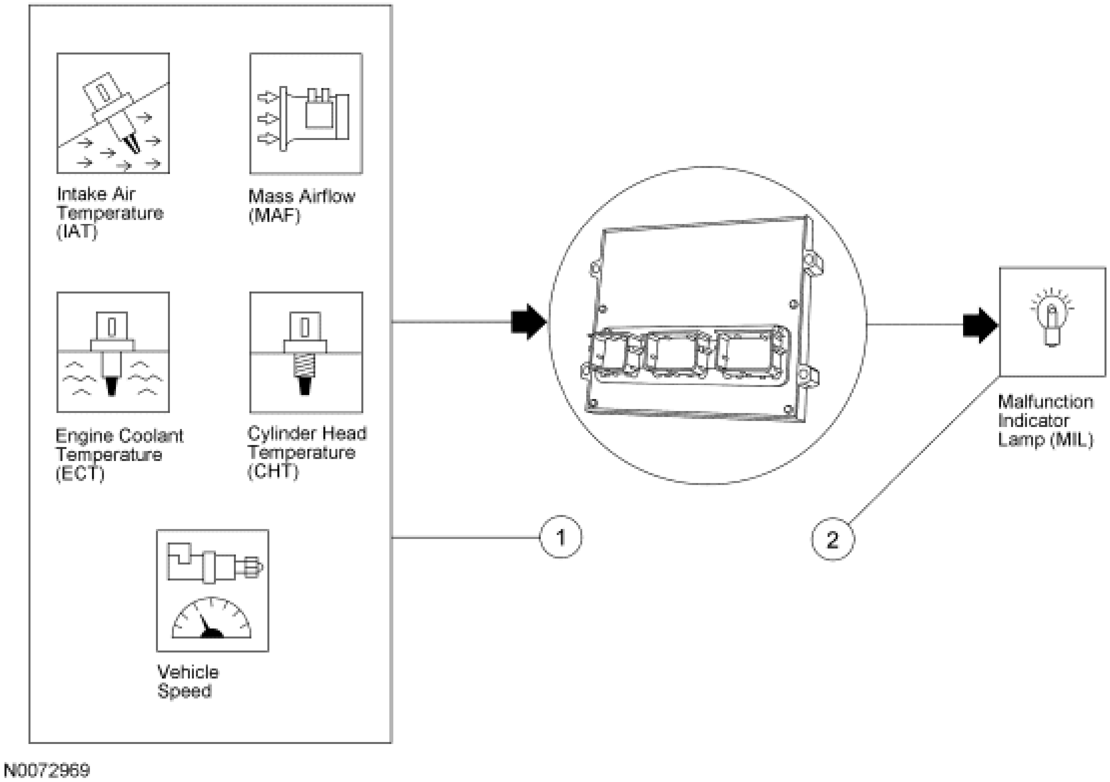

Fig. 109: Thermostat Monitor
Courtesy of FORD MOTOR CO.

VARIABLE CAMSHAFT TIMING (VCT) MONITOR

The VCT output driver in the powertrain control module (PCM) is checked electrically for opens and shorts. The VCT system is checked functionally by monitoring the closed loop camshaft position error correction. If the correct camshaft position cannot be maintained and the system has an advance or retard error greater than the calibrated threshold, a VCT control concern is indicated.

For additional information, refer to **VARIABLE CAMSHAFT TIMING (VCT) SYSTEM**.

2008 ENGINE PERFORMANCE

Diagnostic Methods - Gasoline Engines

DIAGNOSTIC METHODS

OVERVIEW

The Diagnostic Methods Section provides information on routine diagnostic tasks.

When following powertrain diagnostics on vehicles with on board diagnostics (OBD), the system may be checked by an off-board tester referred to as a scan tool. This part contains information for carrying out diagnostics with a scan tool. A scan tool has certain generic capabilities that are standard across the automotive industry in the United States and Canada. All functions are selected from a menu. Refer to the instruction article provided by the tool manufacturer.

DIAGNOSTIC TOOLS

Below is an equipment list with corresponding part numbers:

REQUIRED EQUIPMENT:

- Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool with functionality described under Scan Tool Setup and Functionality.
- Rotunda Smoke Machine, Fuel Evaporative Emission System Tester 218-00001 (522) or equivalent.

RECOMMENDED EQUIPMENT:

- Rotunda Vacuum/Pressure Tester 164-R0253 or equivalent. Range 0-101.3 kPa (0-30 in-Hg.) Resolution 3.4 kPa (1 in-Hg.)
- Rotunda Vacuum Tester 014-R1054 or equivalent. Range 0-101.3 kPa (0-30 in-Hg.)
- Rotunda 73III Automotive Meter 105-R0057 or equivalent. Input impedance 10 Megaohm minimum.
- Spark Tester D81P-6666-A (303-D037) or equivalent.
- Non-powered test lamp.

OPTIONAL EQUIPMENT:

- Rotunda Fuel (Gasoline) pressure test kit 134-R0087 or equivalent. (Use tool manufacturer's instructions.)

SCAN TOOL SETUP AND FUNCTIONALITY

Connect the scan tool to the data link connector (DLC) for communication with the vehicle.

The DLC is located in the driver side compartment under the steering column. It is attached to the instrument

panel and accessible from the driver seat.

The DLC is rectangular in design and capable of accommodating up to 16 terminals. The connector has keying features to allow easy connection.

The required scan tool functions are described below:

- monitor, record, and playback of parameter identification (PIDs)
- freeze frame PID data
- diagnostic test modes; self-test, clear diagnostic trouble codes (DTCs)
- output test mode
- resetting keep alive memory (KAM)
- diagnostic monitoring test results (mode 6) for on board diagnostic (OBD) on board monitors
- on-board system readiness (OBD monitor completion status)

Some of these functions are described. Refer to the scan tool manufacturer's instruction article for specific information on scan tool setup and operation.

INTERNATIONAL STANDARDS ORGANIZATION (ISO) 14229 DIAGNOSTIC TROUBLE CODE (DTC) DESCRIPTIONS

The ISO 14229 DTC is a set of common requirements for diagnostic systems. The scan tool displays a failure type and a status type with the DTC. The types display additional information on the scan tool for the condition that set the DTC. For a list of failure type descriptions, refer to**POWERTRAIN CONTROL SOFTWARE** , International Standards Organization (ISO) 14229 Diagnostic Trouble Code (DTC) Descriptions.

VEHICLE CHECK/PREPARATION

Before using the scan tool to carry out any test, refer to the important Safety Notice located at the beginning of this article and the necessary visual checks listed below.

VISUAL CHECKS

- Inspect the air cleaner and inlet duct.
- Check all engine vacuum hoses for damage, leaks, cracks, kinks, and proper routing.
- Check the electronic engine control (EEC) system wiring harness for proper connections, bent or broken pins, corrosion, loose wires, and proper routing.
- Check the powertrain control module (PCM), sensors, and actuators for physical damage.
- Check the engine coolant for proper level and mixture.
- Check the transmission fluid level and quality.
- Make all necessary repairs before continuing with the quick test. Refer to**QUICK TEST**.

VEHICLE PREPARATION

- Carry out all safety steps required to start and run vehicle tests. Apply the parking brake, place the gear selector lever firmly into the PARK position on automatic transmission vehicles or NEUTRAL on manual transmission vehicles, and block the drive wheels.
- Turn off all electrical loads such as radios, lamps, A/C, blower, and fans.
- Start the engine (if the engine runs) and bring it up to the normal operating temperature before running the quick test.

QUICK TEST DESCRIPTION

QUICK TEST

The quick test is divided into 3 specialized tests:

Key On Engine Off (KOEO) On-Demand Self-Test
Key On Engine Running (KOER) On-Demand Self-Test
Continuous Memory Self-Test

The quick test checks the integrity and function of the electronic engine control (EEC) system and outputs the test results when requested by the scan tool. The quick test also provides a quick check of the powertrain control system, and is usually carried out at the start of each diagnostic procedure with all accessories off. The quick test is also carried out at the end of most pinpoint tests for verification of the repair and to make sure no other concerns are incurred while repairing a previous concern. A system pass is displayed when no diagnostic trouble codes (DTCs) are output and a scan tool communication error does not exist. System pass means that hardware monitored by the powertrain control module (PCM) is functioning within the normal operating limits. Only a system pass, a DTC, or an incomplete on board diagnostic (OBD) drive cycle (P1000) is displayed.

For applications that use a stand-alone transmission control module (TCM) the PCM does not output TCM DTCs. For TCM self-test and diagnostics, refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .

KEY ON ENGINE OFF (KOEO) ON-DEMAND SELF-TEST

The KOEO on-demand self-test is a functional test of the PCM carried out on-demand with the key on and the engine off. This test carries out checks on certain sensor and actuator circuits. A concern must be present at the time of testing for the KOEO self-test to detect the concern. When a concern is detected, a DTC is output on the data link at the end of the test as requested by the scan tool.

KEY ON ENGINE RUNNING (KOER) ON-DEMAND SELF-TEST

The KOER on-demand self-test is a functional test of the PCM carried out on-demand with the key on, the engine running and the vehicle stopped. A check of certain inputs and outputs is made during operating conditions and at a normal operating temperature. The brake pedal position, transmission control, and the power steering tests are part of the KOER on-demand self-test and must be carried out during this operation if applicable. These are described below. A concern must be present at the time of testing for the KOER on-demand self-test to detect the concern. When a concern is detected, a DTC is output on the data link at the end of the test as requested by the scan tool.

Brake Pedal Position (BPP) Test

The BPP test checks the ability of the EEC system to detect a change of state in the BPP switch. The brake pedal is briefly applied and released on all vehicles equipped with a BPP input. This is done during a KOER on-demand self-test.

Power Steering Pressure (PSP) Test

The PSP test checks the ability of the EEC system to detect a change in the power steering system fluid pressure. The steering wheel is briefly turned at least 1/4 of a revolution on vehicles equipped with a PSP switch or sensor. This is done during a KOER on-demand self-test.

Transmission Control Switch (TCS) Test

The TCS test checks the ability of the EEC system to detect a change of state in the TCS. The switch is briefly cycled on all vehicles equipped with a TCS input. This is done during a KOER on-demand self-test.

CONTINUOUS MEMORY SELF-TEST

The continuous memory self-test is a functional test of the PCM carried out under any condition (engine running or off) with the key on. Unlike the KOEO and KOER self-tests, which can only be activated on-demand, the continuous self-test is always active. A concern does not need to be present when accessing continuous memory self-test DTCs, making the test valuable when diagnosing intermittent concerns. The vehicle may need to be driven or the on board diagnostic (OBD) drive cycle completed to allow the PCM to detect a concern. Refer to **ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** for more information. When a concern is stored in memory, a DTC is output on the data link when requested by the scan tool.

There are two types of continuous DTCs. The first type is an emission-related code which illuminates the malfunction indicator lamp (MIL) in the instrument cluster. The second is a non-emission related, non-MIL code which does not illuminate the cluster indicator.

For emission-related MIL codes, the PCM stores the DTC in continuous memory when a concern is detected for the first time. At this point the DTC does not illuminate the MIL and is now considered a pending code. The purpose of pending codes is to assist in repair verification by reporting a pending DTC after one drive cycle. If the same concern is detected after the next ignition start-run cycle, the emission-related MIL code illuminates the MIL. The MIL remains on even if the concern is intermittent. The MIL is extinguished if the concern is not present through 3 consecutive drive cycles or if the concern is fixed and the DTCs are cleared. Also, an emission-related pending MIL and any non-emission related, non-MIL DTCs are erased after approximately 40 vehicle warm-up cycles or if the DTCs are cleared.

Any scan tool that meets OBD requirements can access the continuous memory to retrieve emission-related MIL DTCs. However, not all scan tools access pending and non-emission related, non-MIL DTCs in the same way.

During most diagnostic procedures in this article, it is required that all DTCs be retrieved and cleared. Consult the instruction article from the tool manufacturer for specific instructions.

CLEAR THE CONTINUOUS DIAGNOSTIC TROUBLE CODES (DTCS) AND

RESET THE EMISSION MONITORS INFORMATION IN THE POWERTRAIN CONTROL MODULE (PCM)

DESCRIPTION

All on board diagnostics (OBD) scan tools support the clearing of continuous DTCs and resetting of emission monitors information in the PCM.

The clearing of the continuous DTCs allows the scan tool to command the PCM to clear/reset all emission-related diagnostic information. While carrying out this operation DTC P1000 is stored in the PCM until all the OBD system monitors or components have been tested to satisfy a drive cycle without any other concerns occurring. For more information about a drive cycle, refer to **ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE**.

The following events occur when the continuous DTCs and the emission monitors information is cleared from the PCM:

- the number of DTCs is reset
- the DTCs are cleared
- the freeze frame data is cleared
- the diagnostic monitoring test results are reset
- the status of the OBD system monitors is reset
- DTC P1000 is set

RESETTING THE KEEP ALIVE MEMORY (KAM)

DESCRIPTION

Resetting the KAM returns the powertrain control module (PCM) memory to its default setting. Adaptive learning contents such as adaptive airflow, idle speed, refueling event, and fuel trim are included. Clear the continuous diagnostic trouble codes (DTCs) in the PCM and reset the emission monitors information, is part of a KAM reset. Refer to **CLEAR THE CONTINUOUS DIAGNOSTIC TROUBLE CODES (DTCS) AND RESET THE EMISSION MONITORS INFORMATION IN THE POWERTRAIN CONTROL MODULE (PCM)**. Both can be useful in post-repair testing.

After the KAM has been reset, the vehicle may exhibit certain driveability concerns. It is necessary to allow the engine to idle at normal operating temperature with the air conditioning (A/C) OFF for 2 minutes. Then drive the vehicle to allow the PCM to learn the values for optimum driveability and performance.

This function may not be supported by all scan tools. Refer to the scan tool manufacturer's instruction article.

If an error message is received or the scan tool does not support this function, disconnecting the battery ground cable for a minimum of 5 minutes may be used as an alternative procedure.

ON-BOARD SYSTEM READINESS (OSR) TEST

DESCRIPTION

All on board diagnostic (OBD) scan tools display the on-board system readiness (OSR) test. The OSR displays the supported monitors on the vehicle and the status of all monitors (complete or not complete) at that time. Fuel, misfire, and comprehensive component monitors (CCMs) run continuously and always display YES status. Clearing the continuous diagnostic trouble codes (DTCs) and resetting the emission monitors information in the powertrain control module (PCM), or resetting the keep alive memory (KAM) causes the non-continuous monitors to change to a NO status.

A detailed description of completing the OBD monitors is found. Refer to **ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE**.

OUTPUT STATE CONTROL (OSC)

DESCRIPTION

WARNING: **Safety must be observed when using OSC. Failure to follow these instructions may result in personal injury.**

The OSC aids in diagnosing output actuators associated with the powertrain control module (PCM) for the engine. This mode allows the technician to command the individual actuator state. For example: the output can be enabled or disabled, the duty cycle or the angle of the output can be increased or decreased. The OSC is used to help test the electrical, hydraulic or mechanical components of the vehicle. This function is supported by the vehicle strategy but may not be present on all vehicles or available on all scan tools.

Retrieve the continuous codes and carry out a key on, engine off (KOEO) and key on, engine running (KOER) on-demand self-test before using any OSC. Any diagnostic trouble codes (DTCs) related to the transmission range (TR) sensor, output shaft sensor (OSS) or the vehicle speed sensor (VSS) must be fixed or the PCM does not allow the OSC to operate.

The OSC has 2 options for operation, the Bench Mode and the Drive Mode. The Bench Mode is functional only when the vehicle gear selector is in the PARK or NEUTRAL position. The Bench Mode may be used when the engine is on (running) or off (not running).

Each OSC function has a unique set of vehicle operating requirements that the technician is required to meet before operating the OSC. If the vehicle requirements are not met while commanding the OSC value, an error message appears. When the error message is received, OSC is canceled.

To confirm that the scan tool sent the OSC value and the PCM has accepted the OSC substitution, a corresponding parameter identification (PID) for each OSC parameter must be monitored.

One Touch Integrated Start System - Some vehicles are equipped with one touch integrated start system. It may be necessary to disable the one touch integrated start system to carry out diagnostic procedures that require extended cranking. Connect the scan tool, access the PCM and select the one touch integrated start system control PID to disable the system.

OUTPUT TEST MODE (OTM)

DESCRIPTION

WARNING: **Safety must be observed when using OTM.**

- **When all outputs are on, the electric fuel pump is briefly energized. Make sure the fuel system is intact and is not being repaired at this time.**
- **When low speed or high speed fan control(s) are turned on, make sure the fan blades are clear of any obstruction.**
- **Failure to follow these instructions may result in personal injury.**

The OTM aids in diagnosing output actuators associated with the powertrain control module (PCM). This mode allows the technician to energize and de-energize most of the system output actuators on command. When entering OTM, the outputs can be turned off and on without activating the fan control. The low and high speed fan controls may be turned on separately without energizing the other outputs. This function is supported by each vehicle strategy and may not be available on all scan tools.

As a safety precaution, OTM defaults to the off state after 10 minutes, and the fuel pump off state after approximately 7-10 seconds. OTM also turns off after the vehicle is started or after cycling the key off then on.

PARAMETER IDENTIFICATION (PID)

DESCRIPTION

The PID mode allows access to powertrain control module (PCM) information. This includes analog and digital signal inputs and outputs along with calculated values and the system status. There are 2 types of PID lists available and both are used throughout this article. The first is the generic (J1979) OBD PID list. This is a standard set of PIDs that all scan tools must be able to access. The second is a Ford-specific (J2190) list which can be accessed by an appropriate scan tool. When accessing any of these PIDs, the values are continuously updated. The generic or Ford PID list provides definitions and values in appropriate units. For more information, refer to the Society of Automotive Engineers (SAE) document J2205.

Generic OBD PID List

An X in the Freeze Frame column denotes both a mode 1 and mode 2 PID (real time and freeze frame).

Freeze Frame	Acronym	Description	Measurement Units
X	AAT	Ambient Air Temperature	Degrees
X	AIR	Secondary Air Status	On/Off
X	APP_D	Accelerator Pedal Position D	%
X	APP_E	Accelerator Pedal Position E	%
X	APP_F	Accelerator Pedal Position F	%
X	CATEMP11	Catalyst Temperature Bank 1, Sensor	Degrees

		1	
X	CATEMP12	Catalyst Temperature Bank 1, Sensor 2	Degrees
X	CATEMP21	Catalyst Temperature Bank 2, Sensor 1	Degrees
X	CATEMP22	Catalyst Temperature Bank 2, Sensor 2	Degrees
	CLR_DST	Distance since codes cleared	Km
	CCNT	Continuous DTC Counter	Unitless
X	ECT	Engine Coolant Temperature	Degrees
X	EGR_PCT	Commanded EGR	%
X	EGR_ERR	EGR Error	%
X	EVAP_PCT	Commanded Evaporative Purge	%
X	EVAP_VP	Evaporative System Vapor Pressure	Pa
X	EQ_RAT	Commanded Equivalence Ratio	Unit
X	FUEL SYS1	Fuel System Feedback Control Status-Bank 1	OL/CL/OL DRIVE[a] /OL FAULT/ CL FAULT
X	FUEL SYS2	Fuel System Feedback Control Status-Bank 2	OL/CL/OL DRIVE[a] /OL FAULT/ CL FAULT
	IAT	Intake Air Temperature	Degrees
X	LOAD[b]	Calculated Engine Load	%
X	LOAD_ABS	Absolute Load Value	%
X	LONGFT1	Current Bank 1 Fuel Trim Adjustment (kamref1) From Stoichiometric Which Is Considered Long Term	%

X	VSS	Vehicle Speed Sensor	km/h-mph
CL = Closed loop using HO2S(s) as feedback for fuel control. OL DRIVE = Open loop due to driving conditions (heavy acceleration). OL FAULT = Open loop due to fault with all upstream HO2S sensors. CL FAULT = Closed loop fuel control, but fault with one upstream HO2S sensor on dual bank vehicles.			

[a] OL = Open loop, have not satisfied conditions for closed loop.

[b] Percent engine load adjusted for atmospheric pressure.

Ford PID List

NOTE: This is not a complete list of Ford PIDs available. This is a list of Ford PIDs in this article.

Acronym	Description	Ford Units
ACCS	Air Conditioning Cycling Switch Input	On/Off
ACP	A/C Pressure Transducer Sensor	Volts
ACP	A/C Pressure Transducer Sensor	kPa/psi
ACP_PRESS	A/C Pressure Transducer Sensor	DCV/psi
ACP_PSI	A/C Pressure Transducer Sensor	psi
AIR	Secondary AIR Pump Control	On/Off
AIR_F	Secondary AIR Fault Indicator	Yes/No
AIRM	Secondary AIR Pump Monitor	On/Off
APP	Accelerator Pedal Position	%
APP1	Accelerator Pedal Position 1	Volts
APP2	Accelerator Pedal Position 2	Volts
APP3	Accelerator Pedal Position 3	Volts
APP_MAXDIFF	Maximum Difference between APP1 and APP2	Degrees
APP_MODE	Accelerator Pedal Position Mode	Pedal position
AXLE	Axle Ratio	Ratio
B+	Battery Voltage	DCV
BARO	Barometric Pressure Sensor	Frequency
BOO	Brake Pedal Position (BPP) Switch	On/Off

WAC_F	WOT A/C Primary Circuit Fault	Yes/No

FREEZE FRAME DATA

DESCRIPTION

Freeze frame data allows access to emission-related values from specific generic parameter identification (PIDs). These values are stored when an emission-related diagnostic trouble code (DTC) is stored in continuous memory. This provides a snapshot of the conditions that were present when the DTC was stored. Once one set of freeze frame data is stored, this data remains in memory even if another emission-related DTC is stored, with the exception of misfire or fuel system DTCs. Once freeze frame data for a misfire or fuel system DTC is stored, it overwrites any previous data, and freeze frame data is no longer overwritten. When a DTC associated with the freeze frame data is erased or the DTCs are cleared, new freeze frame data can be stored again. In the event of multiple emission-related DTCs in memory, always note the DTC for the freeze frame data.

FREEZE FRAME DATA TABLE

Acronym	Description	Measurement Units
AAT	Ambient Air Temperature	Degrees
AIR	Secondary Air Status	
APP_D	Accelerator Pedal Position D	%
APP_E	Accelerator Pedal Position E	%
APP_F	Accelerator Pedal Position F	%
BARO	Barometric Pressure	kPa

CATTEMP11	Catalyst Temperature Bank 1, Sensor 1	Degrees

TP	Absolute Throttle Position	%
TP_REL	Relative Throttle Position	%
VS	Vehicle Speed	km/h-mph
WARMUPS	Number of Warm-ups Since Code Cleared	Units

Some unique PIDs are stored in the keep alive memory (KAM) of the powertrain control module (PCM) to help in diagnosing the root cause of misfires. These PIDs are collectively called misfire freeze frame (MFF) data. These parameters are separate from the generic freeze frame data that is stored for every MIL code. They are used for misfire diagnosis only. The MFF data could be more useful for misfire diagnosis than the generic freeze frame data. It is captured at the time of the highest misfire rate, and not when the DTC is stored at the end of a 200 or 1,000 revolution block. (Generic freeze frame data for misfire can be stored minutes after the misfire actually occurred.)

NOTE: MFF PIDs are supported on all vehicles, but may not be available on all scan tools because enhanced PID access may vary by scan tool manufacturer.

MISFIRE FREEZE-FRAME PIDS

PID Name	Description	Measurement Units
MFF RPM	Engine RPM at the time of misfire	RPM
MFF LOAD	Engine load at the time of misfire	%
MFF VSS	Vehicle speed at the time of misfire	km/h-mph
MFF IAT	Intake air temperature at the time of misfire	Degrees
MFF SOAK	Engine-off soak time at the time of misfire	Time
MFF RNTM	Engine running time at the time of misfire	Time
MFF EGR	EGR DPFE sensor at the time of misfire	Volts
MFF TP	Throttle Position at time of misfire	Volts
MFF TRIP	Number of driving cycles at the time of misfire (at least one 1,000 rev block)	Number of Trips
MFF PNP	1= in DRIVE during the time of misfire	Mode
MP LRN	1= Misfire wheel profile learned in KAM	Yes/No

FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)

DESCRIPTION

The EEPROM is contained in an integrated circuit internal to the powertrain control module (PCM). The EEPROM contains the vehicle strategy including calibration information specific to the vehicle, and is capable of being programmed or flashed repeatedly.

As part of the calibration there is an area referred to as the vehicle identification (VID) block. The VID block is programmed when installing a new PCM as described under Programming the VID Block for a Replacement PCM. Failure to carry out this procedure may generate DTCs P1635 or P1639. The VID block in an existing

PCM can also be tailored to accommodate various hardware or parameter changes made to the vehicle since production. Failure to carry out this procedure properly may generate DTC P1635, Tire/Axle Ratio out of Acceptable Range. An incorrect tire/axle ratio is one of the main causes for DTC P1639. This is described under Making Changes to the VID Block and also under Making Changes to the PCM Calibration. The VID block contains many items used by the strategy for a variety of functions. Some of these items include the vehicle identification number (VIN), octane adjust, fuel octane, fuel type, vehicle speed limit, tire size, axle ratio, the presence of speed control, and 4-wheel drive electronic shift-on-the-fly (ESOF) versus manual shift-on-the-fly (MSOF). Only items applicable to the vehicle hardware and supported by the VID block is displayed on the scan tool.

When changing items in the VID block, the strategy places range limits on certain items such as tire and axle ratio. The number of times the VID block may be reconfigured is limited. When this limit is reached, the scan tool displays a message indicating the need to flash the PCM again to reset the VID block.

Programming can be carried out by a local Ford dealer or any non-Ford facility. Refer to the scan tool manufacturer's instruction article for details.

PROGRAMMING THE VID BLOCK FOR A REPLACEMENT PCM

A new PCM contains the latest strategy and calibration level for a particular vehicle. However, the VID block is blank and needs programming. There are 2 procedures available. The first is an automatic data transfer from the old PCM to the new PCM, and the second is manual data entry into the new PCM.

Automatic data transfer is carried out if the old PCM is capable of communicating. This is done by using a scan tool to retrieve data from the old PCM before removing it from the vehicle. The stored data can then be downloaded to the new PCM after it has been installed.

Carry out manual data entry if the old module is damaged or incapable of communicating. Remove and install a new PCM. Using a compatible scan tool, select and carry out the module/parameter programming, referring to the scan tool manufacturer's instruction article. Make certain that all parameters are included. Failure to properly program tire size in revolutions per mile, (rev/mile equals 63,360 divided by the tire circumference in inches), axle ratio, 4x4/4x2, and/or MSOF/ESOF may result in DTCs P1635 and P1639. You may be instructed to contact the As-Built Data Center for the information needed to manually update the VID block with the scan tool. Contact the center only if the old PCM cannot be used or the data is corrupt. For Ford and Lincoln Mercury technicians, contact your National Hotline or the Professional Technician Society (PTS) website for As-Built data listed under the Service Publications Index. Non-Ford technicians use the Motorcraft® website at www.motorcraft.com. From the Motorcraft® homepage, use the search function to find the Module Programming or As-Built Data.

For Ford and Lincoln Mercury technicians, check the Programmable Module Installation link on the PTS website for quick Programmable Module data information by vehicle.

MAKING CHANGES TO THE VID BLOCK

A PCM which is programmed may require changes to be made to certain VID information to accommodate the vehicle hardware. Refer to Module Reprogramming on the scan tool.

MAKING CHANGES TO THE PCM CALIBRATION

At certain times, the entire EEPROM needs to be completely reprogrammed. This is due to changes made to the strategy or calibration after production, or the need to reset the VID block because it has reached its limit. Refer to Module Reprogramming on the scan tool.

DIAGNOSTIC MONITORING TEST RESULTS - MODE 6

Mode 6 allows access to the results of on board diagnostic (OBD) monitor diagnostic test results. The test values are stored at the time of the particular monitor completion. Refer to mode 6 on the scan tool for test information.

ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE

DESCRIPTION OF ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE

The following procedure is designed to execute and complete the OBD monitors and to clear the Ford P1000, I/M readiness code. To complete a specific monitor for repair verification, follow steps 1 through 4, then continue with the step described by the appropriate monitor found under the OBD Monitor Exercised column. For the EVAP/secondary AIR monitor to run, the ambient air temperature must be between 4.4 to 37.8°C (40 to 100°F), and the altitude below 2,438 meters (8,000 feet). If the P1000 code must be cleared in these conditions, the powertrain control module (PCM) must detect them once (twice on some applications) before the EVAP monitor can be bypassed and diagnostic trouble code (DTC) P1000 is cleared. The EVAP bypassing procedure is described in the following drive cycle.

The OBD drive cycle is carried out using a scan tool. Refer to the manufacturer's instruction article for each described function.

A detailed description for clearing the DTCs is found. Refer to **CLEAR THE CONTINUOUS DIAGNOSTIC TROUBLE CODES (DTCS) AND RESET THE EMISSION MONITORS INFORMATION IN THE POWERTRAIN CONTROL MODULE (PCM)**.

DRIVE CYCLE RECOMMENDATIONS

WARNING: **Strict observance of posted speed limits and attention to driving conditions are mandatory when proceeding through the following drive cycles. Failure to follow these instructions may result in personal injury.**

1. Most OBD monitors complete more readily using a steady foot driving style during cruise or acceleration modes. Operating the throttle in a smooth fashion minimizes the time required for monitor completion.
2. The fuel tank level should be between 1/2 and 3/4 full with 3/4 full being the most desirable.
3. The evaporative monitor can operate only during the first 30 minutes of engine operation. When executing the procedure for this monitor, stay in part throttle mode and drive in a smooth fashion to minimize fuel slosh.
4. When bypassing the EVAP engine soak times, the PCM must remain powered (key ON) after clearing the continuous DTCs and relearning emission diagnostic information.

For best results, follow each of the following steps as accurately as possible:

OBD Monitor Exercised	Drive Cycle Procedure	Purpose of Drive Cycle Procedure
Drive Cycle Preparation	**NOTE:** **To bypass the EVAP soak timer (normally 6 hours), the PCM must remain powered after clearing the continuous DTCs and resetting the emission monitors information in the PCM.**	Bypasses the engine soak timer. Resets the OBD monitor status.
	1. Install the scan tool. Turn the key on with the engine off. Cycle the key off, then on. If needed, select the appropriate vehicle and engine qualifier. Clear the continuous DTCs and reset the emission monitors information in the PCM.	
	2. Begin to monitor the following PIDs (if available): ECT, EVAPDC, FLI and TP MODE. Start the vehicle without returning the key to the OFF position.	
	3. Idle the vehicle for 15 seconds. Drive at 64 km/h (40 mph) until the engine coolant temperature (ECT) is at least 76.7°C (170°F).	Executes SEC AIR flow check monitor (if applicable).
Prep for Monitor Entry	4. Is the intake air temperature (IAT) between 4.4 to 37.8°C (40 to 100°F)? If not, complete the following steps, but note that step 14 is required to bypass the EVAP/secondary AIR monitor and clear DTC P1000.	Engine warm-up and provides IAT input to the PCM.
HEGO	5. Cruise at 64 km/h (40 mph) for at least 5 minutes.	Executes the HO2S monitor.
EVAP	6. Cruise at 64 to 89 km/h (40 to 55 mph) for 10 minutes (avoid sharp turns and hills). NOTE: To initiate the monitor, the throttle should be at part throttle, EVAPDC must be greater than 75%, and FLI must be between 15 and 85%, and for fuel tanks over 25 gallons FLI must be between 30 and 85%.	Executes the EVAP monitor if the IAT is between 4.4 to 37.8°C (40 to 100°F).
Catalyst	7. Drive in stop and go traffic conditions. Include 5 different constant cruise speeds, ranging from 32 to 89 km/h (20 to 55 mph) over a	Executes the catalyst monitor.

	10 minute period.	
EGR	8. From a stop, accelerate to 72 km/h (45 mph) at 1/2 to 3/4 throttle. Repeat 3 times.	Executes the EGR monitor.
SEC AIR/CCM (Engine)	9. Bring the vehicle to a stop. Idle with the transmission in drive (neutral for M/T) for 2 minutes.	Executes the idle air control (IAC) portion of the comprehensive component monitor (CCM) and the SEC AIR functional check (if applicable).
CCM (Transmission)	10. For M/T, accelerate from 0 to 81 km/h (0 to 50 mph), and continue to step 12. For A/T, from a stop and in overdrive, moderately accelerate to 81 km/h (50 mph) and cruise for at least 15 seconds. Stop the vehicle and repeat without overdrive to 64 km/h (40 mph) cruising for at least 30 seconds. While at 64 km/h (40 mph), activate the overdrive, accelerate to 81 km/h (50 mph) and cruise for at least 15 seconds. Stop for at least 20 seconds and repeat step 10 five times.	Executes the transmission portion of the CCM.
Misfire and Fuel Monitors	11. From a stop, accelerate to 97 km/h (60 mph). Decelerate at closed throttle to 64 km/h (40 mph) (no brakes). Repeat this 3 times.	Allows learning for the misfire monitor.
Readiness Check	12. Access the On-Board System Readiness (OBD monitor status) function on the scan tool. Determine whether all non-continuous monitors have completed. If not, go to step 13.	Determines if any monitor has not completed.
Pending Code Check and EVAP Monitor Bypass Check	13. With the scan tool, check for pending codes. Conduct the normal repair procedures for any pending code concern. Otherwise, repeat any incomplete monitor. If the EVAP monitor or SEC AIR monitor is not complete and the IAT was out of the 4.4 to 37.8°C (40 to 100°F) temperature range in step 4, or the altitude is over 2438 m (8000 ft.), the EVAP bypass procedure must be followed. Go to Step 14.	Determines if a pending code is preventing the clearing of DTC P1000.
EVAP Monitor Bypass	14. Park the vehicle for a minimum of 8 hours. Repeat steps 2 through 11. Do not repeat step 1.	Allows the bypass counter to increment to 2.

INTERMITTENT DIAGNOSTIC TECHNIQUES

Intermittent diagnostic techniques help find and isolate the root cause of intermittent concerns associated with the electronic engine control (EEC) system. The information is organized to help find the concern and carry out the repair. The process of finding and isolating an intermittent concern starts with recreating a fault symptom, accumulating powertrain control module (PCM) data, and comparing that data to typical values, then analyzing the results. Refer to the scan tool manufacturer's instruction article for the functions described below.

Before proceeding, be sure that:

- Customary mechanical system tests and inspections do not reveal a concern. NOTE: Mechanical component conditions can make a PCM system react abnormally.
- Technical Service Bulletins (TSBs) and On-line Automotive Service Information System (OASIS) messages, if available, are reviewed.
- Quick Test and associated diagnostic subroutines have been completed without finding a concern, and the symptom is still present.

RECREATING THE FAULT

Recreating the concern is the first step in isolating the cause of the intermittent symptom. A thorough investigation should start with the customer information worksheet located in the back of this article. If freeze frame data is available, it may help in recreating the conditions at the time of a malfunction indicator lamp diagnostic trouble code (MIL DTC). Listed below are some of the conditions for recreating the concern:

CONDITIONS TO RECREATE FAULT

Engine Type Conditions	Non-Engine Type Conditions
Engine Temperature	Ambient Temperature
Engine RPM	Moisture Conditions
Engine Load	Road Conditions (smooth-bumpy)
Engine idle/accel/deceleration	

ACCUMULATING PCM DATA

PCM data can be accumulated in a number of ways. This includes circuit measurements with a digital multimeter (DMM) or scan tool parameter identification (PID) data. Acquisition of PCM PID data using a scan tool is one of the easiest ways to gather information. Gather as much data as possible when the concern is occurring to prevent improper diagnosis. Data should be accumulated during different operating conditions and based on the customer description of the intermittent concern. Compare this data with the known good data values located **TYPICAL DIAGNOSTIC REFERENCE VALUES** . This requires recording data in 4 conditions for comparison: 1) KOEO, 2) Hot Idle, 3) 48 km/h (30 mph), and 4) 89 km/h (55 mph).

COMPARING PCM DATA

After the PCM values are acquired, it is necessary to determine the concern area. This typically requires the comparison of the actual values from the vehicle to the typical values from the Section 6 **TYPICAL DIAGNOSTIC REFERENCE VALUES** . The charts apply to different vehicle applications (engine, model,

transmission).

Analyzing PCM Data

Look for abnormal events or values that are clearly incorrect. Inspect the signals for abrupt or unexpected changes. For example, during a steady cruise most of the sensor values should be relatively stable. Sensors such as throttle position (TP), mass air flow (MAF), and RPM that change abruptly when the vehicle is traveling at a constant speed are clues to a possible concern area.

Look for an agreement in related signals. For example, if the APP1, APP2, or APP3, is changed during acceleration, a corresponding change should occur in idle air control (IAC), RPM, and SPARK ADV PID.

Make sure the signals act in proper sequence. An increase in RPM after the TP1 and TP2 is increased is expected. However, if the RPM increases without a TP1 and TP2 change, a concern may exist.

Scroll through the PID data while analyzing the information. Look for sudden drops or spikes in the values.

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES

The Adaptive Fuel DTC Diagnostic Techniques help isolate the root cause of the adaptive fuel concern. Before proceeding, attempt to verify if any driveability concerns are present. These diagnostic aids are meant as a supplement to the pinpoint test steps. For a description of fuel trim, refer to**POWERTRAIN CONTROL SOFTWARE** , Fuel Trim.

Obtain Freeze Frame Data

Freeze frame data is helpful in duplicating and diagnosing adaptive fuel concerns. The data (a snapshot of certain parameter identification (PID) values recorded at the time the DTC is stored in Continuous Memory) is helpful to determine how the vehicle was being driven when the concern occurred, and is especially useful on intermittent concerns. Freeze frame data, in many cases, helps to isolate possible areas of concern as well as rule out others. Refer to **FREEZE FRAME DATA** for a more detailed description of this data.

Using the LONGFT1 and LONGFT2 (Dual Bank Engines) PIDs

The LONGFT1/2 PIDs are useful for diagnosing fuel trim concerns. A negative PID value indicates that fuel is being reduced to compensate for a rich condition. A positive PID value indicates that fuel is being increased to compensate for a lean condition. It is important to know that there is a separate LONGFT value that is used for each RPM/load point of engine operation. When viewing the LONGFT1/2 PIDs, the values may change a great deal as the engine is operating at different RPM and load points. This is because the fuel system may have learned corrections for fuel delivery concerns that can change as a function of engine RPM and load. The LONGFT1/2 PIDs display the fuel trim currently being used at that RPM and load point. Observing the changes in LONGFT1/2 can help when diagnosing fuel system concerns. For example:

- A contaminated mass air flow (MAF) sensor results in matching LONGFT1/2 correction values that are negative at idle (reducing fuel), but positive (adding fuel) at higher RPM and loads.
- LONGFT1 values that differ greatly from LONGFT2 values rule out concerns that are common for both

banks (for example, fuel pressure concerns, MAF sensor, etc. can be ruled out).

- Vacuum leaks result in large rich corrections (positive LONGFT1/2 value) at idle, but little or no correction at higher RPM and loads.
- A plugged fuel filter results in no correction at idle, but large rich corrections (positive LONGFT1/2 value) at high RPM and load.

Resetting Long Term Fuel Trims

Long term fuel trim corrections are reset by resetting the keep alive memory (KAM). Refer to **RESETTING THE KEEP ALIVE MEMORY (KAM)**. After making a fuel system repair, the KAM must be reset. For example, if dirty/plugged injectors cause the engine to run lean and generate rich long term corrections, installing new injectors and not resetting the KAM causes the engine to run very rich. The rich correction eventually leans out during closed loop operation, but the vehicle may have poor driveability and high CO emissions while it is learning.

DTCs P0171/P0174 System Too Lean Diagnostic Aids

NOTE: **If the system is lean at certain conditions, then the LONGFT PID would be a positive value at those conditions, indicating that increased fuel is needed.**

The ability to identify the type of lean condition causing the concern is crucial to a correct diagnosis.

Air Measurement System

With this condition, the engine runs rich or lean of stoichiometric (14.7:1 air/fuel ratio) if the powertrain control module (PCM) is not able to compensate enough to correct for the condition. One possibility is that the mass of air entering the engine is actually greater than what the MAF sensor is indicating to the PCM. For example, with a contaminated MAF sensor, the engine runs lean at higher RPM because the PCM delivers fuel for less air than is actually entering the engine. Examples:

- The MAF sensor measurement is inaccurate due to a corroded connector, contaminated or dirty connector. A contaminated MAF sensor typically results in a rich system at low airflow (PCM reduces fuel) and a lean system at high airflow (PCM increases fuel).

Vacuum Leaks/Unmetered Air

With this condition, the engine runs lean of stoichiometric (14.7:1 air/fuel ratio) if the PCM is not able to compensate enough to correct for the condition. This condition is caused by unmetered air entering the engine, or due to a MAF concern. In this situation, the volume of air entering the engine is actually greater than what the MAF sensor is indicating to the PCM. Vacuum leaks are normally most apparent when high manifold vacuum is present (for example, during idle or light throttle). If freeze frame data indicates that the concern occurred at idle, a check for vacuum leaks/unmetered air is the best starting point. Examples:

- loose, leaking, or disconnected vacuum lines
- intake manifold gaskets, or O-rings
- throttle body gaskets

- brake booster
- air inlet tube
- stuck/frozen/aftermarket positive crankcase valve (PCV)
- unseated engine oil dipstick.

Insufficient Fueling

With this condition, the engine runs lean of stoichiometric (14.7:1 air/fuel ratio) if the PCM is not able to compensate enough to correct for the condition. This condition is caused by a fuel delivery system concern that restricts or limits the amount of fuel being delivered to the engine. This condition is normally apparent as the engine is under a heavy load and at high RPM, when a higher volume of fuel is required. If the freeze frame data indicates that the concern occurs under a heavy load and at higher RPM, a check of the fuel delivery system (checking fuel pressure with engine under a load) is the best starting point. Examples:

- low fuel pressure (fuel pump, fuel filter, fuel leaks, restricted fuel supply lines)
- fuel injector concerns

Exhaust System Leaks

In this type of condition, the engine runs rich of stoichiometric (14.7:1 air/fuel ratio) because the fuel control system is adding fuel to compensate for a perceived (not actual) lean condition. This condition is caused by oxygen (air) entering the exhaust system from an external source. The HO2S reacts to this exhaust leak by increasing fuel delivery. This condition causes the exhaust gas mixture from the cylinder to be rich. Examples:

- exhaust system leaks upstream or near the HO2S
- cracked/leaking HO2S boss
- inoperative secondary air injection system

DTCs P0172/P0175 System Too Rich Diagnostic Aids

NOTE:	**If the system is rich at certain conditions, then the LONGFT PID would be a negative value at that airflow, indicating that decreased fuel is needed.**

System rich concerns are caused by fuel system concerns, although the MAF sensor and base engine (for example, engine oil contaminated with fuel) should also be checked.

Air Measurement System

With this condition, the engine runs rich or lean of stoichiometric (14.7:1 air/fuel ratio) if the PCM is not able to compensate enough to correct for the condition. One possibility is that the mass of air entering the engine is actually less than what the MAF sensor is indicating to the PCM. For example, with a contaminated MAF sensor, the engine runs rich at idle because the PCM delivers fuel for more air than is actually entering the engine. Examples:

- MAF sensor measurement inaccurate due to a corroded connector, contamination/dirt. A contaminated

MAF sensor typically results in a rich system at low airflow (PCM reduces fuel) and a lean system at high airflow (PCM increases fuel).

Fuel System

With this condition, the engine runs rich of stoichiometric (14.7:1 air/fuel ratio), if the PCM is not able to compensate enough to correct for the condition. This situation causes a fuel delivery system that is delivering excessive fuel to the engine.

Examples:

- fuel pressure regulator causes excessive fuel pressure (system rich at all airflow), fuel pressure is intermittent, going to pump deadhead pressure, then returning to normal after the engine is turned off and restarted.
- fuel pulse dampener diaphragm ruptured (fuel leaking into the intake manifold, system rich at lower airflow).
- fuel injector leaks (injector delivers extra fuel).
- EVAP canister purge valve leak (if the canister is full of vapors, introduces extra fuel).
- fuel rail pressure (FRP) sensor (electronic returnless fuel systems) concern causes the sensor to indicate a lower pressure than actual. The PCM commands a higher duty cycle to the fuel pump driver module (FPDM), causing high fuel pressure (system rich at all airflow).

Air Inlet System

A restriction within any of the following components may be significant enough to affect the ability of the PCM adaptive fuel control.

- air inlet tube
- air cleaner element
- air cleaner assembly
- resonators
- clean air tube

Base Engine

Engine oil contaminated with fuel can contribute to a rich-running engine.

2008 ENGINE PERFORMANCE

Introduction - Gasoline Engines

INTRODUCTION

NOTE:	**The descriptions and specifications contained in this article were in effect at the time this article was approved for publication. Ford Motor Company reserves the right to discontinue models at any time, or change specifications or design without notice and without incurring obligation.**

IMPORTANT SAFETY NOTICE

Appropriate repair methods and procedures are essential for the safe, reliable operation of all motor vehicles, as well as the personal safety of the individual doing the work. This article provides general directions for repairing vehicles with tested, effective techniques. Following them helps to establish reliability.

There are numerous variations in procedures, techniques, tools, and parts for repairing vehicles, as well as in the skill of the individual doing the work. This article cannot possibly anticipate all such variations and provide advice or cautions as to each. Accordingly, anyone who departs from the instructions provided in this article must first establish that they compromise neither their personal safety nor the vehicle integrity by their choice of methods, tools, or parts.

NOTE, NOTICE, CAUTION AND WARNING

As you read through this article, you may come across a NOTE, NOTICE, CAUTION or WARNING. Each one is used for a specific purpose. A NOTE calls attention to unique, additional or essential information related to the subject procedure. A NOTICE or CAUTION identifies a hazard that could damage the vehicle or property. A WARNING identifies a hazard that could result in personal injury or death to yourself or others. Some general WARNINGS that you should follow when you work on a vehicle are listed below.

- ALWAYS WEAR SAFETY GLASSES FOR EYE PROTECTION.
- KEEP SOLVENTS AWAY FROM IGNITION SOURCES. SOLVENTS MAY BE FLAMMABLE AND COULD IGNITE OR EXPLODE IF NOT HANDLED CORRECTLY.
- USE SAFETY STANDS WHENEVER A PROCEDURE REQUIRES YOU TO BE UNDER THE VEHICLE.
- MAKE SURE THAT THE IGNITION SWITCH IS ALWAYS IN THE OFF POSITION, UNLESS OTHERWISE REQUIRED BY THE PROCEDURE.
- SET THE PARKING BRAKE WHEN WORKING ON THE VEHICLE. IF YOU HAVE AN AUTOMATIC TRANSMISSION, SET IN PARK UNLESS INSTRUCTED OTHERWISE FOR A SPECIFIC OPERATION. IF YOU HAVE A MANUAL TRANSMISSION, IT SHOULD BE IN REVERSE (ENGINE OFF) OR NEUTRAL (ENGINE ON) UNLESS INSTRUCTED OTHERWISE FOR A SPECIFIC OPERATION. PLACE WOOD BLOCKS (4" X 4" OR LARGER) OR WHEEL CHOCKS AGAINST THE FRONT AND REAR SURFACES OF THE TIRES TO HELP PREVENT THE VEHICLE FROM MOVING.
- OPERATE THE ENGINE ONLY IN A WELL-VENTILATED AREA TO AVOID THE DANGER OF

CARBON MONOXIDE POISONING.

- KEEP YOURSELF AND YOUR CLOTHING AWAY FROM MOVING PARTS WHEN THE ENGINE IS RUNNING, ESPECIALLY THE DRIVE BELTS.
- TO PREVENT SERIOUS BURNS, AVOID CONTACT WITH HOT METAL PARTS SUCH AS THE RADIATOR, EXHAUST MANIFOLD, TAIL PIPE, THREE-WAY CATALYTIC CONVERTER AND MUFFLER.
- DO NOT SMOKE WHILE WORKING ON A VEHICLE.
- TO AVOID INJURY, ALWAYS REMOVE RINGS, WATCHES, LOOSE HANGING JEWELRY AND LOOSE CLOTHING BEFORE BEGINNING TO WORK ON A VEHICLE.
- WHEN IT IS NECESSARY TO WORK UNDER THE HOOD, KEEP HANDS AND OTHER OBJECTS CLEAR OF THE COOLING FAN BLADES!

PREFACE

This article provides a step-by-step approach for diagnosing driveability, emission, and powertrain control system symptoms. Before beginning diagnosis, it may be helpful to reference any Technical Service Bulletins (TSBs) or On-line Automotive Service Information System (OASIS) information when this is available. TSB/OASIS information is available on either the Professional Technician Society (PTS) or Motorcraft® website.

NOTE: **For the diesel engines, refer to the appropriate Diesel Powertrain Control/Emissions Diagnosis Manual to continue diagnosis. For the Escape Hybrid or Mariner Hybrid, refer to the Escape Hybrid, Mariner Hybrid Powertrain Control/Emissions Diagnosis Manual to continue diagnosis.**

This article is used in conjunction with the Workshop Manual and Wiring Diagrams. The Workshop Manuals are used to provide additional diagnostic or component removal and installation information. The Wiring Diagrams are used to provide vehicle specific wiring information, component, connector, and splice locations.

The following is a description of the information contained in each part of this article.

Description and Operation

This part contains description and operation information on powertrain control systems and components and provides the technician with a general knowledge of the powertrain control system. Use this part when general information about the powertrain control system is desired.

Diagnostic Methods

This part contains information on specific diagnostic tasks that are used during diagnosis. Descriptions of specific diagnostic methods are included, as well as detailed instructions on how to access or carry out the task.

Symptom Charts

All diagnosis begins in the **SYMPTOM CHARTS** article with QT Powertrain Control Module (PCM) Quick Test. If the PCM Quick Test is completed and no diagnostic trouble codes (DTCs) are retrieved, the technician

is directed to the **NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** . The No Diagnostic Trouble Codes (DTCs) Present Symptom Chart Index contains the list of symptoms addressed in this article, and directs the technician to the appropriate chart in the **NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS** . If no PCM DTCs are present and the vehicle symptom is not listed in the No Diagnostic Trouble Codes (DTCs) Present Symptom Chart Index, the technician should go to the appropriate Workshop Manual part to continue diagnosis.

Powertrain Diagnostic Trouble Code (DTC) Charts and Descriptions

This part contains the Diagnostic Trouble Code (DTC) Charts and Descriptions. These charts and descriptions are referenced if a DTC is retrieved in the **SYMPTOM CHARTS** article. Also included are the list of possible causes and diagnostic aids.

Pinpoint Tests

All pinpoint tests are included. Never enter a pinpoint test unless directed there. When directed to a pinpoint test, always read the information included at the beginning of the pinpoint test.

Reference Values

This part contains the Typical Diagnostic Reference Values charts. The technician is directed to these charts from Pinpoint Test Z in the **PINPOINT TESTS** article.

HOW TO USE THE DIAGNOSTIC PROCEDURES

- Use the information about the vehicle driveability or emission concerns to attempt to verify/recreate the symptom. Look for any vehicle modifications or aftermarket items that may contribute to the symptom. A check of any applicable TSBs or OASIS messages may be useful if this information is available.
- Go to the **SYMPTOM CHARTS** article, QT Powertrain Control Module (PCM) Quick Test. Carry out the PCM quick test steps. Follow any notes as directed.
- If the PCM quick test is completed, no DTCs were retrieved, and no special notes applied, go to the **NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** .
- Select the symptom that best describes the vehicle symptom (for multiple symptoms select the one that is most evident). Go to the **NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS** as indicated. If no PCM DTCs are present and the vehicle symptom is not listed in the No Diagnostic Trouble Codes (DTCs) Present Symptom Chart Index, go to the appropriate Workshop Manual part to continue diagnosis.
- The No Diagnostic Trouble Codes (DTCs) Present Symptom Charts contain areas to be tested for diagnosis of the vehicle symptom. The chart is arranged to place the higher probability or easiest to test items toward the top of the chart. However, the technician is not required to follow this order due to reasons such as variations in vehicle type, vehicle repair history, or technician experience.
  - The System/Component column indicates the areas that are tested. This column may also contain a quick system/component test.
  - The Reference column indicates where to go for the System/Component testing. All references are to the beginning of a pinpoint test in the **PINPOINT TESTS** article of this article unless noted otherwise. If referred to a pinpoint test in this article or a Workshop Manual part, go to the procedures. Follow the directions given in those procedures, including directions to other tests or

parts. If a damaged part is found, repair as directed. If no concern is found, and diagnosis in that area is complete, return to the **NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS** to continue to the next item.

  - If a quick system/component test is in the System/Component column, the Reference column indicates where to go if the test failed.

- During diagnosis, if directed to test a system/component that is not contained on that vehicle, go to the next step.
- If the No Diagnostic Trouble Codes (DTCs) Present Symptom Chart for the vehicle symptom is completed and no concern is found, return to the **NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** to address the next most prominent symptom. If all diagnosis is complete and no concern is found, it may be helpful to refer to **PINPOINT TEST Z - INTERMITTENT** to continue diagnosis.
- The installation of any new component that affects the PCM adaptive learning strategies (adaptive airflow, idle speed, refueling event, or fuel trim) requires the reset of keep alive memory (KAM). Refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** to reset the KAM.
- After any repair, reconnect any components and remove any test equipment. Verify that the vehicle is operating correctly and the original complaint is no longer present. If a DTC was present, clear the DTCs and repeat the self-test to verify the repair.
- If a symptom is determined to be intermittent, a careful visual and physical underhood inspection of connectors, wiring harnesses, vacuum lines, and components is required. The Customer Information Worksheet may contain more detailed symptom information. Before an in-depth diagnosis begins, start the engine and wiggle wires, tap on components while listening for an indication of a concern (such as an RPM change or a relay clicking).

Information about engine conditions is stored when a DTC that illuminates the malfunction indicator lamp (MIL) is set. This information is called freeze frame data and may be helpful in diagnosing intermittent concerns. Refer to**FREEZE FRAME DATA** for additional information.

WHAT'S NEW IN THIS ARTICLE

The following is a list of changes to this article for 2008:

New Vehicles:

- Taurus with new 3.5L 4V engine
- Taurus X with new 3.5L 4V engine
- Sable with new 3.5L 4V engine

Deleted Vehicles:

- Five Hundred
- Freestyle
- Montego
- Freestar
- Monterey

Other Changes:

- Focus available with 2.0L engine and new international standards organization (ISO) 14229 software only. The 2.3L engine is not available.
- Sable, Taurus, and Taurus X vehicles equipped with a new universal heated oxygen sensor (HO2S) for the 3.5L 4V PZEV engine.
- Sable, Taurus, and Taurus X vehicles equipped with a mechanical returnless fuel system (MRFS).

ACRONYMS AND DEFINITIONS

NOTE: This acronyms and definitions listing contains technical terms applicable to Ford Motor Company products. It is not intended to be an all-inclusive dictionary of components and their functions. If a detailed description of a particular system or component is desired, refer to the applicable part within this PC/ED article or refer to the Workshop Manual for additional information regarding the specific vehicle being repaired.

2V: Two valves per engine cylinder

3V: Three valves per engine cylinder

4V: Four valves per engine cylinder

4WD: Four Wheel Drive

ABS: Antilock Braking System

A/C: Air Conditioning

A/CC: Air Conditioning Clutch

A/CCR: Air Conditioning Clutch Control Relay

ACCS: Air Conditioning Cycling Switch

ACET: Air Conditioning Evaporator Temperature

ACP: Air Conditioning Pressure

ACPSW: Air Conditioning Pressure Switch

A/D: Analog-to-Digital. Analog-to-Digital signal conversion.

APP: Accelerator Pedal Position

BARO: Barometric Pressure

BJB: Battery Junction Box

BPP: Brake Pedal Position

BPS: Brake Pedal Switch

BTDC: Before Top Dead Center

CAC: Charge Air Cooler. A device which lowers the temperature of pressurized intake air.

CAN: Controller Area Network

CCM: Comprehensive Component Monitor

CF: Cooling Fan

CHT: Cylinder Head Temperature

CKP: Crankshaft Position

CL: Closed Loop. An operating condition or mode which enables operation based on sensor feedback.

CMCV: Charge Motion Control Valve

CMP: Camshaft Position

CO: Carbon Monoxide. A colorless, odorless, and toxic gas that is a component of auto exhaust emissions.

CO_2 : Carbon Dioxide. A colorless, odorless gas that is a normal by-product of the combustion of fuel.

COP: Coil On Plug. Ignition coil on plug assembly.

CPP: Clutch Pedal Position

CPU: Central Processing Unit

CTO: Clean Tach Output. Signal used to drive the instrument panel tachometer.

CV: Canister Vent Solenoid. A solenoid which seals the evaporative emission (EVAP) system from the atmosphere during the EVAP monitor test.

CVT: Continuously Variable Transmission

DBA: Driver Brake Application

DC: 1. Direct Current. Electric current flowing in one direction. 2. Duty Cycle. The voltage measurement of ON time versus the full cycle period, expressed in percent.

DEPS: Dual Equal Phase Shifting

DIPS: Dual Independent Phase Shifting

DLC: Data Link Connector. SAE standard J1962 connector providing access to vehicle diagnostic information.

DMM: Digital Multimeter

DRI: Deposit Resistant Injector

DTM: Diagnostic Test Mode. A level of capability in an OBD system.

DTC: Diagnostic Trouble Code. An alpha/numeric identifier for a concern identified by the OBD system.

E10: Fuel containing 10% ethanol

E85: Fuel containing 85% ethanol

EATC: Electronic Automatic Temperature Control

ECM: Electronic Control Module

ECT: Engine Coolant Temperature

EEC: Electronic Engine Control

EEGR: Electric Exhaust Gas Recirculation

EEPROM: Electrically Erasable Programmable Read-Only Memory

EGR: Exhaust Gas Recirculation

EI: Electronic Ignition

EMD: Engine Manufacturers Diagnostics

EMI: Electromagnetic Interference. Usually caused by ignition voltage spikes, solenoids, relay operation,

or noisy generator contacts.

EONV: Engine Off Natural Vacuum

EOT: Engine Oil Temperature

EPS: Exhaust Phase Shifting

E-Quizzer: Enhanced Quizzer

ERFS: Electronic Returnless Fuel System

ESM: EGR System Module

ESOF: Electronic Shift-on-the-Fly

ETB: Electronic Throttle Body

ETBTACM: Electronic Throttle Body Throttle Actuator Control Motor

ETBTPS: Electronic Throttle Body Throttle Position Sensor

ETC: Electronic Throttle Control

ETCREF: Electronic Throttle Control Reference Voltage

ETCRTN: Electronic Throttle Control Return

EVAPCP: Evaporative Canister Purge Valve. A valve which controls the venting of fuel vapor from the evaporative emissions canister into the intake manifold for combustion.

FAOS: Fore-Aft Oxygen Sensor

FC: Fan Control

FCIL: Fuel Cap Indicator Lamp. Indicates that the fuel filler cap is not correctly installed.

FEPS: Flash EEPROM Programming Signal. An 18-volt DC signal input from the scan tool used by the PCM to initiate programming.

FFV: Flexible Fuel Vehicle

FLI: Fuel Level Input. Provides information on the amount of liquid fuel in the fuel tank. Used by the EVAP monitor to calculate the fuel tank vapor volume. Displayed as a percentage.

FMEM: Failure Mode Effects Management. Operating strategy that maintains limited vehicle function in the event of a PCM or EEC component failure.

FP: Fuel Pump

FPC: Fuel Pump Control

FPDM: Fuel Pump Driver Module. A module that controls the electric fuel pump.

FPM: Fuel Pump Monitor

FRP: Fuel Rail Pressure

FRPT: Fuel Rail Pressure Temperature

FSS: Fan Speed Sensor

FTP: Fuel Tank Pressure

FWD: Front Wheel Drive

GND: Ground

GPM: 1. Grams per Mile. 2. Gallons per Minute.

H: Hydrogen

HC: 1. Hydrocarbon. A by-product of combustion and a component of auto exhaust emissions. 2. High

Compression.

HDR: High Data Rate

HLOS: Hardware Limited Operating Strategy. A mode of operation where the PCM uses fixed values in response to internal PCM concerns in place of output commands.

HO2S: Heated Oxygen Sensor. Provides information on rich or lean exhaust conditions to the PCM.

Hz: Hertz. Cycles per second.

IAC: Idle Air Control. Electrical control of throttle bypass air.

IAT: Intake Air Temperature

IAT2: Intake Air Temperature 2. Used on supercharged vehicles.

IDM: Ignition Diagnostic Monitor

IFS: Inertia Fuel Shut-Off

I/M: Inspection/Maintenance

IMRC: Intake Manifold Runner Control. Controls or modifies airflow in the intake air system.

IMRCM: Intake Manifold Runner Control Monitor. Monitors the IMRC circuits for concerns.

IMTV: Intake Manifold Tuning Valve. Controls airflow through runners in a split intake manifold.

INJ: Injector

IPC: Independent Plausibility Checker

IPS: Intake Phase Shifting

ISO: International Standards Organization

KAM: Keep Alive Memory. A portion of the memory within the PCM that must have power even when the vehicle is not operating.

KAPWR: Keep Alive Power. A dedicated and unswitched power circuit that maintains KAM.

KOEO Self-Test: Key On Engine Off self-test. A test of the EEC system conducted by the PCM with power applied and the engine at rest.

KOER Self-Test: Key On Engine Running self-test. A test of the EEC system conducted by the PCM with the engine running and the vehicle at rest.

Km/h: Kilometers per Hour

kPa: Kilopascals. Unit of pressure. 3.386 kPa equals 1 (in-Hg).

KS: Knock Sensor

L: Liters. The unit of volume in the metric measuring system. One liter equals 1.06 quarts.

LDR: Low Data Rate

LONGFT: Long-Term Fuel Trim. Fuel flow adjustment determined by the PCM.

LOS: Limited Operating Strategy

MAF: Mass Air Flow

MAP: Manifold Absolute Pressure. The internal pressure of the intake manifold.

MFF: Misfire Freeze Frame

MIL: Malfunction Indicator Lamp. An indicator lamp alerting the driver of an emission related concern.

MRFS: Mechanical Returnless Fuel System

MSOF: Manual Shift-on-the-Fly

N: Nitrogen

NMOG: Non-Methane Organic Gases

NO_X : Oxides of Nitrogen. Gasses formed at high combustion temperatures.

OASIS: On-line Automotive Service Information System

OHC: Overhead Cam. An engine configuration that uses a single camshaft positioned above the valves.

OL: Open Loop. An operating condition based on instructions not modified by PCM feedback.

OSC: Output State Control

OSR: On-Board System Readiness

OTM: Output Test Mode

PATS: Passive Anti-Theft System

PCM: Powertrain Control Module

PCM-VSO: Powertrain Control Module - Vehicle Speed Output

PCV: Positive Crankcase Ventilation

PCVTE: Positive Crankcase Ventilation Thermal Extension

Pd: Palladium

PDJB: Power Distribution Junction Box

PID: Parameter Identification. Identifies an address in the PCM memory which contains operating information.

PIP: Profile Ignition Pickup. Provides crankshaft position information for ignition synchronization.

PPM: Parts per Million. A measure used in emission analysis.

PS: Pressure Switch

PSP: Power Steering Pressure. Indicates the pressure in the power steering system.

PSPT: Power Steering Pressure Transducer

Pt: Platinum

PTO: Power Take-Off

PTS: Professional Technician Society

PWM: Pulse Width Modulation. Controls the intensity of an output by varying the signal duty cycle.

PWR GND: Power Ground. The main ground circuit in the EEC system.

RAM: Random Access Memory. Memory into which information can be written as well as read.

RFI: Radio Frequency Interference

Rh: Rhodium

ROM: Read-Only Memory. Computer memory that can be accessed and used, but not altered.

RPM: Revolutions Per Minute

RWD: Rear Wheel Drive

SAE: Society of Automotive Engineers

SCB: Supercharger Bypass

SFI: Sequential Multiport Fuel Injection. A multiport fuel delivery system in which each injector is individually energized and timed relative to its cylinder intake event.

SHRTFT: Short-Term Fuel Trim. Fuel flow adjustment in response to the HO2S sensor(s) input during closed-loop operation.

SIG RTN: Signal Return. A dedicated sensor ground circuit that is common to 2 or more sensors.

SJB: Smart Junction Box

SMR: Starter Motor Request

TAC: Throttle Actuator Control

TACM: Throttle Actuator Control Motor

TCM: Transmission Control Module

TCSS: Transfer Case Speed Sensor

TDC: Top Dead Center

TP: Throttle Position

TPPC: Throttle Plate Position Controller

TSB: Technical Service Bulletin. Notifies technician of any known vehicle concerns, procedures, or general repair information.

TWC: Three-Way Catalytic

VBPWR: Vehicle Buffered Power. A PCM-supplied power source that supplies regulated voltage.

VCM: Vehicle Communication Module

VCT: Variable Camshaft Timing

VECI: Vehicle Emission Control Information

VID: Vehicle Identification

VIN: Vehicle Identification Number. A unique identification number given to every vehicle produced. Includes information about the year, model, engine, and plant origin of the vehicle.

VMV: Vapor Management Valve

VPWR: Vehicle Power. A switched circuit that provides power to the EEC system. Compare to battery voltage (B+).

VR: Variable Reluctance

VREF: Reference Voltage. A dedicated circuit that provides an approximately 5.0 volt signal used as a reference by certain sensors.

WAC: Wide Open Throttle Air Conditioning Cutoff

WOT: Wide Open Throttle. A condition of maximum airflow through the throttle body.

Transmissions:

NOTE: **The automatic transmission naming convention is as follows:**

- **The first character, a number, is the number of forward gears.**
- **The second character, either the letter F or R, represents front (transaxle) or rear (transmission) wheel drive.**
- **The next set of characters, a grouping of numbers, represents the design torque capacity of the transmission/transaxle.**
- **The last character, if used, is one of the following:**

- **E for electronic shift**
- **N for non-synchronous shift**
- **S for synchronous shift**
- **W for wide ratio**

As an example, for the 4F27E transaxle, the number of forward gears is 4, the character F indicates front transaxle, 27 represents 270 ft-lbs of torque capacity and the character E represents an electronic shift.

A/T: Automatic Transmission

CCS: Coast Clutch Solenoid

EPC: Electronic Pressure Control

ESS: Electronic Shift Scheduling

ISS: Intermediate/Input Shaft Speed Sensor

M/T: Manual Transmission/Transaxle

OCS: Overdrive Cancel Switch

OSS: Output Shaft Speed. Indicates the rotational speed of the transmission output shaft.

PNP: Park/Neutral Position switch.

REVERSE or REV: Transmission Reverse Switch Input

SSA/SSB/SSC/SSD/SSE: Shift solenoids. Devices in an automatic transmission that control the shifting by varying fluid flow when commanded by the PCM.

SS1/SS2/SS3: Shift solenoids. Devices in an automatic transmission that control the shifting by varying fluid flow when commanded by the PCM.

TCC: Torque Converter Clutch. When energized, causes a mechanical engagement and disengagement of the torque converter clutch.

TCIL: Transmission Control Indicator Lamp. Indicates that the TCS has been activated.

TCS: Transmission Control Switch. Modifies the operation of electronically controlled transmissions.

TFT: Transmission Fluid Temperature. Indicates the temperature of transmission fluid.

TR: Transmission Range. The range in which the transmission is operating.

TSS: Turbine Shaft Speed. Indicates the rotational speed of the transmission turbine shaft.

VSS: Vehicle Speed Sensor. A magnetic pickup device that generates an AC signal that is proportional to the vehicle speed.

VSOUT: Vehicle Speed Output. A pulse width modulated vehicle speed signal.

2008 ENGINE PERFORMANCE

Pinpoint Tests - Gasoline Engines

PINPOINT TEST A: NO START

INTRODUCTION

WARNING: **Stop this test at the first sign of a fuel leak and repair as required.**

No open flame. No smoking during fuel delivery checks.

Failure to follow these instructions may result in personal injury.

This pinpoint test is intended to diagnose the following:

- spark (as related to electronic engine control)
- powertrain control module (PCM) (12A650)

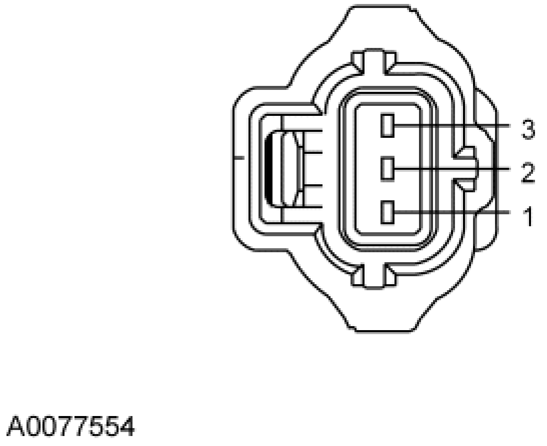

Fig. 1: Throttle Position (TP) Sensor Connector - A

13	FEPS (Flash EEPROM Programming Signal)

TEST PROCEDURE

A1 ATTEMPT TO CRANK THE ENGINE

NOTE: **Verify the inertia fuel shutoff (IFS) switch is set (button pushed in). Refer to the Owner's Literature for location.**

- **Does the engine crank?**

Yes	No
GO to A2.	REFER to the **STARTING SYSTEM - GASOLINE ENGINES -- E-SERIES** and diagnose the engine does not crank symptom.

A2 IDENTIFY THE TYPE OF NO START

NOTE: **The purpose of this test step is to identify intermittent no starts in order to**

determine the proper repair procedure.

- **Does the vehicle start?**

Yes	No
The vehicle has an intermittent no start. refer to **PINPOINT TEST Z**.	GO to A3.

A3 DETERMINE THE THROTTLE TYPE

- **Is the vehicle equipped with electronic throttle control?**

Yes	No
GO to A5.	GO to A4.

A4 CHECK THE VREF VOLTAGE TO TP SENSOR

- Key in OFF position.
- TP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) TP Sensor Connector, Harness Side	(-) TP Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to A6.	refer to **PINPOINT TEST C**.

A5 CHECK VREF VOLTAGE TO ETBTPS SENSOR

- Key in OFF position.
- ETBTPS connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ETBTPS Connector, Harness Side	(-) ETBTPS Connector, Harness Side
ETCREF	ETCRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to A6.	refer to **PINPOINT TEST C**.

A6 CHECK THE FLASH EEPROM PROGRAMMING SIGNAL (FEPS) CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key in OFF position.
- TP Sensor connector connected.
- ETBTPS connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) DLC, Harness Side	(-) Vehicle Battery
FEPS - Pin 13	Negative terminal

- **Is the voltage less than 9 V?**

Yes	No
GO to A7.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

A7 CHECK THE RPM IN THE PCM

NOTE: **Connect the scan tool to a reliable voltage source that is powered with the key in the START position (such as directly to the vehicle battery). Also verify that the vehicle battery is fully charged.**

NOTE: **Normal engine cranking speed is between 150 RPM and 350 RPM.**

- Access the PCM and monitor the RPM PID.
- Crank the engine while viewing the RPM PID.
- **Is the RPM between 150 RPM - 350 RPM?**

Yes	No
GO to A8.	For base engine concerns, REFER to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** - General Information and diagnose difficult starting symptom. For all others, GO to JD2.

A8 CHECK FOR CKP AND CMP SYNCHRONIZATION

- Access the PCM and monitor the SYNC PID.
- Crank the engine while viewing the SYNC PID.
- **Does the SYNC PID read YES?**

Yes	No
GO to A9.	GO to JD2.

A9 CHECK THE PCM DRIVER SIGNAL TO THE COILS

NOTE: **Test lamp bulb filament wattages vary widely. The intensity and duration of blinking depends on the test lamp being used.**

- Connect a test lamp between B+ and each coil driver circuit at the harness connector.
- Crank the engine.
- **Does the test lamp blink consistently for each coil driver (1 blink per engine revolution)?**

Yes	No
GO to A10.	For coil-on-plug (COP) ignition testing, GO to JB2. For coil pack ignition testing, GO to JC2.

A10 CHECK THE FUEL PRESSURE

WARNING: **The fuel system remains pressurized when the engine is not running. To prevent injury or fire, use caution when working on the fuel system.**

Refer to the fuel system WARNING information at the beginning of Pinpoint Test HC.

Failure to follow these instructions may result in personal injury.

NOTE: **While activating the fuel pump on an electronic returnless fuel system a brief pressure spike may occur.**

- Key in OFF position.
- Relieve the fuel pressure. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure.
- Connect the fuel pressure gauge to the Schrader valve using the appropriate fuel pressure test hose and adaptor.
- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Activate the fuel pump to obtain maximum fuel pressure.
- **Is the fuel pressure within specification (refer to the fuel pressure chart in Pinpoint Test HC)?**

Yes	No
GO to A11.	refer to **PINPOINT TEST HC**.

A11 CHECK THE FUEL PRESSURE LEAKDOWN

- Key ON, engine OFF.

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Activate the fuel pump to obtain maximum fuel pressure.
- Exit output test mode.
- Monitor the fuel pressure.
- Verify the fuel pressure remains within 34 kPa (5 psi) of the maximum pressure for 1 minute after turning the pump off.
- **Does fuel pressure remain within 34 kPa (5 psi)?**

Yes	No
GO to A12.	refer to **PINPOINT TEST HC**.

A12 CHECK THE FUEL INJECTORS FOR VOLTAGE

NOTE: **A no start condition typically exists only if greater than half of the fuel injectors are without voltage. Check at least 2 fuel injectors, 1 on each bank on V type engines.**

- Key in OFF position.
- Disconnect 2 fuel injectors.
- Key ON, engine OFF.
- Measure the VPWR voltage at each fuel injector harness connector.
- **Is the voltage greater than 10 volts?**

Yes	No
GO to A13.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

A13 CHECK THE FUEL INJECTORS' ABILITY TO DELIVER FUEL

- Cycle the key several times to charge the fuel system.
- Disable the fuel pump.
- Monitor the fuel pressure gauge while cranking the engine for at least 5 seconds.
- **Is there a pressure drop greater than 34 kPa (5 psi) while cranking the engine?**

Yes	No
The electronic engine control (EEC) system is not the cause of the no start. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	GO to A14.

A14 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.

- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST B: POWERTRAIN CONTROL MODULE (PCM) POWER RELAY

INTRODUCTION

NOTE: The IGN START/RUN and ground circuits, or the B+ and VPWR circuits may be reversed in the harness connector. Refer to the Wiring Diagrams article Electronic Engine Control Cell for schematic and connector information.

This pinpoint test is intended to diagnose the following:

- harness circuits: B+, IGN START/RUN, INJPWRM, ISP-R, PCMRC, VPWR and GND
- PCM power relay (12A646)
- PCM (12A650)

All other vehicles	170 Pin	B35, B36	VPWR

TEST PROCEDURE

B1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Is DTC P0685, P0689, or P0690 present?**

Yes	No
For DTCs P0685 or P0690, GO to B8. For DTC P0689, GO to B11.	GO to B2.

B2 CHECK THE B+ AND IGN START/RUN VOLTAGE TO PCM POWER RELAY

- Key in OFF position.
- PCM Power Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Power Relay Connector, Harness Side	(-)
B+	Ground
IGN START/RUN	Ground

- **Are the voltages greater than 10 V?**

Yes	No
For Crown Victoria, Grand Marquis, E-Series, Escape/Mariner, Ranger, and Town Car, GO to B6. For all others, GO to B3.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

B3 CHECK THE PCMRC CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Power Relay Connector, Harness Side	(-) PCM Connector, Harness Side
PCMRC	PCMRC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to B4.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

B4 CHECK THE PCMRC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)

PCMRC	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to B5.

B5 CHECK THE ISP-R VOLTAGE AT THE PCM HARNESS CONNECTOR

- Key in OFF position.
- PCM Power Relay connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
ISP-R	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to B7.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

B6 CHECK THE PCM POWER RELAY GROUND CIRCUIT FOR AN OPEN

- Measure the voltage between:

(+) PCM Power Relay Connector, Harness Side	(-) PCM Power Relay Connector, Harness Side
B+	GND

- **Is the voltage greater than 10 V?**

Yes	No
GO to B7.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

B7 CHECK FOR AN OPEN VPWR CIRCUIT BETWEEN THE PCM AND POWER RELAY

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Power Relay Connector, Harness	

Side	(-) PCM Connector, Harness Side
VPWR	VPWR

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new PCM Power relay. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

B8 DTCS P0685 OR P0690: CHECK THE PCMRC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- PCM Power Relay connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
PCMRC	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to B9.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

B9 CHECK THE ISP-R CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key in OFF position.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
ISP-R	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to B10.

B10 CHECK THE INJPWRM CIRCUIT FOR AN OPEN IN THE HARNESS

- INJ connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) INJ Connector, Harness Side
INJPWRM	VPWR

- **Is the resistance less than 5 ohms?**

Yes	No
GO to B12.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

B11 DTC P0689: CHECK THE ISP-R VOLTAGE AT THE PCM HARNESS CONNECTOR

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
ISP-R	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to B12.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

B12 CHECK FOR CORRECT PCM OPERATION

- Key in OFF position.
- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST C: REFERENCE VOLTAGE (VREF)

INTRODUCTION

WARNING: Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.

This pinpoint test is intended to diagnose the following:

- harness circuits: ETCREF, ETCRTN, SIGRTN and VREF
- accelerator pedal position (APP) sensor (9F836)
- air conditioning pressure (ACP) transducer sensor (19D594)
- differential pressure feedback exhaust gas recirculation (EGR) sensor (9J460)
- EGR system module (ESM) (9Y456)
- fuel rail pressure temperature (FRPT) sensor (9G756)
- fuel tank pressure (FTP) sensor (9C052)
- manifold absolute pressure (MAP) sensor (9F479)
- power steering pressure (PSP) sensor (3N824)
- throttle position (TP) sensor (9B989)
- powertrain control module (PCM) (12A650)

NOTE:

- **ETCREF and ETCRTN are internally bussed within the PCM and are dedicated circuits for the APP sensor and the electronic throttle body TP sensor only. Refer to the Wiring Diagrams article Electronic Engine Controls Cell for schematic and connector information.**

TEST PROCEDURE

C1 CHECK THE REFERENCE VOLTAGE TO SIGRTN/ETCRTN

NOTE: **Diagnostic trouble codes (DTCs) P0642 and P0643 are set due to VREF circuit concerns only. When diagnosing DTC P0642 or P0643, follow the**

path for VREF concerns.

- Key in OFF position.
- Disconnect the suspect sensor.
- Key ON, engine OFF.
- For ETCREF concerns.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-) Suspect Sensor Connector, Harness Side
ETCREF	ETCRTN

- For VREF concerns.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-) Suspect Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to C19.	GO to C2.

C2 CHECK THE REFERENCE VOLTAGE TO GROUND

- For ETCREF concerns.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
ETCREF	Ground

- For VREF concerns.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to C18.	GO to C3.

C3 CHECK THE REFERENCE VOLTAGE WITH ALL SENSORS DISCONNECTED

NOTE: **Refer to the Sensors Connected To VREF/ETCREF Chart at the beginning of this pinpoint test and the Wiring Diagrams article Electronic Engine Controls Cell to identify the sensors connected to VREF/ETCREF.**

- Key in OFF position.
- Disconnect all of the sensors connected to the VREF/ETCREF circuit.
- Key ON, engine OFF.
- Measure the voltage at the sensor disconnected in C1.
- For ETCREF concerns.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
ETCREF	Ground

- For VREF concerns.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For electronic throttle control (ETC) concerns, GO to C8. For all other VREF concerns, GO to C10.	GO to C4.

C4 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR AN OPEN

- Key in OFF position.
- Disconnect the PCM.
- For ETCREF concerns.
- Measure the resistance between:

(+) Suspect Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
ETCREF	ETCREF

- For VREF concerns.
- Measure the resistance between:

(+) Suspect Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	VREF

- **Is the resistance less than 5 ohms?**

Yes	No
GO to C5.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

C5 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO GROUND

- For ETCREF concerns.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
ETCREF	ETCRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
ETCREF	Ground

- For VREF concerns.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
VREF	Ground

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to C6.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

C6 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO VPWR

- For ETCREF concerns.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
ETCREF	VPWR

- For VREF concerns.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	VPWR

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to C7.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

C7 CHECK THE REFERENCE VOLTAGE FOR A SHORT TO VOLTAGE

- Key ON, engine OFF.
- For ETCREF concerns.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
ETCREF	Ground

- For VREF concerns.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
VREF	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to C20.

C8 CHECK THE REFERENCE VOLTAGE WITH THE ELECTRONIC THROTTLE CONTROL CONNECTED

NOTE: If this sensor was used for the ETCREF measurement in C3, GO to C9.

- Key in OFF position.
- Connect the electronic throttle body throttle position sensor (ETBTPS).
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
ETCREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
The concern is intermittent. refer to **PINPOINT TEST Z**.	INSTALL a new ETBTPS. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C9 CHECK THE REFERENCE VOLTAGE WITH THE APP SENSOR CONNECTED

- Key in OFF position.
- Connect the APP sensor.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
ETCREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
The concern is intermittent. refer to **PINPOINT TEST Z**.	INSTALL a new APP sensor. REFER to the **ACCELERATION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C10 CHECK THE REFERENCE VOLTAGE WITH THE TP SENSOR CONNECTED

NOTE: If this sensor was used for the VREF measurement in C3, GO to C11.

- Key in OFF position.
- Connect the TP sensor.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For additional sensors disconnected, GO to C11. For no additional sensors disconnected, refer to **PINPOINT TEST Z**.	INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C11 CHECK THE REFERENCE VOLTAGE WITH THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR CONNECTED

NOTE: **If the vehicle is not equipped with a differential pressure feedback EGR sensor or if this sensor was used for the VREF measurement in C3, GO to C12.**

- Key in OFF position.
- Differential Pressure Feedback EGR Sensor connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For additional sensors disconnected, GO to C12. For no additional sensors disconnected, refer to **PINPOINT TEST Z**.	INSTALL a new Differential Pressure Feedback EGR sensor. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C12 CHECK THE REFERENCE VOLTAGE WITH THE ESM CONNECTED

NOTE: **If the vehicle is not equipped with an ESM or if this sensor was used for the VREF measurement in C3, GO to C13.**

- Key in OFF position.
- Connect the ESM.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For additional sensors disconnected, GO to C13. For no additional sensors disconnected, refer to **PINPOINT TEST Z**.	INSTALL a new ESM. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C13 CHECK THE REFERENCE VOLTAGE WITH THE MAP SENSOR CONNECTED

NOTE: **If the vehicle is not equipped with a MAP sensor or if this sensor was used for the VREF measurement in C3, GO to C14.**

- Key in OFF position.
- Connect the MAP sensor.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For additional sensors disconnected, GO to C14. For no additional sensors disconnected, refer to **PINPOINT TEST Z**.	INSTALL a new MAP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C14 CHECK THE REFERENCE VOLTAGE WITH THE FRPT SENSOR CONNECTED

NOTE: **If the vehicle is not equipped with a FRPT sensor or if this sensor was used for the VREF measurement in C3, GO to C15.**

- Key in OFF position.
- Connect the FRPT sensor.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For additional sensors disconnected, GO to C15. For no additional sensors disconnected, refer to **PINPOINT TEST Z**.	INSTALL a new FRPT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C15 CHECK THE REFERENCE VOLTAGE WITH THE FTP SENSOR CONNECTED

NOTE: **If the vehicle is not equipped with a FTP sensor or if this sensor was used for the VREF measurement in C3, GO to C16.**

- Key in OFF position.
- Connect the FTP sensor.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For additional sensors disconnected, GO to C16. For no additional sensors disconnected, refer to **PINPOINT TEST Z**.	INSTALL a new FTP sensor. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

C16 CHECK THE REFERENCE VOLTAGE WITH THE ACP TRANSDUCER SENSOR CONNECTED

NOTE: **If the vehicle is not equipped with an ACP transducer sensor or if this sensor was used for the VREF measurement in C3, GO to C17.**

- Key in OFF position.
- Connect the ACP transducer sensor.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For additional sensors disconnected, GO to C17. For no additional sensors disconnected, refer to **PINPOINT TEST Z**.	INSTALL a new Air Conditioning Pressure (ACP) Transducer Sensor. CLEAR the DTCs. REPEAT the self-test.

C17 CHECK THE REFERENCE VOLTAGE WITH THE PSP SENSOR CONNECTED

- Key in OFF position.
- Connect the PSP sensor.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
The concern is intermittent. refer to **PINPOINT TEST Z**.	INSTALL a new PSP sensor. CLEAR the DTCs. REPEAT the self-test.

C18 CHECK THE SIGRTN OR ETCRTN CIRCUIT(S) FOR AN OPEN

NOTE: **Refer to the Wiring Diagrams article Electronic Engine Controls Cell for specific vehicle application and pin locations.**

- Key in OFF position.
- Disconnect the PCM.
- For ETCRTN concerns.
- Measure the resistance between:

(+) Suspect Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
ETCRTN	ETCRTN

- For SIGRTN concerns.
- Measure the resistance between:

(+) Suspect Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
SIGRTN	SIGRTN

- **Is the resistance less than 5 ohms?**

Yes	No
GO to C20.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

C19 CHECK THE SUSPECT SENSOR FOR AN INTERNAL SHORT

- Clear the KOEO, KOER, and continuous DTCs.
- Key in OFF position.
- Connect the suspect sensor.
- Key ON, engine OFF.
- Carry out the PCM self-test.
- **Is the concern still present?**

Yes	No
INSTALL a new sensor for the sensor in question. CLEAR the DTCs. REPEAT the self-test.	The concern is intermittent. refer to **PINPOINT TEST Z**.

C20 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DA: INTAKE AIR TEMPERATURE (IAT) SENSOR

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- integrated mass air flow/intake air temperature (MAF/IAT) sensor (12B579)
- harness circuits: IAT and SIGRTN
- powertrain control module (PCM) (12A650)

Voltage values calculated for VREF equal 5 volts. These values can vary by 15% due to sensor and VREF variations.

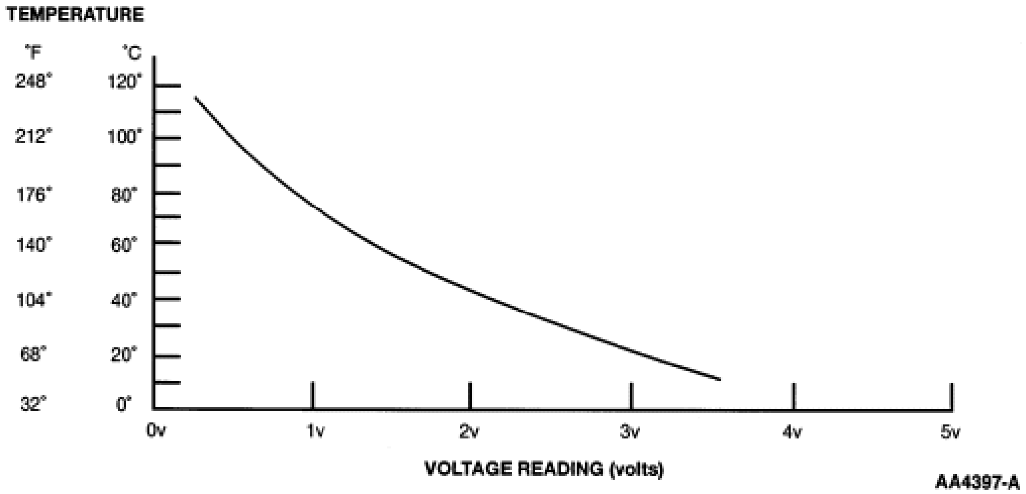

Fig. 30: Temperature Sensor Temperature To Voltage Graph
Courtesy of FORD MOTOR CO.

TEMPERATURE SENSOR VOLTAGE AND RESISTANCE SPECIFICATIONS

Temperature		Temperature Sensor Values	
°C	**°F**	**Voltage**	**Resistance (K ohms)**
120	248	0.28	1.18
110	230	0.36	1.55
100	212	0.47	2.07
90	194	0.61	2.80
80	176	0.80	3.84
70	158	1.05	5.37
60	140	1.37	7.70
50	122	1.77	10.97
40	104	2.23	16.15
30	86	2.74	24.27
20	68	3.26	37.30
10	50	3.73	58.75
0	32	4.14	95.85
-10	14	4.45	160.31

Expedition, Fusion, Milan, MKZ, Navigator	140 Pin	B58 B43	SIGRTN IAT
F-150, Mark LT	190 Pin	E58 E22	SIGRTN IAT

Focus	190 Pin	B58 B47	SIGRTN IAT
All other vehicles	170 Pin	E58 E22	SIGRTN IAT

TEST PROCEDURE

DA1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0111, P0112, P0113, P0114, or P1112 present?**

Yes	No
For DTC P0111, GO to DA12. For KOEO and KOER DTC P0112, GO to DA6. For KOEO and KOER DTC P0113, GO to DA2. For continuous memory DTCs P0112, P0113 or P1112, GO to DA9. For DTC P0114, GO to DA9.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DA2 DTC P0113: CHECK THE IAT SIGNAL CIRCUIT

NOTE: The DTC indicates the sensor signal is greater than the self-test maximum.

- MAF/IAT Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MAF/IAT Sensor Connector, Harness Side	(-)
IAT - Pin 1	Ground

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to DA3.	GO to DA4.

DA3 CHECK THE IAT SENSOR RESISTANCE

- Key in OFF position.
- Measure the resistance between:

(+) MAF/IAT Sensor Connector, Component Side	(-) MAF/IAT Sensor Connector, Component Side
IAT - Pin 1	SIGRTN - Pin 2

- **Is the resistance between 1K - 500K ohms?**

Yes	No
GO to DA4.	INSTALL a new MAF/IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DA4 CHECK THE SIGNAL AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) MAF/IAT Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
IAT - Pin 1	IAT
SIGRTN - Pin 2	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DA5.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DA5 CHECK THE SIGNAL FOR A SHORT TO VOLTAGE IN HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MAF/IAT Sensor Connector, Harness Side	(-)
IAT - Pin 1	Ground

- **Is the voltage greater than 1 V?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to DA14.

DA6 DTC P0112: SIMULATE AN OPPOSITE SIGNAL TO THE PCM

NOTE: The DTC indicates the sensor signal is less than the self-test minimum.

- MAF/IAT Sensor connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the IAT PID.
- **Is the voltage greater than 4.2 V?**

Yes	No
INSTALL a new MAF/IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DA7.

DA7 CHECK THE IAT CIRCUIT FOR A SHORT TO MAF RTN

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) MAF/IAT Sensor Connector, Harness Side	(-) MAF/IAT Sensor Connector, Harness Side
IAT - Pin 1	MAF RTN - Pin 4

- **Is the resistance less than 5 ohms?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to DA8.

DA8 CHECK THE IAT CIRCUIT FOR A SHORT TO GROUND

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
IAT	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) 12 Volt Vehicle Battery
IAT	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DA14.	REPAIR the short circuit. CLEAR the DTCs.

	REPEAT the self-test.

DA9 SELF-TEST DTCS P0112, P0113, P0114 OR P1112: INTERMITTENT CHECK

- Key ON, engine OFF.
- Access the PCM and monitor the IAT PID.
- While observing the PID, carry out the following:
  - Tap on the sensor to simulate road shock
  - Wiggle the sensor connector
- **Is there a large change in the voltage reading?**

Yes	No
DISCONNECT and INSPECT the connector. If OK, INSTALL a new MAF/IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DA10.

DA10 CHECK THE ELECTRONIC ENGINE CONTROL (EEC) WIRING HARNESS

- Access the PCM and monitor the IAT PID.
- While observing the PID, wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **Is there a large change in the voltage reading?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DA11.

DA11 CHECK THE PCM AND VEHICLE HARNESS CONNECTORS

- Key in OFF position.
- PCM connector disconnected.
- MAF/IAT Sensor connector disconnected.
- **Are the connectors and terminals OK?**

Yes	No
The concern is not present at this time. DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DA12 DTC P0111: CHECK THE RESISTANCE OF THE IAT SENSOR WITH THE ENGINE OFF

NOTE: **Verify the engine temperature is at ambient temperature before continuing with this test.**

- Key in OFF position.
- IAT Sensor connector disconnected.
- Measure the resistance between:

(+) IAT Sensor Connector, Component Side	(-) IAT Sensor Connector, Component Side
IAT	SIGRTN

- Refer to the chart at the beginning of this test for the resistance specifications.
- **Is the resistance within specification?**

Yes	No
GO to DA13.	INSTALL a new IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DA13 DTC P0111: CHECK THE RESISTANCE OF THE IAT SENSOR

NOTE: **Verify the engine is at operating temperature before taking the IAT reading.**

- IAT Sensor connector connected.
- Run the engine until the engine temperature stabilizes.
- Key in OFF position.
- IAT Sensor connector disconnected.
- Measure the resistance between:

(+) IAT Sensor Connector, Component Side	(-) IAT Sensor Connector, Component Side
IAT	SIGRTN

- Refer to the chart at the beginning of this test for the resistance specifications.
- **Is the resistance within specification?**

Yes	No
The concern is not present at this time. CARRY OUT the OBD drive cycle to determine if fuel, HO2S, catalyst and misfire monitors can be executed. REFER to On Board Diagnostic (OBD) Drive Cycle. REPEAT the PCM self-test if necessary.	INSTALL a new IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DA14 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DC: MASS AIR FLOW (MAF) SENSOR

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- mass air flow (MAF) sensor (12B579)
- harness circuits: MAF SIG, MAF RTN, vehicle power (VPWR), power ground (PWRGND), IAT and SIGRTN
- powertrain control module (PCM) (12A650)

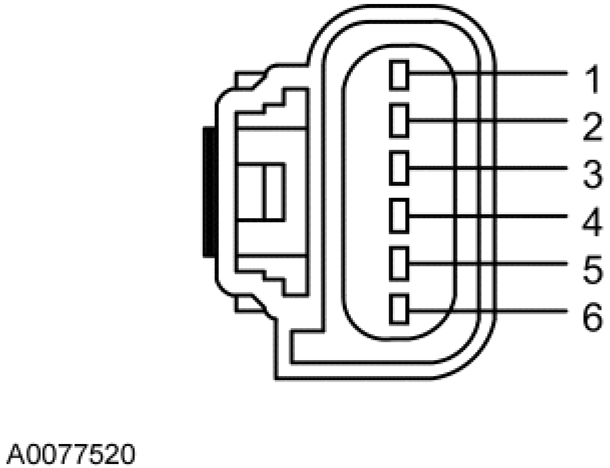

Fig. 32: Electronic Throttle Body Throttle Position Sensor (ETBTPS) Connector - A
Courtesy of FORD MOTOR CO.

Pin	Circuit
1	IAT (Intake Air Temperature)
2	SIGRTN (Signal Return)
4	MAF RTN (Mass Air Flow Return)
3	MAF (Mass Air Flow)
5	PWRGND (Power Ground)
6	VPWR (Vehicle Power)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Edge, MKX, Sable, Taurus, Taurus X	190 Pin	B41 B42	MAF MAF RTN
Escape/Mariner	150 (50-50-50) Pin	B32 B43	MAF MAF RTN
Expedition, Fusion, Milan, MKZ, Navigator	140 Pin	B41 B42	MAF MAF RTN
F-150, Mark LT	190 Pin	E25 E26	MAF MAF RTN
Focus	190 Pin	B40 B41	MAF MAF RTN
All other vehicles	170 Pin	E25 E26	MAF MAF RTN

TEST PROCEDURE

DC1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0102, P0103, P0104, P1100, or P1101 present?**

Yes	No
For KOER and continuous memory DTC P0102, P0104, GO to DC5. For DTC P0103, GO to DC21. For KOEO DTC P1101, GO to DC7. For KOER and continuous memory DTC P1101, GO to DC2. For continuous memory DTC P1100, GO to DC19.	For all other symptoms without DTCs, GO to DC27.

DC2 DTC P1101: CHECK FOR MAF SENSOR CONTINUOUS MEMORY DTCS

- Retrieve continuous memory DTCs.
- **Is a continuous memory MAF DTC present with the KOER DTC P1101?**

Yes	No
GO to DC3.	GO to DC5.

DC3 VERIFY CONTINUOUS MEMORY DTC P0102

- **Is a continuous memory DTC P0102 present with the KOER DTC P1101?**

Yes	No
GO to DC5.	GO to DC4.

DC4 VERIFY CONTINUOUS MEMORY DTC P0103

- **Is a continuous memory DTC P0103 present with the KOER DTC P1101?**

Yes	No
GO to DC21.	All other continuous memory DTCs: DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DC5 KOER AND CONTINUOUS MEMORY DTCS P0102, P0104 OR P1101: CHECK THE INTAKE AIR SYSTEM FOR LEAKS, OBSTRUCTIONS, AND DAMAGE

- Key in OFF position.
- Check the air inlet system (air cleaner, housing, duct work) for obstructions or blockage.
- Check for broken/loose air outlet tube clamps (throttle body and air cleaner assembly ends), cracks/holes in the air outlet tube, and worn gaskets between the MAF sensor and the air cleaner assembly. Check the throttle body bore for sludge. Verify the MAF sensor is connected. Repair as necessary.
- **Are there any concerns found during the visual inspection?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DC6.

DC6 CHECK THE MAF PID

- Access the PCM and monitor the RPM PID.
- Run the engine up to 1,500 RPM for 5 seconds, then bring it back to idle.
- Access the PCM and monitor the MAF PID.
- **Is the voltage less than 0.23 V?**

Yes	No
GO to DC9.	GO to DC7.

DC7 CHECK THE MAF SIGNAL SENT TO THE PCM

NOTE: **DTC P1101 can be generated by a low charged vehicle battery or the garage exhaust ventilation system. Charge the battery as necessary, then remove the ventilation system and properly vent to the outside atmosphere. Check the air inlet system (air cleaner, housing, duct work) for obstructions or blockage. Repeat the KOEO self-test.**

- Key in OFF position.
- MAF/IAT Sensor connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the MAF PID.
- **Is the voltage less than 0.2 V?**

Yes	No
GO to DC8.	GO to DC9.

DC8 CHECK THE MAF SIGNAL SENT TO THE PCM

- Key ON, engine running.
- Access the PCM and monitor the MAF PID.
- **Is the voltage between 0.46 - 2.44 V?**

Yes	No
Unable to identify the concern at this time. refer to **PINPOINT TEST Z**.	GO to DC9.

DC9 CHECK THE VPWR TO THE MAF SENSOR

- Key in OFF position.
- MAF/IAT Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MAF/IAT Sensor Connector, Harness Side	(-) Vehicle Battery
VPWR - Pin 6	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No

GO to DC10.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DC10 CHECK THE PWRGND CIRCUIT TO THE MAF SENSOR

- Measure the voltage between:

(+) Vehicle Battery	(-) MAF/IAT Sensor Connector, Harness Side
Positive terminal	PWRGND - Pin 5

- **Is the voltage greater than 10 V?**

Yes	No
GO to DC11.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DC11 CHECK FOR SHORTS BETWEEN THE CIRCUITS IN THE MAF HARNESS

- Key in OFF position.
- MAF/IAT Sensor connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) MAF/IAT Sensor Connector, Harness Side	(-) MAF/IAT Sensor Connector, Harness Side
MAF - Pin 3	PWRGND - Pin 5
MAF - Pin 3	MAF RTN - Pin 4
MAF - Pin 3	SIGRTN - Pin 2
MAF - Pin 3	IAT - Pin 1

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DC12.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DC12 CHECK THE MAF RTN CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) MAF/IAT Sensor Connector, Harness Side
MAF RTN	MAF RTN - Pin 4

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DC13.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DC13 CHECK THE MAF RTN CIRCUIT FOR A SHORT TO PWRGND IN THE HARNESS

- Measure the resistance between:

(+) MAF/IAT Sensor Connector, Harness Side	(-) MAF/IAT Sensor Connector, Harness Side
MAF RTN - Pin 4	PWRGND - Pin 5

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DC14.	REPAIR the short circuit to GND. CLEAR the DTCs. REPEAT the self-test.

DC14 CHECK THE MAF CIRCUIT FOR A SHORT TO PWRGND IN THE PCM

- PCM connector connected.
- Measure the resistance between:

(+) MAF/IAT Sensor Connector, Harness Side	(-) MAF/IAT Sensor Connector, Harness Side
MAF - Pin 3	PWRGND - Pin 5

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DC15.	GO to DC31.

DC15 CHECK THE MAF CIRCUIT VOLTAGE CYCLING INTEGRITY

- Key ON, engine OFF.
- Access the PCM and monitor the MAF PID.
- Connect a 5 amp fused jumper wire between the following:

Point A MAF/IAT Sensor Connector, Harness Side	Point B MAF/IAT Sensor Connector, Harness Side
MAF RTN - Pin 4	PWRGND - Pin 5
MAF - Pin 3	VPWR - Pin 6

- Record the PID reading while both jumpers are installed.
- Remove the VPWR jumper while observing the MAF PID.

- **Does the MAF PID change from greater than 4.50 volts to less than 0.26 volt when the VPWR jumper is removed?**

Yes	No
INSTALL a new MAF/IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .	GO to DC16.

DC16 CHECK THE MAF CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Remove the jumper wire(s).
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) MAF/IAT Sensor Connector, Harness Side
MAF	MAF - Pin 3

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DC17.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DC17 CHECK THE PWRGND CIRCUIT FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) MAF/IAT Sensor Connector, Harness Side	(-) Vehicle Battery
PWRGND - Pin 5	Negative terminal

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DC18.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DC18 CHECK THE MAF RTN CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) MAF/IAT Sensor Connector, Harness Side
MAF RTN	MAF RTN - Pin 4

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DC31.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DC19 DTC P1100: CHECK THE MAF CIRCUIT FOR INTERMITTENT VOLTAGE TO THE PCM

- Check for broken/loose air outlet tube clamps (throttle body and air cleaner assembly ends), cracks/holes in the air outlet tube, and worn gaskets between the MAF sensor and the air cleaner assembly. Verify the MAF sensor is connected.
- Key ON, engine running.
- Access the PCM and monitor the MAF PID.
- If idle is not stable, refer to **NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** .
- Access the PCM and monitor the RPM PID.
- Run the engine up to 1,500 RPM for 5 seconds, then bring it back to idle.
- Lightly tap on the MAF sensor and wiggle the harness connector to simulate road shock.
- **Does the MAF PID go below 0.23 volt or above 4.6 volts?**

Yes	No
INSPECT the MAF/IAT sensor connector. If OK, INSTALL a new MAF/IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .	GO to DC20.

DC20 CHECK THE MAF CIRCUIT FOR AN INTERMITTENT OPEN OR SHORTS

- Key ON, engine running.
- Access the PCM and monitor the MAF PID.
- Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **Does the MAF PID go below 0.23 volt or above 4.6 volts?**

Yes	No
REPAIR as necessary. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .	Unable to duplicate or identify the concern at this time. CLEAR the DTCs. REPEAT the self-test.

DC21 DTC P0103: CHECK THE MAF SENSOR SCREEN FOR CONTAMINATION

NOTE: DTC P0103 can be generated by foreign material blocking the MAF sensor screen, causing an air flow restriction.

- Check the MAF sensor screen for contamination or blockage.
- Check the air cleaner element and air tubes for proper installation and sealing.
- **Are any concerns present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DC22.

DC22 DTC P0103: CHECK THE MAF SENSOR SIGNAL HIGH INPUT TO THE PCM

- Key ON, engine OFF.
- Access the PCM and monitor the MAF PID.
- **Is the voltage greater than 2.44 V?**

Yes	No
GO to DC23.	GO to DC25.

DC23 CHECK THE MAF SENSOR SIGNAL SENT TO THE PCM

- Key in OFF position.
- MAF/IAT Sensor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A MAF/IAT Sensor Connector, Harness Side	Point B MAF/IAT Sensor Connector, Harness Side
MAF RTN - Pin 4	PWRGND - Pin 5

- Key ON, engine OFF.
- Access the PCM and monitor the MAF PID.
- **Is the voltage less than 0.1 V?**

Yes	No
CHECK the MAF/IAT sensor electrical connector for damage, corrosion, and water ingress. If OK, INSTALL a new MAF/IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .	GO to DC24.

DC24 CHECK THE MAF CIRCUIT FOR A SHORT TO VOLTAGE

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
MAF	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to DC26.	REPAIR the short circuit to PWR. CLEAR the DTCs. REPEAT the self-test.

DC25 CHECK THE MAF SIGNAL SENT TO THE PCM

- Key ON, engine running.
- Access the PCM and monitor the RPM PID.
- Monitor the MAF signal voltage while increasing the engine RPM from idle to approximately 2,500 RPM, and then back to idle.
- Access the PCM and monitor the MAF PID.
- **Is the voltage between 0.23 - 4.6 V?**

Yes	No
This is an intermittent concern. refer to **PINPOINT TEST Z**.	GO to DC23.

DC26 VERIFY THE IDLE CONCERN

- PCM connector connected.
- MAF/IAT Sensor connector connected.
- Key ON, engine running.
- **Is an idle concern present?**

Yes	No
DISREGARD DTC P0103 at this time. The concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** to diagnose unique idle concerns.	GO to DC31.

DC27 SYMPTOMS WITHOUT DTCS: CHECK THE CONDITIONS RELATED TO THE MAF SENSOR

- Check the air inlet system (air cleaner, housing, duct work) for obstructions or blockage.
- Check for broken/loose air outlet tube clamps (throttle body and air cleaner assembly ends), cracks/holes in the air outlet tube, and worn gaskets between the MAF sensor and the air cleaner assembly. Verify the MAF sensor is connected.
- **Is a concern present?**

Yes	No
REPAIR as necessary. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .	GO to DC28.

DC28 DTCS P0171, P0172, P0174, P0175, P2195, P2196, P2197 OR P2198: CHECK THE FUNCTIONALITY OF THE MAF SENSOR

NOTE: **A MAF PID value of less than 0.6 volt may indicate an incorrectly installed air cleaner or a leak in the air inlet system.**

- Key ON, engine running.
- Allow the engine to stabilize at the correct operating temperature.
- Access the PCM and monitor the MAF PID.
- Check that the MAF PID at idle and NEUTRAL is not greater than 30% of the normal MAF listed in the **REFERENCE VALUES** article, Reference Values or not greater than 1.3 volts.
- **Is the PID value within the expected range?**

Yes	No
GO to DC30.	GO to DC29.

DC29 CHECK TO ISOLATE THE MAF SENSOR FROM A LEAN DRIVEABILITY OCCURRENCE

NOTE: **Due to increasingly stringent emission/OBD requirements, a fuel system DTC on some vehicles can be generated without a noticeable driveability concern with or without the MAF sensor disconnected. Under these conditions, if the MAF PID indicates a MAF sensor concern, install a new MAF sensor. Refer to the ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES .**

- Key in OFF position.
- MAF/IAT Sensor connector disconnected.
- Key ON, engine running.
- Drive the vehicle on the road.
- **Is the lean driveability symptom (lack of power, spark knock/detonation, buck/jerk or hesitation/surge on acceleration) gone?**

Yes	No
INSTALL a new MAF/IAT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .	GO to DC30.

DC30 VERIFY THE DTC

- **Are any of the following DTCs present:**

  P0171, P0172, P0174, P0175, P2195, P2196, P2197, or P2198?

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	The concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** to diagnose performance while driving concerns.

DC31 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DD: FUEL RAIL PRESSURE TEMPERATURE (FRPT) SENSOR

INTRODUCTION

WARNING: **Vehicle fuel systems are pressurized even when the engine is not running. To avoid fire or personal injury, disable the fuel delivery system and relieve fuel system pressure before removing any fuel system**

component. Refer to the fuel system information at the beginning of pinpoint HC. Failure to follow these instructions may result in personal injury.

NOTE: **With the engine running, the FRP PID value may be 48-70 kPa (7-10 psi) higher than a fuel pressure reading taken with a mechanical gauge.**

This pinpoint test is intended to diagnose the following:

- fuel rail pressure temperature (FRPT) sensor (9G756)
- harness circuits: FRP and FRT
- powertrain control module (PCM) (12A650)

FRPT SENSOR VOLTAGE AND PRESSURE SPECIFICATIONS

Voltage	Pressure (kPa)	Pressure (psi)
4.5	482	70
3.9	413	60
3.4	344	50
2.8	275	40
2.2	207	30
1.6	138	20
1.1	69	10
0.5	0	0

FRPT SENSOR TEMPERATURE, VOLTAGE, AND RESISTANCE SPECIFICATIONS

Temperature		Sensor	
°C	°F	Volts	K Ohms
100	212	0.47	2.073
95	203	0.54	2.405
90	194	0.61	2.800
85	185	0.70	3.273
80	176	0.80	3.840

TEST PROCEDURE

DD1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

- **Are DTCs P0180, P0181, P0182, P0183, P0190, P0191, P0192 or P0193 present?**

Yes	No
For DTC P0180, GO to DD24. For DTC P0181, GO to DD26. For continuous memory DTCs P0182 or P0183, GO to DD2. For KOEO and KOER DTCs P0182 or P0183, GO to DD17. For continuous memory DTC P0190, GO to DD3. For DTC P0191, GO to DD11. For continuous memory DTCs P0192 or P0193, GO to DD16. For KOEO and KOER DTCs P0192 or P0193, GO to DD3.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DD2 CHECK THE FRPT AND PCM CONNECTORS FOR DAMAGE

- Key ON, engine OFF.
- Access the PCM and monitor the FRT PID.
- While observing the PID, carry out the following:
  - Tap on the sensor to simulate road shock
  - Wiggle the sensor connector
  - Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM
- Check the FRPT and PCM connectors for damage and corrosion.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary.	DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DD3 CONTINUOUS MEMORY DTC P0190, KOEO AND KOER DTCS P0192 AND P0193: CHECK THE FRPT SENSOR FOR FUEL LEAKS

NOTE: Repair any fuel pump DTCs prior to this test.

- Key ON, engine running.

- Idle the engine for 2 minutes.
- Inspect the FRPT vacuum hose between the intake manifold and the FRPT sensor for air leaks and correct connection.
- Key in OFF position.
- Remove the vacuum hose from the FRPT.
- Inspect the FRPT and vacuum hose for traces of fuel.
- **Is any fuel present?**

Yes	No
INSTALL a new FRPT sensor. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DD4.

DD4 CHECK THE VREF AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- Connect the vacuum hose to the FRPT.
- FRPT Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FRPT Sensor Connector, Harness Side	(-) FRPT Sensor Connector, Harness Side
VREF - Pin 2	SIGRTN - Pin 4

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
For DTC P0190, GO to DD12. For DTC P0192, GO to DD5. For DTC P0193, GO to DD7.	refer to **PINPOINT TEST C**.

DD5 INDUCE A HIGH VOLTAGE ON THE FRPT CIRCUIT

- Key in OFF position.
- Connect a 5 amp fused jumper wire between the following:

Point A FRPT Sensor Connector, Harness Side	Point B FRPT Sensor Connector, Harness Side
VREF - Pin 2	FRP - Pin 1

- Key ON, engine OFF.

- Access the PCM and monitor the FRP PID.
- **Is the voltage greater than 4.5 V?**

Yes	No
INSTALL a new FRPT sensor. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DD6.

DD6 CHECK THE FRP CIRCUIT FOR A SHORT TO FRT, SIGRTN, AND GND IN THE HARNESS

- Key in OFF position.
- Remove the jumper wire(s).
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
FRP	SIGRTN
FRP	FRT

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
FRP	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DD28.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DD7 CHECK THE FRP CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) FRPT Sensor Connector, Harness Side
FRP	FRP - Pin 1

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DD8.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DD8 CHECK THE FRP CIRCUIT FOR A SHORT TO VREF AND FRT IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
FRP	VREF
FRP	FRT

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DD9.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DD9 CHECK THE FRP CIRCUIT FOR A SHORT TO VOLTAGE

- Key ON, engine OFF.
- Measure the voltage between:

(+) FRPT Sensor Connector, Harness Side	(-)
FRP - Pin 1	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to DD10.

DD10 INDUCE A LOW VOLTAGE ON THE FRPT CIRCUIT

- Key in OFF position.
- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A FRPT Sensor Connector, Harness Side	Point B FRPT Sensor Connector, Harness Side
FRP - Pin 1	SIGRTN - Pin 4

- Key ON, engine OFF.

- Access the PCM and monitor the FRP PID.
- **Is the voltage less than 0.01 V?**

Yes	No
INSTALL a new FRPT sensor. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DD28.

DD11 DTC P0191: CHECK FOR FUEL PUMP DTCS

- Carry out the self-test.
- **Are DTCs P1233, P1234, P1235, P1236, P1237 or P1238 present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to DD12.

DD12 INSPECT ALL THE VACUUM HOSES CONNECTED TO THE INTAKE MANIFOLD FOR LEAKS

- Key in OFF position.
- FRPT Sensor connector connected.
- Key ON, engine running.
- Allow the engine idle to stabilize.
- Inspect all the vacuum hoses connected to the intake manifold for leaks.
- **Are any vacuum hose concerns present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DD13.

DD13 CHECK THE FRPT CONNECTOR FOR DAMAGE OR CORROSION

- Key in OFF position.
- FRPT Sensor connector disconnected.
- Inspect the sensor, wiring, and connector for damage, corrosion, or water intrusion.
- **Is a concern present?**

Yes	No

REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DD14.

DD14 CHECK THE FRP PID

NOTE: **The fuel pressure is likely to increase after the fuel pressure is relieved with the system closed. The rate and amount of the fuel pressure increase is dependent upon the ambient air and fuel temperatures.**

NOTE: **Prepare to record the FRP PID value within 5 seconds after the engine is shut off and also after the fuel pressure is relieved.**

- FRPT Sensor connector connected.
- Key ON, engine running.
- Allow the engine idle to stabilize.
- Access the PCM and monitor the FRP PID.
- Key in OFF position.
- Key ON, engine OFF.
- Record the FRP PID value within 5 seconds of the key off.
- Relieve the fuel pressure. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure.
- Disable the fuel pump.
- Key ON, engine OFF.
- Record the FRP PID value within 5 seconds of carrying out the fuel system pressure release procedure.
- **Is the difference between the recorded FRP PID values greater than 34 kPa (5 psi)?**

Yes	No
refer to **PINPOINT TEST HC**.	GO to DD15.

DD15 COMPARE THE FRP PID TO THE MECHANICAL GAUGE

NOTE: **Most mechanical gauges are referenced to atmospheric pressure. The FRPT sensor is referenced to manifold pressure. In order to make a valid comparison, the engine must be off.**

NOTE: **The vehicle may exhibit a long crank until the fuel system is pressurized.**

- Key in OFF position.
- Connect a mechanical fuel pressure gauge.
- Key ON, engine OFF.
- Monitor the mechanical gauge.

- Access the PCM and monitor the FRP PID.
- Compare the FRP PID value to the mechanical gauge.
- Key in OFF position.
- Pressurize the fuel system. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure to pressurize the fuel system.
- Key ON, engine running.
- Allow the fuel pressure to stabilize.
- Key in OFF position.
- Key ON, engine OFF.
- Compare the FRP PID value to the mechanical gauge.
- **Are the FRP PID values within 34 kPa (5 psi) of the mechanical gauge readings?**

Yes	No
GO to DD28.	INSTALL a new FRPT sensor. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DD16 CONTINUOUS MEMORY DTCS P0192 AND P0193: CHECK THE FRPT CIRCUIT FOR AN INTERMITTENT CONCERN

NOTE: Repair any fuel pump DTCs prior to this test.

- Key ON, engine OFF.
- Access the PCM and monitor the FRP PID.
- While observing the PID, carry out the following:
  - Tap on the sensor to simulate road shock
  - Wiggle the sensor connector
  - Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM
- Check the FRPT connector for damage or corrosion.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

DD17 KOEO AND KOER DTCS P0182 OR P0183: CHECK THE RESISTANCE OF THE FRPT

SENSOR

- Key in OFF position.
- FRPT Sensor connector disconnected.
- Measure the resistance between:

(+) FRPT Sensor Connector, Component Side	(-) FRPT Sensor Connector, Component Side
FRT - Pin 3	SIGRTN - Pin 4

- **Is the resistance between 2K - 96K ohms?**

Yes	No
GO to DD18.	INSTALL a new FRPT sensor. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DD18 CHECK THE FRPT FOR INTERNAL SHORTS

- Measure the resistance between:

(+) FRPT Sensor Connector, Component Side	(-)
FRT - Pin 3	Ground

- Measure the resistance between:

(+) FRPT Sensor Connector, Component Side	(-) FRPT Sensor Connector, Component Side
FRT - Pin 3	FRP - Pin 1
FRT - Pin 3	VREF - Pin 2

- **Are the resistances greater than 10K ohms?**

Yes	No
For DTC P0182, GO to DD19. For DTC P0183, GO to DD21.	INSTALL a new FRPT sensor. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DD19 CHECK THE FRT CIRCUIT(S) FOR A SHORT TO SIGRTN OR GND IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
FRT	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
FRT	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DD20.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DD20 FRPT SENSOR: INDUCE A HIGH VOLTAGE ON THE FRT CIRCUIT

- PCM connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the FRT PID.
- **Is the voltage greater than 4.5 V?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	GO to DD28.

DD21 CHECK THE FRT AND SIG RTN CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) FRPT Sensor Connector, Harness Side
FRT	FRT - Pin 3
SIGRTN	SIGRTN - Pin 4

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DD22.	REPAIR the open circuit. CLEAR the DTCs.

	REPEAT the self-test.

DD22 CHECK THE FRT SIGNAL FOR A SHORT TO VREF AND FRP

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
FRT	VREF
FRT	FRP

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DD23.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DD23 FOR THE FRPT SENSOR INDUCE A LOW VOLTAGE ON THE FRT CIRCUIT

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A FRPT Sensor Connector, Harness Side	Point B FRPT Sensor Connector, Harness Side
FRT - Pin 3	SIGRTN - Pin 4

- Key ON, engine OFF.
- Access the PCM and monitor the FRT PID.
- **Is the voltage less than 0.2 V?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	GO to DD28.

DD24 DTC P0180: CHECK FOR THE PRESENCE OF DTC P0182 OR P0183

- Key ON, engine OFF.
- Carry out the self-test.
- **Are DTCs P0182 or P0183 present?**

Yes	No
GO to DD17.	GO to DD25.

DD25 CHECK THE FRT CIRCUIT FOR AN INTERMITTENT CONCERN

- PCM connector connected.

- Access the PCM and monitor the FRT PID.
- Carry out a thorough wiggle test on the FRPT sensor harness.
- **Is the FRT signal stable?**

Yes	No
GO to DD27.	ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DD26 KOEO AND KOER DTC P0181: CHECK THE FRT PID

NOTE: Allow vehicle temperatures to stabilize prior to temperature sensor tests.

- Key ON, engine OFF.
- The normal test range is 0°C to 100°C (32°F to 212°F).
- Access the PCM and monitor the FRT PID.
- **Is the voltage between 0.4 - 4.5 V?**

Yes	No
GO to DD27.	DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DD27 COMPARE THE PIDS AFTER STABILIZING THE VEHICLE TEMPERATURE

- Access the PCM and monitor the FRT, CHT and ECT PIDs.
- **Are the temperature PIDs nearly equal in value?**

Yes	No
The concern is not present at this time. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

DD28 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No

INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DF: VEHICLE SPEED CIRCUIT (VSC) CHECK

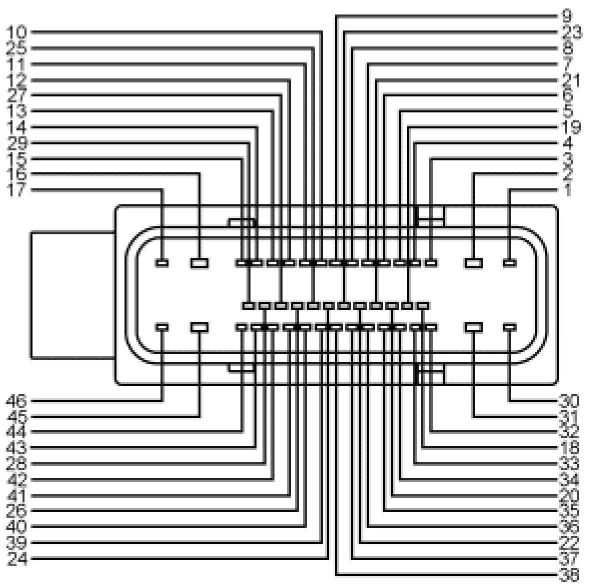
INTRODUCTION

WARNING: **Strict observance of posted speed limits and driving conditions is mandatory when proceeding through the following drive cycles.**

Failure to follow these instructions may result in personal injury.

This pinpoint test is intended to diagnose the following:

- harness circuits: VSC
- powertrain control module (PCM) (12A650)



A0077542

Fig. 34: Anti-lock Brake System (ABS) Module Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
21	VSC (Vehicle Speed Circuit)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Connector	Pin	Circuit
170 Pin	B29	VSC

TEST PROCEDURE

DF1 DTCS P0500, P0503, P1500, P1501 AND P1502: CHECK THE VEHICLE SPEED CIRCUIT FOR INTERMITTENT CONCERNS

NOTE: The PCM detected an error in the vehicle speed information received from the ABS control module. This test step checks for the recurrence of this vehicle speed error.

- Key ON, engine OFF.
- Clear the DTCs.
- Gradually increase the vehicle speed to 80 km/h (50 mph).
- Coast to an idle and stop the vehicle.
- Key in OFF position.
- Key ON, engine OFF.
- Retrieve the continuous memory DTCs.
- **Are DTCs P0500, P0503, P1500, P1501 or P1502 present?**

Yes	No
The vehicle speed input is incorrect. GO to DF2.	The vehicle speed input is correct. The concern that produced the original DTC may be intermittent. GO to DF5.

DF2 CHECK THE VSC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Anti-lock Brake System (ABS) Module connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
VSC - Pin B29	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to DF3.	GO to DF6.

DF3 CHECK FOR AN OPEN VSC BETWEEN THE PCM AND THE ABS CONTROL MODULE

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Anti-lock Brake System (ABS) Module Connector, Harness Side
VSC - Pin B29	VSC - Pin 21

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DF4.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test. GO to DF7.

DF4 CHECK THE VSC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
VSC - Pin B29	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
REFER to the **VEHICLE DYNAMIC SYSTEMS - - E-SERIES** to continue diagnosis of the ABS control module, speed sensors and wheel speed sensor harness circuits. If these components are working properly, GO to DF8.	GO to DF6.

DF5 VISUAL INSPECTION

NOTE: Refer to the Wiring Diagrams article for harness, module, and connector locations.

- Key in OFF position.
- Visually inspect the VSC circuit harness and connectors at the PCM, ABS, and other VSC user modules for damage, loose connections, loose grounds, or incorrect routing.
- **Does the visual inspection reveal a concern?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. GO to DF7.	Unable to duplicate or identify the concern at this time. REFER to the **VEHICLE DYNAMIC SYSTEMS -- E-SERIES** to continue diagnosis of the ABS control module, speed sensors and wheel speed sensor harness circuits.

DF6 VERIFY IF THE VSC IS SHORTED IN THE HARNESS OR ANOTHER MODULE

- Key in OFF position.
- Determine which, if any, modules are connected to the VSC. Refer to the Wiring Diagrams article. If no other modules are connected to the VSC, go to the YES Action To Take.
- One at a time, disconnect the modules associated with the VSC. After disconnecting each module, test again for a short circuit. (Refer to test step that sent you here). Repeat until each associated module is disconnected or the short circuit is eliminated.
- **Does the short circuit remain after all associated modules are disconnected?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test. GO to DF7.	REFER to the Workshop article for further diagnosis of the appropriate module. GO to DF7.

DF7 VSC REPAIR VERIFICATION DRIVE CYCLE

NOTE: Warm the engine to a normal operating temperature before continuing.

NOTE: Carry out the VSC drive cycle at least 3 times as described below.

- Automatic Transmission Drive Cycle:
  - Place the transmission range selector lever in DRIVE range
  - Accelerate heavily to 56 km/h (35 mph)
  - Coast down to an idle and stop the vehicle
  - Cycle the key OFF and ON
- Manual Transmission Drive Cycle:
  - Accelerate moderately to 64 km/h (40 mph), while shifting from first to second gear
  - Coast down to an idle and stop the vehicle
  - Cycle the key OFF and ON
- Key in OFF position.
- Key ON, engine OFF.
- Retrieve the continuous memory DTCs.
- **Are DTCs P0500, P0503, P1500, P1501 or P1502 present?**

Yes	No
REFER to the **VEHICLE DYNAMIC SYSTEMS - - E-SERIES** to continue diagnosis of the ABS control module, speed sensors and wheel speed sensor harness circuits. If these components are working properly, GO to DF8.	The repair has been verified.

DF8 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DG: KNOCK SENSOR (KS)

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- knock sensors KS1, KS2 (12A699)
- harness circuits: KS1+, KS1-, KS2+, and KS2-
- powertrain control module (PCM) (12A650)

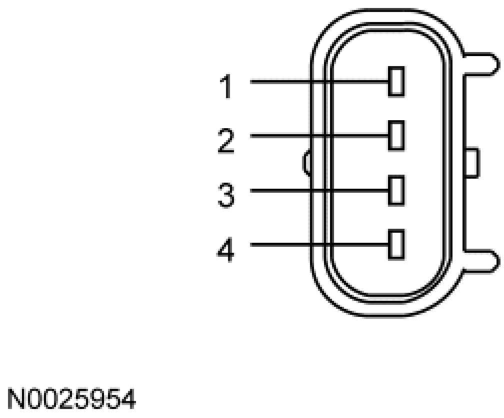


Fig. 35: Knock Sensor 1 (KS1) Connector - A
Courtesy of FORD MOTOR CO.

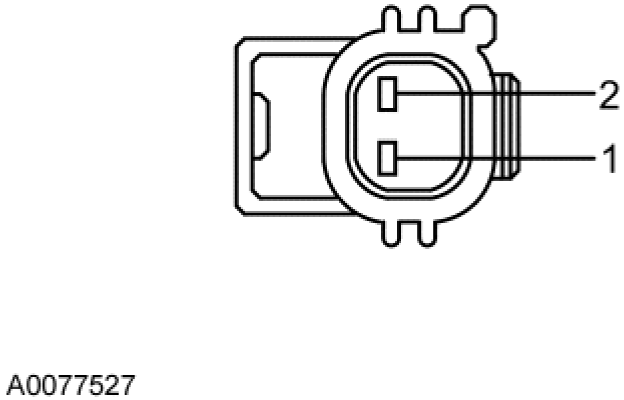

Fig. 36: Knock Sensor 1 (KS1) Connector - A
Courtesy of FORD MOTOR CO.

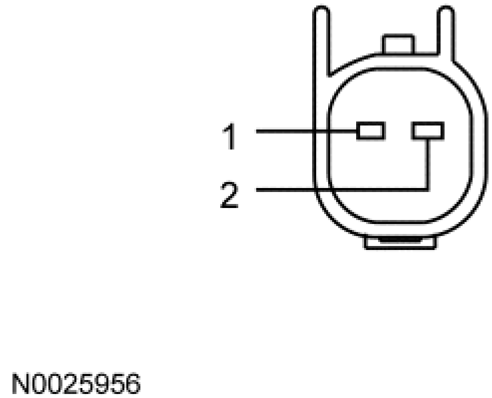

Fig. 37: Knock Sensor 1 (KS1) Connector - C

TEST PROCEDURE

DG1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

- **Are DTCs P0325, P0326, P0330, or P0331 present?**

Yes	No
For KOER and continuous memory DTCs P0325, P0326, P0330 and P0331, GO to DG2.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DG2 KOER AND CONTINUOUS MEMORY DTCS P0325, P0326, P0330 AND P0331: CHECK THE INTERNAL RESISTANCE OF THE KS

- KS connector disconnected.
- Measure the resistance between:

(+) KS Connector, Component Side	(-) KS Connector, Component Side
Suspect KS+	Suspect KS-

- **Is the resistance between 4.39M - 5.35M ohms?**

Yes	No
GO to DG3.	INSTALL a new KS. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DG3 CHECK THE KS+ CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) KS Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect KS+	Suspect KS+

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DG4.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DG4 CHECK THE KS- CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) KS Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect KS-	Suspect KS-

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DG5.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DG5 CHECK THE KS+ CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) KS Connector, Harness Side	(-) Vehicle Battery
Suspect KS+	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DG6.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DG6 CHECK THE KS- CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) KS Connector, Harness Side	(-) Vehicle Battery
Suspect KS-	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DG7.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DG7 CHECK THE KS+ CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Measure the resistance between:

(+) KS Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect KS+	VPWR
Suspect KS+	VREF

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DG8.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DG8 CHECK THE KS- CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Measure the resistance between:

(+) KS Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect KS-	VREF
Suspect KS-	VPWR

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DG9.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DG9 CHECK THE KS+ CIRCUIT FOR INTERMITTENT CONCERNS

NOTE: Carefully wiggle all accessible wiring and connectors associated with the KS circuit.

- Measure the resistance between:

(+) KS Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect KS+	Suspect KS+

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DG10.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DG10 CHECK THE KS- CIRCUIT FOR INTERMITTENT CONCERNS

NOTE: Carefully wiggle all accessible wiring and connectors associated with the KS circuit.

- Measure the resistance between:

(+) KS Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect KS-	Suspect KS-

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DG11.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DG11 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

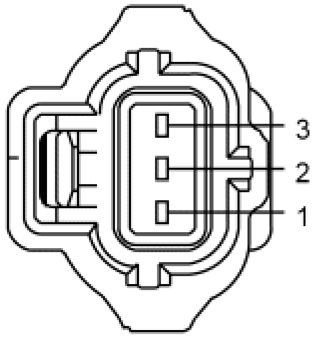
Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DH: THROTTLE POSITION (TP) SENSOR

INTRODUCTION

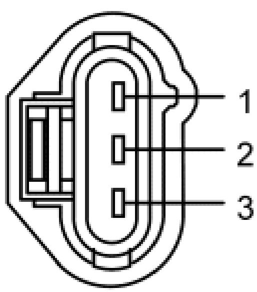
This pinpoint test is intended to diagnose the following:

- TP sensor (9B989)
- binding or sticking throttle linkage
- harness circuits: TP, SIGRTN, VREF, VPWR, and PWRGND
- powertrain control module (PCM) (12A650)



A0077554

Fig. 44: Throttle Position (TP) Sensor Connector - A
Courtesy of FORD MOTOR CO.



A0077555

Fig. 45: Throttle Position (TP) Sensor Connector - B
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Escape/Mariner 2.3L, Ranger 2.3L	A	2 1 3	TP SIGRTN VREF
All other vehicles	B	2 3 1	TP SIGRTN VREF

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Escape/Mariner	150 (50-50-50) Pin	E41 B47, B48, B49, B50 B40, E40 B35, B36 E19	SIGRTN PWRGND VREF VPWR TP
Ranger	170 Pin	E58 B47, B48, B49, B50 B40, E57 B35, B36 E61	SIGRTN PWRGND VREF VPWR TP

TEST PROCEDURE

DH1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0068, P0121, P0122, P0123, P1120, or P1124 present?**

Yes	No
For DTC P0068, GO to DH18. For DTC P0121, GO to DH24. For KOEO and KOER DTC P0122, GO to DH14. For continuous memory DTC P0122, GO to DH13. For DTC P0123, GO to DH9. For DTC P1120, GO to DH4. For DTC P1124, GO to DH2.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DH2 KOEO AND KOER DTC P1124: CHECK FOR ANY OTHER DTCS

- Key ON, engine OFF.
- Check for KOEO and KOER DTCs.
- **Is DTC P0405 present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to DH3.

DH3 CHECK FOR A STUCK THROTTLE PLATE OR LINKAGE

- Key in OFF position.
- Visually inspect the throttle linkage and throttle plate for binding or sticking.
- Verify the throttle plate and linkage is at closed throttle position.
- **Does the throttle move freely and return to a closed throttle position?**

Yes	No
The throttle plate and linkage are OK. GO to DH9.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DH4 DTC P1120: CHECK THE TP CIRCUIT FOR FRAYED WIRES OR CORROSION ON THE CONNECTORS

- Key in OFF position.
- Carry out a visual inspection of the pins on the harness connector at the TP sensor for corrosion.
- Carry out a visual inspection of the harness wires between the TP sensor and the PCM for insulation fraying and corrosion.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DH5.

DH5 CHECK FOR A STUCK TP SENSOR

- Key ON, engine OFF.
- Slowly move the throttle from the closed throttle position to the wide open throttle position and observe the TP PID.
- Access the PCM and monitor the TP PID.
- **Is the voltage greater than 4.5 V?**

Yes	No
GO to DH22.	GO to DH6.

DH6 CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE TP SENSOR HARNESS CONNECTOR

- TP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) TP Sensor Connector, Harness Side	(-) TP Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to DH7.	refer to **PINPOINT TEST C**.

DH7 CHECK THE TP CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) TP Sensor Connector, Harness Side
TP	TP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DH8.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DH8 CHECK THE TP SENSOR VOLTAGE TO THE PCM

- PCM connector connected.
- TP Sensor connector connected.
- Key ON, engine running.
- Idle the engine for 2 minutes.
- Key in OFF position.
- Key ON, engine OFF.
- Access the PCM and monitor the TP PID.
- Slowly move the throttle from the closed throttle position to the wide open throttle position and observe the TP PID.
- **Is the voltage between 0.17 - 0.49 V?**

Yes	No
INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	If DTC P1120 is still present, GO to DH22.

DH9 DTC P0123 OR DTC P1124: INDUCE THE OPPOSITE TP SENSOR VOLTAGE

- TP Sensor connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the TP PID.
- **Is the voltage less than 0.17 V?**

Yes	No
GO to DH10.	GO to DH11.

DH10 CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE TP SENSOR VEHICLE HARNESS CONNECTOR

- Key ON, engine OFF.
- Measure the voltage between:

(+) TP Sensor Connector, Harness Side	(-) TP Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST C**.

DH11 CHECK THE CIRCUIT FOR A SHORT TO VREF AND VPWR IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VPWR	TP
VREF	TP

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DH12.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DH12 CHECK FOR AN INTERMITTENT SHORT TO VOLTAGE IN THE TP CIRCUIT

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VPWR	TP
VREF	TP

- Observe the digital multimeter (DMM) for an indication of a concern while shaking, wiggling, and bending the TP circuit between the TP sensor and the PCM.
- **Is a concern present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs.	GO to DH26.

REPEAT the self-test.	

DH13 CONTINUOUS MEMORY DTC P0122: CHECK THE TP CIRCUIT FOR AN INTERMITTENT CONCERN

- Key ON, engine OFF.
- Clear the PCM DTCs.
- Key ON, engine running.
- Retrieve the continuous memory DTCs.
- **Is DTC P0122 present?**

Yes	No
GO to DH14.	refer to **PINPOINT TEST Z**.

DH14 KOEO AND KOER DTC P0122: CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE TP SENSOR VEHICLE HARNESS CONNECTOR

- Key in OFF position.
- TP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) TP Sensor Connector, Harness Side	(-) TP Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to DH15.	refer to **PINPOINT TEST C**.

DH15 CHECK THE TP CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) TP Sensor Connector, Harness Side
TP	TP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DH16.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DH16 CHECK THE TP CIRCUIT FOR A SHORT TO PWRGND OR SIGRTN IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
TP	PWRGND
TP	SIGRTN

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DH17.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DH17 INDUCE THE OPPOSITE TP SENSOR VOLTAGE

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A TP Sensor Connector, Harness Side	Point B TP Sensor Connector, Harness Side
VREF	TP

- Key ON, engine OFF.
- Access the PCM and monitor the TP PID.
- **Is the voltage greater than 4.65 V?**

Yes	No
INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DH26.

DH18 DTC P0068: CHECK THE RATIONALITY BETWEEN THE TP AND MAF SENSORS

- Attempt to start the engine.
- **Does the engine start?**

Yes	No
GO to DH19.	CHECK for major leaks, cracks and openings between the MAF sensor and the throttle body. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. If OK, refer to **PINPOINT TEST A**.

DH19 CHECK THE TP SENSOR FOR MECHANICAL OPERATION

- Key ON, engine OFF.
- Access the PCM and monitor the TP PID.
- Slowly move the throttle from the closed throttle position to the wide open throttle position and observe the TP PID.
- **Is the voltage between 0.49 - 4.65 V?**

Yes	No
GO to DH20.	INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DH20 CHECK THE TP SENSOR SIGNAL HIGH VERSUS THE ENGINE LOAD WHILE DRIVING THE VEHICLE

- Key ON, engine running.
- Access the PCM and monitor the TP PID.
- Access the PCM and monitor the LOAD PID.
- Drive the vehicle, exercising the throttle and TP sensor.
- **Is the TP PID greater than 2.44 volts and the LOAD PID less than 30%?**

Yes	No
LISTEN for air noise around the MAF sensor and throttle body while the engine is running. REPAIR as necessary. If OK, INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DH21.

DH21 CHECK THE TP SENSOR SIGNAL LOW VERSUS THE ENGINE LOAD WHILE DRIVING THE VEHICLE

- Key ON, engine running.
- Access the PCM and monitor the TP PID.
- Access the PCM and monitor the LOAD PID.
- Drive the vehicle while exercising the throttle and TP sensor near higher gears (preferably overdrive).
- **Is the TP PID less than 0.24 volt and the LOAD PID greater than 55%?**

Yes	No
If continuous memory DTC P0068 is present, INSTALL a new MAF sensor. REFER to the	Unable to duplicate or identify the concern at this time.

ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES . CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

DH22 CHECK FOR AN INTERMITTENT TP SIGNAL

- Key ON, engine running.
- Access the PCM and monitor the TP PID.
- Increase the engine speed to 1,500 RPM for 10 seconds.
- Lightly tap on the TP sensor and wiggle the harness connector to simulate road shock.
- **Is the voltage between 0.49 V - 4.65 V?**

Yes	No
GO to DH23.	INSPECT the TP sensor connector. REPAIR as necessary. If OK, INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DH23 CHECK THE TP SENSOR HARNESS FOR INTERMITTENT OPENS OR SHORTS

- Key in OFF position.
- Key ON, engine OFF.
- Access the PCM and monitor the TP PID.
- Grasp the vehicle harness closest to the TP sensor connector.
- Shake and bend a small section of the harness all the way to the bulkhead.
- Wiggle, shake, and bend the harness from the bulkhead to the PCM.
- **Is the voltage between 0.49 V - 4.65 V?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DH24 DTC P0121: CHECK FOR OBSTRUCTION OR STICKING CONCERNS

NOTE: **Do not attempt to clean the throttle bore and plate area. Cleaning damages the throttle body assembly.**

NOTE: **Conditions of sticking or obstruction can either be within the cables or throttle body assembly.**

- Disconnect the accelerator cable and speed control cable from the throttle body linkage.

- Rotate the throttle body linkage.
- **Does the throttle body rotate freely without a sticking, binding, or grabbing condition?**

Yes	No
INSPECT the cable(s). REPAIR as necessary. REPEAT the self-test. If DTC P0121 is still present, GO to DH25.	INSTALL a new throttle body assembly. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DH25 CHECK THE FUNCTIONALITY OF THE THROTTLE POSITION SENSOR

- Key ON, engine OFF.
- Access the PCM and monitor the TP PID.
- While slowly pressing the accelerator from the closed throttle position to the wide open throttle position, observe the TP PID.
- **Does the TP PID display a smooth reading during accelerator movement?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DH26 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DJ: AIR CONDITIONING EVAPORATOR TEMPERATURE (ACET) SENSOR

INTRODUCTION

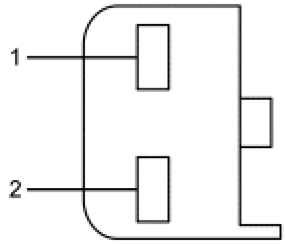
This pinpoint test is intended to diagnose the following:

- ACET sensor (19C734)
- harness circuits: ACET and SIGRTN
- powertrain control module (PCM) (12A650)

AIR CONDITIONING EVAPORATOR TEMPERATURE (ACET) SENSOR

°C	°F	Voltage	Resistance (K ohms)
100	212	0.47	2.08
90	194	0.61	2.8
80	176	0.80	3.84
70	158	1.05	5.34
60	140	1.37	7.55
50	122	1.77	10.93
40	104	2.23	16.11
30	86	2.74	24.25
20	68	3.26	37.34
10	50	3.73	58.99
0	32	4.14	95.85
-10	14	4.45	160.31
-20	-4	4.66	276.96

These values can vary by 15% due to sensor and VREF variations. Voltage values calculated for VREF are equal to 5 volts.



N0072971

Fig. 46: Powertrain Control Module (PCM) (12A650)
Courtesy of FORD MOTOR CO.

Pin	Circuit
1	SIGRTN (Signal Return)
2	ACET (Air Conditioning Evaporator Temperature)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Connector	Pin	Circuit
140 Pin	B33, E57 B58, E58 B53	VREF SIGRTN ACET

TEST PROCEDURE

DJ1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0537, P0538, P1436, or P1437 present?**

Yes	No
For KOEO and KOER DTCs P0538 or P1437, GO to DJ2. For KOEO and KOER DTCs P0537 or P1436, GO to DJ6. For continuous memory DTCs P0537, P0538, P1436 or P1437, GO to DJ9.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DJ2 KOEO AND KOER DTCS P0538 OR P1437: SIMULATE AN OPPOSITE SIGNAL TO THE PCM

- ACET Sensor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A ACET Sensor Connector, Harness Side	Point B ACET Sensor Connector, Harness Side
ACET - Pin 2	SIGRTN - Pin 1

- Check for self-test DTCs.
- **Are DTCs P0537 or P1436 present?**

Yes	No
INSTALL a new ACET sensor. CLEAR the DTCs. REPEAT the self-test.	GO to DJ3.

DJ3 CHECK THE ACET AND SIGRTN CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Remove the jumper wire(s).
- PCM connector disconnected.
- Measure the resistance between:

(+) ACET Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
ACET - Pin 2	ACET - Pin B53
SIGRTN - Pin 1	SIGRTN - Pin B58, E58

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DJ4.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DJ4 CHECK THE ACET CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) ACET Sensor Connector, Harness Side	(-)
ACET - Pin 2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to DJ5.	REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

DJ5 CHECK THE ACET CIRCUIT FOR A SHORT TO VREF IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
ACET - Pin B53	VREF - Pin E57

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DJ10.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DJ6 KOEO AND KOER DTCS P0537 OR P1436: SIMULATE AN OPPOSITE SIGNAL TO THE PCM

- ACET Sensor connector disconnected.
- Carry out the KOEO self-test.
- **Are DTCs P0538 or P1437 present?**

Yes	No
INSTALL a new ACET sensor. CLEAR the DTCs. REPEAT the self-test.	GO to DJ7.

DJ7 CHECK THE ACET CIRCUIT(S) FOR A SHORT TO SIGRTN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) ACET Sensor Connector, Harness Side	(-) ACET Sensor Connector, Harness Side
ACET - Pin 2	SIGRTN - Pin 1

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DJ8.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DJ8 CHECK THE ACET CIRCUIT(S) FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) ACET Sensor Connector, Harness Side	(-)
ACET - Pin 2	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DJ10.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DJ9 CONTINUOUS MEMORY DTCS P0537, P0538, P1436 OR P1437: CHECK THE ACET AND SIGRTN CIRCUIT FOR AN INTERMITTENT CONCERN

NOTE: **The voltage should be between 4.5 and 5.5 volts. The voltage reading changes suddenly when a concern is detected. For P0537/P1436, a sudden change could indicate a short to ground. For P0538/P1436, a sudden change could indicate an open ACET or SIGRTN circuit.**

- ACET Sensor connector disconnected.
- Inspect the connectors for signs of damage, water intrusion, or corrosion.
- Measure the voltage between:

(+) ACET Sensor Connector, Harness Side	(-) ACET Sensor Connector, Harness Side
ACET - Pin 2	SIGRTN - Pin 1

- Key ON, engine OFF.

- While monitoring the voltage reading on the digital multimeter (DMM), wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- Key in OFF position.
- **Is there any change in the voltage reading, or is a concern found?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DJ10 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins.
  - corrosion.
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DK: ACCELERATOR PEDAL POSITION (APP) SENSOR

INTRODUCTION

NOTE: After clearing an APP sensor diagnostic trouble code (DTC) to verify a repair or an intermittent concern, apply the accelerator pedal before carrying out the self-test. Take 10 seconds to carry out a full sweep of the accelerator pedal from fully released to fully applied and back to fully released.

This pinpoint test is intended to diagnose the following:

- accelerator pedal position (APP) sensor (9F836)
- harness circuits: ETCRTN, SIGRTN, ETCREF, APP1, APP2, and APP3
- powertrain control module (PCM) (12A650)

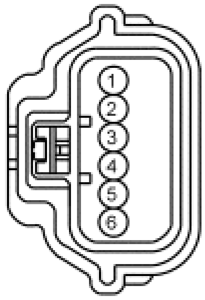


Fig. 47: Accelerator Pedal Position (APP) Sensor Connector - A
Courtesy of FORD MOTOR CO.

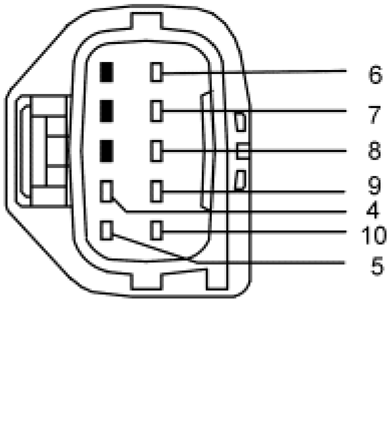

Fig. 48: Accelerator Pedal Position (APP) Sensor Connector - B
Courtesy of FORD MOTOR CO.

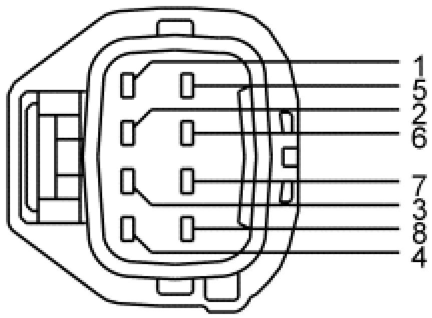

Fig. 49: Accelerator Pedal Position (APP) Sensor Connector - C

TEST PROCEDURE

DK1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P1575, P2104, P2121, P2122, P2123, P2126, P2127, P2128, P2131, P2132, P2133, or P2138 present?**

Yes	No

For DTC P1575, GO to DK2. For all others, GO to DK4.	For a lack/loss of power, GO to DK3. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DK2 DTC P1575: REPEAT THE KOEO SELF-TEST

NOTE: Make sure the accelerator pedal is not applied during the KOEO self-test.

- Key ON, engine OFF.
- Carry out the KOEO self-test.
- **Are any DTCs present other than P1575?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to DK3.

DK3 CHECK THE ACCELERATOR PEDAL FOR OBSTRUCTION

- Key ON, engine OFF.
- Press the accelerator pedal fully to the floor and release.
- **Does the pedal move freely to the floor and back?**

Yes	No
GO to DK4.	ISOLATE and REPAIR the obstruction. CLEAR the DTCs. REPEAT the self-test.

DK4 CHECK THE APP SENSOR SIGNAL VOLTAGE RANGES FOR THE ACCELERATOR PEDAL FULLY APPLIED AND RELEASED POSITIONS

- Access the PCM and monitor the APP1, APP2 and APP3 PIDs.
- Press the accelerator pedal fully to the floor and release.

ACCELERATOR PEDAL FULLY APPLIED VOLTAGE VALUES

Vehicle	APP1	APP2	APP3
E-Series	0.73 - 1.28	3.03 - 4.55	2.59 - 3.89
Expedition, Navigator	0.79 - 2.09	2.75 - 4.33	2.26 - 3.73
Explorer, Explorer Sport Trac, Mountaineer	0.60 - 1.57	3.07 - 4.50	2.57 - 3.89
F-150, Mark LT	0.60 - 1.57	3.07 - 4.50	2.57 - 3.89
F-Super Duty	0.28 - 0.97	3.45 - 4.71	2.95 - 4.10
Focus	3.69 - 4.60	1.75 - 2.40	-
Fusion, Milan, MKZ	1.20 - 2.50	2.50 - 3.94	2.00 - 3.33
All others	0.48 - 1.76	2.95 - 4.62	2.43 - 4.02

ACCELERATOR PEDAL FULLY RELEASED VOLTAGE VALUES

Vehicle	APP1	APP2	APP3
Focus	0.70 - 0.90	0.30 - 0.50	-
All vehicles	3.43 - 4.69	1.13 - 1.88	0.64 - 1.28

- **Are all APP signals out of range for the pedal fully applied and released positions?**

Yes	No
GO to DK5.	For continuous memory DTCs P2121 and P2126 with P2131, GO to DK24. For all others, GO to DK5.

DK5 CHECK THE VREF VOLTAGE TO APP SENSOR

- Key in OFF position.
- APP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
ETCREF	ETCRTN

- **Is the voltage between 4 - 6 V?**

Yes	No
For E-Series, Explorer, Explorer Sport Trac, F-150, Mark LT, and Mountaineer, GO to DK6. For F-Super Duty, GO to DK7. For Fusion, Milan, and MKZ, GO to DK10. For Focus with DTC P2122, P2123, or P2138, GO to DK12. For Focus with DTC P2127 or P2128, GO to DK16. For all others, GO to DK11.	refer to **PINPOINT TEST C**.

DK6 E-SERIES, EXPLORER, EXPLORER SPORT TRAC, F-150, MARK LT, MOUNTAINEER: CHECK THE APP SENSOR FOR THE CORRECT RESISTANCE

NOTE: **Make sure the accelerator pedal is fully released when taking the resistance measurements.**

- Key in OFF position.
- APP Sensor connector disconnected.
- Measure the resistance between:

(+) APP Sensor Connector, Component Side	(-) APP Sensor Connector, Component Side	Minimum Resistance (ohms)	Maximum Resistance (ohms)
APP1	ETCREF	550	1,390
APP1	ETCRTN	1,030	2,590
APP1	APP2	2,125	5,335
APP1	APP3	1,930	4,845
APP2	ETCREF	1,785	4,480
APP2	ETCRTN	1,475	3,705
APP2	APP3	2,520	6,330
APP3	ETCREF	1,620	4,070
APP3	ETCRTN	1,135	2,860
ETCREF	ETCRTN	780	1,955
ETCREF	ETCREF	0	10
ETCRTN	ETCRTN	0	10

- **Are all the resistances within specifications?**

Yes	No
For DTCs P2121, P2122 or P2123 alone or in combination, GO to DK12. For DTCs P2126, P2127 or P2128 alone or in combination, GO to DK16. For DTCs P2131, P2132 or P2133 alone or in combination, GO to DK20. For DTC P2104 alone, GO to DK30. For a lack/loss of power, the concern is elsewhere. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction. For all others, GO to DK24.	INSTALL a new APP sensor. REFER to the **ACCELERATION CONTROL -- E-SERIES** to INSTALL a new accelerator pedal. CLEAR the DTCs. REPEAT the self-test.

DK7 F-SUPER DUTY: CHECK THE ACCELERATOR PEDAL CONFIGURATION AND APP SENSOR HOUSING

- Check the configuration of the accelerator pedal and determine the color of the APP sensor housing.
- **Is the vehicle equipped with an adjustable accelerator pedal?**

Yes	No
GO to DK8.	For F-Super Duty with a fixed accelerator pedal and a white APP sensor housing, GO to DK9. For all others, GO to DK11.

DK8 F-SUPER DUTY WITH ADJUSTABLE ACCELERATOR PEDAL: CHECK THE APP SENSOR FOR THE CORRECT RESISTANCE

NOTE: Make sure the accelerator pedal is fully released when taking the resistance measurements.

- Key in OFF position.
- APP Sensor connector disconnected.
- Measure the resistance between:

(+) APP Sensor Connector, Component Side	(-) APP Sensor Connector, Component Side	Minimum Resistance (ohms)	Maximum Resistance (ohms)
APP1	ETCREF	550	1,390
APP1	ETCRTN	1,030	2,590
APP1	APP2	2,125	5,335
APP1	APP3	1,930	4,845
APP2	ETCREF	1,785	4,480
APP2	ETCRTN	1,475	3,705
APP2	APP3	2,520	6,330
APP3	ETCREF	1,620	4,070
APP3	ETCRTN	1,135	2,860
ETCREF	ETCRTN	780	1,955
ETCREF	ETCREF	0	10
ETCRTN	ETCRTN	0	10

- **Are all the resistances within specifications?**

Yes	No
For DTCs P2121, P2122 or P2123 alone or in combination, GO to DK12. For DTCs P2126, P2127 or P2128 alone or in combination, GO to DK16. For DTCs P2131, P2132 or P2133 alone or in combination, GO to DK20. For DTC P2104 alone, GO to DK30. For a lack/loss of power, the concern is elsewhere. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction. For all others, GO to DK24.	INSTALL a new APP sensor. REFER to the **ACCELERATION CONTROL -- E-SERIES** to INSTALL a new accelerator pedal. CLEAR the DTCs. REPEAT the self-test.

DK9 F-SUPER DUTY WITH FIXED ACCELERATOR PEDAL AND WHITE APP SENSOR HOUSING: CHECK THE APP SENSOR FOR THE CORRECT RESISTANCE

NOTE: Make sure the accelerator pedal is fully released when taking the resistance measurements.

- Key in OFF position.
- APP Sensor connector disconnected.
- Measure the resistance between:

(+) APP Sensor Connector, Component Side	(-) APP Sensor Connector, Component Side	Minimum Resistance (ohms)	Maximum Resistance (ohms)
APP1	ETCREF	1,080	1,865
APP1	ETCRTN	1,535	2,860
APP1	APP2	2,820	5,225
APP1	APP3	2,775	5,205
APP2	ETCREF	1,995	3,700
APP2	ETCRTN	1,625	3,170
APP2	APP3	3,000	5,835
APP3	ETCREF	1,985	3,735
APP3	ETCRTN	1,440	2,870
ETCREF	ETCRTN	805	1,500
ETCREF	ETCREF	0	10
ETCRTN	ETCRTN	0	10

- **Are all the resistances within specifications?**

Yes	No
For DTCs P2121, P2122 or P2123 alone or in combination, GO to DK12. For DTCs P2126, P2127 or P2128 alone or in combination, GO to DK16. For DTCs P2131, P2132 or P2133 alone or in combination, GO to DK20. For DTC P2104 alone, GO to DK30. For a lack/loss of power, the concern is elsewhere. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction. For all others, GO to DK24.	INSTALL a new APP sensor. REFER to the **ACCELERATION CONTROL -- E-SERIES** to INSTALL a new accelerator pedal. CLEAR the DTCs. REPEAT the self-test.

DK10 FUSION, MILAN, MKZ: CHECK THE APP SENSOR FOR THE CORRECT RESISTANCE

NOTE: **Make sure the accelerator pedal is fully released when taking the resistance measurements.**

- Key in OFF position.
- APP Sensor connector disconnected.

- Measure the resistance between:

(+) APP Sensor Connector, Component Side	(-) APP Sensor Connector, Component Side	Minimum Resistance (ohms)	Maximum Resistance (ohms)
APP1	ETCREF	650	1,340
APP1	ETCRTN	1,210	2,470
APP1	APP2	2,430	4,960
APP1	APP3	2,390	4,880
APP2	ETCREF	2,020	4,120
APP2	ETCRTN	1,650	3,380
APP2	APP3	3,000	6,130
APP3	ETCREF	2,010	4,110
APP3	ETCRTN	1,450	2,970
ETCREF	ETCRTN	900	1,840
ETCREF	ETCREF	0	10
ETCRTN	ETCRTN	0	10

- **Are all the resistances within specifications?**

Yes	No
For DTCs P2121, P2122 or P2123 alone or in combination, GO to DK12. For DTCs P2126, P2127 or P2128 alone or in combination, GO to DK16. For DTCs P2131, P2132 or P2133 alone or in combination, GO to DK20. For DTC P2104 alone, GO to DK30. For a lack/loss of power, the concern is elsewhere. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction. For all others, GO to DK24.	INSTALL a new APP sensor. REFER to the **ACCELERATION CONTROL -- E-SERIES** to INSTALL a new accelerator pedal. CLEAR the DTCs. REPEAT the self-test.

DK11 ALL OTHERS: CHECK THE APP SENSOR FOR THE CORRECT RESISTANCE

NOTE: **Make sure the accelerator pedal is fully released when taking the resistance measurements.**

- Key in OFF position.
- APP Sensor connector disconnected.
- Measure the resistance between:

(+) APP Sensor	(-) APP Sensor		

Connector, Component Side	Connector, Component Side	Minimum Resistance (ohms)	Maximum Resistance (ohms)
APP1	ETCREF	600	1,370
APP1	ETCRTN	720	1,660
APP1	APP2	1,300	2,960
APP1	APP3	1,250	2,860
APP2	ETCREF	750	1,720
APP2	ETCRTN	660	1,520
APP2	APP3	1,230	2,810
APP3	ETCREF	710	1,640
APP3	ETCRTN	580	1,340
ETCREF	ETCRTN	200	470
ETCREF	ETCREF	0	10
ETCRTN	ETCRTN	0	10

- **Are all the resistances within specifications?**

Yes	No
For DTCs P2121, P2122 or P2123 alone or in combination, GO to DK12. For DTCs P2126, P2127 or P2128 alone or in combination, GO to DK16. For DTCs P2131, P2132 or P2133 alone or in combination, GO to DK20. For DTC P2104 alone, GO to DK30. For a lack/loss of power, the concern is elsewhere. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction. For all others, GO to DK24.	INSTALL a new APP sensor. REFER to the **ACCELERATION CONTROL -- E-SERIES** to INSTALL a new accelerator pedal. CLEAR the DTCs. REPEAT the self-test.

DK12 CHECK THE APP1 CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- APP Sensor connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
APP1	APP1

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DK13.	REPAIR the open circuit. CLEAR the DTCs.

	REPEAT the self-test.

DK13 CHECK THE APP1 CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) Vehicle Battery
APP1	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DK14.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK14 CHECK THE APP1 CIRCUIT FOR A SHORT IN THE HARNESS

- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
APP1	ETCRTN
APP1	ETCREF

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DK15.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK15 CHECK THE APP1 CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) APP Sensor Connector, Harness Side	(-) Vehicle Battery
APP1	Negative terminal

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to DK24.

DK16 CHECK THE APP2 CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.

- APP Sensor connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
APP2	APP2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DK17.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DK17 CHECK THE APP2 CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
APP2	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DK18.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK18 CHECK THE APP2 CIRCUIT FOR A SHORT IN THE HARNESS

- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
APP2	ETCRTN
APP2	ETCREF

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DK19.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK19 CHECK THE APP2 CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
APP2	Negative terminal

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to DK25.

DK20 CHECK THE APP3 CIRCUIT FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
APP3	APP3

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DK21.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DK21 CHECK THE APP3 CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
APP3	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DK22.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK22 CHECK THE APP3 CIRCUIT FOR A SHORT IN THE HARNESS

- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
APP3	ETCRTN
APP3	ETCREF

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DK23.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK23 CHECK THE APP3 CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
APP3	Negative terminal

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to DK26.

DK24 CHECK FOR THE APP1 CIRCUIT SHORTED TO SIGNALS IN THE SAME HARNESS

- Key in OFF position.
- PCM connector disconnected.
- APP Sensor connector disconnected.
- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
APP1	APP2
APP1	APP3
APP1	ETCREF
APP1	ETCRTN

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DK27.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK25 CHECK FOR THE APP2 CIRCUIT SHORTED TO SIGNALS IN THE SAME HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
APP2	APP1
APP2	APP3

APP2	ETCREF
APP2	ETCRTN

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DK27.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK26 CHECK FOR THE APP3 CIRCUIT SHORTED TO SIGNALS IN THE SAME HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
APP3	APP1
APP3	APP2
APP3	ETCREF
APP3	ETCRTN

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DK27.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DK27 CHECK THE APP SENSOR CIRCUITS FOR AN INTERMITTENT CONCERN

- Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
APP1	APP1
APP2	APP2
APP3	APP3

- **Are the resistances less than 5 ohms?**

Yes	No
For Focus, GO to DK28. For all others, GO to DK30.	ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DK28 CHECK FOR DTCS

- PCM connector connected.
- Key ON, engine OFF.
- Carry out the KOEO self-test.
- **Are DTCs P2122 and P2127 present?**

Yes	No
GO to DK29.	GO to DK30.

DK29 SIMULATE THE OPPOSITE SIGNAL

- Key in OFF position.
- Connect a 5 amp fused jumper wire between the following:

Point A APP Sensor Connector, Harness Side	Point B APP Sensor Connector, Harness Side
ETCREF	APP1
ETCREF	APP2

- Key ON, engine OFF.
- Access the PCM and monitor the APP1 and APP2 PIDs.
- **Are the voltages greater than 4.5 V?**

Yes	No
INSTALL a new APP sensor. REFER to the **ACCELERATION CONTROL -- E-SERIES** to INSTALL a new accelerator pedal. CLEAR the DTCs. REPEAT the self-test.	GO to DK30.

DK30 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DL: CYLINDER HEAD TEMPERATURE (CHT) SENSOR

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- cylinder head temperature (CHT) sensor (6G004)
- harness circuits: CHT, VREF, and SIGRTN
- powertrain control module (PCM) (12A650)

On applications that do not use an engine coolant temperature (ECT) sensor, the CHT sensor is used to determine the engine coolant temperature. To cover the entire temperature range of both the CHT and ECT sensors, the PCM has a dual switching resistor circuit on the CHT input. A graph showing the temperature switching from the COLD END line to the HOT END line, with increasing temperature and back with decreasing temperature is included. Note the temperature to voltage overlap zone. Within this zone it is possible to have either a COLD END or HOT END voltage at the same temperature. For example, at 90°C (194°F) the voltage could read either 0.60 volt or 3.71 volts. Refer to the table for the temperature to voltage expected values.

Voltage values calculated for VREF = 5 volts. These values can vary by 15% due to sensor and VREF variations.

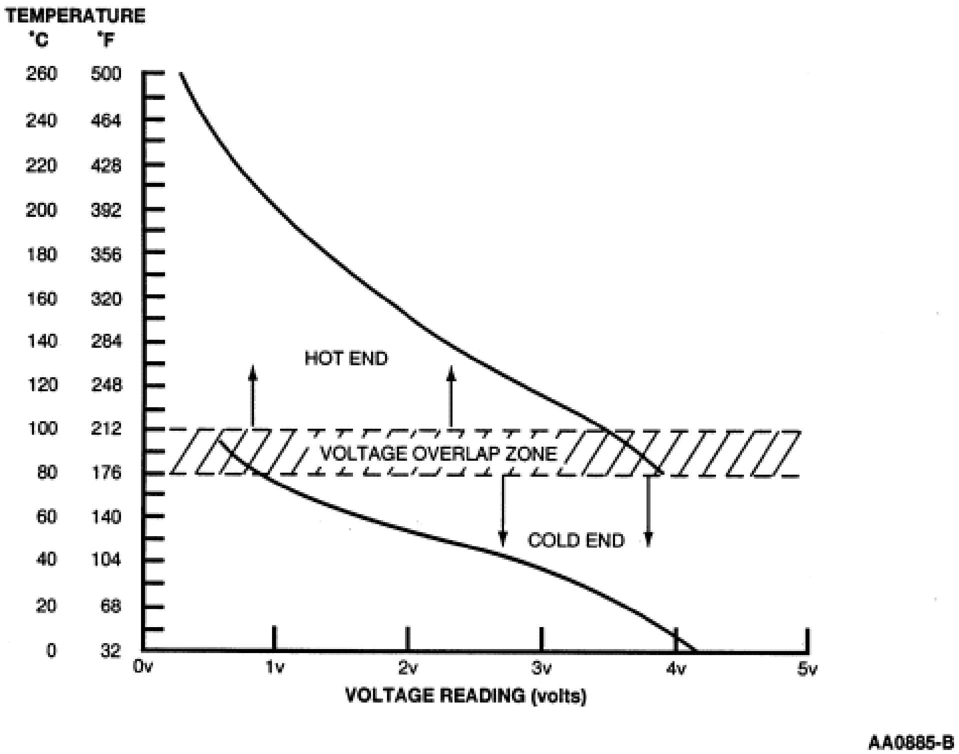

Fig. 50: Cylinder Head Temperature Sensor Voltage Graph
Courtesy of FORD MOTOR CO.

CYLINDER HEAD TEMPERATURE SENSOR EXPECTED VALUES

Temperature		CHT Sensor Values		
°C	°F	Cold End (volts)	Hot End (volts)	Resistance (K ohms)
-40	-40	4.89	-	965.808
-30	-22	4.81	-	513.019
-20	-4	4.67	-	283.664
-10	14	4.45	-	162.584
0	32	4.14	-	96.255
10	50	3.73	-	59.175
20	68	3.26	-	37.387

TEST PROCEDURE

DL1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0116, P0119, P0125, P0128, P1116, P1285, P1288, P1289, P128A, P1290, or P1299 present?**

Yes	No
For DTCs P1116 or P1288, GO to DL2. For KOEO and KOER DTCs P1289 or P1290, GO to DL8. For continuous memory DTCs P0119, P1289, P128A, or P1290, GO to DL15. For KOEO or continuous memory DTC P1299, GO to DL21. For continuous memory DTCs P0125 or P0128, GO to DL22. For continuous memory DTC P0116, GO to DL24. For DTC P1285, GO to DL18.	For Temperature Warning Indicator Lamp or Gauge (applications with CHT sensor only) symptom, GO to DL29. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DL2 SELF-TEST DTCS P1288 OR P1116: CHECK THE COOLING SYSTEM

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

- The DTC indicates the temperature sensor is out of self-test range. The engine is not at normal operating temperature.
- Check the vehicle coolant level.
- **Is the cooling system OK?**

Yes	No
GO to DL3.	REFER to the **ENGINE COOLING -- E-SERIES** , for loss of coolant diagnosis. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL3 CHECK IF THE VEHICLE ENGINE STARTS

- Attempt to start the engine.
- **Does the engine start and run normally?**

Yes	No
GO to DL6.	GO to DL4.

DL4 CHECK THE RESISTANCE OF THE CHT SENSOR WITH THE ENGINE OFF

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- Key in OFF position.
- CHT Sensor connector disconnected.
- Measure the resistance between:

(+) CHT Sensor Connector, Component Side	(-) CHT Sensor Connector, Component Side
CHT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to DL5.	INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DL5 CHECK THE CIRCUIT FROM THE MODULE TO THE COMPONENT

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- CHT Sensor connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the CHT PID.
- Using the data collected from the previous step, compare temperature resistance measured at the sensor to the PID temperature voltage measured at the PCM.
- **Does the measured value at the sensor agree with measured PID value at the PCM?**

Yes	No
The concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** , for further direction.	GO to DL12.

DL6 CHECK THE CHT SENSOR OPERATION

- Run the engine until the engine temperature stabilizes.
- Verify the radiator hoses are hot and the cooling system is pressurized.
- Carry out the PCM self-test.
- **Are DTCs P1116 or P1288 present?**

Yes	No
GO to DL7.	The engine temperature was not stabilized. REPAIR any other DTCs as necessary.

DL7 CHECK THE RESISTANCE OF THE CHT SENSOR

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- The vehicle must be at normal operating temperature.
- Key in OFF position.
- CHT Sensor connector disconnected.
- Measure the resistance between:

(+) CHT Sensor Connector, Component Side	(-) CHT Sensor Connector, Component Side
CHT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to DL31.	INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DL8 DTCS P1289 OR P1290: ACCESS THE CHT PID AND CHECK THE VOLTAGE

- Key ON, engine OFF.
- Access the PCM and monitor the CHT PID.
- **Is the voltage less than 0.2 V?**

Yes	No
GO to DL9.	GO to DL10.

DL9 CHECK FOR A GROUNDED CIRCUIT

- CHT Sensor connector disconnected.
- Key ON, engine OFF.

- Access the PCM and monitor the CHT PID.
- **Is the voltage greater than 4.6 V?**

Yes	No
INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DL14.

DL10 CHECK THE CHT CIRCUIT FOR A SHORT TO VOLTAGE

- CHT Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CHT Sensor Connector, Harness Side	(-)
CHT - Pin 1	Ground

- **Is the voltage greater than 5.5 V?**

Yes	No
REPAIR the short circuit to PWR. CHECK the CHT sensor for damage. GO to DL11.	GO to DL11.

DL11 CHECK THE RESISTANCE OF THE CHT SENSOR WITH THE ENGINE OFF

NOTE: **Refer to the chart at the beginning of this test for the resistance specifications.**

- Key in OFF position.
- CHT Sensor connector disconnected.
- Measure the resistance between:

(+) CHT Sensor Connector, Component Side	(-) CHT Sensor Connector, Component Side
CHT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to DL12.	INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** .

	CLEAR the DTCs. REPEAT the self-test.

DL12 CHECK THE SIGNAL AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) CHT Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
CHT - Pin 1	CHT
SIGRTN - Pin 2	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DL13.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DL13 CHECK THE SENSOR SIGNAL FOR A SHORT TO VREF

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
CHT	VREF

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DL31.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DL14 CHECK THE SENSOR SIGNAL FOR A SHORT TO GROUND

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
CHT	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) 12 Volt Vehicle Battery
CHT	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DL31.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DL15 DTCS P0119, P1289, P1290 OR P128A: INTERMITTENT CHECK

- Key ON, engine OFF.
- Access the PCM and monitor the CHT PID.
- While observing the PID, carry out the following:
  - Tap on the sensor to simulate road shock
  - Wiggle the sensor connector
- **Is there a large change in the voltage reading?**

Yes	No
DISCONNECT and INSPECT the connector. If OK, INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DL16.

DL16 CHECK THE ELECTRONIC ENGINE CONTROL (EEC) WIRING HARNESS

- Access the PCM and monitor the CHT PID.
- While observing the PID, wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **Is there a large change in the voltage reading?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DL17.

DL17 CHECK THE PCM AND VEHICLE HARNESS CONNECTORS

- PCM connector disconnected.
- CHT Sensor connector disconnected.
- **Are the connectors and terminals OK?**

Yes	No
GO to DL31.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL18 SELF-TEST DTC P1285: EARLY WARNING OF ENGINE OVERHEAT CONDITION

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

NOTE: **If the electric cooling fan does not operate, return toDIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS for electric cooling fan DTC. Return toNO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX for symptom diagnosis.**

- An engine overheat condition is sensed by the CHT sensor.
- Check the cooling system for:
  - correct coolant level
  - internal or external coolant leaks
  - blockage of the radiator
  - cooling fan operation
- **Is the cooling system OK?**

Yes	No
GO to DL19.	REFER to the **ENGINE COOLING -- E-SERIES** , for loss of coolant diagnosis. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL19 CHECK THE OPERATION OF THE CYLINDER HEAD TEMPERATURE SENSOR

- Run the engine until the engine temperature stabilizes.
- Verify the radiator hoses are hot and the cooling system is pressurized.
- Carry out the self-test.
- **Is DTC P1285 present?**

Yes	No
GO to DL20.	An engine overheat temperature was not detected. REPAIR any other DTCs as necessary.

DL20 CHECK THE RESISTANCE OF THE CHT SENSOR

NOTE: **Refer to the chart at the beginning of this test for the resistance specifications.**

- The vehicle must be at normal operating temperature.
- Key in OFF position.

- CHT Sensor connector disconnected.
- Measure the resistance between:

(+) CHT Sensor Connector, Component Side	(-) CHT Sensor Connector, Component Side
CHT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to DL31.	INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DL21 SELF-TEST DTC P1299: INDICATES AN ENGINE OVERHEAT CONDITION

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

NOTE: **Refer toDIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS for possible causes and additional DTC description information.**

- Check the engine coolant level.
- **Is the engine coolant fill level correct?**

Yes	No
REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the engine overheating condition. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the loss of coolant. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL22 SELF-TEST DTCS P0125 OR P0128: CHECK THE ENGINE COOLANT LEVEL

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

NOTE: **DTC P0125 or P0128 indicates the engine coolant temperature has not**

achieved the required engine operation temperature level, since start-up within a specified amount of time.

- Check the engine coolant level.
- **Is the engine coolant fill level correct?**

Yes	No
GO to DL23.	REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the loss of coolant. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL23 CHECK THE SENSOR OPERATION

- Run the engine until the engine temperature stabilizes.
- Verify the radiator hoses are hot and the cooling system is pressurized.
- Access the PCM and monitor the CHT PID.
- **Is the temperature greater than 77°C (170.6°F)?**

Yes	No
The test is complete. CLEAR the DTCs. REPEAT the self-test.	REFER to the **ENGINE COOLING -- E-SERIES** to diagnosis engine not reaching normal operating temperature. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL24 DTC P0116: CHECK THE RESISTANCE OF THE CHT SENSOR WITH THE ENGINE OFF

NOTE: **Verify the engine temperature is at ambient room temperature before continuing with this test. A soak period of 6 hours may be required. Refer toDIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS for information concerning P0116.**

- Key in OFF position.
- CHT Sensor connector disconnected.
- Measure the resistance between:

(+) CHT Sensor Connector, Component Side	(-) CHT Sensor Connector, Component Side
CHT - Pin 1	SIGRTN - Pin 2

- Refer to the chart at the beginning of this test for the resistance specifications.
- **Is the resistance within specification?**

Yes	No
GO to DL25.	INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DL25 DTC P0116: CHECK THE RESISTANCE OF THE CHT SENSOR

NOTE: Verify the engine is at operating temperature before taking the CHT reading.

- CHT Sensor connector connected.
- Run the engine until the engine temperature stabilizes.
- Key in OFF position.
- CHT Sensor connector disconnected.
- Measure the resistance between:

(+) CHT Sensor Connector, Component Side	(-) CHT Sensor Connector, Component Side
CHT - Pin 1	SIGRTN - Pin 2

- Refer to the chart at the beginning of this test for the resistance specifications.
- **Is the resistance within specification?**

Yes	No
The concern is not present at this time. CARRY OUT the OBD drive cycle to determine if fuel, HO2S, catalyst and misfire monitors can be executed. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . REPEAT the PCM self-test if necessary.	INSTALL a new CHT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DL26 DTC P0298: ENGINE OIL OVER TEMPERATURE CONDITION

NOTE: The engine oil temperature protection strategy in the PCM has been activated. This protects the engine against mechanical damage due to overheating. Refer toDIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS for possible causes and additional DTC description information.

- Check for an overheating condition and base engine concerns.
- **Are there any overheating or base engine concerns?**

Yes	No

ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DL27.

DL27 CHECK FOR CHT DTCS

- Carry out the self-test.
- **Are DTCs P1285, P1288, P1289 or P1299 present?**

Yes	No
DISREGARD the engine oil temperature (EOT) diagnostic trouble code (DTC) at this time. ADDRESS the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to DL28.

DL28 ROAD TEST THE VEHICLE AND MONITOR FOR ENGINE OVER TEMPERATURE

- Access the freeze frame data (if available) and record the DTC malfunction conditions.
- Access the PCM and monitor the CHT PID.
- Test drive the vehicle and allow the engine to reach normal operating temperature.
- Observe CHT PID.
- **Does the engine overheat?**

Yes	No
REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the overheat symptom. REPAIR as necessary. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time.

DL29 ENGINE TEMPERATURE WARNING INDICATOR LAMP ON OR TEMPERATURE GAUGE INDICATES HOT, BUT ENGINE IS NOT OVERHEATING

NOTE: The PCM self-test must be carried out prior to entering this pinpoint test.

- **Was the PCM self-test carried out prior to entering this pinpoint test?**

Yes	No
GO to DL30.	The concern is elsewhere. RETURN to**PINPOINT TEST QT** for further direction.

DL30 ENGINE TEMPERATURE INDICATOR LAMP ON OR TEMPERATURE GAUGE INDICATES HOT WITH NO DTCS

NOTE: The engine temperature warning indicator (gauge or lamp) is a warning

system that gives the driver information during an engine overheating condition. The PCM monitors the CHT sensor and determines if fail-safe cooling mode is needed. If fail-safe cooling mode is needed, the PCM sends a controller area network (CAN) message to the instrument cluster to signal an overheating condition. This causes the instrument cluster indicator to illuminate and forces the temperature gauge to the H (hot) zone. DTC P1285 is stored in the PCM.

NOTE: **For Engine Temperature Warning Indicator system problems, refer to the INSTRUMENT CLUSTER (IC) AND WARNING CHIMES -- E-SERIES .**

- PCM connector disconnected.
- Key ON, engine OFF.
- **Does the engine temperature warning indicator lamp turn OFF (prove out) and\or the temperature gauge return to the normal zone with the PCM disconnected?**

Yes	No
REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the overheat symptom. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	REFER to the **INSTRUMENT CLUSTER (IC) AND WARNING CHIMES -- E-SERIES** to diagnose the incorrect temperature gauge. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL31 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

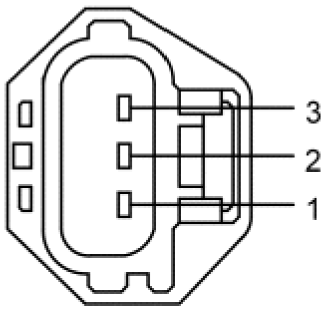
Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DM: MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- manifold absolute pressure (MAP) sensor (9F479)
- harness circuits: MAP, SIGRTN, VREF
- powertrain control module (PCM) (12A650)



A0077537

Fusion, Milan	140 Pin	B51, B52 B33, E57 B58, E58 E62	VPWR VREF SIGRTN MAP
All other vehicles	170 Pin	B35, B36 B40, E57 B41, E58, T41 E62	VPWR VREF SIGRTN MAP

TEST PROCEDURE

DM1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0106, P0107, P0108, P0109, P012B, P012C, P012D, or P012E present?**

Yes	No
For vehicles with an EGR system module (ESM), KOEO, KOER DTCs P0107, P0108, P012C, or P012D. GO to DM2. For vehicles without an EGR system module (ESM), any DTC P0106, KOEO, KOER DTCs P0107 or P0108, GO to DM20. For vehicles with an EGR system module (ESM) continuous memory DTCs P0107, P0108, P012C, P012D or KOEO P0109, or P012E. GO to DM14.	For all others, GO to **DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

For vehicles without an EGR system module (ESM) continuous memory DTCs P0107, P0108, or KOEO P0109, GO to DM26. For vehicles with an EGR system module (ESM) DTC P0106, or P012B. GO to DM15.	

DM2 DTCS P0107 AND P0108: MONITOR THE MAP PID

- Key ON, engine running.
- Carry out the KOER self-test.
- Access the PCM and monitor the MAP PID.
- **Is the voltage between 0.05 - 4.95 V?**

Yes	No
VERIFY the PCM is at the latest calibration level. REPROGRAM if necessary. If the PCM is at the latest calibration level, the concern is not present at this time.	GO to DM3.

DM3 VERIFY HARNESS AND CONNECTOR INTEGRITY

- Key in OFF position.
- ESM connector disconnected.
- Carry out a thorough visual inspection of the connector, pins and wires attaching to the pins.
- **Are there any concerns with the wiring or the ESM connection?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DM4.

DM4 MONITOR THE MAP PID

- ESM connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the MAP PID.
- **Is the voltage between 0.05 - 4.95 V?**

Yes	No
The concern is not present at this time. CLEAR the DTCs. REPEAT the self-test.	GO to DM5.

DM5 DETERMINE THE PRESENT MAP PID VOLTAGE

- Access the PCM and monitor the MAP PID.
- **Is the voltage less than 0.05 V?**

Yes	No
GO to DM6.	GO to DM9.

DM6 KOEO AND KOER DTC P0107: CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE ESM HARNESS CONNECTOR

- ESM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ESM Connector, Harness Side	(-) ESM Connector, Harness Side
VREF - Pin 2	SIGRTN - Pin 6

- **Is the voltage between 4 - 5.5 V?**

Yes	No
GO to DM7.	refer to **PINPOINT TEST C**.

DM7 CHECK THE MAP CIRCUIT FOR A SHORT TO SIGRTN AND GND IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) ESM Connector, Harness Side	(-)
MAP - Pin 3	Ground

- Measure the resistance between:

(+) ESM Connector, Harness Side	(-) ESM Connector, Harness Side
MAP - Pin 3	SIGRTN - Pin 6

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DM8.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DM8 INDUCE THE OPPOSITE MAP SENSOR VOLTAGE TO SIMULATE A HIGH CONDITION

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A ESM Connector, Harness Side	Point B ESM Connector, Harness Side

MAP - Pin 3	VREF - Pin 2

- Key ON, engine OFF.
- Access the PCM and monitor the MAP PID.
- **Is the voltage greater than 4.6 V?**

Yes	No
INSTALL a new ESM. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DM27.

DM9 KOEO AND KOER DTC P0108: CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE ESM HARNESS CONNECTOR

- ESM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ESM Connector, Harness Side	(-) ESM Connector, Harness Side
VREF - Pin 2	SIGRTN - Pin 6

- **Is the voltage between 4 - 5.5 V?**

Yes	No
GO to DM10.	refer to **PINPOINT TEST C**.

DM10 CHECK THE MAP AND SIGRTN CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) ESM Connector, Harness Side
MAP	MAP - Pin 3
SIGRTN	SIGRTN - Pin 6

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DM11.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DM11 CHECK THE MAP CIRCUIT FOR A SHORT TO VREF IN THE HARNESS

- Measure the resistance between:

(+) ESM Connector, Harness Side	(-) ESM Connector, Harness Side
MAP - Pin 3	VREF - Pin 2

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DM12.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DM12 CHECK THE MAP CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Measure the resistance between:

(+) ESM Connector, Harness Side	(-) ESM Connector, Harness Side
MAP - Pin 3	VPWR - Pin 4

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DM13.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DM13 INDUCE THE OPPOSITE MAP SENSOR VOLTAGE TO SIMULATE A LOW CONDITION

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A ESM Connector, Harness Side	Point B ESM Connector, Harness Side
MAP - Pin 3	SIGRTN - Pin 6

- Key ON, engine OFF.
- Access the PCM and monitor the MAP PID.
- **Is the voltage less than 0.1 V?**

Yes	No
INSTALL a new ESM. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DM27.

DM14 DTCS P0107, P0108 AND P0109: CHECK THE MAP CIRCUIT(S) FOR INTERMITTENT CONCERNS

- Key ON, engine OFF.
- Access the PCM and monitor the MAP PID.
- Carry out a thorough wiggle test on the ESM harness.
- Lightly tap on the ESM and wiggle the harness connector to simulate road shock.
- **Does a sudden change in voltage occur while monitoring the PID?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DM15 DTC P0106: MAP RANGE/PERFORMANCE

NOTE: **If MAP DTC(s) P0107, P0108 or P0109 are present, diagnose those DTC(s) first. If any mass air flow (MAF) sensor related DTCs are present, diagnose those DTCs prior to diagnosing MAP DTC P0106. Disregard any DTC(s) generated as a result of this test.**

- Key in OFF position.
- ESM connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A ESM Connector, Harness Side	Point B ESM Connector, Component Side
VREF - Pin 2	VREF - Pin 2
SIGRTN - Pin 6	SIGRTN - Pin 6

- Key ON, engine running.
- Measure the voltage between:

(+) ESM Connector, Component Side	(-) Vehicle Battery
MAP - Pin 3	Negative terminal

- **Is the voltage between 1 - 2 V?**

Yes	No
GO to DM19.	GO to DM16.

DM16 CHECK THE MAP CIRCUIT FOR AN OPEN IN THE ESM HARNESS

- Key in OFF position.
- Remove the jumper wires.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) ESM Connector, Harness Side
MAP	MAP - Pin 3

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DM17.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DM17 CHECK THE MAP CIRCUIT FOR A SHORT IN THE ESM HARNESS

- Measure the resistance between:

(+) ESM Connector, Harness Side	(-) ESM Connector, Harness Side
MAP - Pin 3	SIGRTN - Pin 6
MAP - Pin 3	VREF - Pin 2
MAP - Pin 3	VPWR - Pin 4

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DM18.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DM18 KOEO AND KOER MAP VOLTAGE

NOTE: The MAP PID should change by at least 1.5 volts from key on engine off to key on engine running.

- Key in OFF position.
- ESM connector connected.
- PCM connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the MAP PID.
- Record the KOEO MAP voltage.
- Key ON, engine running.
- Access the PCM and monitor the MAP PID.
- Record the KOER MAP voltage.
- **Does the MAP PID value change?**

Yes	No
GO to DM19.	CHECK the MAP hose for freezing or obstructions. If OK, INSTALL a new ESM. REFER to the

	ENGINE EMISSION CONTROL -- E-SERIES . CLEAR the DTCs. REPEAT the self-test.

DM19 COMPARE ACTUAL MAP VOLTAGE TO MAP PID VOLTAGE

- Key in OFF position.
- ESM connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A ESM Connector, Harness Side	Point B ESM Connector, Component Side
VREF - Pin 2	VREF - Pin 2
SIGRTN - Pin 6	SIGRTN - Pin 6
MAP - Pin 3	MAP - Pin 3

- Measure the voltage between:

(+) ESM Connector, Harness Side	(-)
MAP - Pin 3	Ground

- Record the actual MAP voltage values at key on engine off, idle, 1,000 and 2,000 RPM.
- Access the PCM and monitor the MAP PID.
- Record the MAP PID voltage values at key on engine off, idle, 1,000 and 2,000 RPM.
- **Does the MAP PID voltage stay within 0.5 volt of the actual MAP voltage?**

Yes	No
The concern is not present at this time. CLEAR the DTCs. REPEAT the self-test.	CARRY OUT a visual inspection. CHECK for loose connections, and damaged or corroded pins. WIGGLE the harness, attempting to RECREATE the concern. CLEAR the DTCs. REPEAT the self-test.

DM20 KOEO AND KOER DTCS P0106, P0107 AND P0108: CHECK THE VOLTAGE BETWEEN VREF AND SIGRTN AT THE MAP SENSOR

- MAP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MAP Sensor Connector, Harness Side	(-) MAP Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No

GO to DM22.	GO to DM21.

DM21 CHECK FOR VREF VOLTAGE AT THE SENSOR

- Measure the voltage between:

(+) MAP Sensor Connector, Harness Side	(-) Vehicle Battery
VREF	Negative terminal

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
REPAIR the open SIGRTN circuit. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST C**.

DM22 CHECK MAP SIGNAL VOLTAGE AT THE SENSOR

- Measure the voltage between:

(+) MAP Sensor Connector, Harness Side	(-) MAP Sensor Connector, Harness Side
MAP	SIGRTN

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to DM24.	GO to DM23.

DM23 CHECK THE MAP CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) MAP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
MAP	MAP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DM24.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DM24 CHECK THE MAP CIRCUIT FOR A SHORT TO VOLTAGE OR SIGRTN IN THE HARNESS

- Key in OFF position.

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
MAP	VREF
MAP	SIGRTN
MAP	VPWR

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DM25.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DM25 INDUCE THE OPPOSITE SIGNAL

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A MAP Sensor Connector, Harness Side	Point B MAP Sensor Connector, Harness Side
MAP	SIGRTN

- Access the PCM and monitor the MAP PID.
- **Is the voltage less than 0.1 V?**

Yes	No
INSTALL a new MAP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DM27.

DM26 DTCS P0107, P0108 AND P0109: CHECK THE MAP CIRCUIT(S) FOR INTERMITTENT CONCERNS

- Key ON, engine OFF.
- Access the PCM and monitor the MAP PID.
- Carry out a thorough wiggle test on the MAP harness.
- Lightly tap on the MAP and wiggle the harness connector to simulate road shock.
- **Does a sudden change in voltage occur while monitoring the PID?**

Yes	No
GO to DM20.	Unable to duplicate or identify the concern at this time.

	refer to **PINPOINT TEST Z**.

DM27 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DP: OUTPUT SHAFT SPEED (OSS) SENSOR/VEHICLE SPEED SENSOR (VSS)/TRANSFER CASE SPEED SENSOR (TCSS)

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- OSS/VSS/TCSS (7F293/7M101/7H103)
- harness circuits: OSS/VSS, TCSS, and SIGRTN
- powertrain control module (PCM) (12A650)

TEST PROCEDURE

DP1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

NOTE: **For vehicles with automatic transmission and output shaft speed (OSS) sensor DTCs, refer to the DIAGNOSTIC METHODS -- GASOLINE ENGINES .**

- **Are DTCs P0500, P0503, P0720, P0721, P0722, P0723, P1500, P1501, P1502 or P1900 present?**

Yes	No
For DTCs P0500, P0503, P1500, P1501 or P1502, with manual shift transfer case, GO to DP16. For DTCs P0500, P0720, P0721, P0722, P0723, P1502 or P1900, with a manual transmission or an electronic shift transfer case, GO to DP2. For DTCs P0503 or P1500, with a manual transmission or an electronic shift transfer case, GO to DP13. For DTC P1501, with a manual transmission or an electronic shift transfer case, GO to DP12.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DP2 DTCS P0500, P0720, P0721, P0722, P0723, P1502 AND P1900: VERIFY THE DRIVE CYCLE

- Access the PCM and monitor the OSS PID.
- Access the PCM and monitor the VSS PID.
- Drive the vehicle.
- Monitor the PID in all transmission gear ranges while increasing and decreasing the speed.
- **Does the PID reading increase and decrease with engine and vehicle speed?**

Yes	No
GO to DP3.	GO to DP4.

DP3 VISUAL INSPECTION

- OSS/VSS connector disconnected.
- Inspect the OSS/VSS harness for damage.
- Inspect the OSS/VSS vehicle harness connector for damage and proper seating.
- If possible, carry out a wiggle test.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

DP4 VERIFY THE TYPE OF OSS/VSS SENSOR

NOTE: The variable reluctance (VR) sensors have 2-wire connectors, Hall-effect sensors have 3-wire connectors.

- Key in OFF position.
- Inspect for a Hall-effect or a VR type of OSS/VSS sensor.
- **Is this a Hall-effect type OSS/VSS sensor?**

Yes	No
GO to DP5.	GO to DP7.

DP5 CHECK VOLTAGE TO THE OSS/VSS SENSOR

- Key in OFF position.
- OSS/VSS connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) OSS/VSS Connector, Harness Side	(-) Vehicle Battery
VPWR	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to DP6.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DP6 CHECK THE VPWR GROUND TO THE OSS/VSS SENSOR

- Key in OFF position.
- Measure the resistance between:

(+) OSS/VSS Connector, Harness Side	(-) Vehicle Battery
PWRGND	Negative terminal

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DP7.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DP7 CHECK THE OSS/VSS CIRCUIT FOR A SHORT TO VREF AND VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- OSS/VSS connector disconnected.
- Measure the voltage between:

(+) OSS/VSS Connector, Harness Side	(-) Vehicle Battery
OSS/VSS	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to DP8.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DP8 CHECK THE OSS/VSS CIRCUIT(S) FOR AN OPEN IN THE HARNESS

NOTE: Hall-effect sensors are not equipped with a SIGRTN circuit. Disregard the SIGRTN measurement.

- Key in OFF position.
- PCM connector disconnected.
- OSS/VSS connector disconnected.

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) OSS/VSS Connector, Harness Side
OSS/VSS	OSS/VSS
SIGRTN	SIGRTN
PWRGND	PWRGND

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DP9.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DP9 CHECK THE OSS/VSS CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) OSS/VSS Connector, Harness Side	(-) OSS/VSS Connector, Harness Side
OSS/VSS	PWRGND

- **Is the resistance greater than 10K ohms?**

Yes	No
For Hall-effect sensors, GO to DP10. For VR sensors, GO to DP11.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DP10 CHECK THE OSS/VSS SIGNAL OUTPUT TO THE PCM, HALL-EFFECT TYPE SENSOR

NOTE: The opposite wheel must be held stationary.

- PCM connector disconnected.
- Raise the vehicle to allow for the rotation of the front drive wheels.
- Key ON, engine OFF.
- Transmission gear selector in NEUTRAL.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
OSS/VSS	PWRGND

- The voltage should rise above 5 volts and fall below 1 volt in a regular cycle. Observe several cycles.
- **Does the OSS/VSS output voltage rise and fall as specified?**

Yes	No
GO to DP22.	REMOVE the OSS/VSS sensor and inspect the target wheel. REPAIR as necessary. If OK, INSTALL a new OSS/VSS sensor. REFER to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DP11 CHECK THE RESISTANCE OF THE OSS/VSS SENSOR

- Measure the resistance between:

(+) OSS/VSS Connector, Component Side	(-) OSS/VSS Connector, Component Side
OSS/VSS	SIGRTN

- **Is the resistance between 170 - 270 ohms (VSS) or 400 - 1.25K ohms (OSS)?**

Yes	No
GO to DP22.	REMOVE the OSS/VSS sensor and inspect the target wheel. REPAIR as necessary. If OK, INSTALL a new OSS/VSS sensor. REFER to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DP12 KOER DTC P1501: CHECK THE VSS PID FOR AN INPUT SIGNAL

- Key ON, engine running.
- Access the PCM and monitor the VSS PID.
- Observe the VSS input to the PCM.
- Increase the engine speed, not greater than 2,000 RPM, several times while observing the VSS PID.
- **Is the reading on the PID less than 5 km/h (3 mph)?**

Yes	No
Unable to duplicate or identify the concern at this time. REFER to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** for possible causes and additional DTC description information. If DTC P1501 still exists, refer to **PINPOINT TEST Z**.	GO to DP15.

DP13 DTCS P0503 AND P1500: INSPECT THE VSS AND THE CIRCUIT FOR AN INTERMITTENT

- Visually inspect the VSS and harness circuits for any potential failures.
- Use the following check list for reference:
  - loose wires/connectors
  - pushed out connector pins

  - damaged wiring harness insulation
  - incorrect harness routing
  - incorrect VSS mounting
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DP14.

DP14 CHECK THE PCM VSS PID FOR AN INPUT SIGNAL

NOTE: For scan tools which have a data record feature, record the data for future playback to help identify any variations.

- Access the PCM and monitor the VSS PID.
- Drive the vehicle at several steady state speeds above and below 50 km/h (30 mph).
- **Are there any indicators of a noisy or intermittent signal with the VSS PID?**

Yes	No
GO to DP15.	Unable to duplicate or identify the concern at this time. REPAIR any other DTCs. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.

DP15 CHECK THE VSS HARNESS ROUTING

NOTE: Refer to Pinpoint Test Schematic and Connectors at the beginning of this pinpoint test.

- Check the VSS harness routing:
  - Verify the harness is not routed adjacent to any high current wires such as ignition wires or generator wiring.
  - Verify the VSS harness is shielded and grounded, if applicable.
- Measure the resistance of the VSS harness.
- **Is a concern present?**

Yes	No
REPAIR as necessary.	Unable to duplicate or identify the concern at this time. REFER to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** for possible causes and additional DTC description information. refer to **PINPOINT TEST Z**.

DP16 DTCS P0500, P0503, P1500, P1501 AND P1502: VISUAL INSPECTION OF TCSS

NOTE: **The TCSS provides the rotational speed of the output shaft of the transfer case.**

The PCM uses this information to control the powertrain behavior and on some applications it is used as the source for the vehicle speed information.

- TCSS connector disconnected.
- Inspect the TCSS vehicle harness connector for damage and proper seating.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DP17.

DP17 CHECK THE RESISTANCE OF THE TCSS

- Measure the resistance between:

(+) TCSS Connector, Component Side	(-) TCSS Connector, Component Side
SIGRTN - Pin 1	TCSS - Pin 2

- **Is the resistance between 1K - 1.25K ohms?**

Yes	No
GO to DP18.	INSTALL a new TCSS. REFER to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DP18 CHECK THE TCSS SENSOR OUTPUT

NOTE: **The opposite wheel must be held stationary.**

- With the vehicle in NEUTRAL and the parking brake off, position it on a hoist. Refer to the **JACKING AND LIFTING -- E-SERIES** for the locations of the lifting points.
- Raise the vehicle.
- Measure the frequency between:

(+) TCSS Connector, Component Side	(-) TCSS Connector, Component Side
SIGRTN - Pin 1	TCSS - Pin 2

- Monitor the TCSS signal while rotating the driven wheel as fast as possible.
- **Does the frequency reading increase and decrease with the wheel speed?**

Yes	No
GO to DP19.	REMOVE the TCSS and inspect the target wheel. REPAIR as necessary. If OK, INSTALL a new TCSS sensor. REFER to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DP19 CHECK THE TCSS CIRCUIT(S) FOR A SHORT TO GROUND AND VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- TCSS connector disconnected.
- Measure the voltage between:

(+) TCSS Connector, Harness Side	(-)
TCSS - Pin 2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to DP20.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DP20 CHECK THE CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) TCSS Connector, Harness Side
TCSS	TCSS - Pin 2
SIGRTN	SIGRTN - Pin 1

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DP21.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DP21 CHECK THE HARNESS FOR A SHORT TO GROUND

- Measure the resistance between:

(+) TCSS Connector, Harness Side	(-) TCSS Connector, Harness Side
SIGRTN - Pin 1	TCSS - Pin 2

- Measure the resistance between:

(+) TCSS Connector, Harness Side	(-)
TCSS - Pin 2	Ground

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DP22.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DP22 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DR: CAMSHAFT POSITION (CMP) SENSOR

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- camshaft position (CMP) sensor (6B288)
- harness circuits: CMP, CMP2, SIGRTN, VBPWR, VRSRTN, and VRSRTN2
- powertrain control module (PCM) (12A650)

Fusion 2.3L, Milan 2.3L	140 Pin	E58 E45	SIGRTN CMP
All other vehicles	170 Pin	E58 E45	SIGRTN CMP

TEST PROCEDURE

DR1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0340, P0344, P0345, or P0349 present?**

Yes	No
For DTCs P0340, P0344, P0345 or P0349, GO to DR2.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DR2 CONTINUOUS MEMORY DTCS P0340, P0344, P0345 AND P0349: CHECK IF THE ENGINE STARTS

- Attempt to start the engine.
- **Does the engine start?**

Yes	No
GO to DR3.	RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.

DR3 CLEAR AND ATTEMPT TO RETRIEVE THE DTC

NOTE: **If DTCs P0340, P0344, P0345, or P0349 are present, ignition, alternator noise, RFI and CKP concerns should be considered.**

NOTE: **For vehicles with variable camshaft timing (VCT), concerns with the engine oil level, oil filter, oil contamination, or the VCT system may cause camshaft positioning errors.**

- Key ON, engine OFF.
- Clear the PCM DTCs.
- Key ON, engine running.
- Increase engine speed to greater than 1,500 RPM for 10 seconds. Repeat this 3 times.
- Retrieve the continuous memory DTCs.
- **Are DTCs P0340, P0344, P0345 or P0349 present?**

Yes	No
GO to DR4.	refer to **PINPOINT TEST Z**.

DR4 CHECK THE GENERATOR FOR EXCESSIVE ELECTRICAL NOISE

NOTE: **If the generator/regulator is electrically noisy, the noise decreases when the B+ connector is disconnected.**

- PCM connector connected.
- CMP Sensor connector connected.
- Key ON, engine running.
- Monitor the generator for an audible electric noise.
- Key in OFF position.
- Generator/regulator B+ connector disconnected.
- Key ON, engine running.
- With the engine running, determine if the generator is still noisy.
- **Does the noise remain constant when the B+ connector is disconnected?**

Yes	No
For continuous memory DTCs P0340 or P0344, GO to DR5. For continuous memory DTCs P0345 or P0349, GO to DR13.	REFER to the **GENERATOR AND REGULATOR -- E-SERIES** to diagnose the generator is noisy symptom.

DR5 DETERMINE THE CMP SENSOR PHYSICAL TYPE

- Key in OFF position.
- **Is the CMP sensor a synchronizer (gear driven) type?**

Yes	No
GO to DR6.	GO to DR7.

DR6 VERIFY THE CORRECT INSTALLATION OF THE CMP SENSOR

NOTE: A CMP sensor identifies the cylinder 1 power stroke. A sensor that is improperly installed/indexed can identify the wrong cylinder as 1, produce a tip-in hesitation and generate DTC P0340.

- **Is the CMP sensor installed correctly?**

Yes	No
GO to DR7.	INSTALL the CMP sensor correctly. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** for the Camshaft Synchronizer removal and installation procedures. CLEAR the DTCs. REPEAT the self-test.

DR7 DETERMINE THE CMP SENSOR ELECTRONIC TYPE

NOTE: The variable reluctance (VR) sensors have 2-wire connectors, Hall-effect sensors have 3-wire connectors.

- **Is the CMP sensor a VR type?**

Yes	No
GO to DR8.	The CMP sensor is a Hall-effect type. GO to DR19.

DR8 CONTINUOUS MEMORY DTCS P0340 AND P0344: CHECK THE CMP SENSOR RESISTANCE

- Key in OFF position.
- CMP Sensor connector disconnected.
- Measure the resistance between:

(+) CMP Sensor Connector, Component Side	(-) CMP Sensor Connector, Component Side
CMP	SIGRTN
CMP	VRSRTN

Vehicle	Minimum Resistance (ohms)	Maximum Resistance (ohms)

Edge, MKX	586	2,033
F-150 4.6L	1,978	5,590
F-150, Mark LT	205	579
MKZ	586	2,033
Taurus, Taurus X, Sable	586	2,033
All others	250	1,000

- **Is the resistance within specification?**

Yes	No
GO to DR9.	INSTALL a new CMP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DR9 CHECK THE CMP CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CMP Sensor Connector, Harness Side	(-) Vehicle Battery
CMP	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to DR10.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DR10 CHECK THE CMP AND SIGRTN OR VRSRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) CMP Sensor Connector, Harness Side
CMP	CMP
SIGRTN	SIGRTN
VRSRTN	VRSRTN

- **Are the resistances less than 5 ohms?**

Yes	No

GO to DR11.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DR11 CHECK FOR A SHORT IN THE HARNESS BETWEEN THE PCM AND THE CMP SENSOR

- Measure the resistance between:

(+) CMP Sensor Connector, Harness Side	(-) CMP Sensor Connector, Harness Side
CMP	SIGRTN
CMP	VRSRTN

- Measure the resistance between:

(+) CMP Sensor Connector, Harness Side	(-) Vehicle Battery
CMP	Negative terminal
SIGRTN	Negative terminal
VRSRTN	Negative terminal

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DR12.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DR12 CHECK THE CMP SENSOR OUTPUT

- Key in OFF position.
- Generator/regulator B+ connector connected.
- CMP Sensor connector disconnected.
- Key ON, engine running.
- Digital multimeter (DMM) on low voltage AC scale.
- Measure the voltage between:

(+) CMP Sensor Connector, Component Side	(-) CMP Sensor Connector, Component Side
CMP	SIGRTN
CMP	VRSRTN

- Run the engine at approximately 2,500 RPM.
- **Is the voltage greater than 0.25 V?**

Yes	No
For Edge,	INSTALL a new CMP sensor. REFER to the

Expedition, Explorer 4.6L, Explorer Sport Trac 4.6L, F-150 5.4L, F-Super Duty 5.4L, Fusion, Mark LT, Milan, MKX, MKZ, Mountaineer 4.6L, Mustang 4.6L, Navigator, Sable, Taurus, and Taurus X, GO to DR25. For all others, GO to DR26.	**ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DR13 CONTINUOUS MEMORY DTCS P0345 AND P0349: CHECK THE CMP2 SENSOR RESISTANCE

- Key in OFF position.
- CMP2 Sensor connector disconnected.
- Measure the resistance between:

(+) CMP2 Sensor Connector, Component Side	(-) CMP2 Sensor Connector, Component Side
CMP2	SIGRTN
CMP2	VRSRTN
CMP2	VRSRTN2

Vehicle	Minimum Resistance (ohms)	Maximum Resistance (ohms)
Edge, MKX	586	2,033
F-150, Mark LT	205	579
MKZ	586	2,033
Taurus, Taurus X, Sable	586	2,033
All others	250	1,000

- **Is the resistance value(s) within specifications?**

Yes	No
GO to DR14.	INSTALL a new CMP2 sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** .

	CLEAR the DTCs. REPEAT the self-test.

DR14 CHECK THE CMP2 CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CMP2 Sensor Connector, Harness Side	(-) Vehicle Battery
CMP2	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to DR15.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DR15 CHECK THE CMP2 AND SIGRTN, VRSRTN, OR VRSRTN2 CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) CMP2 Sensor Connector, Harness Side
CMP2	CMP2
SIGRTN	SIGRTN
VRSRTN	VRSRTN
VRSRTN2	VRSRTN2

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DR16.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DR16 CHECK FOR A SHORT IN THE HARNESS BETWEEN THE PCM AND THE CMP2 SENSOR

- Measure the resistance between:

(+) CMP2 Sensor Connector, Harness Side	(-) CMP2 Sensor Connector, Harness Side
CMP2	SIGRTN
CMP2	VRSRTN
CMP2	VRSRTN2

- Measure the resistance between:

(+) CMP2 Sensor Connector, Harness Side	(-) Vehicle Battery
CMP2	Negative terminal
SIGRTN	Negative terminal
VRSRTN	Negative terminal
VRSRTN2	Negative terminal

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DR17.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DR17 CHECK FOR A SHORT BETWEEN THE CMP AND THE CMP2 CIRCUITS

- CMP Sensor connector disconnected.
- CMP2 Sensor connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
CMP	CMP2

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DR18.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DR18 CHECK THE CMP2 SENSOR OUTPUT

- Key in OFF position.
- Generator/regulator B+ connector connected.
- CMP2 Sensor connector disconnected.
- Key ON, engine running.
- DMM on low voltage AC scale.
- Measure the voltage between:

(+) CMP2 Sensor Connector, Component Side	(-) CMP2 Sensor Connector, Component Side
CMP2	SIGRTN
CMP2	VRSRTN
CMP2	VRSRTN2

- Run the engine at approximately 2,500 RPM.
- **Is the voltage greater than 0.25 V?**

Yes	No
For Edge, Expedition, Explorer 4.6L, Explorer Sport Trac 4.6L, F-150 5.4L, F-Super Duty 5.4L, Fusion, Mark LT, Milan, MKX, MKZ, Mountaineer 4.6L, Mustang 4.6L, Navigator, Sable, Taurus, and Taurus X, GO to DR25. For all others, GO to DR26.	INSTALL a new CMP2 sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DR19 CONTINUOUS MEMORY DTCS P0340 AND P0344: CHECK THE VOLTAGE TO THE CMP SENSOR

- CMP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CMP Sensor Connector, Harness Side	(-) Vehicle Battery
VPWR	Negative terminal
VBPWR	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to DR20.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DR20 CHECK THE PWRGND OR SIGRTN CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the voltage between:

(+) Vehicle Battery	(-) CMP Sensor Connector, Harness Side

Positive terminal	PWRGND
Positive terminal	SIGRTN

- **Is the voltage greater than 10 V?**

Yes	No
GO to DR21.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DR21 CHECK THE CMP CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CMP Sensor Connector, Harness Side	(-) Vehicle Battery
CMP	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to DR22.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DR22 CHECK FOR AN OPEN CIRCUIT BETWEEN THE PCM AND CMP SENSOR

- Key in OFF position.
- CMP Sensor connector disconnected.
- Measure the resistance between:

(+) CMP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
CMP	CMP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DR23.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DR23 CHECK THE CMP CIRCUIT FOR A SHORT TO PWRGND OR SIGRTN IN THE HARNESS

NOTE: **The measurement may be taken at the PCM or CMP connector, whichever is easier to access.**

- Measure the resistance between:

(+) CMP Sensor Connector, Harness Side	(-) CMP Sensor Connector, Harness Side
CMP	PWRGND
CMP	SIGRTN

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DR24.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DR24 CHECK THE CMP SENSOR FOR CORRECT OPERATION

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A CMP Sensor Connector, Harness Side	Point B CMP Sensor Connector, Component Side
VPWR	VPWR
VBPWR	VBPWR
SIGRTN	SIGRTN
PWRGND	PWRGND

- Key ON, engine running.
- DMM on low voltage DC scale.
- Measure the voltage between:

(+) CMP Sensor Connector, Component Side	(-) Vehicle Battery
CMP	Negative terminal

- **Does the voltage switch between LOW (less than 2 volts DC) and HIGH (greater than 8 volts DC)?**

Yes	No
GO to DR26.	INSTALL a new CMP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DR25 CHECK THE VARIABLE CAMSHAFT TIMING (VCT) SYSTEM

NOTE: Only diagnose the bank indicated by the DTC.

- Check the VCT system for correct operation.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DR26.

DR26 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DS: AIR CONDITIONING PRESSURE (ACP) TRANSDUCER SENSOR

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- ACP transducer sensor (19D594)
- harness circuits: ACP, VREF, SIGRTN
- powertrain control module (PCM) (12A650)

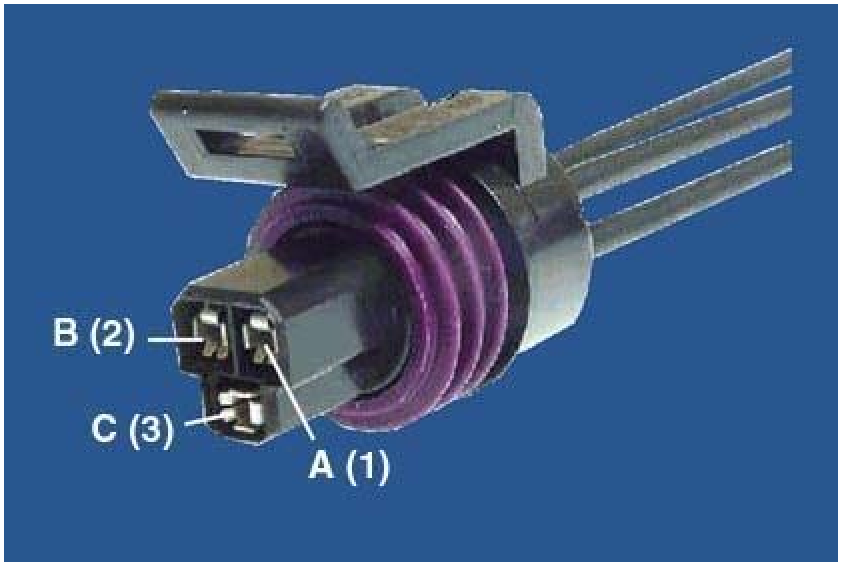

Fig. 69: Air Conditioning Pressure (ACP) Transducer Sensor Connector - A
Courtesy of FORD MOTOR CO.

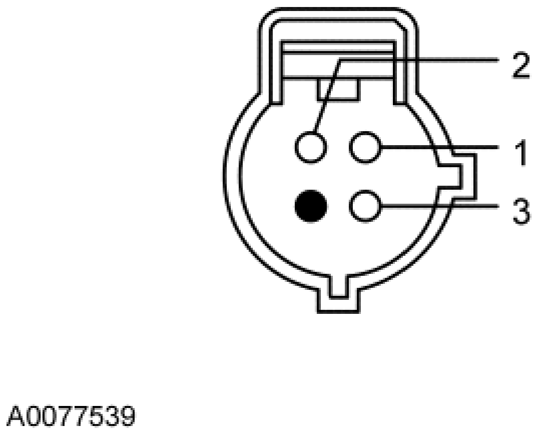

Fig. 70: Barometric Pressure (BARO) Sensor Connector
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Edge, Fusion, Milan, MKX, MKZ	A	3 1 2	ACP SIGRTN VREF
All other vehicles	B	3 1 2	ACP SIGRTN VREF

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Crown Victoria, Grand Marquis, Mustang, Town Car	170 Pin	B40, E57 B35 B47 B26	VREF VPWR PWRGND ACP
Expedition, Navigator	140 Pin	E57 B51 B67 B19	VREF VPWR PWRGND ACP
Explorer, Explorer Sport Trac	170 Pin	B40, E57 B35 B47 B18	VREF VPWR PWRGND ACP
F-150	190 Pin	B29, E57 B51 B67 B10	VREF VPWR PWRGND ACP
Focus	190 Pin	B52, B66, E63 B67 B69 B31	VREF VPWR PWRGND ACP
Fusion, Milan, MKZ	140 Pin	B33, E57 B51 B67 B63	VREF VPWR PWRGND ACP
All other vehicles	190 Pin	B29, B64 B51 B67 B37	VREF VPWR PWRGND ACP

TEST PROCEDURE

DS1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0532, P0533, P1461, P1462, or P1463 present?**

Yes	No
For DTC P0533, P1461, GO to DS2. For DTC P0532, P1462, GO to DS8. For DTC P1463, GO to DS17.	For symptoms without DTCs, GO to DS19. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DS2 DTC P0533, P1461: CHECK THE ACP PID

- Key ON, engine OFF.
- Access the PCM and monitor the ACP_PRESS PID.

- **Is the voltage less than 4.9 V?**

Yes	No
The ACP transducer sensor voltage is now below maximum. To determine if an intermittent condition exists, GO to DS16.	GO to DS3.

DS3 CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE ACP TRANSDUCER SENSOR VEHICLE HARNESS CONNECTOR

- Air Conditioning Pressure (ACP) Transducer Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 6 V?**

Yes	No
GO to DS4.	refer to **PINPOINT TEST C**.

DS4 CHECK THE ACP CIRCUIT FOR A SHORT TO VREF

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side
ACP	VREF

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DS5.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DS5 CHECK THE ACP CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-)
ACP	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to DS6.	REPAIR the short circuit to PWR. CLEAR the DTCs. REPEAT the self-test.

DS6 CHECK FOR AN OPEN ACP CIRCUIT IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
ACP	ACP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DS7.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DS7 CHECK THE PCM

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	Point B Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side
ACP	SIGRTN

- Key ON, engine OFF.
- Access the PCM and monitor the ACP_PRESS PID.
- **Is the voltage less than 4.9 V?**

Yes	No
INSTALL a new Air Conditioning Pressure (ACP) Transducer Sensor. CLEAR the DTCs. REPEAT the self-test.	GO to DS23.

DS8 DTC P0532, P1462: CHECK THE ACP PID

- Key ON, engine OFF.

- Access the PCM and monitor the ACP_PRESS PID.
- **Is the voltage greater than 0.15 V?**

Yes	No
The ACP transducer sensor voltage is now above the minimum. To determine if an intermittent condition exists, GO to DS16.	GO to DS9.

DS9 CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE ACP TRANSDUCER SENSOR VEHICLE HARNESS CONNECTOR

- Air Conditioning Pressure (ACP) Transducer Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 6 V?**

Yes	No
GO to DS10.	refer to **PINPOINT TEST C**.

DS10 SIMULATE AN OPPOSITE SIGNAL TO THE PCM

- Key in OFF position.
- Connect a 5 amp fused jumper wire between the following:

Point A Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	Point B Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side
VREF	ACP

- Key ON, engine OFF.
- Access the PCM and monitor the ACP_PRESS PID.
- **Is the voltage greater than 4 V?**

Yes	No
INSTALL a new Air Conditioning Pressure (ACP) Transducer Sensor. CLEAR the DTCs. REPEAT the self-test.	GO to DS11.

DS11 CHECK THE ACP CIRCUIT FOR A SHORT TO GND

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-)
ACP	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DS12.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DS12 CHECK THE ACP CIRCUIT FOR A SHORT TO SIGRTN

- Measure the resistance between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side
ACP	SIGRTN

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DS13.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DS13 CHECK THE ACP CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
ACP	ACP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DS14.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DS14 CHECK FOR THE A/C CLUTCH TO ENGAGE

- PCM connector connected.
- Air Conditioning Pressure (ACP) Transducer Sensor connector connected.

- Key ON, engine running.
- While listening for the A/C clutch to engage, turn the A/C on. Repeat if necessary.
- **Does the A/C engage when the A/C is turned on?**

Yes	No
GO to DS23.	GO to DS15.

DS15 VERIFY THE A/C SYSTEM FUNCTION, INCLUDING THE REFRIGERANT CHARGE

- Restore the vehicle.
- Verify the A/C system function, including the refrigerant charge. Refer to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** .
- **Does the A/C system have the correct refrigerant charge and if so does the A/C system function correctly?**

Yes	No
GO to DS23.	REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is inoperative/does not operate correctly symptom.

DS16 CHECK THE ACP CIRCUIT FOR AN INTERMITTENT CONCERN

NOTE: A concern is indicated by a sudden change in voltage.

- Key ON, engine OFF.
- Access the PCM and monitor the ACP PID.
- Observe the ACP PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the ACP, SIGRTN, and VREF wires between the ACP sensor and PCM
  - Lightly tap on the ACP transducer sensor to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DS17 DTC P1463: VERIFY THE A/C CLUTCH CAN DISENGAGE

- Turn the A/C and defroster OFF.
- Key ON, engine running.
- Verify the A/C clutch can disengage.

- **Is the A/C clutch disengaged?**

Yes	No
GO to DS18.	REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is always on symptom.

DS18 CHECK FOR VOLTAGE AND GROUND TO THE A/C CLUTCH USING A NON-POWERED TEST LAMP

NOTE: If voltage and ground to the A/C clutch have already been checked or the A/C clutch can be heard clicking on when the A/C is turned on, go to the question at the end of this test step.

- Key in OFF position.
- A/CCS Switch connector disconnected.
- Connect a jumper wire in the A/C low pressure cycling switch harness connector to complete the circuit.
- A/CC Assembly connector disconnected.
- Connect a non-powered test lamp between the voltage pin and ground pin at the A/C clutch harness connector.
- Key ON, engine running.
- Turn the A/C on, and wait 15 seconds.
- Monitor the test lamp.
- Connect the A/C clutch and A/C cycling switch when done testing.
- **Does the lamp illuminate, or can the A/C clutch be heard clicking on?**

Yes	No
GO to DS19.	REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is inoperative/does not operate correctly symptom.

DS19 DETERMINE IF A SUFFICIENT A/C PRESSURE CHANGE CAN BE DETECTED BY THE ACP PID

- Key ON, engine running.
- Turn the A/C and defroster OFF.
- Access the PCM and monitor the ACP PID.
- Turn the A/C and defroster OFF.
- Five seconds after A/C clutch engagement, note the voltage. If the clutch does not engage, follow

the NO answer instructions.

- **Does the PCM-ACP PID change more than 0.3 volt within 5 seconds of clutch engagement?**

Yes	No
The ACP transducer sensor and the PCM can detect a sufficient change in the A/C pressure. For symptom without DTC P1463, REFER to the **SYMPTOM CHARTS** article, Symptom Charts. For all others, REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is inoperative/does not operate correctly symptom.	GO to DS20.

DS20 CHECK THE A/C SYSTEM PRESSURE AND PRESSURE CHANGE

- Key in OFF position.
- Install an A/C system manifold gauge set and check the A/C system high pressure reading.
- Turn the A/C and defroster OFF.
- Key ON, engine running.
- Note the A/C high pressure reading.
- While monitoring the A/C system high pressure reading, turn the A/C on. Five seconds after clutch engagement, note the pressure (the pressure should increase).
- A/C and defroster OFF.
- **Does the A/C high pressure reading change more than 207 kPa (30 psi) within 5 seconds of clutch engagement?**

Yes	No
GO to DS21.	REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is inoperative/does not operate correctly symptom.

DS21 CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE ACP TRANSDUCER SENSOR VEHICLE HARNESS CONNECTOR

- Key in OFF position.
- Air Conditioning Pressure (ACP) Transducer Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 6 V?**

Yes	No
GO to DS22.	refer to **PINPOINT TEST C**.

DS22 CHECK THE ACP CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) Air Conditioning Pressure (ACP) Transducer Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
ACP	ACP

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new Air Conditioning Pressure (ACP) Transducer Sensor. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DS23 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DT: POWER STEERING PRESSURE (PSP) SENSOR

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to**

follow these instructions may result in personal injury.

This pinpoint test is intended to diagnose the following:

- PSP sensor (3K215)
- harness circuit(s): PSP, SIGRTN and VREF
- powertrain control module (PCM) (12A650)

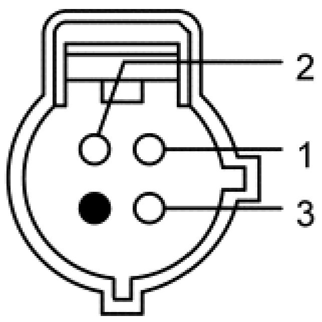

Fig. 71: Barometric Pressure (BARO) Sensor Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
3	PSP (Power Steering Pressure)
1	SIGRTN (Signal Return)
2	VREF (Reference Voltage)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Focus	190 Pin	T29	PSP
All other vehicles	190 Pin	E24	PSP

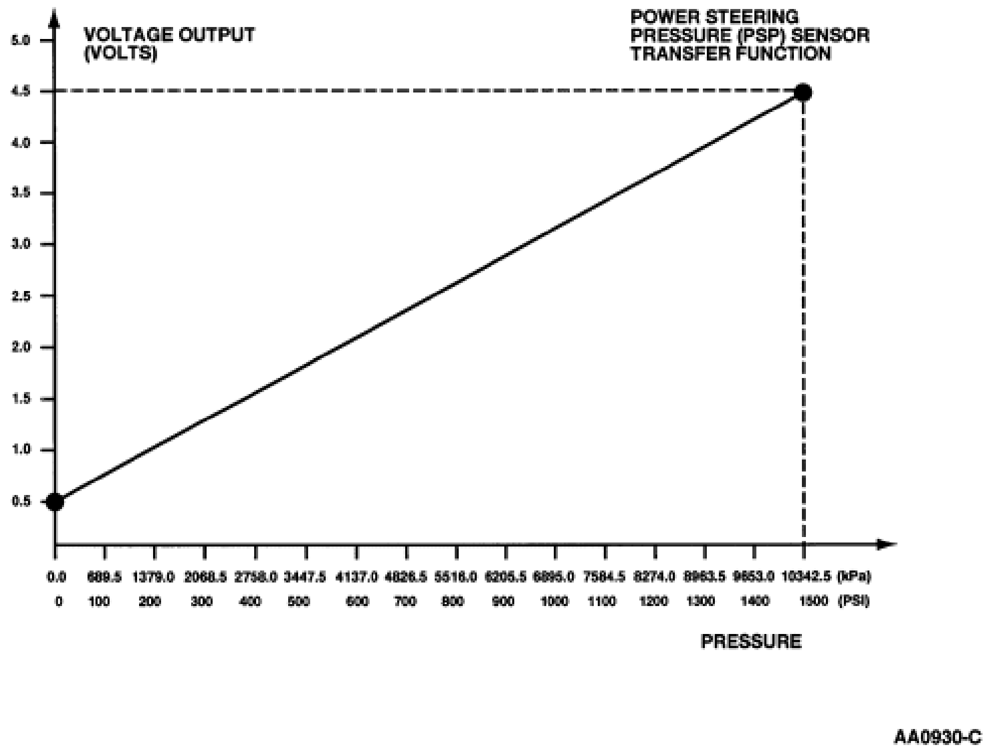

Fig. 72: Power Steering Pressure Sensor Voltage To Pressure Graph
Courtesy of FORD MOTOR CO.

TEST PROCEDURE

DT1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

- **Are DTCs P0552, P0553, or P1550 present?**

Yes	No
For KOEO and KOER DTCs P0552 or P0553, GO to DT4. For continuous memory DTCs P0552 or P0553, GO to DT8. For KOEO and KOER DTC P1550, GO to DT2.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DT2 DTC P1550: MAKE SURE THE STEERING WHEEL IS TURNED

- **Did you turn the steering wheel at least one half turn within 20 seconds of starting the KOER self-test?**

Yes	No
If there are any symptoms with the power steering system (for example, lack of power assist), REFER to the **STEERING SYSTEM - GENERAL**	REPEAT the KOER self-test.

INFORMATION -- E-SERIES to diagnosis the lack of assist or inconsistent assist of steering system. If no symptoms are present with the power steering system, GO to DT3.	

DT3 CHECK THE VOLTAGE BETWEEN VREF AND SIGRTN AT THE PSP SENSOR

- PSP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PSP Sensor Connector, Harness Side	(-) PSP Sensor Connector, Harness Side
VREF - Pin 2	SIGRTN - Pin 1

- **Is the voltage between 4 - 6 V?**

Yes	No
GO to DT4.	refer to **PINPOINT TEST C**.

DT4 CHECK THE PSP CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PSP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
PSP - Pin 3	PSP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DT5.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DT5 CHECK THE PSP CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PSP Sensor Connector, Harness Side	(-)
PSP - Pin 3	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to DT6.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DT6 CHECK THE PSP CIRCUIT FOR A SHORT TO VREF, SIGRTN AND GND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PSP Sensor Connector, Harness Side	(-) PSP Sensor Connector, Harness Side
PSP - Pin 3	VREF - Pin 2
PSP - Pin 3	SIGRTN - Pin 1

- Measure the resistance between:

(+) PSP Sensor Connector, Harness Side	(-)
PSP - Pin 3	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DT7.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DT7 CHECK THE SENSOR OPERATION

- Connect a 5 amp fused jumper wire between the following:

Point A PSP Sensor Connector, Harness Side	Point B PSP Sensor Connector, Component Side
VREF - Pin 2	VREF - Pin 2
SIGRTN - Pin 1	SIGRTN - Pin 1
PSP - Pin 3	PSP - Pin 3

- Start engine and allow to idle.
- Measure the voltage between:

(+) PSP Sensor Connector, Component Side	(-)
PSP - Pin 3	Ground

- Observe the voltage while turning the steering wheel at least 1/2 turn right and left.
- **Is the voltage reading between 0.3 and 4.7 volts and does the voltage change when the steering wheel is turned?**

Yes	No
GO to DT9.	INSTALL a new PSP sensor. CLEAR the DTCs. REPEAT the self-test.

DT8 CONTINUOUS MEMORY DTCS P0552 OR P0553: CHECK THE POWER STEERING PRESSURE SENSOR CIRCUIT(S) FOR INTERMITTENT CONCERNS

- Key ON, engine OFF.
- Access the PCM and monitor the PSP PID.
- Observe the PSP PID for an indication of a concern while carrying out the following. (a concern is indicated by a sudden change in the voltage):
  - Shake, wiggle, and bend the PSP, VREF, SIGRTN circuit(s).
  - Lightly tap on the power steering pressure sensor to simulate road shock.
- **Is a concern indicated?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DT9 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DU: INTAKE AIR TEMPERATURE 2 (IAT2) SENSOR

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- intake air temperature 2 (IAT2) sensor (12A697)

- harness circuits: IAT2 and SIGRTN
- powertrain control module (PCM) (12A650)

Voltage values calculated for VREF = 5 volts. These values can vary by 15% due to sensor and VREF variations.

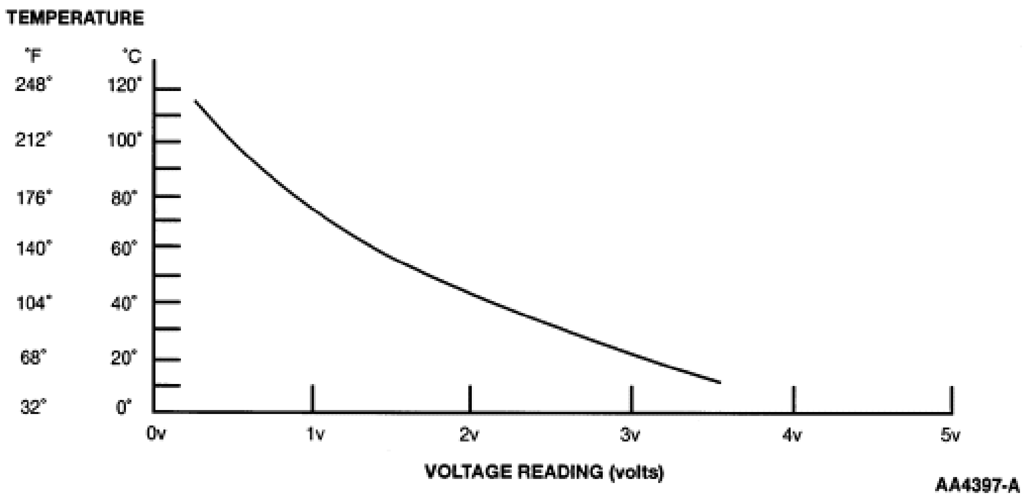

Fig. 73: Temperature Sensor Temperature To Voltage Graph
Courtesy of FORD MOTOR CO.

TEMPERATURE SENSOR VOLTAGE AND RESISTANCE SPECIFICATIONS

Temperature		Temperature Sensor Values	
°C	°F	Voltage	Resistance (K ohms)
120	248	0.28	1.18
110	230	0.36	1.55
100	212	0.47	2.07
90	194	0.61	2.80
80	176	0.80	3.84
70	158	1.05	5.37
60	140	1.37	7.70
50	122	1.77	10.97
40	104	2.23	16.15
30	86	2.74	24.27
20	68	3.26	37.30
10	50	3.73	58.75
0	32	4.14	95.85
-10	14	4.45	160.31

Connector	Pin	Circuit
170 Pin	B41, E58, T41 B40, E57 E27	SIGRTN VREF IAT2

TEST PROCEDURE

DU1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0097, P0098, P0127, P1114, or P1115 present?**

Yes	No
For DTCs P0097 or P1114, GO to DU4. For DTCs P0098 or P1115, GO to DU2. For DTC P0127, GO to DU6.	For all others, GO to **DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DU2 CHECK FOR AN OPPOSITE SIGNAL TO THE PCM

- The DTC indicates the sensor signal is greater than the self-test maximum.
- IAT2 Sensor connector disconnected.
- Key ON, engine OFF.
- Connect a 5 amp fused jumper wire between the following:

Point A IAT2 Sensor Connector, Harness	

Side	Point B IAT2 Sensor Connector, Harness Side
IAT2 - Pin 1	SIGRTN - Pin 2

- Access the PCM and monitor the IAT2 PID.
- **Is the voltage less than 0.2 V?**

Yes	No
INSTALL a new IAT2 sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DU3.

DU3 CHECK THE SENSOR SIGNAL FOR A SHORT TO VREF

- Key in OFF position.
- Remove the jumper wire(s).
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
IAT2 - Pin E27	VREF - Pin B40, E57

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DU10.	REPAIR the short circuit to VREF. CLEAR the DTCs. REPEAT the self-test.

DU4 DTC P1114: SIMULATE AN OPPOSITE SIGNAL TO THE PCM

- The DTC indicates the sensor signal is less than the self-test minimum.
- IAT2 Sensor connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the IAT2 PID.
- **Is the voltage greater than 4.2 V?**

Yes	No
INSTALL a new IAT2 sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DU5.

DU5 CHECK THE SENSOR SIGNAL FOR A SHORT TO GROUND

- Key in OFF position.

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
IAT2 - Pin E27	SIGRTN - Pin B41, E58, T41

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) 12 Volt Vehicle Battery
IAT2 - Pin E27	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DU10.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DU6 DTC P0127: CHECK CHARGE AIR COOLER PUMP (CAC) OPERATION

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- **Does the CAC pump run?**

Yes	No
GO to DU7.	DIAGNOSE the charge air cooler (CAC) pump. GO to KP9.

DU7 CHECK THE CHARGE AIR COOLER (CAC) SYSTEM

- Check the CAC system for low fluid level, cracked, blocked or misrouted coolant lines, cracked or blocked heat exchanger.
- **Is a concern present?**

Yes	No
REFER to the **ENGINE COOLING -- E-SERIES** , Supercharger Cooling to diagnose a loss of coolant. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DU8.

DU8 SIMULATE THE HIGH IAT2 SIGNAL TO THE PCM

- Key ON, engine OFF.
- Access the PCM and monitor the IAT2 PID.
- Observe the PID while disconnecting the IAT2 sensor.
- **Is the voltage greater than 4.2 V?**

Yes	No
GO to DU9.	GO to DU10.

DU9 SIMULATE THE LOW IAT2 SIGNAL TO THE PCM

- Key in OFF position.
- IAT2 Sensor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A IAT2 Sensor Connector, Harness Side	Point B IAT2 Sensor Connector, Harness Side
IAT2 - Pin 1	SIGRTN - Pin 2

- Key ON, engine OFF.
- Access the PCM and monitor the IAT2 PID.
- **Is the voltage less than 0.2 V?**

Yes	No
CONNECT the sensor and GO to the **REFERENCE VALUES** article, Reference Values. COMPARE the IAT2 PID to reference values under different road test conditions. If the sensor is not in range, INSTALL a new IAT2 sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DU10.

DU10 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DV: THROTTLE BODY ASSEMBLY ELECTRONIC THROTTLE CONTROL (ETC)

INTRODUCTION

WARNING: **Substantial opening and closing torque is applied by this system. To prevent injury, be careful to keep fingers away from throttle mechanism when actuated. Failure to follow these instructions may result in personal injury.**

NOTE: The voltage of the TP2 circuit and PID reaches a limit of approximately 4.5 volts at approximately 45 degrees of throttle angle.

This pinpoint test is intended to diagnose the following:

- electronic throttle body (ETB) (9F991)
- electronic throttle body throttle position sensor (ETBTPS) (9E928)
- harness circuits: ETCRTN, ETCREF, TP1, TP2, TACM+, and TACM-
- powertrain control module (PCM) (12A650)

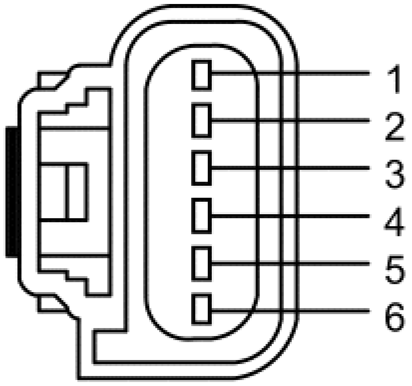

Fig. 75: Electronic Throttle Body Throttle Position Sensor (ETBTPS) Connector - A
Courtesy of FORD MOTOR CO.

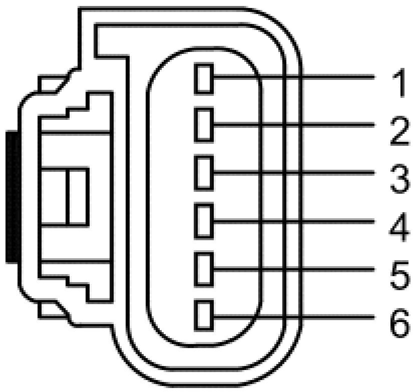

Fig. 76: Electronic Throttle Body Throttle Position Sensor (ETBTPS) Connector - B

TEST PROCEDURE

DV1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

NOTE: Diagnose and repair ETBTPS circuit DTCs before addressing DTC P0068.

- **Are DTCs P0068, P0121, P0122, P0123, P0221, P0222, P0223, P1124, P2100, P2101, P2107, P2111, P2112, or P2135 present?**

Yes	No
For DTC P0068, GO to DV12. For DTCs P0121, P0122, P0123, P0221, P0222, P0223, P2111, or P2112, GO to DV3. For DTC P1124, GO to DV2. For DTC P2100, GO to DV19. For DTC P2101, GO to DV27. For DTC P2107, GO to DV18. For Fusion and Milan with DTC P2135, GO to DV6. For all others with DTC P2135, GO to DV7.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DV2 DTC P1124: REPEAT THE KOEO OR KOER SELF-TEST

NOTE: Make sure the accelerator pedal is not applied during the KOEO and KOER self-tests.

- Key ON, engine OFF.
- Carry out the self-test.
- **Are any DTCs present other than P1124?**

Yes	No
DISREGARD the current diagnostic trouble code	GO to DV3.

(DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	

DV3 CHECK THE THROTTLE POSITION (TP) OPEN AND CLOSED VOLTAGES

NOTE: Certain failure mode effects management (FMEM) operating strategies maintain limited vehicle function in the event of a PCM, harness, or component concern and may prevent the throttle plate from opening. If the throttle plate does not open, follow the NO answer.

- Key ON, engine OFF.
- Access the PCM and monitor the TP1 and TP2 PIDs.
- Press the accelerator pedal to the floor and release.

ELECTRONIC THROTTLE CONTROL THROTTLE POSITION SENSOR SIGNAL VOLTAGES

Accelerator Pedal Position	TP1	TP2
Pedal fully released	3.7 - 4.7	0.3 - 1.9
Pedal fully applied	0.7 - 2.9	4.1 - 4.7

- **Are both PIDs within the chart ranges?**

Yes	No
For DTCs P2111 or P2112, GO to DV4. For all others, GO to DV17.	GO to DV4.

DV4 CHECK FOR OBSTRUCTION OF THE THROTTLE BODY

WARNING: **Substantial opening and closing torque is applied by this system. To prevent injury, be careful to keep fingers away from throttle mechanism when actuated. Failure to follow these instructions may result in personal injury.**

- Key in OFF position.
- Remove the inlet tube from the throttle body.
- Visually inspect for throttle plate obstructions or engine deposits.
- Slowly, push the throttle plate to wide open and release.
- **Does the throttle plate move freely to wide open and back?**

Yes	No
For continuous memory DTCs P0121, P0122, P0123, P0221, P0222, or P0223 alone or together,	ISOLATE and REPAIR the obstruction. CLEAR the DTCs. REPEAT the self-test.

GO to DV5. For DTCs P2111, P2112 or continuous memory DTCs P2100, P2101, or P2107 alone or together, GO to DV19. For Fusion and Milan with all other DTCs, GO to DV6. For all others, GO to DV7.	

DV5 CHECK THE VREF VOLTAGE TO TP

- ETBTPS connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ETBTPS Connector, Harness Side	(-) ETBTPS Connector, Harness Side
ETCREF	ETCRTN

- **Is the voltage between 4 - 6 V?**

Yes	No
For Fusion and Milan, GO to DV6. For all others, GO to DV7.	refer to **PINPOINT TEST C**.

DV6 FUSION, MILAN: CHECK THE RESISTANCE OF THE ETBTPS

NOTE: Do not move the throttle plate during the resistance measurement. Measure the sensor resistance with the throttle plate at the default position.

- Key in OFF position.
- ETBTPS connector disconnected.
- For Fusion 2.3L and Milan 2.3L, measure the resistance between:

(+) ETBTPS Connector, Component Side	(-) ETBTPS Connector, Component Side	Minimum Resistance (ohms)	Maximum Resistance (ohms)
ETCREF	ETCRTN	2,000	4,000

- For Fusion 3.0L and Milan 3.0L, measure the resistance between:

(+) ETBTPS Connector, Component Side	(-) ETBTPS Connector, Component Side	Minimum Resistance (ohms)	Maximum Resistance (ohms)
TP1	ETCREF	380	987

TP1	ETCRTN	665	1,890
TP2	ETCREF	608	1,932
TP2	ETCRTN	390	1,187
ETCREF	ETCRTN	475	1,365

- **Are all the resistances within specifications?**

Yes	No
GO to DV8.	INSTALL a new ETB. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** to INSTALL a new throttle body. CLEAR the DTCs. REPEAT the self-test.

DV7 ALL OTHERS: CHECK THE RESISTANCE OF THE ETBTPS

NOTE: **Do not move the throttle plate during the resistance measurement. Measure the sensor resistance with the throttle plate at the default position.**

- ETBTPS connector disconnected.
- Measure the resistance between:

(+) ETBTPS Connector, Component Side	(-) ETBTPS Connector, Component Side	Minimum Resistance (ohms)	Maximum Resistance (ohms)
TP1	ETCREF	700	1,800
TP1	ETCRTN	1,300	2,800
TP2	ETCREF	1,000	2,400
TP2	ETCRTN	500	1,500
ETCREF	ETCRTN	700	2,100

- **Are all the resistances within the specifications?**

Yes	No
GO to DV8.	For E-Series 4.6L, Edge, F-150 4.2L, F-150 4.6L, Focus, MKX, MKZ, Sable, Taurus, and

	Taurus X, INSTALL a new ETB. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** to INSTALL a new throttle body. CLEAR the DTCs. REPEAT the self-test. For all others, INSTALL a new ETBTPS. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** to INSTALL a new TP sensor. CLEAR the DTCs. REPEAT the self-test.

DV8 CHECK THE TP1 AND TP2 CIRCUITS FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ETBTPS Connector, Harness Side	(-)
TP1	Ground
TP2	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to DV9.

DV9 CHECK THE TP1 AND TP2 CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) ETBTPS Connector, Harness Side	(-) PCM Connector, Harness Side
TP1	TP1
TP2	TP2

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DV10.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DV10 CHECK THE TP1 AND TP2 CIRCUITS FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) ETBTPS Connector, Harness Side	(-) Vehicle Battery
TP1	Negative terminal
TP2	Negative terminal

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DV11.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DV11 CHECK THE TP CIRCUITS FOR A SHORT TOGETHER

- Measure the resistance between:

(+) ETBTPS Connector, Harness Side	(-) ETBTPS Connector, Harness Side
TP1	TP2
TP1	ETCREF
TP1	ETCRTN
TP2	ETCREF
TP2	ETCRTN

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DV14.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DV12 DTC P0068: CHECK FOR DTCS

- Carry out the self-test.
- **Are DTCs P0121, P0122, P0123, P0221, P0222, P0223 or P2135 present?**

Yes	No
For DTCs P0121, P0122, P0123, P0221, P0222, and P0223, GO to DV3. For Fusion and Milan with DTC P2135, GO to DV6. For all others with DTC P2135, GO to DV7.	GO to DV13.

DV13 CHECK FOR INLET AIR LEAKS

- Check the air inlet system for leaks.
- Listen for air noise around the mass air flow (MAF) sensor and throttle body while the engine is running.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DV14.

DV14 CHECK FOR A TP2 SIGNAL HIGH VERSUS LOAD WHILE DRIVING THE VEHICLE

- ETBTPS connector connected.
- PCM connector connected.
- Key ON, engine running.
- Access the PCM and monitor the TP2 PID.
- Access the PCM and monitor the LOAD PID.
- Drive the vehicle while exercising the throttle and ETCTP sensor and accessing the PIDS.
- **Is the TP2 PID greater than 2.44 volts and the LOAD PID less than 30%?**

Yes	No
GO to DC5.	GO to DV15.

DV15 CHECK FOR A TP2 SIGNAL LOW VERSUS LOAD WHILE DRIVING THE VEHICLE

- Key ON, engine running.
- Access the PCM and monitor the TP2 PID.
- Access the PCM and monitor the LOAD PID.
- Drive the vehicle while exercising the throttle and ETCTP sensor and accessing the PIDS.
- **Is the TP2 PID less than 0.24 volt and the LOAD PID greater than 55%?**

Yes	No
GO to DV16.	GO to DV17.

DV16 CHECK FOR SELF-TEST DTCS

NOTE: After retrieving the continuous memory DTCs, diagnose any non-ETC related DTCs before continuing.

- Key ON, engine OFF.
- Clear the DTCs.
- Drive the vehicle while exercising the throttle.
- Retrieve the continuous memory DTCs.
- **Are any DTCs present?**

Yes	No
For continuous memory DTC P0068, CHECK the MAF sensor and connector for damage and corrosion. REPAIR as necessary.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

CLEAR the DTCs. REPEAT the self-test. For E-Series 4.6L, Edge, F-150 4.2L, F-150 4.6L, Focus, Fusion, Milan, MKX, MKZ, Sable, Taurus, and Taurus X with DTC P2135, INSTALL a new ETB. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** to INSTALL a new throttle body. CLEAR the DTCs. REPEAT the self-test. For all others with DTC P2135, INSTALL a new ETBTPS. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** to INSTALL a new TP sensor. CLEAR the DTCs. REPEAT the self-test. For all others, GO to DV17.	

DV17 CHECK THE TP CIRCUITS FOR AN INTERMITTENT CONCERN

- Access the PCM and monitor the TP1 and TP2 PIDs.
- Wiggle, shake, and bend the harness from the TP to the PCM.
- **Are the voltages between 0.49 - 4.65 V?**

Yes	No
GO to DV29.	REPAIR as necessary. If DTC P2100 or P2101 is present, GO to DV19.

DV18 DTC P2107: CHECK FOR OTHER SELF-TEST DTCS

NOTE: **The DTC P2107 may set when a failure mode effects management (FMEM) action is taken. If the FMEM DTC P2110 is present with other DTCs, diagnose the other DTCs before diagnosing the DTC P2110.**

- Key ON, engine OFF.
- Check for self-test DTCs.
- **Are any DTCs present other than P2107 and P2110?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	For DTC P2110, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** and diagnose the DTC. For DTC P2107, GO to DV23.

DV19 VISUALLY INSPECT THE ETB

NOTE: **Make sure the ETB harness connector is properly connected.**

- Key in OFF position.
- Inspect the ETB for damaged housing, harness connector, and harness.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DV20.

DV20 CHECK THE TACM FOR A SHORT OR OPEN

- ETBTACM connector disconnected.
- Measure the resistance between:

(+) ETBTACM Connector, Component Side	(-) ETBTACM Connector, Component Side
TACM+	TACM-

- **Is the resistance between 1 ohm - 900 ohms?**

Yes	No
GO to DV21.	INSTALL a new ETB. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** to INSTALL a new throttle body. CLEAR the DTCs. REPEAT the self-test.

DV21 CHECK THE TACM HARNESS FOR AN OPEN

- PCM connector disconnected.
- Measure the resistance between:

(+) ETBTACM Connector, Harness Side	(-) PCM Connector, Harness Side
TACM+	TACM+
TACM-	TACM-

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DV22.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DV22 CHECK THE TACM+ AND TACM- CIRCUITS FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) ETBTACM Connector, Harness Side	(-)
TACM+	Ground
TACM-	Ground

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DV23.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DV23 CHECK THE HARNESS FOR A SHORT TO GND, PWR, ETCREF, AND ETCRTN

- Measure the resistance between:

(+) ETBTACM Connector, Harness Side	(-) PCM Connector, Harness Side
TACM+	PWRGND
TACM+	VPWR
TACM+	ETCRTN
TACM+	ETCREF
TACM-	PWRGND
TACM-	ETCRTN
TACM-	VPWR
TACM-	ETCREF

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DV24.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DV24 CHECK FOR TACM HARNESS CIRCUITS SHORTED TOGETHER

- Measure the resistance between:

(+) ETBTACM Connector, Harness Side	(-) ETBTACM Connector, Harness Side
TACM+	TACM-

- **Is the resistance greater than 10K ohms?**

Yes	No
For DTCs P2111 or P2112, GO to DV25. For all others, GO to DV26.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DV25 CHECK FOR AN INTERMITTENT CONCERN

- ETBTACM connector connected.
- PCM connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the TP1 and TP2 PIDs.
- Wiggle, shake, and bend the harness from the TP to the PCM.
- **Are the voltages between 0.49 - 4.65 V?**

Yes	No
GO to DV26.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DV26 CHECK FOR SELF-TEST CODES

- ETBTACM connector connected.
- PCM connector connected.
- Key ON, engine OFF.
- Carry out the self-test.
- **Is DTC P2101 present?**

Yes	No
GO to DV27.	GO to DV29.

DV27 CHECK FOR PROPER TACM+ WIRING IN THE HARNESS CONNECTOR

- Key in OFF position.
- ETBTACM connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) ETBTACM Connector, Harness Side	(-) PCM Connector, Harness Side
TACM+	TACM+

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DV28.	REPAIR the open circuit. WIRE the TACM harness connector per the TACM and PCM connector diagrams. CLEAR the DTCs. REPEAT the self-test.

DV28 CHECK FOR PROPER TACM- WIRING IN THE HARNESS CONNECTOR

- Measure the resistance between:

(+) ETBTACM Connector, Harness Side	(-) PCM Connector, Harness Side
TACM-	TACM-

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DV30.	GO to DV29.

DV29 CHECK THE REPAIR THROUGH PROCEDURE

- Key ON, engine OFF.
- Record and clear the DTCs.
- Cycle the accelerator pedal to the floor and back several times.
- Check for self-test DTCs.
- **Are any ETC system related DTCs present?**

Yes	No
GO to DV30.	refer to **PINPOINT TEST Z**.

DV30 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DW: HEATED OXYGEN SENSOR (HO2S)

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

WARNING: While conducting tests on a hot engine take all safety precautions to prevent skin contact with hot engine components. Failure to follow these instructions may result in personal injury.

This pinpoint test is intended to diagnose the following:

- HO2S/O2S (9F472)
- HO2S/O2S (9G444)
- harness circuits: HO2S, HO2S Heater, VPWR, and SIGRTN
- powertrain control module (PCM) (12A650)

The pin numbering for the connector is in reference to the connector lock tab. Not all connector key combinations are shown.

TEST PROCEDURE

DW1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0040, P0041, P0053, P0054, P0055, P0059, P0060, P0132, P0133, P0135, P0138, P0139, P0141, P0144, P0147, P0152, P0153, P0155, P0158, P0159, P0161, or P1127 present?**

Yes	No
For DTCs P0040 or P0041, GO to DW2. For DTCs P0053, P0054, P0055, P0059 or P0060, GO to DW14. For DTCs P0132, P0138, P0144, P0152 or P0158, GO to DW20. For DTCs P0133 or P0153, GO to DW3. For DTCs P0135, P0139, P0141, P0147, P0155, P0159 or P0161, GO to DW9. For DTC P1127, GO to DW19.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DW2 KOER DTCS P0040 AND P0041: CROSSED SENSOR WIRES

- Key in OFF position.
- Check the vehicle repair history.
- Verify the HO2S connectors are connected to the correct engine bank.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DW3 CONTINUOUS MEMORY DTCS P0133 AND P0153: CARRY OUT THE KOER SELF-

TEST

- Engine at normal operating temperature.
- Carry out the KOER self-test.
- **Are DTCs P0040, P0041 or P1127 present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to DW4.

DW4 CHECK THE HO2S RESPONSE TEST RESULTS

- Key ON, engine OFF.
- Access the diagnostic monitoring test results for the HO2S11 and HO2S21.
- **Is the indicated value greater than the minimum threshold?**

Yes	No
CLEAR the DTCs. GO to DW3.	GO to DW5.

DW5 CHECK FOR UNMETERED AIR LEAKS

NOTE: Fuel calculations can be affected by unmetered air leaks.

- Carefully inspect the following areas for potential air leaks:
  - hoses connecting to the mass air flow (MAF) sensor assembly
  - hoses connecting to the throttle body
  - intake manifold gasket leaks
  - PCV system
  - the vacuum lines are disconnected
  - improperly seated engine oil dipstick, tube or oil fill cap
  - exhaust leaks at flanges and gaskets
- **Are any air leaks present?**

Yes	No
REPAIR the source of the air leak. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to DW6.

DW6 CHECK THE HO2S CIRCUIT CONTINUITY

NOTE: HO2S is displayed as O2S on the scan tool.

- HO2S connector disconnected.
- Check the connector (both halves) for any water contamination.
- Connect a 5 amp fused jumper wire between the following:

Point A HO2S Connector, Harness Side	Point B HO2S Connector, Harness Side
HO2S Signal	VPWR

- Key ON, engine running.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage greater than 1 V?**

Yes	No
INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CHANGE the engine oil and oil filter. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to DW7.

DW7 CHECK THE HO2S CIRCUIT(S) FOR AN OPEN IN THE HARNESS

NOTE: A vehicle hoist may be required to access the HO2S harness.

- Key in OFF position.
- Remove the jumper wire(s).
- Visually inspect the HO2S harness for exposed wiring, water contamination, corrosion, and proper assembly.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) HO2S Connector, Harness Side
HO2S Signal	HO2S Signal
SIGRTN	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DW8.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DW8 CHECK THE HO2S CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
HO2S Signal	VPWR

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DW9.	GO to DW12.

DW9 DTCS P0135, P0139, P0141, P0147, P0155, P0159 OR P0161: CHECK FOR A SOURCE OF POTENTIAL HO2S CONTAMINATION

- Investigate the following items as potential sources of HO2S contamination:
  - use of unapproved silicon sealers
  - fuel contaminated by silicon additives
  - excessive oil consumption
  - glycol leaking internally in the engine
  - lead-contaminated fuel
  - short drive cycles in cold weather
  - use of unapproved cleaning agents
- **Is a concern present?**

Yes	No
REPAIR the source of the contamination. CHANGE the engine oil and oil filter. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to DW10.

DW10 VISUALLY INSPECT THE HO2S HARNESS

- PCM connector connected.
- Visually inspect the HO2S harness for exposed wiring, water contamination, corrosion, and proper assembly.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	For DTCs P0139 or P0159, GO to DW11. For all others, GO to DW12.

DW11 CHECK THE EXHAUST SYSTEM FOR LEAKS AND MODIFICATIONS

- Check for leaks in the exhaust system.
- Visually inspect the vehicle for aftermarket accessories and performance modifications.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DW25.

DW12 CHECK THE HO2S AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

NOTE: **Verify the harness pins are in the proper location.**

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) HO2S Connector, Harness Side
HO2S Signal	HO2S Signal
SIGRTN	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DW13.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DW13 CARRY OUT THE KOEO ON DEMAND SELF-TEST

- Key ON, engine OFF.
- Carry out the KOEO self-test.
- **Are DTCs P0135, P0141, P0147, P0155 or P0161 present?**

Yes	No
GO to DW14.	GO to DW15.

DW14 DTCS P0053, P0054, P0055, P0059 AND P0060: CHECK FOR VPWR IN THE HARNESS

NOTE: **If DTCs P0053, P0054, P0055, P0059, or P0060 are present, test their related circuits individually.**

- Key in OFF position.
- HO2S connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HO2S Connector, Harness Side	(-) HO2S Connector, Harness Side
VPWR	SIGRTN

- **Is the voltage greater than 10 V?**

Yes	No
GO to DW15.	REPAIR the open circuit. CHECK the fuses. CLEAR the DTCs. REPEAT the self-test.

DW15 CHECK THE HO2S HEATER FOR SHORTS IN THE HARNESS

NOTE: **If DTCs P0053, P0054, P0055, P0059, or P0060 are present, test their related circuits individually.**

- Key in OFF position.
- HO2S connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) HO2S Connector, Harness Side	(-) Vehicle Battery
HO2S Heater	Negative terminal

- Measure the resistance between:

(+) HO2S Connector, Harness Side	(-) HO2S Connector, Harness Side
HO2S Heater	VPWR
HO2S Heater	SIGRTN
HO2S Heater	HO2S Signal

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DW16.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DW16 CHECK THE HO2S HEATER CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) HO2S Connector, Harness Side
HO2S Heater	HO2S Heater

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DW17.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DW17 CHECK THE INTERNAL RESISTANCE OF THE HO2S HEATER

- Measure the resistance between:

(+) HO2S Connector, Component Side	(-) HO2S Connector, Component Side
HO2S Heater	VPWR

- **Is the resistance between 3 - 30 ohms?**

Yes	No
GO to DW18.	INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

DW18 CHECK THE HO2S HEATER CIRCUIT FOR AN INTERNAL SHORT TO SIGRTN OR GND

- Measure the resistance between:

(+) HO2S Connector, Component Side	(-) HO2S Connector, Component Side
HO2S Heater	SIGRTN

- Measure the resistance between:

(+) HO2S Connector, Component Side	(-) Vehicle Battery
HO2S Heater	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DW25.	INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

DW19 KOER DTC P1127: EXHAUST TEMPERATURE OUT OF RANGE

NOTE: Address all other DTCs before proceeding.

- Key ON, engine running.
- Engine at normal operating temperature.
- Access the PCM and monitor the HO2S Heater PID.
- **Is the PID state ON?**

Yes	No
CARRY OUT the KOER self-test.	RUN the engine until the PID indicates ON. CARRY OUT the KOER self-test.

DW20 DTCS P0132, P0138, P0144, P0152 AND P0158: VISUALLY INSPECT THE HO2S HARNESS

NOTE: Disconnect the suspect HO2S harness connector. Only the suspect HO2S needs to be diagnosed.

- Key in OFF position.
- HO2S connector disconnected.
- Visually inspect the HO2S harness.
  - check the connector (both halves) for contamination
  - make sure the connector pins are fully seated
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DW21.

DW21 CHECK THE HO2S SIGNAL LEVEL TOO HIGH

- HO2S connector connected.
- Key ON, engine running.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage less than 1.1 V?**

Yes	No
GO to DW22.	GO to DW23.

DW22 CARRY OUT A THOROUGH WIGGLE TEST ON THE HO2S HARNESS

- Key in OFF position.

- Key ON, engine OFF.
- Access the PCM and monitor the HO2S Signal PID.
- Carry out a thorough wiggle test on the HO2S harness.
- **Does the voltage change during the wiggle test?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

DW23 CHECK THE HO2S SIGNAL FOR A SHORT TO VPWR INSIDE THE SENSOR

- Key in OFF position.
- HO2S connector disconnected.
- Key ON, engine running.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage less than 1.1 V?**

Yes	No
INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to DW24.

DW24 CHECK THE HO2S CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HO2S Connector, Harness Side	(-)
HO2S Signal	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to DW25.

DW25 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.

- Visually inspect for:
    - pushed out pins
    - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DX: ENGINE COOLANT TEMPERATURE (ECT) SENSOR

INTRODUCTION

NOTE: **Engine coolant temperature must be greater than 10°C (50°F) to pass the KOEO self-test and greater than 82°C (180°F) to pass the KOER self-test. to accomplish this, the engine must be at normal operating temperature.**

This pinpoint test is intended to diagnose the following:

- engine coolant temperature (ECT) sensor (12A648)
- harness circuits: ECT and SIGRTN
- powertrain control module (PCM) (12A650)

Voltage values calculated for VREF = 5 volts. These values can vary by 15% due to sensor and VREF variations.

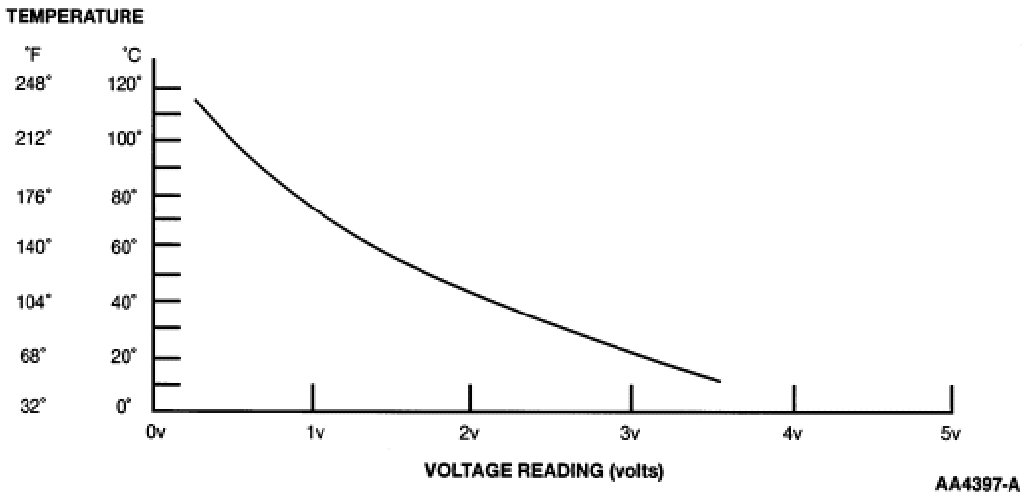

Fig. 87: Temperature Sensor Temperature To Voltage Graph
Courtesy of FORD MOTOR CO.

TEMPERATURE SENSOR VOLTAGE AND RESISTANCE SPECIFICATIONS

Temperature		Temperature Sensor Values	
°C	°F	Voltage	Resistance (K ohms)
120	248	0.28	1.18
110	230	0.36	1.55
100	212	0.47	2.07
90	194	0.61	2.80
80	176	0.80	3.84
70	158	1.05	5.37
60	140	1.37	7.70

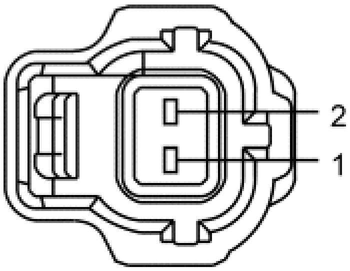

Fig. 88: Engine Coolant Temperature (ECT) Sensor Connector - B
Courtesy of FORD MOTOR CO.

Pin	Circuit
2	SIGRTN (Signal Return)
1	ECT (Engine Coolant Temperature)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Escape/Mariner	150 (50-50-50) Pin	E40 E41 E21	VREF SIGRTN ECT
Fusion, Milan	140 Pin	E57 E58 E18	VREF SIGRTN ECT
All other vehicles	170 Pin	E57 E58 E18	VREF SIGRTN ECT

TEST PROCEDURE

DX1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0116, P0117, P0118, P0119, P0125, P0128, P0217, P1116, or P1117 present?**

Yes	No
For continuous memory DTC P0116, GO to DX14. For KOEO and KOER DTC P0117, GO to DX12. For continuous memory DTCs P0117, P0118,	For all others, GO to **DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

P0119, or P1117, GO to DX16. For KOEO and KOER DTC P0118, GO to DX8. For continuous memory DTCs P0125, or P0128, GO to DX19. For DTC P0217, GO to DX21. For KOEO and KOER DTC P1116, GO to DX2.	

DX2 DTC P1116: CHECK THE COOLING SYSTEM

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

- The DTC indicates the temperature sensor is out of self-test range. The engine is not at normal operating temperature.
- Check the vehicle coolant level.
- **Is the cooling system OK?**

Yes	No
GO to DX3.	REFER to the **ENGINE COOLING -- E-SERIES** , for loss of coolant diagnosis. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DX3 CHECK IF THE VEHICLE ENGINE STARTS

- Attempt to start the engine.
- **Does the engine start and run normally?**

Yes	No
GO to DX6.	GO to DX4.

DX4 CHECK THE RESISTANCE OF THE ECT SENSOR WITH THE ENGINE OFF

NOTE: **Refer to the chart at the beginning of this test for the resistance specifications.**

- Key in OFF position.
- ECT Sensor connector disconnected.
- Measure the resistance between:

(+) ECT Sensor Connector, Component Side	(-) ECT Sensor Connector, Component Side

ECT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to DX5.	INSTALL a new ECT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DX5 CHECK THE CIRCUIT FROM THE MODULE TO THE COMPONENT

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- ECT Sensor connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the ECT PID.
- Using the data collected from the previous step, compare temperature resistance measured at the sensor to the PID temperature voltage measured at the PCM.
- **Does the measured value at the sensor agree with the measured PID voltage value at the PCM?**

Yes	No
RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	GO to DX10.

DX6 CHECK THE ECT SENSOR OPERATION

- Run the engine until the engine temperature stabilizes.
- Verify the upper radiator hose is hot and the cooling system is pressurized.
- Repeat the KOER self-test.
- **Is DTC P1116 present?**

Yes	No
GO to DX7.	The engine temperature was not stabilized. REPAIR any other DTCs as necessary.

DX7 CHECK THE RESISTANCE OF THE ECT SENSOR

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- The vehicle must be at normal operating temperature.

- Key in OFF position.
- ECT Sensor connector disconnected.
- Measure the resistance between:

(+) ECT Sensor Connector, Component Side	(-) ECT Sensor Connector, Component Side
ECT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to DX25.	INSTALL a new ECT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DX8 DTC P0118: CHECK THE ECT SIGNAL CIRCUIT

- The DTC indicates the sensor signal is greater than the self-test maximum.
- ECT Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ECT Sensor Connector, Harness Side	(-) ECT Sensor Connector, Harness Side
ECT - Pin 1	SIGRTN - Pin 2

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to DX9.	GO to DX10.

DX9 CHECK THE RESISTANCE OF THE ECT SENSOR WITH THE ENGINE OFF

NOTE: **Refer to the chart at the beginning of this test for the resistance specifications.**

- Key in OFF position.
- ECT Sensor connector disconnected.
- Measure the resistance between:

(+) ECT Sensor Connector, Component Side	(-) ECT Sensor Connector, Component Side
ECT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to DX11.	INSTALL a new ECT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DX10 CHECK THE SIGNAL AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) ECT Sensor Connector, Harness Side
ECT	ECT - Pin 1
SIGRTN	SIGRTN - Pin 2

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DX25.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DX11 CHECK THE SENSOR SIGNAL FOR A SHORT TO VREF

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
ECT	VREF

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DX25.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DX12 DTC P0117: SIMULATE AN OPPOSITE SIGNAL TO THE PCM

- The DTC indicates the sensor signal is less than the self-test minimum.
- Possible causes:
  - grounded circuit in the harness
  - incorrect harness connections
  - damaged sensor
  - damaged PCM

- ECT Sensor connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the ECT PID.
- **Is the voltage greater than 4.2 V?**

Yes	No
INSTALL a new ECT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DX13.

DX13 CHECK THE SENSOR SIGNAL FOR A SHORT TO GROUND

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
ECT	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) 12 Volt Vehicle Battery
ECT	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DX25.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DX14 DTC P0116: CHECK THE RESISTANCE OF THE ECT SENSOR WITH THE ENGINE OFF

NOTE: **Verify the engine temperature is at ambient room temperature before continuing with this test. A soak period of 6 hours may be required. Refer toDIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS for information concerning P0116.**

NOTE: **Refer to the chart at the beginning of this test for the resistance specifications.**

- Key in OFF position.
- ECT Sensor connector disconnected.
- Measure the resistance between:

(+) ECT Sensor Connector, Component Side	(-) ECT Sensor Connector, Component Side
ECT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
GO to DX15.	INSTALL a new ECT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DX15 DTC P0116: CHECK THE RESISTANCE OF THE ECT SENSOR

NOTE: **Refer to the chart at the beginning of this test for the resistance specifications.**

NOTE: **Verify the engine is at operating temperature before taking the ECT reading.**

- ECT Sensor connector connected.
- Run the engine until the engine temperature stabilizes.
- Key in OFF position.
- ECT Sensor connector disconnected.
- Measure the resistance between:

(+) ECT Sensor Connector, Component Side	(-) ECT Sensor Connector, Component Side
ECT - Pin 1	SIGRTN - Pin 2

- **Is the resistance within specification?**

Yes	No
The concern is not present at this time. CARRY OUT the OBD drive cycle to determine if fuel, HO2S, catalyst and misfire monitors can be executed. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** .	INSTALL a new ECT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DX16 DTCS P0117, P0118, P0119 OR P1117: INTERMITTENT CHECK

- Key ON, engine OFF.
- Access the PCM and monitor the ECT PID.
- While observing the PID, carry out the following:
  - Tap on the sensor to simulate road shock

- Wiggle the sensor connector
- **Is there a large change in the voltage reading?**

Yes	No
DISCONNECT and INSPECT the connector. If OK, INSTALL a new ECT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DX17.

DX17 CHECK THE ELECTRONIC ENGINE CONTROL (EEC) WIRING HARNESS

- Access the PCM and monitor the ECT PID.
- While observing the PID, wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **Is there a large change in the voltage reading?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DX18.

DX18 CHECK THE PCM AND VEHICLE HARNESS CONNECTORS

- Key in OFF position.
- PCM connector disconnected.
- ECT Sensor connector disconnected.
- **Are the connectors and terminals OK?**

Yes	No
The concern is not present at this time. DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DX19 DTCS P0125 OR P0128: CHECK THE ENGINE COOLANT LEVEL

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

- The DTC indicates the engine coolant temperature has not achieved the required engine operation temperature level, since start-up within a specified amount of time.

- Possible causes:
    - insufficient warm up time
    - leaking or stuck-open thermostat
    - low engine coolant
- Check the engine coolant level.
- **Is the engine coolant fill level correct?**

Yes	No
GO to DX20.	REFER to the **ENGINE COOLING -- E-SERIES** , for loss of coolant diagnosis. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DX20 CHECK THE SENSOR OPERATION

- Run the engine until the engine temperature stabilizes.
- Verify the radiator hoses are hot and the cooling system is pressurized.
- Access the PCM and monitor the ECT PID.
- **Is the temperature greater than 77°C (170.6°F)?**

Yes	No
The test is complete. DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	REFER to the **ENGINE COOLING -- E-SERIES** for cooling system diagnosis. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DX21 DTC P0217: INDICATES AN ENGINE OVERHEAT CONDITION

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

- Check the engine coolant level.
- **Is the engine coolant fill level correct?**

Yes	No
REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the overheating condition. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the loss of coolant. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DX22 DTC P0298: ENGINE OIL OVER TEMPERATURE CONDITION

NOTE: The engine oil temperature protection strategy in the PCM is activated. This protects the engine against mechanical damage due to overheating.

- Check for an overheating condition and base engine concerns.
- **Are there any overheating or base engine concerns?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DX23.

DX23 CHECK FOR ECT DTCS

- Carry out the self-test.
- **Are DTCs P0117, P0118, P1116 or P1117 present?**

Yes	No
DISREGARD the engine oil temperature (EOT) diagnostic trouble code (DTC) at this time. ADDRESS the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to DX24.

DX24 ROAD TEST THE VEHICLE AND MONITOR FOR ENGINE OVER TEMPERATURE

- Access the freeze frame data (if available) and record the DTC concern conditions.
- Access the PCM and monitor the ECT PID.
- Test drive the vehicle and allow the engine to reach normal operating temperature.
- Observe the ECT PID.
- **Does the engine overheat?**

Yes	No
REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the overheat symptom. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. CLEAR the DTCs. REPEAT the self-test.

DX25 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DY: ENGINE OIL TEMPERATURE (EOT) SENSOR

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- engine oil temperature (EOT) sensor (12A648)
- harness circuits: EOT and SIGRTN
- powertrain control module (PCM) (12A650)

Engine oil temperature must be greater than 10°C (50°F) to pass the KOEO self-test and greater than 66°C (150°F) to pass the KOER self-test.

Voltage values calculated for VREF = 5 volts. These values can vary by 15% due to sensor and VREF variations.

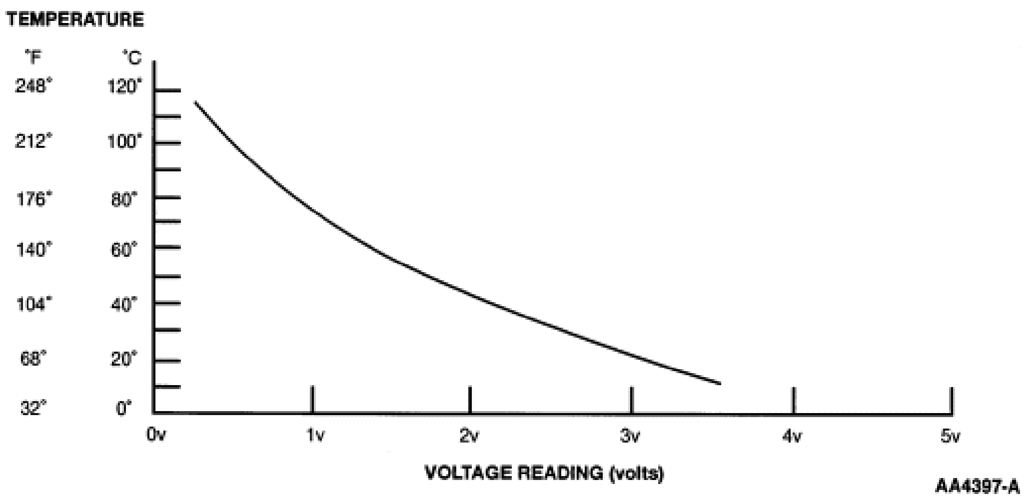

Fig. 89: Temperature Sensor Temperature To Voltage Graph
Courtesy of FORD MOTOR CO.

TEMPERATURE SENSOR VOLTAGE AND RESISTANCE SPECIFICATIONS

Temperature		Temperature Sensor Values	
°C	°F	Voltage	Resistance (K ohms)
120	248	0.28	1.18
110	230	0.36	1.55

Connector	Pin	Circuit
170 Pin	E58 B35 E57 E27	SIGRTN VPWR VREF EOT

TEST PROCEDURE

DY1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0196, P0197, P0198, P0298, or P1184 present?**

Yes	No
For DTCs P0196 or P1184, GO to DY2. For DTCs P0197 or P0198, GO to DY3. For continuous memory DTC P0298, GO to DY14.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DY2 DTCS P0196 OR P1184: CHECK THE EOT SENSOR OPERATION

NOTE: Before continuing with this pinpoint test, verify the engine oil condition and level are within specification.

- Run the engine until the engine temperature stabilizes.
- Verify the radiator hoses are hot and the cooling system is pressurized.
- Carry out the self-test.
- **Are DTCs P0196 or P1184 present?**

Yes	No
GO to DY3.	The engine temperature was not stabilized. REPAIR any other DTCs as necessary.

DY3 DTCS P0196, P0197, P0198, P1184 OR P0298: CHECK THE TEMPERATURE SENSOR SIGNAL

- Key ON, engine OFF.
- Access the PCM and monitor the EOT PID.
- **Is the voltage less than 0.3 V?**

Yes	No
GO to DY4.	GO to DY6.

DY4 SIMULATE AN OPPOSITE SIGNAL TO THE PCM

- Key ON, engine OFF.
- EOT Sensor connector disconnected.
- Access the PCM and monitor the EOT PID.
- **Is the voltage greater than 4.2 V?**

Yes	No
INSTALL a new EOT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DY5.

DY5 CHECK THE SENSOR SIGNAL FOR A SHORT TO GROUND

- PCM connector disconnected.
- Measure the resistance between:

(+) EOT Sensor Connector, Harness Side	(-) EOT Sensor Connector, Harness Side
EOT	SIGRTN

- Measure the resistance between:

(+) EOT Sensor Connector, Harness Side	(-) Vehicle Battery
EOT	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DY18.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DY6 CHECK FOR HIGH EOT SENSOR VOLTAGE

- Access the PCM and monitor the EOT PID.
- **Is the voltage greater than 4.2 V?**

Yes	No
GO to DY7.	GO to DY11.

DY7 CHECK THE EOT CIRCUIT VOLTAGE

- EOT Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) EOT Sensor Connector, Harness Side	(-) EOT Sensor Connector, Harness Side
EOT	SIGRTN

- **Is the voltage greater than 4.2 V?**

Yes	No
GO to DY8.	GO to DY10.

DY8 CHECK THE RESISTANCE OF THE EOT SENSOR WITH THE ENGINE OFF

- Key in OFF position.
- EOT Sensor connector disconnected.
- Measure the resistance between:

(+) EOT Sensor Connector, Component Side	(-) EOT Sensor Connector, Component Side
EOT	SIGRTN

- Refer to the chart at the beginning of this test for the resistance specifications.
- **Is the resistance within specification?**

Yes	No
GO to DY9.	INSTALL a new EOT sensor. REFER to the

	ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES . CLEAR the DTCs. REPEAT the self-test.

DY9 CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORTS TO PWR

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
EOT - Pin E27	VREF - Pin E57
EOT - Pin E27	VPWR - Pin B35

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DY18.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DY10 CHECK THE SIGNAL AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) EOT Sensor Connector, Harness Side
EOT - Pin E27	EOT
SIGRTN - Pin E58	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DY18.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DY11 INTERMITTENT CHECK

- Key ON, engine OFF.
- Access the PCM and monitor the EOT PID.
- While observing the PID, carry out the following:
  - Tap on the sensor to simulate road shock
  - Wiggle the sensor connector
- **Is there a large change in the voltage reading?**

Yes	No
DISCONNECT and INSPECT the connector. REPAIR as necessary. If OK, INSTALL a new EOT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to DY12.

DY12 CHECK THE ELECTRONIC ENGINE CONTROL (EEC) WIRING HARNESS

- Access the PCM and monitor the EOT PID.
- While observing the PID, wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **Is there a large change in the voltage reading?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DY13.

DY13 CHECK THE RESISTANCE OF THE EOT SENSOR WITH THE ENGINE RUNNING

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

- Run the engine until the engine temperature stabilizes.
- Verify the radiator hoses are hot and the cooling system is pressurized.
- Measure the resistance between:

(+) EOT Sensor Connector, Component Side	(-) EOT Sensor Connector, Component Side
EOT	SIGRTN

- **Is the resistance within specification for the given engine temperature?**

Yes	No
The concern is not present at this time. refer to **PINPOINT TEST Z**.	INSTALL a new EOT sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

DY14 DTC P0298: ENGINE OIL OVER TEMPERATURE CONDITION

NOTE: The engine oil temperature protection strategy in the PCM has been activated. This protects the engine against mechanical damage due to overheating.

- Check for an overheating condition and base engine concerns.

- **Are there any overheating or base engine concerns?**

Yes	No
ISOLATE the concern. REPAIR as necessary. REFER to the **ENGINE COOLING -- E-SERIES** to diagnose the overheat symptom. CLEAR the DTCs. REPEAT the self-test.	GO to DY15.

DY15 CHECK FOR EOT SENSOR HARDWARE

- The engine oil temperature protection strategy in the PCM can be activated with or without an EOT sensor.
- **Does the vehicle have a EOT sensor?**

Yes	No
GO to DY3.	GO to DY16.

DY16 IDENTIFY THE CUSTOMER'S DRIVING HABITS

- Identify the customers driving habits.
- Access the freeze frame data (if available) and record the DTC concern conditions.
- **Does the vehicle appear to have been driven in an incorrect transmission gear or at high RPM for an extended period?**

Yes	No
ADVISE the customer that improper transmission gear selection and high RPM for an extended period initializes the engine protection strategy. CLEAR the DTCs. REPEAT the self-test.	GO to DY17.

DY17 TYPE OF ENGINE COOLANT SENSOR

NOTE: **When an oil temperature sensor is not present, the PCM uses an oil algorithm to infer actual temperature based on input from the engine temperature sensor.**

- **Is the vehicle equipped with cylinder head temperature (CHT) sensor?**

Yes	No
GO to DL26.	GO to DX22.

DY18 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
    - pushed out pins

 - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DZ: UNIVERSAL HEATED OXYGEN SENSOR (HO2S)

INTRODUCTION

WARNING: **While conducting tests on a hot engine take all safety precautions to prevent skin contact with hot engine components. Failure to follow these instructions may result in personal injury.**

NOTE: Only diagnose the suspect universal HO2S indicated by the DTC.

This pinpoint test is intended to diagnose the following:

- universal HO2S (9Y460)
- harness circuits: UO2S, UO2SGREF, UO2SHTR, UO2SPC, UO2SPCT, and VPWR
- powertrain control module (PCM) (12A650)

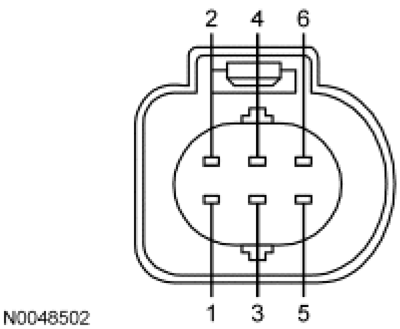

Fig. 92: Universal Heated Oxygen Sensor (HO2S)
Courtesy of FORD MOTOR CO.

Pin	Circuit
5	UO2SPCT (Universal Oxygen Sensor Pumping Current Trim)
1	UO2SPC (Universal Oxygen Sensor Pumping

	Current)
4	VPWR (Vehicle Power)
2	UO2SGREF (Universal Oxygen Sensor Ground Reference)
6	UO2S (Universal Oxygen Sensor)
3	UO2SHTR (Universal Oxygen Sensor Heater)

Pin	Circuit
E18	UO2S11 (Universal Oxygen Sensor Bank 1, Sensor 1)
E20	UO2S21 (Universal Oxygen Sensor Bank 2, Sensor 1)
E19	UO2SGREF11 (Universal Oxygen Sensor Ground Reference Bank 1, Sensor 1)
E21	UO2SGREF21 (Universal Oxygen Sensor Ground Reference Bank 2, Sensor 1)
E69	UO2SHTR11 (Universal Oxygen Sensor Heater Bank 1, Sensor 1)
E70	UO2SHTR21 (Universal Oxygen Sensor Heater Bank 2, Sensor 1)
E4	UO2SPC11 (Universal Oxygen Sensor Pumping Current Bank 1, Sensor 1)
E6	UO2SPC21 (Universal Oxygen Sensor Pumping Current Bank 2, Sensor 1)
E5	UO2SPCT11 (Universal Oxygen Sensor Pumping Current Trim Bank 1, Sensor 1)
E7	UO2SPCT21 (Universal Oxygen Sensor Pumping Current Trim Bank 2, Sensor 1)

TEST PROCEDURE

DZ1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0030, P0040, P0050, P0053, P0059, P0130, P0133, P0134, P0135, P0150, P0153, P0154, P0155, P1127, P2096, P2097, P2098, or P2099 present?**

Yes	No
For DTCs P0030 or P0050, GO to DZ2. For DTC P0040, GO to DZ5. For DTCs P0053, P0059, P0135 or P0155, GO to DZ6. For DTCs P0130 or P0150, GO to DZ11. For DTCs P0133 or P0153, GO to DZ15. For DTCs P0134 or P0154, GO to DZ18. For DTC P1127, GO to DZ19. For DTCs P2096, P2097, P2098 or P2099, GO to DZ20.	For symptoms without DTCs, GO to DZ23. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

DZ2 DTCS P0030 AND P0050: CHECK FOR MISFIRE CONCERNS AND AFTERMARKET EQUIPMENT

- Key in OFF position.
- Check for the following:
  - misfire concern
  - non-factory or aftermarket equipment that may increase the exhaust temperature
- Universal HO2S connector disconnected.
- Check the universal HO2S connector for damage or corrosion.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DZ3.

DZ3 CHECK THE UO2SHTR CIRCUIT FOR A SHORT TO VOLTAGE

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Universal HO2S Connector, Harness Side	(-)
UO2SHTR - Pin 3	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to DZ4.

DZ4 CHECK THE UO2S, UO2SGREF, UO2SHTR CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-) PCM Connector, Harness Side
UO2S - Pin 6	UO2S
UO2SGREF - Pin 2	UO2SGREF
UO2SHTR - Pin 3	HO2S Heater

- **Are the resistances less than 5 ohms?**

Yes	No
INSTALL a new Universal HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DZ5 DTC P0040: CROSSED SENSOR WIRES

- Key in OFF position.
- Check the vehicle repair history.
- Verify the connectors are connected to the correct engine bank.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

DZ6 DTCS P0053, P0059, P0135 AND P0155: CHECK FOR VPWR IN THE HARNESS

- Key in OFF position.
- Universal HO2S connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Universal HO2S Connector, Harness Side	(-)
VPWR - Pin 4	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to DZ7.	REPAIR the open circuit. CHECK the fuses. CLEAR the DTCs. REPEAT the self-test.

DZ7 CHECK THE UO2SHTR CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Universal HO2S connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) Universal HO2S Connector, Harness	

Side	(-) PCM Connector, Harness Side
UO2SHTR - Pin 3	UO2SHTR

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DZ8.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DZ8 CHECK THE UO2SHTR CIRCUIT FOR A SHORT IN THE HARNESS

- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-) Vehicle Battery
UO2SHTR - Pin 3	Negative terminal

- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-) Universal HO2S Connector, Harness Side
UO2SHTR - Pin 3	UO2S - Pin 6
UO2SHTR - Pin 3	UO2SGREF - Pin 2
UO2SHTR - Pin 3	UO2SPC - Pin 1
UO2SHTR - Pin 3	UO2SPCT - Pin 5
UO2SHTR - Pin 3	VPWR - Pin 4

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to DZ9.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DZ9 CHECK THE INTERNAL RESISTANCE OF THE UNIVERSAL HO2S HEATER

- Measure the resistance between:

(+) Universal HO2S Connector, Component Side	(-) Universal HO2S Connector, Component Side
VPWR - Pin 4	UO2SHTR - Pin 3

- **Is the resistance between 1.8 - 9 ohms?**

Yes	No
GO to DZ10.	INSTALL a new Universal HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS -**

	GASOLINE ENGINES -- E-SERIES . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

DZ10 CHECK THE UO2SHTR CIRCUIT FOR AN INTERNAL SHORT TO GROUND

- Measure the resistance between:

(+) Universal HO2S Connector, Component Side	(-)
UO2SHTR - Pin 3	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to DZ25.	INSTALL a new Universal HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

DZ11 DTCS P0130 AND P0150: CHECK THE UO2S AND UO2SGREF CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Universal HO2S connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-) PCM Connector, Harness Side
UO2S - Pin 6	UO2S
UO2SGREF - Pin 2	UO2SGREF

- **Are the resistances less than 5 ohms?**

Yes	No
GO to DZ12.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DZ12 CHECK THE UO2S, UO2SGREF, UO2SPC, AND UO2SPCT CIRCUITS FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	**(-)**
UO2S - Pin 6	Ground
UO2SGREF - Pin 2	Ground
UO2SPC - Pin 1	Ground
UO2SPCT - Pin 5	Ground

- **Are the resistances greater than 10K ohms?**

Yes	**No**
GO to DZ13.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DZ13 CHECK THE UO2S, UO2SGREF, UO2SPC, AND UO2SPCT CIRCUITS FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) Universal HO2S Connector, Harness Side	**(-)**
UO2S - Pin 6	Ground
UO2SGREF - Pin 2	Ground
UO2SPC - Pin 1	Ground
UO2SPCT - Pin 5	Ground

- **Is any voltage present?**

Yes	**No**
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to DZ14.

DZ14 CHECK THE UO2SGREF CIRCUIT FOR VOLTAGE

- Key in OFF position.
- PCM connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Universal HO2S Connector, Harness Side	**(-)**
UO2SGREF - Pin 2	Ground

- **Is the voltage between 2.4 - 2.6 V?**

Yes	No
INSTALL a new Universal HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to DZ25.

DZ15 DTCS P0133 AND P0153: CARRY OUT THE KOER SELF-TEST

- Engine at normal operating temperature.
- Carry out the KOER self-test.
- **Are any DTCs present other than P0133 or P0153?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to DZ16.

DZ16 CHECK FOR A SOURCE OF POTENTIAL CONTAMINATION

- Investigate the following items as potential sources of universal HO2S contamination:
  - use of unapproved silicon sealers
  - fuel contaminated by silicon additives
  - excessive oil consumption
  - glycol leaking internally in the engine
  - lead-contaminated fuel
  - short drive cycles in cold weather
  - use of unapproved cleaning agents
- **Is a concern present?**

Yes	No
REPAIR the source of the contamination. CHANGE the engine oil and oil filter. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to DZ17.

DZ17 CHECK THE UNIVERSAL HO2S RESPONSE TEST RESULTS

- Key ON, engine OFF.
- Access the diagnostic monitoring test results for the HO2S11 and HO2S21.

- **Is the indicated value greater than the minimum threshold?**

Yes	No
Unable to duplicate or identify the concern at this time. CLEAR the DTCs. REPEAT the self-test.	INSTALL a new Universal HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

DZ18 DTCS P0134 AND P0154: CHECK THE UO2SPC CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Universal HO2S connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-) PCM Connector, Harness Side
UO2SPC - Pin 1	UO2SPC

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new Universal HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DZ19 KOER DTC P1127: EXHAUST TEMPERATURE OUT OF RANGE

NOTE: Address all other DTCs before proceeding.

- Key ON, engine running.
- Engine at normal operating temperature.
- Access the PCM and monitor the HTR11 and HTR21 PIDs.
- **Are the PID states ON?**

Yes	No

CARRY OUT the KOER self-test.	RUN the engine until the PID indicates ON. CARRY OUT the KOER self-test.

DZ20 DTCS P2096, P2097, P2098 AND P2099: VISUALLY INSPECT THE UPSTREAM AND DOWNSTREAM HO2S CONNECTORS

- Key in OFF position.
- HO2S connector disconnected.
- Universal HO2S connector disconnected.
- Check for a loose connection, and damaged or corroded terminals.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DZ21.

DZ21 CHECK FOR LEAKS IN THE EXHAUST SYSTEM

- Visually inspect the exhaust system for the following:
  - exhaust leaks at flanges and gaskets
  - HO2Ss not tightened to specification
  - physical exhaust system concerns
  - aftermarket exhaust
  - punctures or cracks in the catalytic converter
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to DZ22.

DZ22 CHECK FOR POTENTIAL SENSOR CONTAMINATION CONCERNS

- Investigate the following items as potential sources of universal HO2S contamination:
  - use of unapproved silicon sealers
  - fuel contaminated by silicon additives
  - excessive oil consumption
  - glycol leaking internally in the engine
  - lead-contaminated fuel
  - short drive cycles in cold weather
  - use of unapproved cleaning agents
- **Is a concern present?**

Yes	No

REPAIR the source of the contamination. CHANGE the engine oil and oil filter. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to DZ25.

DZ23 CHECK THE UO2SPCT CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Universal HO2S connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-) PCM Connector, Harness Side
UO2SPCT - Pin 5	UO2SPCT

- **Is the resistance less than 5 ohms?**

Yes	No
GO to DZ24.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

DZ24 CHECK THE RESISTANCE OF THE CURRENT TRIM RESISTOR IN THE UNIVERSAL HO2S

- Measure the resistance between:

(+) Universal HO2S Connector, Component Side	(-) Universal HO2S Connector, Component Side
UO2SPCT - Pin 5	UO2SPC - Pin 1

- **Is the resistance between 25 - 330 ohms?**

Yes	No
The concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** for further direction.	INSTALL a new Universal HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

DZ25 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.

- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST EM: EMISSION COMPLIANCE

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

NOTE: Canada and some states or metropolitan areas in the United States require periodic emission, or inspection/maintenance (I/M) tests. All Ford products are designed to pass these tests. If a Ford product fails an I/M test, it is probably because 1) the engine or catalyst temperature was not warm and stabilized before the test, or 2) the vehicle had idled excessively before the test.

If any new emission components are installed, carry out the following steps before repeating the I/M test procedure:

- Reset the keep alive memory (KAM). Refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .
- To relearn some basic adaptive learning (trim) values, run the engine at 2,500 RPM for 1 minute and idle the engine for 2 minutes.

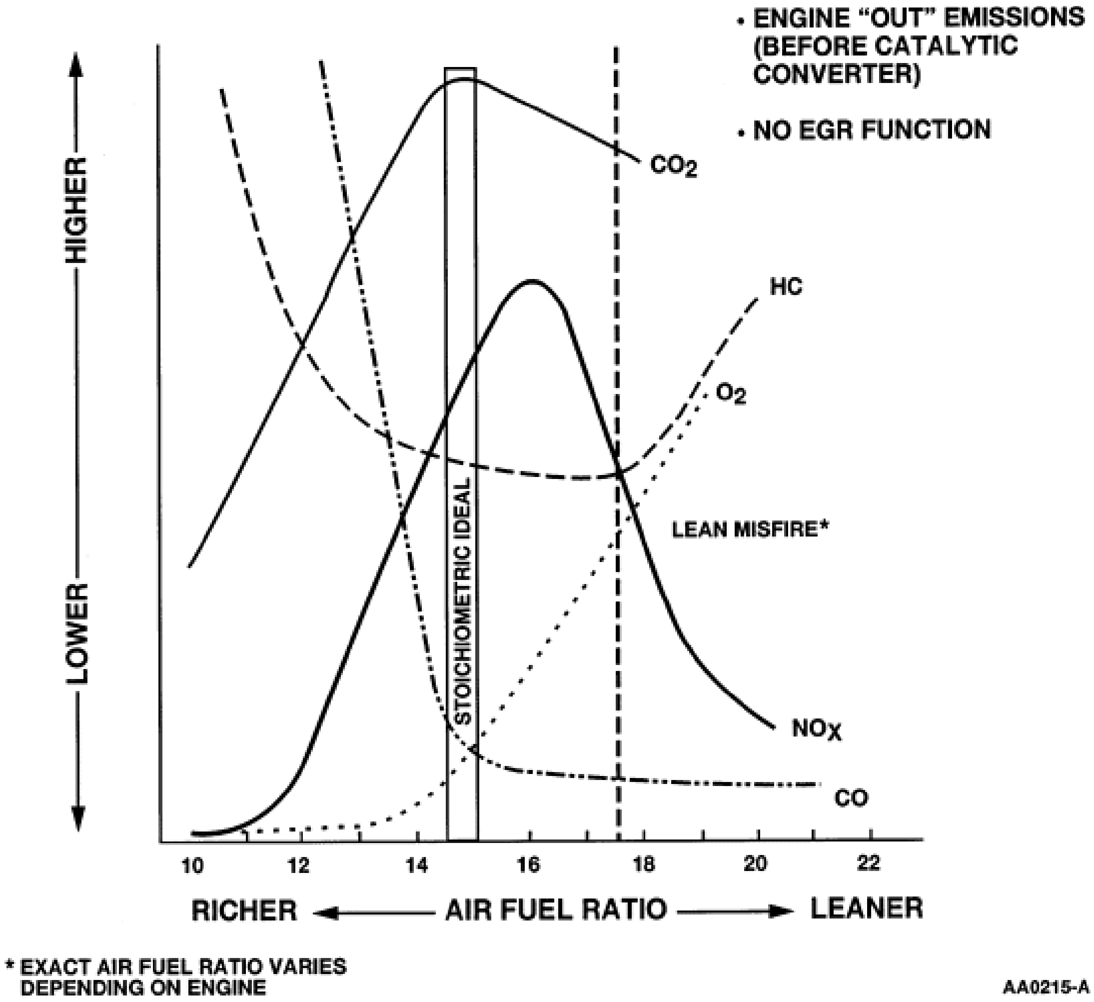

Fig. 93: Exhaust Gas Analysis Chart
Courtesy of FORD MOTOR CO.

Verifying an Excessive Grams Per Mile (GPM) Indication Using a Parts Per Million (PPM) Reading.

For vehicle gas reading(s) that are excessive, compare the actual GPM reading to the gas cut point level needed to pass testing. This gives an indication of how much the PPM reading has to be reduced (if the actual reading is twice the cut point, the baseline reading has to be cut in half or more).

Example:

- The actual HC produced by a vehicle is 1.6 gpm. The cut point for HC in this example is 0.8 gpm. The actual reading is twice the cut point.
- The HC reading obtained for the same vehicle during the baseline drive averages 440 ppm. In order for this vehicle to pass the I/M test, the HC reading from the verification trip must be at least half of the baseline reading, or an average of 220 ppm or less.
- This method only gives a general idea of how much the PPM reading needs to be reduced in order for the vehicle to pass an I/M test that calculates GPM. This test is not exact. Experience still has to be used to

determine if the emission readings are reduced enough for the vehicle to pass the I/M test.

TEST PROCEDURE

EM1 ANALYZE THE I/M TEST REPORT

- Analyze the I/M test report for data entry errors.
  - model
  - model year
  - correct calibration, if included on the report
  - correct test weight, if included on the report (this number is less than the vehicle's GVW)
- Analyze the I/M test report results.
  - identify high and low gas readings.
  - for reports that include a drive trace, identify during which mode the gas(es) failed. Be aware that if all gases were high early then decreased, the catalyst may have been cool when testing began.
- **Has the I/M test report been analyzed?**

Yes	No
GO to EM2.	REPEAT the test step.

EM2 EVAP SYSTEM LEAK OR PURGE FLOW TEST (IF THESE TESTS WERE CARRIED OUT)

- **Does the vehicle fail only an EVAP system leak or purge flow test (if these tests are carried out)?**

Yes	No
This is an EVAP concern only. GO to EM22.	GO to EM3.

EM3 BASELINE THE VEHICLE

NOTE: Baselining the vehicle exhaust gas readings is important so the baseline readings can be used for comparison after any repair is made.

- Baseline the vehicle using an exhaust gas analyzer. If the vehicle must be driven, be certain any baseline drive used is repeatable. The same drive cycle will be used to verify any repair.
- During the baseline, check for any related symptoms that may be present, such as driveability, transmission shifting or exhaust smoke concerns.
- **Has the vehicle been baselined?**

Yes	No
GO to EM4.	REPEAT the test step.

EM4 SYMPTOM CHECKS

- Check if any of the following symptoms are present:
  - transmission concerns
  - idle concerns
  - driveability concerns
  - exhaust smoke
  - cooling system concerns
- **Are any of the symptoms present?**

Yes	No
CARRY OUT the PCM Quick Test. REFER to the **SYMPTOM CHARTS** article, QT: Step 1: Powertrain Control Module (PCM) Quick Test. REFER to the Exhaust Gas Analysis Chart at the beginning of this pinpoint test. After any repair, GO to EM26.	GO to EM5.

EM5 PRELIMINARY CHECKS

- Carry out the following checks:
  - vacuum lines for leaks and blockages
  - electrical connections
  - proper scheduled maintenance
  - Ford authorized emission controls and components installed on the vehicle
  - intake air tube and air cleaner concerns such as obstructions, leaks, or a dirty air cleaner element
- **Is a concern present?**

Yes	No
REPAIR as necessary. After any repair, GO to EM26.	GO to EM6.

EM6 CARRY OUT THE PCM QUICK TEST

- Carry out the PCM Quick Test to access any PCM DTCs. For the procedure information, refer to**PINPOINT TEST QT** .
- **Is a concern present?**

Yes	No
FOLLOW the Quick Test direction. After any repair, GO to EM26.	GO to EM7.

EM7 CHECK FOR EXCESSIVE CARBON MONOXIDE (CO) LEVELS

- **Does the vehicle have excessive CO levels?**

Yes	No
Excessive CO levels indicate the engine is running rich. GO to EM10.	GO to EM8.

EM8 CHECK FOR EXCESSIVE HYDROCARBON (HC) LEVELS

- **Does the vehicle have excessive HC levels?**

Yes	No
Excessive HC levels with low to normal CO levels indicate the engine is running lean. GO to EM16.	GO to EM9.

EM9 CHECK FOR EXCESSIVE OXIDES OF NITROGEN (NOX) LEVELS

- **Does the vehicle have excessive NOx levels?**

Yes	No
GO to EM20.	VERIFY the test step results.

EM10 HIGH CO LEVELS: CHECK THE HC LEVELS

- **Does the vehicle have excessive HC levels?**

Yes	No
CHECK for the engine running rich and incomplete combustion. GO to EM11.	GO to EM12.

EM11 CHECK THE SECONDARY IGNITION SYSTEM

- For ignition coil on plug (COP) equipped vehicles, GO to JB2 and follow the pinpoint test direction.
- For ignition coil pack equipped vehicles, GO to JC2 and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
FOLLOW the pinpoint test direction. After any repair, GO to EM26.	GO to EM12.

EM12 CHECK THE FUEL DELIVERY SYSTEM FOR CONCERNS SUCH AS HIGH FUEL PRESSURE AND THE ABILITY TO HOLD PRESSURE

- refer to **PINPOINT TEST HC** and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
FOLLOW the pinpoint test direction. After any repair, GO to EM26.	GO to EM13.

EM13 CHECK FOR VACUUM LEAKS/OBSTRUCTION IN THE PCV SYSTEM (SUCH AS OIL CAP, PCV VALVE, HOSES, CUT GROMMETS, VALVE COVER BOLT TORQUE/GASKET LEAK)

- GO to HG2 and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
FOLLOW the pinpoint test direction. After any repair, GO to EM26.	GO to EM14.

EM14 CHECK THE EXHAUST SYSTEM

- GO to HF2 and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
FOLLOW the pinpoint test direction. After any repair, GO to EM26.	GO to EM15.

EM15 CHECK THE BASE ENGINE

- Check for base engine concerns. Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** .
- **Is a concern present?**

Yes	No
REPAIR as necessary. After any repair, GO to EM26.	GO to EM27.

EM16 HIGH HC WITH A NORMAL TO LOW CO LEVEL

- Check the fuel delivery system for concerns. refer to **PINPOINT TEST HC** and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No

FOLLOW the pinpoint test direction. After any repair, GO to EM26.	GO to EM17.

EM17 CHECK THE SECONDARY IGNITION

- For ignition coil on plug (COP) equipped vehicles, GO to JB2 and follow the pinpoint test direction.
- For ignition coil pack equipped vehicles, GO to JC2 and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
FOLLOW the pinpoint test direction. After any repair, GO to EM26.	GO to EM18.

EM18 CHECK FOR VACUUM LEAKS/OBSTRUCTION IN THE PCV SYSTEM (SUCH AS OIL CAP, PCV VALVE, HOSES, CUT GROMMETS, VALVE COVER BOLT TORQUE/GASKET LEAK)

- GO to HG2 and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
FOLLOW the pinpoint test direction. After any repair, GO to EM26.	GO to EM19.

EM19 CHECK THE BASE ENGINE

- Check for base engine concerns such as intake manifold leaks, improper compression, or valvetrain or camshaft damage. Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** to carry out the intake manifold vacuum test, compression test, and valve train analysis.
- **Is a concern present?**

Yes	No
REPAIR as necessary. After any repair, GO to EM26.	GO to EM27.

EM20 HIGH NOX WITH NORMAL TO LOW HC AND CO LEVELS: CHECK THE BASE ENGINE

- Check for base engine concerns such as excessive carbon build up in the combustion chamber. Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** to diagnose the abnormal combustion.
- **Is a concern present?**

Yes	No
REPAIR as necessary. After any repair, GO to EM26.	GO to EM21.

EM21 ADDITIONAL CHECKS

- Check the following:
  - transmission torque converter clutch operation
  - cooling system concerns such as an aftermarket front fascia covering the intake air or intake air system modifications
  - engine running lean concerns such as vacuum leaks or low fuel pressure
- **Is a concern present?**

Yes	No
REPAIR as necessary. After any repair, GO to EM26.	GO to EM27.

EM22 EVAP SYSTEM CONCERN: PRELIMINARY CHECKS

- Analyze the I/M test report to determine when the concern is present. Attempt to verify the concern.
- Check the following:
  - fuel filler cap
  - capless fuel tank filler pipe (if equipped)
  - EVAP system lines/hoses for proper connections, damage or blockage
  - fuel vapor storage canister damage
- **Is a concern present?**

Yes	No
REPAIR as necessary. After any repair, GO to EM25.	GO to EM23.

EM23 CARRY OUT THE PCM QUICK TEST

- Carry out the PCM Quick Test to access any PCM DTCs. For the procedure information, refer to**PINPOINT TEST QT** .
- **Is a concern present?**

Yes	No
FOLLOW the Quick Test direction. After any repair, GO to EM25.	GO to EM24.

EM24 EVAP SYSTEM CHECK

- Check the EVAP system for leaks. Refer to the **EVAPORATIVE EMISSIONS -- E-SERIES** to carry out the evaporative emission system leak test.
- **Is a concern present?**

Yes	No
REPAIR as necessary. After any repair, GO to EM25.	VERIFY the test step results. If all the test steps are OK, refer to **PINPOINT TEST Z**. For additional symptoms, REFER to the **SYMPTOM CHARTS** article. After any repair, GO to EM25.

EM25 EVAP SYSTEM REPAIR VERIFICATION

- Confirm the vehicle repair.
- Reset the keep alive memory (KAM). Refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . Be aware that this will set DTC P1000 and reset the On-Board System Readiness test.
- To relearn some basic adaptive learning (trim) values, run the engine at 2,500 RPM for 1 minute and idle the engine for 2 minutes.
- Carry out the PCM Quick Test to access any PCM DTCs. For the procedure information, refer to**PINPOINT TEST QT** .
- Carry out the EVAP system leak test and flow check.
- **Does the vehicle pass the EVAP system leak test and flow check?**

Yes	No
SAVE any repair documentation that may be required by local/federal laws. RETURN the vehicle to the customer.	The original concern was not repaired, or another concern exists. GO to EM1.

EM26 REPAIR AND VERIFICATION

NOTE: **If the vehicle needs to be driven for the baseline test, it may be necessary to drive the vehicle first up to 8 km (5 miles) to relearn some additional adaptive learning (trim) values. Also, during the baseline make sure to use the same drive mode that was used for the original baseline test.**

- Confirm the vehicle repair.
- Reset the keep alive memory (KAM). Refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . Be aware that this will set DTC P1000 and reset the On-Board System Readiness test.
- To relearn some basic adaptive learning (trim) values, run the engine at 2,500 RPM for 1 minute and idle the engine for 2 minutes.
- Carry out the PCM Quick Test to access any PCM DTCs. For the procedure information, refer

to**PINPOINT TEST QT** . Repair any other DTCs.

- Carry out the baseline test using the exhaust gas analyzer.
- For I/M 240 emission testing areas:
  - Refer to the beginning of this pinpoint test for information on verifying an excessive grams per mile indication using a parts per million (PPM) reading.
- All others (original gas concentrations reported in parts per million):
  - Verify the gas levels are within the acceptable range
- **Are all gases within the acceptable range?**

Yes	No
SAVE any repair documentation that may be required by local/federal laws. RETURN the vehicle to the customer.	The gas level is still high, or another gas level is above the acceptable range. GO to EM1.

EM27 CATALYST DELTA TEMPERATURE TEST

- Complete all previous testing.
- Run the engine for 2 minutes at 2,500 RPM to heat the exhaust system.
- Key in OFF position.
- Disconnect and ground 1 spark plug wire from each cylinder bank (for coil-on-plug applications, disconnect the coil connector).
- Run the engine at approximately 1,000 RPM.
- Disconnect the IAC valve and maintain 1,000 RPM (if equipped).
- Measure the surface temperature at both the inlet and outlet of each catalytic converter.
- Compare the difference in temperature between the inlet and outlet readings of each catalytic converter.
- **Does each catalytic converter have a difference of more than 28°C (50°F) between its inlet and outlet reading?**

Yes	No
The catalytic converter(s) is operating correctly. CONNECT the spark plug wire(s) and the IAC (if equipped). CLEAR the DTCs. VERIFY the test step results. If all test steps are OK, refer to **PINPOINT TEST Z**. For additional symptoms, REFER to the **SYMPTOM CHARTS** article. After any repair, GO to EM26.	For catalytic converter(s) that have less than 28°C (50°F) difference, testing indicates the catalytic converter(s) is not working. REPEAT the test to verify the results. If the temperature difference is still less than required, INSTALL a new catalytic converter. After any repair, GO to EM26.

PINPOINT TEST FB: POWER TAKE OFF (PTO)

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- PTO switch
- harness circuit: PTO, PTOIL
- powertrain control module (PCM) (12A650)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Connector	Pin	Circuit
170 Pin	B7 B42 B9 B26	PTORPM PTOIL PTOENG PTO

TEST PROCEDURE

FB1 PTO INDICATOR LAMP

- **Did you come to this pinpoint test for an always on/ never on PTO indicator?**

Yes	No
GO to FB7.	GO to FB2.

FB2 PTO NOT WORKING CORRECTLY: CHECK THE PTO INDICATOR LAMP OPERATION

NOTE: The following conditions must be met before the PTO engages:

- **Engine at normal operating temperature**
- **Accelerator pedal is released**
- **TFT within normal operating temperature**
- **Parking brake is applied**
- **Brake pedal is released**
- **Automatic transmission is in the PARK position**
- **Manual transmission - the clutch pedal is released**

NOTE: This step requires operating the PTO component. Refer to the aftermarket manufacturer for the PTO operating instructions. Follow all safety precautions.

- Key ON, engine running.
- Activate the PTO switch.

- **Does the PTO indicator illuminate?**

Yes	No
GO to the aftermarket PTO mechanical manual.	GO to FB3.

FB3 CHECK THE INTEGRITY OF THE PTO SWITCH AND THE PTO SWITCH CIRCUIT

- Access the PCM and monitor the PTO PID.
- Cycle the PTO switch, from off to on to off.
- **Does the PTO PID change state?**

Yes	No
GO to FB4.	REPAIR the PTO circuit or switch as necessary. CLEAR the DTCs. REPEAT the self-test.

FB4 CHECK THE PTO LOAD PID STATE IN THE PCM

- Access the PCM and monitor the PTOLOAD PID.
- Cycle the PTO switch,
- **Does the PTO LOAD PID change state?**

Yes	No
GO to FB5.	REPAIR the PTO ENG circuit or switch as necessary. CLEAR the DTCs. REPEAT the self-test.

FB5 CHECK THE PTOIR_V PID STATE IN THE PCM

NOTE: **The PTOIR_V PID represents an analog input which reflects the user requested engine speed.**

- Access the PCM and monitor the PTOIR_V PID.
- Cycle the PTO switch,
- **Does the PTOIR_V PID change state?**

Yes	No
GO to FB6.	REPAIR the PTO RPM circuit or switch as necessary. CLEAR the DTCs. REPEAT the self-test.

FB6 CHECK THE PTOIL PID STATE IN THE PCM

- Access the PCM and monitor the PTOIL PID.
- Cycle the PTO switch,
- **Does the PTOIL PID change state?**

Yes	No
GO to FB7.	VERIFY no DTCs are present. VERIFY the vehicle conditions in step FB2 are correct for PTO operation.

FB7 PTO INDICATOR LAMP ALWAYS OFF OR ON: CHECK THE PTOIL_F PID

- Access the PCM and monitor the PTOIL_F PID.
- **Is a concern present?**

Yes	No
REPAIR the circuit as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to the aftermarket PTO mechanical manual.

PINPOINT TEST FD: BRAKE PEDAL INPUTS

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- brake pedal position (BPP) (13480)
- brake pedal switch (BPS) (9F924), (9C872)
- harness circuits: B+, BPP, BPS
- powertrain control module (PCM) (12A650)

Refer to the Wiring Diagrams article for specific vehicle application and pin locations.

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Crown Victoria, Grand Marquis, Town Car	170 Pin	B9	BPS
E-Series, F-Super Duty	170 Pin	E65 B8	BPS BPP
Escape/Mariner	150 (50-50-50) Pin	B8	BPP
Expedition, Fusion, Milan, MKZ, Navigator	140 Pin	B47 B46	BPS BPP
Explorer, Explorer Sport Trac, Mountaineer, Mustang	170 Pin	B9 B8	BPS BPP

Focus	190 Pin	B46 B13	BPS BPP
Ranger	170 Pin	B8	BPP
All other vehicles	190 Pin	B47 B46	BPS BPP

TEST PROCEDURE

FD1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

- **Are DTCs P0504, P0572, P0573, P0703, P1572, or P1703 present?**

Yes	No
For KOEO or continuous memory DTCs P0504, P0572, P0573, P0703, P1703 and continuous memory DTC P1572, GO to FD3. For KOER DTCs P0703, or P1703, GO to FD2.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

FD2 KOER DTCS P0703 AND P1703: VERIFY THE BRAKE PEDAL WAS APPLIED

- **Was the brake pedal applied and released during the KOER self-test?**

Yes	No
GO to FD3.	REPEAT the KOER self-test. APPLY and RELEASE the brake pedal during the KOER test. CLEAR the DTCs. REPEAT the self-test.

FD3 DTCS P0572, P0573, P0703, P1572 AND P1703: CHECK THE OPERATION OF THE STOPLAMP

- Key ON, engine OFF.
- Apply and release the brake pedal and check the stop lamp operation.
- **Do the stoplamp operate correctly?**

Yes	No
For Crown Victoria, Grand Marquis, Sable, Taurus, Taurus X, and Town Car, GO to FD4. For all others, GO to FD5.	REFER to the **EXTERIOR LIGHTING -- E-SERIES** to diagnose the inoperative stoplamp. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

FD4 CHECK THE BRAKE SWITCH OPERATION

- Key ON, engine OFF.
- Access the PCM and monitor the BPP_BOO PID.

- Apply and release the brake pedal while monitoring the brake position PID.
- **Does the PID cycle ON and OFF?**

Yes	No
GO to FD6.	REFER to the **MODULE COMMUNICATIONS NETWORK -- E-SERIES** to diagnose the powertrain control module (PCM) not responding to the scan tool. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

FD5 CHECK FOR BPP CIRCUIT CYCLING

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Apply and release the brake pedal while monitoring the voltage.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
BPP	Ground

- **Is voltage less than 1 volt with the brake pedal released and greater than 10 volts with the brake pedal fully applied?**

Yes	No
For Ranger, GO to FD7. For all others, GO to FD6.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

FD6 CHECK FOR BPS CIRCUIT CYCLING

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Apply and release the brake pedal while monitoring the voltage.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
BPS	Ground

- **Is voltage greater than 10 volts with the brake pedal released and less than 1 volt with the brake pedal fully applied?**

Yes	No
GO to FD7.	REFER to the **SPEED CONTROL -- E-SERIES** .

	CARRY OUT the diagnostic steps for DTC P1703 to continue diagnose.

FD7 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST FF: POWER STEERING PRESSURE (PSP) SWITCH

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- power steering pressure (PSP) Switch (3N824)
- harness circuits: PSPSW and SIGRTN
- powertrain control module (PCM) (12A650)

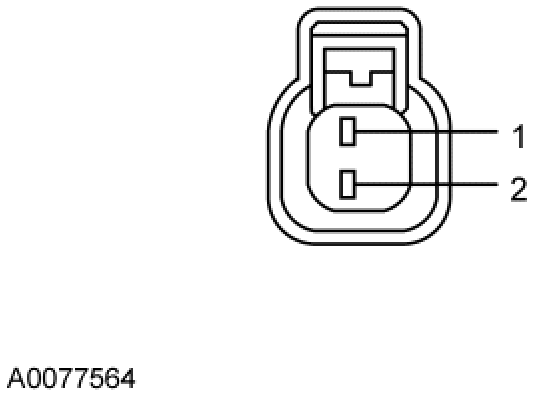

Fig. 94: Positive Crankcase Ventilation Thermal Extension -Harness Side (PCVTE-Harness Side)

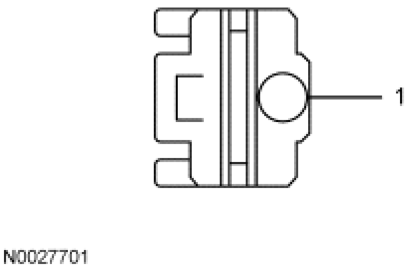

Fig. 95: Power Steering Pressure (PSP) Switch Connector - B
Courtesy of FORD MOTOR CO.

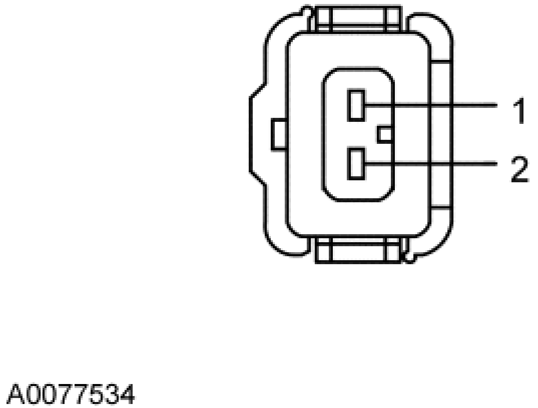

Fig. 96: Power Steering Pressure (PSP) Switch Connector - C
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Crown Victoria, Fusion 3.0L, Grand Marquis, Milan 3.0L, Town Car	A	2 1	SIGRTN PSPSW
Edge, Fusion 2.3L, Milan 2.3L, MKX, MKZ	B	1	PSPSW
Ranger	C	2 1	SIGRTN PSPSW
All other vehicles	C	1 2	SIGRTN PSPSW

The PSP and SIGRTN circuits may be reversed in the harness connector. Refer to the Wiring Diagrams article for schematic and connector information.

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Edge, MKX	190 Pin	B17	PSPSW
Explorer, Explorer Sport Trac, Mountaineer	170 Pin	B41 B27	SIGRTN PSPSW
Fusion 3.0L, Milan 3.0L	140 Pin	E58 E65	SIGRTN PSPSW
Fusion 2.3L, Milan 2.3L, MKZ	140 Pin	E65	PSPSW
Ranger	170 Pin	B41 B34	SIGRTN PSPSW
Sable, Taurus, Taurus X	190 Pin	E41 B17	SIGRTN PSPSW
All other vehicles	170 Pin	E58 B34	SIGRTN PSPSW

TEST PROCEDURE

FF1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

- **Are DTCs P1650 or P1651 present?**

Yes	No
For KOEO DTC P1650, GO to FF3. For KOER DTC P1650, GO to FF2. For continuous memory DTC P1651, GO to FF7.	For all others, GO to **DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

FF2 KOER DTC P1650: CARRY OUT TURNING THE STEERING WHEEL ONE HALF TURN

- **Did you turn the steering wheel at least one half turn within 20 seconds of starting the KOER self-test?**

Yes	No
GO to FF3.	CARRY OUT the KOER self-test.

FF3 DTC P1650: CHECK THE PSP PID

- Key ON, engine running.
- Access the PCM and monitor the PSP PID.
- Turn the steering wheel back and forth.
- **Does the PID state change?**

Yes	No
GO to FF7.	GO to FF4.

FF4 CHECK THE PSP CIRCUITS TO THE PSP SWITCH FOR CYCLING

- Key in OFF position.
- PSP Switch connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the PSP PID.

- For Fusion/Milan 2.3L, Edge/MKX or MKZ,
- Connect a 5 amp fused jumper wire between the following:

Point A PSP Switch Connector, Harness Side	Point B
PSPSW	Ground

- For all others,
- Connect a 5 amp fused jumper wire between the following:

Point A PSP Switch Connector, Harness Side	Point B PSP Switch Connector, Harness Side
PSPSW	SIGRTN

- Remove the jumper wire(s).
- **Does the PID state change?**

Yes	No
INSTALL a new PSP switch. CLEAR the DTCs. REPEAT the self-test.	GO to FF5.

FF5 CHECK THE PSP AND SIGRTN CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PSP Switch Connector, Harness Side
PSPSW	PSPSW
SIGRTN	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to FF6.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

FF6 CHECK THE PSP CIRCUIT(S) FOR A SHORT TO SIGRTN OR GND IN THE HARNESS

- Measure the resistance between:

(+) PSP Switch Connector, Harness Side	(-)
PSPSW	Ground

- Measure the resistance between:

(+) PSP Switch Connector, Harness Side	(-) PSP Switch Connector, Harness Side
PSPSW	SIGRTN

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to FF8.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

FF7 DTC P1651: CHECK THE PSP CIRCUIT(S) FOR INTERMITTENT CONCERNS

NOTE: **Be aware that P1651 could be set if the vehicle is towed with the engine running, or if a power steering hydraulic concern is present.**

- Key ON, engine OFF.
- Access the PCM and monitor the PSP PID.
- Check for open circuits while carrying out the following (a concern is indicated by a sudden change in the PCM-PSP PID):
  - Shake, wiggle, and bend the PSP and SIGRTN circuit(s).
  - Lightly tap on the PSP to simulate road shock
- PSP Switch connector disconnected.
- Check the PSP circuit for a short to ground. Shake, wiggle and bend the PSP circuits.
- **Is a concern present?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	CONNECT the PSP switch. Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

FF8 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

(EEPROM) , Programming the VID Block for a Replacement PCM.	

PINPOINT TEST H: FUEL CONTROL

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

WARNING: **While conducting tests on a hot engine take all safety precautions to prevent skin contact with hot engine components. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- HO2S/O2S (9F472)
- HO2S/O2S (9G444)
- fuel injector(s) (9F593)
- harness circuits: HO2S, HO2S Heater, VPWR, and SIGRTN
- vacuum systems
- powertrain control module (PCM) (12A650)

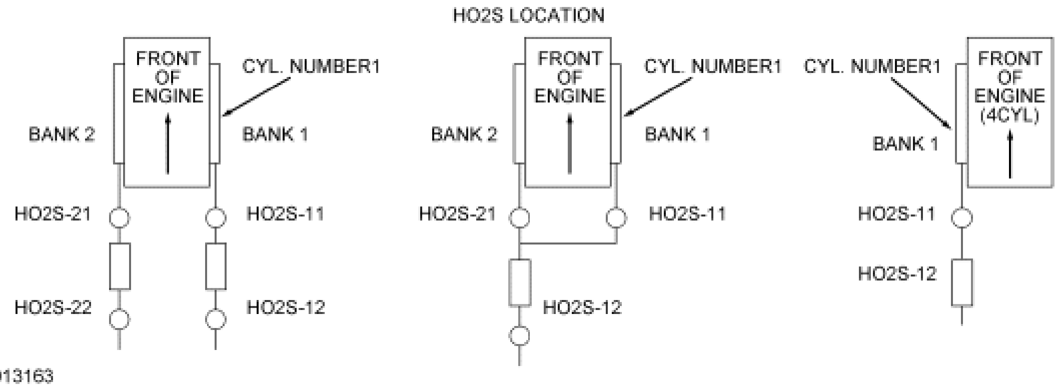

Fig. 98: Identifying HO2S Location (1 Of 2)

TEST PROCEDURE

H1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0171, P0172, P0174, P0175, P2195, P2196, P2197, P2198, P2270, P2271, P2272, P2273, P2274, or P2275 present?**

Yes	No
For DTCs P2270, P2271, P2272, P2273, P2274 or P2275, GO to H32. For DTCs P0171, P0174, P2195 or P2197, GO to	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

H2. For DTCs P0172, P0175, P2196 or P2198, GO to H7.	

H2 DTCS P0171, P0174, P2195 OR P2197: LEAN SYSTEM DTCS

NOTE: Do not clear the DTCs or reset the keep alive memory (KAM).

- Access the PCM and record the engine coolant temperature (ECT) PID from the freeze frame data. The freeze frame data is used to recreate the concern.
- Retrieve and record the self-test DTCs.
- **Are any DTCs present other than the following: P0171, P0174, P2195 or P2197?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to H3.

H3 CARRY OUT A VISUAL INSPECTION ON THE INTAKE AIR SYSTEM AND ALL VACUUM HOSES

- Key in OFF position.
- Check the intake air system for leaks, obstructions, and damage.
- Inspect the entire length of all the vacuum hoses for:
  - proper connections
  - damage or cracks
  - damaged or cracked vacuum tees
- Verify the integrity of the positive crankcase ventilation (PCV) system.
- Verify the proper PCV valve part number.
- **Is a concern present?**

Yes	No
GO to H6.	GO to H4.

H4 CHECK FOR THE PRESENCE OF A VACUUM LEAK

NOTE: Fuel trim values at idle are more sensitive to a vacuum leak. The vacuum leak (unmetered air) represents a larger portion of the total air flow at idle than at part throttle.

NOTE: The barometric pressure (BARO) PID is not a recommended PID to monitor when diagnosing a vacuum leak. Barometric pressure is calculated during

high engine load, when the vacuum leak represents a small portion of the total air flow.

NOTE: **When calculating the total fuel correction in the following steps, if LONGFT1 equals +13% and SHRTFT1 equals +23%, the total fuel correction for bank 1 equals +36%. If LONGFT2 equals +24% and SHRTFT2 equals -3% the total fuel correction for bank 2 equals +21%.**

NOTE: **If the freeze frame ECT PID is available, stabilize the engine at the temperature recorded by the freeze frame ECT PID. If the freeze frame ECT PID is not available, maintain the engine coolant temperature between 82° C - 101°C (180°F - 215°F) and the intake air temperature less than 46°C (115°F).**

- Key ON, engine running.
- Access the PCM and monitor the ECT, CHT and IAT PIDs.
- Access the PCM and monitor the LONGFT1, SHRTFT1, LONGFT2 and SHRTFT2 PIDs.
- Allow the engine to stabilize at the temperature necessary to recreate the concern.
- Mathematically add and record the LONGFT PID value to the SHRTFT PID value for each bank, for a total fuel correction at idle.
- Increase the engine speed to 3,500 RPM for 10 seconds. For vehicles with electronic throttle control (ETC), increase the engine speed to the maximum RPM without activating RPM limiting.

  Record the LONGFT1, SHRTFT1, LONGFT2, and SHRTFT2 PID values.

- Mathematically add and record the LONGFT PID value to the SHRTFT PID value for each bank, for a total fuel correction at 3,500 RPM or the maximum allowable RPM for vehicles with ETC.
- **Is the total fuel correction value difference, between idle and 3,500 RPM or the maximum allowable RPM for vehicles with ETC, less than 15 percent?**

Yes	No
No vacuum leak is present. For DTCs P0171 or P0174, GO to H16. For Sable, Taurus, and Taurus X PZEVs with DTCs P2195 or P2197, GO to H15. For all other vehicles with DTCs P2195 or P2197, GO to H9.	GO to H5.

H5 LOCATE THE VACUUM LEAK

NOTE: **Do not clamp or pinch a hard plastic hose. Use a vacuum cap or equivalent to restrict the hose.**

NOTE: **Restricting the EVAP vapor hose while the EVAP emission canister is**

purging may shift the SHRTFT. Carry out a visual inspection as necessary.

NOTE: **When monitoring for a decrease in the SHRTFT PIDs in the following steps, if SHRTFT1 equals +15% and the hose is restricted, SHRTFT1 decreases to -7%. The total decrease in the SHRTFT PIDs equals 22%.**

- Locate the vacuum tees for the intake air and PCV systems.
- Access the PCM and monitor the SHRTFT1 and SHRTFT2 PIDs.
- Restrict the vacuum lines one at a time for 30 seconds. If a vacuum leak is present, the SHRTFT PID values decrease as the hose is restricted.
- **Is the decrease in the SHRTFT PIDs greater than 15 percent when one of the vacuum hoses is restricted?**

Yes	No
GO to H6.	INSPECT the intake air system for a vacuum leak in the intake manifold or intake gaskets. REPAIR as necessary. For repair verification, GO to H6.

H6 VACUUM LEAK REPAIR VERIFICATION

NOTE: **If the freeze frame ECT PID is available, stabilize the engine at the temperature recorded by the freeze frame ECT PID. If the freeze frame ECT PID is not available, maintain the engine coolant temperature between 82°C - 101°C (180°F - 215°F) and the intake air temperature less than 46°C (115°F).**

- Access the PCM and monitor the SHRTFT1 and SHRTFT2 PIDs.
- Allow the engine to stabilize at the temperature necessary to recreate the concern.
- Record the SHRTFT1 and SHRTFT2 PID values.
- Key in OFF position.
- Repair the vacuum leak.
- Key ON, engine running.
- Allow the engine to stabilize at the temperature necessary to recreate the concern.
- Access the PCM and monitor the SHRTFT1 and SHRTFT2 PIDs.
- Compare the recorded SHRTFT PID values, prior to the vacuum leak repair, to the current SHRTFT PID values.
- **Is the decrease in the SHRTFT PIDs greater than 15 percent?**

Yes	No
RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY**	A vacuum leak is still present. GO to H5.

(KAM) . REPEAT the self-test.	

H7 DTCS P0172, P0175, P2196 OR P2198: RICH SYSTEM DTCS

NOTE: Do not clear the DTCs or reset the keep alive memory (KAM).

- Access the PCM and record the freeze frame data.
- Retrieve and record the self-test DTCs.
- **Are any DTCs present other than the following: P0172, P0175, P2196 or P2198?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to H8.

H8 INSPECT THE ENTIRE INTAKE AIR SYSTEM FOR DEBRIS, BLOCKAGE OR OTHER DAMAGE

- Check the intake air system for obstructions, restrictions, and damage.
- Check the throttle plate for obstructions or sludge.
- Check the air filter element and housing for blockage.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	For DTCs P0172 or P0175, GO to H16. For Sable, Taurus, and Taurus X PZEVs with DTCs P2196 or P2198, GO to H15. For all other vehicles with DTCs P2196 or P2198, GO to H13.

H9 CHECK THE HO2S AND SIGRTN CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Disconnect the HO2S related to the current DTC.
- PCM connector disconnected.
- Measure the resistance between:

(+) HO2S Connector, Harness Side	(-) PCM Connector, Harness Side
HO2S Signal	HO2S Signal
SIGRTN	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to H10.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

H10 CHECK THE HO2S CIRCUIT FOR A SHORT TO SIGRTN IN THE HARNESS

- Measure the resistance between:

(+) HO2S Connector, Harness Side	(-) HO2S Connector, Harness Side
HO2S Signal	SIGRTN

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to H11.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

H11 CHECK THE HO2S CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) HO2S Connector, Harness Side	(-)
HO2S Signal	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to H12.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

H12 HO2S CIRCUIT TEST (WITH LEAN DTCS)

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A HO2S Connector, Harness Side	Point B HO2S Connector, Harness Side
HO2S Signal	VPWR

- Key ON, engine OFF.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage greater than 1.3 V?**

Yes	No
GO to H16.	GO to H42.

H13 HO2S CIRCUIT TEST (WITH RICH DTCS)

- Disconnect the HO2S related to the current DTC.
- Key ON, engine OFF.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage less than 0.2 V?**

Yes	No
GO to H16.	GO to H14.

H14 CHECK THE HO2S CIRCUIT FOR A SHORT TO THE VPWR OR HEATER IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
HO2S Signal	HO2S Heater
HO2S Signal	VPWR

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to H42.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

H15 CHECK THE UO2SPC CIRCUIT FOR AN OPEN IN THE HARNESS

NOTE: Only the suspect UO2S needs to be diagnosed.

- Key in OFF position.
- Universal HO2S connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) Universal HO2S Connector, Harness Side	(-) PCM Connector, Harness Side
UO2SPC - Pin 1	UO2SPC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to H16.	REPAIR the open circuit. CLEAR the DTCs.

	REPEAT the self-test.

H16 CHECK THE FUEL PRESSURE

WARNING: **When checking the fuel system remember that the fuel system may still be pressurized when the engine is switched off. Always follow the instructions related to fuel system pressure relief. All fuel handling safety precautions must be observed. Failure to follow these instructions may result in personal injury.**

NOTE: **For vehicle specific fuel pressure ranges, refer to the Fuel System Specification Chart in pinpoint test HC.**

- Remove the jumper wire(s).
- HO2S connector connected.
- Relieve the fuel pressure. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure.
- Mechanical fuel pressure gauge connected.
- Pressurize the fuel system. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure to pressurize the fuel system.
- Key ON, engine running.
- Allow the fuel pressure to stabilize.
- Key in OFF position.
- Key ON, engine running.
- Access the PCM and control the FP PID.
- Run the fuel pump to obtain maximum fuel pressure.
- **Is the fuel pressure within range for the vehicle being diagnosed?**

Yes	No
GO to H17.	refer to **PINPOINT TEST HC**.

H17 CHECK THE FUEL SYSTEM FOR PRESSURE STABILITY - FAST LEAKDOWN

NOTE: **When the fuel pump is commanded off, the fuel pressure may substantially decrease and then stabilize.**

NOTE: **During output state control, the fuel pump stays commanded on for only about 5 seconds.**

- Key in OFF position.
- Key ON, engine OFF.

- Access the PCM and control the FP PID.
- Run the fuel pump to obtain maximum fuel pressure.
- Command the fuel pump off.
- Allow the fuel pressure to stabilize.
- Record the stabilized reading.
- Monitor the fuel pressure for 10 seconds.
- **Does the fuel pressure remain within 34 kPa (5 psi) of the recorded reading after 10 seconds?**

Yes	No
GO to H19.	GO to H18.

H18 CHECK FOR AN EXTERNAL FUEL LEAK

- Inspect the fuel tank, lines, and filler pipe for a fuel leak.
- **Is a concern present?**

Yes	No
REPAIR as necessary. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**. CLEAR the DTCs. REPEAT the self-test.	GO to H26.

H19 CHECK THE FUEL SYSTEM FOR PRESSURE STABILITY - SLOW LEAKDOWN

- Continue to monitor the fuel pressure for 1 minute.
- **Does the fuel pressure remain within 34 kPa (5 psi) of the recorded reading (MRFS) or greater than 275 kPa (40 psi) (ERFS) after 1 minute?**

Yes	No
GO to H20.	GO to HC13.

H20 CHECK THE SEPARATION LEVEL OF THE ETHANOL/WATER MIXTURE AND GASOLINE IN THE FUEL

NOTE: **This step requires the use of a locally obtained 200 ml beaker and a 25 ml graduated cylinder.**

NOTE: **After approximately 3 minutes of standing, the ethanol and water mixes together and settles to the bottom of the 25 ml graduated cylinder. The gasoline rises to the top.**

- Fill the 200 ml beaker with 5 ml of clean water.
- Use the pressure relief valve on the mechanical fuel gauge to drain 22 ml of fuel into an approved

clean container.

- Pour 20 ml of fuel from the approved clean container into the 25 ml graduated cylinder.
- Add enough water from the 200 ml beaker to the 25 ml graduated cylinder to bring the total volume of liquid to 24 ml.
- Insert a stopper plug in the opening of the 25 ml graduated cylinder.
- Firmly hold the stopper in place and shake the 25 ml graduated cylinder to mix the water and fuel.
- Allow the liquid to stand and separate for approximately 3 minutes.
- Record the separation level from the 25 ml graduated cylinder where the ethanol/water mixture and gasoline meet.
- **Did the ethanol/water mixture and gasoline separate?**

Yes	No
GO to H21.	COMPLETE all steps before continuing. The ethanol/water mixture will separate from the gasoline. If the fuel does not appear to separate, then the fuel is either 100% ethanol or a mixture of ethanol and water.

H21 CALCULATE THE PERCENTAGE OF ETHANOL IN THE FUEL

NOTE: Use the illustration as an example for calculating the percentage of ethanol in the following steps. If the separation level is at 14 ml the calculation becomes; 14 minus 4, then multiply by 5 to equal 50. The percentage of ethanol in the fuel is 50%.

- Key in OFF position.
- Take the recorded separation level from the previous step and subtract the amount of water added.
- Multiply the new value by 5. This new value is the percentage of ethanol in the fuel.

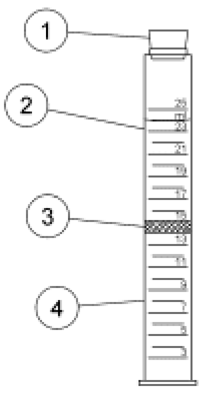

Fig. 107: Calculating Ethanol In Fuel
Courtesy of FORD MOTOR CO.

Item Number	Description

1	Stopper
2	Gasoline
3	Separation Point at 14 ml
4	Ethanol/Water Mixture

- Record the calculated percentage of ethanol in the fuel.
- **Is any ethanol present in the fuel?**

Yes	No
For flex fuel vehicles, GO to H22. For all others, GO to H25.	GO to H26.

H22 COMPARE THE FF_INF PID TO THE CALCULATED PERCENTAGE OF ETHANOL

NOTE: **When determining if the FF_INF PID value is within 50% of the calculated percentage of ethanol, if the calculated percentage of ethanol value is 40% then the PID value should be between 0 - 90%. The PID value cannot be less than zero.**

- Key ON, engine OFF.
- Access the PCM and monitor the FF_INF PID.
- Compare the FF_INF PID to the calculated percentage of ethanol.
- **Is the FF_INF PID value within 50% of the calculated percentage of ethanol?**

Yes	No
GO to H26.	GO to H23.

H23 RESET THE PERCENT ETHANOL PARAMETER IN THE PCM

NOTE: **Certain customer fueling practices such as only fueling with small amounts of fuel or repeatedly switching between gasoline and an ethanol blend greater than E15 may prevent the PCM from learning the correct ethanol content in the fuel.**

- Reset the keep alive memory (KAM). Refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .
- Key ON, engine running.
- Access the PCM and monitor the FF_LRND PID.
- Drive the vehicle approximately 11.3 km (7 miles) or until the FF_LRND PID indicates yes.
- **Is the PID state YES?**

Yes	No

GO to H24.	GO to H42.

H24 COMPARE THE UPDATED FF_INF PID TO THE CALCULATED PERCENTAGE OF ETHANOL

- Key in OFF position.
- Key ON, engine OFF.
- Access the PCM and monitor the FF_INF PID.
- **Is the FF_INF PID value within 50% of the calculated percentage of ethanol?**

Yes	No
RETURN the vehicle to the customer. ADVISE the customer of the correct fueling practices when using flex fuel. REFER to the Owner's Literature for additional information. ADVISE the customer to continue to use the same fuel for the next 2-3 refuels. This practice helps to verify the PCM is learning the correct percentage of ethanol in the fuel.	A fuel system concern may be present, which prevents the PCM from learning the correct percentage of ethanol in the fuel, GO to HC13.

H25 DETERMINE IF THE PERCENTAGE OF ETHANOL IN THE FUEL IS LESS THAN 25%

- Check the recorded calculated percentage of ethanol in the fuel.
- **Is the calculated percentage of ethanol in the fuel less than 25%?**

Yes	No
GO to H26.	REPAIR as necessary. ADVISE the customer of the correct fuel type required for this vehicle. REFER to the Owner's Literature for additional information. CLEAR the DTCs. REPEAT the self-test.

H26 FLOW TEST

- Key in OFF position.
- PCM connector connected.
- Flow test the injector using the fuel injector tester.
- **Is the flow rate for each injector within specification?**

Yes	No
For DTCs P0171, P0172, P0174 or P0175, GO to DC28. For DTCs P2195 or P2197, GO to H27. For DTCs P2196 or P2198, GO to H28.	INSTALL a new fuel injector. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

H27 CHECK THE HO2S OUTPUT VOLTAGE

- HO2S connector disconnected.
- Visually inspect the HO2S circuit for exposed wiring, contamination, corrosion and correct assembly. Repair as necessary.
- Measure the voltage between:

(+) HO2S Connector, Component Side	(-) HO2S Connector, Component Side
HO2S Signal	SIGRTN

- Increase the engine speed to 2,000 RPM for 3 minutes.
- Carry out the KOER self-test.
- Monitor the signal voltage during the self-test.
- **Is the voltage greater than 0.5 volt at any time during the self-test?**

Yes	No
GO to H30.	INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

H28 ATTEMPT TO RETRIEVE DTC P2195 OR P2197

- HO2S connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A HO2S Connector, Harness Side	Point B Vehicle Battery
HO2S Signal	Negative terminal

- Carry out the KOER self-test.
- **Are DTCs P2195 or P2197 present?**

Yes	No
GO to H29.	GO to H42.

H29 HO2S VOLTAGE CHECK

- Key in OFF position.
- Remove the jumper wire(s).
- HO2S connector disconnected.
- Key ON, engine running.
- Increase the engine speed to 2,000 RPM for 30 seconds.

- Measure the voltage between:

(+) HO2S Connector, Component Side	(-) HO2S Connector, Component Side
HO2S Signal	SIGRTN

- Carry out the KOER self-test.
- Monitor the signal voltage during the self-test.
- **Is the voltage less than 0.4 volt at any time during the self-test?**

Yes	No
GO to H30.	INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

H30 CARRY OUT A THOROUGH WIGGLE TEST ON THE HO2S HARNESS

- Key in OFF position.
- HO2S connector connected.
- Key ON, engine running.
- Engine at normal operating temperature.
- Access the PCM and monitor the HO2S Signal PID.
- Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **While monitoring the HO2S PID, does the HO2S stop switching?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to H31.

H31 TEST DRIVE THE VEHICLE WHILE MONITORING THE HO2S PID FOR SWITCHING

- Access the PCM and monitor the HO2S Signal PID.
- Access the PCM and monitor the FUELSYS PID.
- Start the engine and let idle until the vehicle goes into the closed loop fuel condition.
- Drive the vehicle in a manner consistent with the freeze frame data in an attempt to simulate the original concern.
- **Does the HO2S PID switch?**

Yes	No
GO to DC28.	INSTALL a new HO2S. REFER to the

	ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

H32 DTCS P2270, P2272, P2271, P2273, P2274 OR P2275: HO2S LACK OF SWITCHES STUCK LEAN OR RICH

NOTE: Address all continuous memory ignition and misfire DTCs before any KOER HO2S DTCs.

- Key in OFF position.
- Visually inspect for:
  - pinched, shorted, and corroded wiring and pins
  - oil or water contamination
  - crossed sensor wires
  - contaminated or damaged sensor
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	For KOER DTCs P2270, P2271, P2272, P2273, P2274 or P2275, GO to H34. For continuous memory DTCs P2270, P2271, P2272, P2273, P2274 or P2275, GO to H33.

H33 CHECK FOR KOER DTCS

- Key ON, engine OFF.
- Clear the DTCs.
- Key ON, engine running.
- Run the engine at approximately 2,000 RPM. Maintain the engine speed for 3 minutes.
- Retrieve the continuous memory DTCs.
- **Are DTCs P2270, P2271, P2272, P2273, P2274 or P2275 present?**

Yes	No
GO to H34.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

H34 CHECK THE HO2S SIGNAL LEVEL TOO HIGH

NOTE: Fuel calculations can be affected by unmetered air leaks.

- Key in OFF position.
- Carefully inspect the following areas for potential air leaks:
  - hoses connecting to the mass air flow (MAF) sensor assembly
  - hoses connecting to the throttle body
  - intake manifold gasket leaks
  - PCV system
  - the vacuum lines are disconnected
  - improperly seated engine oil dipstick, tube or oil fill cap
  - exhaust leaks at flanges and gaskets
- With the vehicle in NEUTRAL, position it on a hoist. Refer to the **JACKING AND LIFTING -- E-SERIES** for the locations of the lifting points.
- Visually inspect for:
  - exhaust leaks at flanges and gaskets
  - HO2S not tightened to specification
  - physical exhaust system concerns
  - aftermarket exhaust
  - punctures or cracks in the catalyst
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to H35.

H35 CHECK FOR SHORTS BETWEEN CIRCUITS IN THE HO2S HARNESS

- PCM connector disconnected.
- Disconnect the HO2S harness connector.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
HO2S Signal	Negative terminal

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
HO2S Signal	SIGRTN
HO2S Signal	VPWR
HO2S Signal	HO2S Heater

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to H36.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

H36 CHECK THE HO2S CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) HO2S Connector, Harness Side
HO2S Heater	HO2S Heater
VPWR	VPWR
HO2S Signal	HO2S Signal
SIGRTN	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to H37.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

H37 CHECK THE HO2S CIRCUIT VOLTAGE

- PCM connector connected.
- HO2S connector connected.
- Key ON, engine running.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage greater than 1.5 V?**

Yes	No
For partial zero emission vehicle (PZEV), GO to H40. For all others, GO to H39.	GO to H38.

H38 CHECK THE HO2S CIRCUIT VOLTAGE

- Key in OFF position.
- PCM connector connected.
- HO2S connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A HO2S Connector, Harness Side	Point B HO2S Connector, Harness Side
HO2S Signal	VPWR

- Key ON, engine OFF.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage greater than 1.5 V?**

Yes	No
INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to H42.

H39 CHECK FOR OVER VOLTAGE IN THE PCM

- Key in OFF position.
- HO2S connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HO2S Connector, Harness Side	(-) Vehicle Battery
SIGRTN	Negative terminal
HO2S Signal	Negative terminal

- **Are the voltages less than 1.5 V?**

Yes	No
INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to H42.

H40 CHECK THE HO2S CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- HO2S connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) HO2S Connector, Harness Side
HO2S Signal	VPWR

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to H41.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

H41 CHECK THE HO2S CIRCUIT VOLTAGE

- PCM connector connected.
- HO2S connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A HO2S Connector, Harness Side	Point B HO2S Connector, Harness Side
HO2S Signal	VPWR

- Key ON, engine running.
- Access the PCM and monitor the HO2S Signal PID.
- **Is the voltage greater than 1.5 V?**

Yes	No
INSTALL a new HO2S. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to H42.

H42 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
    - pushed out pins
    - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HC: FUEL DELIVERY SYSTEM

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

WARNING: **The fuel system remains under pressure after the engine is off. Relieve pressure before repairing. Highly flammable mixtures are present. To release pressure from the fuel system, carry out the following:**

- **Connect Rotunda fuel pressure gauge 134-R0087 or equivalent.**
- **Gradually open the testing kit valve to relieve the fuel pressure in the vehicle fuel system and drain the fuel into a suitable container or return it to the fuel tank.**
- **To avoid unnecessary fuel spillage and fire hazard, any time fuel lines are disconnected, the ignition switch must be in the OFF position unless fuel pump operation is required for test purposes.**

Failure to follow these instructions may result in personal injury.

WARNING: **Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

WARNING: **When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.**

WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.

NOTE: Replacement fuel injectors may not be the same color as the original injectors in the vehicle. Verify the replacement injector is correct for the application by part number.

This pinpoint test is intended to diagnose the following:

- chassis components
- engine vacuum
- fuel pressure
- fuel supply line
- fuel supply
- fuel filter (9155)
- fuel injector(s) (9F593)
- fuel pump (9H307)

NOTE: With the engine running, the FRP PID value may be 48-70 kPa (7-10 psi) higher than a fuel pressure reading taken with a mechanical gauge.

NOTE: For fuel pressure specifications using a mechanical gauge, see FUEL PRESSURE SPECIFICATIONS .

FUEL SYSTEM SPECIFICATION CHART (KEY ON, ENGINE OFF VALUES)

Application	Fuel System Type	FRP PID Fuel Pressure (kPa)	FRP PID Fuel Pressure (psi)
Crown Victoria/Grand Marquis/Town Car	ERFS (1)	240-485	35-70
Edge/MKX	MRFS (2)	-	-
Escape/Mariner	ERFS (1)	240-485	35-70
E-Series	ERFS (1)	240-485	35-70
Expedition/Navigator	MRFS (2)	-	-
Explorer/Explorer Sport Trac/Mountaineer	ERFS (1)	240-485	35-70
F-150, Mark LT	ERFS (1)	240-485	35-70
F-Super Duty	ERFS (1)	240-485	35-70
Taurus/Taurus X/Sable	MRFS (2)	-	-
Focus	MRFS (2)	-	-
Fusion/Milan/MKZ	MRFS (2)	-	-
Mustang	ERFS (1)	240-485	35-70

Ranger	MRFS (2)	-	-

Fuel System Type Definitions:

(1) Electronic Returnless Fuel System (ERFS):

This type of fuel delivery system does not return fuel to the fuel tank by means of a return line. This system does not incorporate a mechanical pressure regulator. Pressure is controlled by continuously varying the fuel pump speed through the fuel pump driver module (FPDM). All vehicles equipped with ERFS use a fuel rail pressure temperature (FRPT) sensor.

(2) Mechanical Returnless Fuel System (MRFS):

This type of fuel delivery system does not return fuel to the fuel tank by means of a return line. Fuel pressure is controlled by a mechanical pressure regulator located on the fuel pump module in the fuel tank. Vehicles equipped with MRFS do not use a fuel rail pressure temperature (FRPT) sensor.

WARNING: **If you see or smell gasoline at any time other than during fueling, do not reset the inertia fuel shutoff (IFS) switch. Failure to follow these instructions may result in personal injury.**

- Key in OFF position.
- Check for fuel leaks in the engine compartment.
- If no leak is present, reset the IFS switch by pushing the reset button on the top of the switch. Refer to the Owner's Literature, Roadside Emergencies for the location of the IFS switch.
- In the closed position, the button can be pressed an additional 1.57 mm (1/16 in) against a spring.
- Key ON, engine OFF.
- Key in OFF position.
- Key ON, engine OFF.
- Key in OFF position.
- Check for leaking fuel.

TEST PROCEDURE

HC1 DTC P0148 OR SYMPTOMS WITHOUT DTCS: CHECK THE SYSTEM INTEGRITY

- Visually inspect the complete fuel delivery system for damage and leakage.

  Check the following:

  - fuel lines and connections
  - relays
  - fuel tank
  - fuel pump

    - fuel pressure regulator
    - fuel pulse damper
    - fuel rail at injectors
    - damaged connector pins
    - electrical connectors not fully engaged
- Verify the vehicle has followed the maintenance schedule. A new fuel filter should have been installed within the last 48,280 km (30,000 miles).
- Verify the inertia fuel shutoff (IFS) switch is set (button pushed in). Refer to the Owner's Literature, Roadside Emergencies for the location of the IFS switch.
- Verify the fuse integrity.
- Verify the battery is fully charged.
- Verify clean sufficient fuel.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HC2.

HC2 CHECK ALL SYSTEM RELATED DEVICES (SENSOR, DAMPER OR REGULATOR) FOR LEAKAGE

- Key in OFF position.
- FP connector connected.
- Remove the vacuum hose on each system device connected to the fuel rail.
- Inspect for the presence of fuel in the vacuum line of each device connected to the fuel rail.
- Key ON, engine running.
- Check for manifold vacuum at each system related component with a vacuum line.
- Key in OFF position.
- **Are all vacuum lines for system related devices indicating no fuel present?**

Yes	No
GO to HC3.	If the vacuum line connected to a component indicates that a fuel leak is present, INSTALL a new component. CLEAR the DTCs. REPEAT the self-test.

HC3 CHECK THE FUEL PRESSURE

- Key in OFF position.
- Relieve the fuel pressure. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure.
- Mechanical fuel pressure gauge connected.
- Key ON, engine OFF.

- Pressurize the fuel system. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure to pressurize the fuel system.
- FP connector connected.
- Cycle the key several times to charge the fuel system.
- Compare the fuel pressure reading to the Fuel System Specification Chart.
- **Is the fuel pressure within range?**

Yes	No
GO to HC6.	GO to HC4.

HC4 CHECK THE FUEL PUMP GROUND CIRCUIT FOR AN OPEN IN THE HARNESS

NOTE: **Refer to the Wiring Diagrams article for schematic and connector information.**

- FP connector disconnected.
- Measure the voltage between:

(+) Vehicle Battery	(-) FP Connector, Harness Side
Positive terminal	FPGND

- **Is the voltage greater than 10 V?**

Yes	No
GO to HC5.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HC5 CHECK THE FUEL PUMP POWER CIRCUIT FOR AN OPEN IN THE HARNESS

NOTE: **During output state control, the fuel pump stays commanded on for only about 5 seconds.**

- Verify the inertia fuel shutoff (IFS) switch is set (button pushed in). Refer to the Owner's Literature, Roadside Emergencies for the location of the IFS switch.
- FP connector disconnected.
- Key ON, engine OFF.
- Access the PCM and control the FP PID.
- Be aware that output state control turns off the FP after a calibrated time. If this happens, command the outputs on again to continue testing.
- Measure the voltage between:

(+) FP Connector, Harness Side	(-) Vehicle Battery
FPPWR	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to HC12.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HC6 CHECK THE SEPARATION LEVEL OF THE ETHANOL/WATER MIXTURE AND GASOLINE IN THE FUEL

NOTE: **This step requires the use of a locally obtained 200 ml beaker and a 25 ml graduated cylinder.**

NOTE: **After approximately 3 minutes of standing, the ethanol and water mixes together and settles to the bottom of the 25 ml graduated cylinder. The gasoline rises to the top.**

- Fill the 200 ml beaker with 5 ml of clean water.
- Use the pressure relief valve on the mechanical fuel gauge to drain 22 ml of fuel into an approved clean container.
- Pour 20 ml of fuel from the approved clean container into the 25 ml graduated cylinder.
- Add enough water from the 200 ml beaker to the 25 ml graduated cylinder to bring the total volume of liquid to 24 ml.
- Insert a stopper plug in the opening of the 25 ml graduated cylinder.
- Firmly hold the stopper in place and shake the 25 ml graduated cylinder to mix the water and fuel.
- Allow the liquid to stand and separate for approximately 3 minutes.
- Record the separation level from the 25 ml graduated cylinder where the ethanol/water mixture and gasoline meet.
- **Did the ethanol/water mixture and gasoline separate?**

Yes	No
GO to HC7.	COMPLETE all steps before continuing. The ethanol/water mixture will separate from the gasoline. If the fuel does not appear to separate, then the fuel is either 100% ethanol or a mixture of ethanol and water.

HC7 CALCULATE THE PERCENTAGE OF ETHANOL IN THE FUEL

NOTE: **Use the illustration as an example for calculating the percentage of ethanol in the following steps. If the separation level is at 14 ml the**

calculation becomes; 14 minus 4, then multiply by 5 to equal 50. The percentage of ethanol in the fuel is 50%.

- Key in OFF position.
- Take the recorded separation level from the previous step and subtract the amount of water added.
- Multiply the new value by 5. This new value is the percentage of ethanol in the fuel.

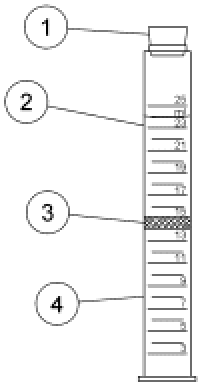

Fig. 108: Calculating Ethanol In Fuel
Courtesy of FORD MOTOR CO.

Item Number	Description
1	Stopper
2	Gasoline
3	Separation Point at 14 ml
4	Ethanol/Water Mixture

- Record the calculated percentage of ethanol in the fuel.
- **Is any ethanol present in the fuel?**

Yes	No
For flex fuel vehicles, GO to HC8. For all others, GO to HC11.	GO to HC12.

HC8 COMPARE THE FF_INF PID TO THE CALCULATED PERCENTAGE OF ETHANOL

NOTE: **When determining if the FF_INF PID value is within 50% of the calculated percentage of ethanol, if the calculated percentage of ethanol value is 40% then the PID value should be between 0 - 90%. The PID value cannot be less than zero.**

- Key ON, engine OFF.
- Access the PCM and monitor the FF_INF PID.
- Compare the FF_INF PID to the calculated percentage of ethanol.

- **Is the FF_INF PID value within 50% of the calculated percentage of ethanol?**

Yes	No
GO to HC12.	GO to HC9.

HC9 RESET THE PERCENT ETHANOL PARAMETER IN THE PCM

NOTE:	Certain customer fueling practices such as only fueling with small amounts of fuel or repeatedly switching between gasoline and an ethanol blend greater than E15 may prevent the PCM from learning the correct ethanol content in the fuel.

- Reset the keep alive memory (KAM). Refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .
- Key ON, engine running.
- Access the PCM and monitor the FF_LRND PID.
- Drive the vehicle approximately 11.3 km (7 miles) or until the FF_LRND PID indicates yes.
- **Is the PID state YES?**

Yes	No
GO to HC10.	GO to HC18.

HC10 COMPARE THE UPDATED FF_INF PID TO THE CALCULATED PERCENTAGE OF ETHANOL

- Key in OFF position.
- Key ON, engine OFF.
- Access the PCM and monitor the FF_INF PID.
- **Is the FF_INF PID value within 50% of the calculated percentage of ethanol?**

Yes	No
RETURN the vehicle to the customer. ADVISE the customer of the correct fueling practices when using flex fuel. REFER to the Owner's Literature for additional information. ADVISE the customer to continue to use the same fuel for the next 2-3 refuels. This practice helps to verify the PCM is learning the correct percentage of ethanol in the fuel.	A fuel system concern may be present, which prevents the PCM from learning the correct percentage of ethanol in the fuel, GO to HC12.

HC11 DETERMINE IF THE PERCENTAGE OF ETHANOL IN THE FUEL IS LESS THAN 25%

- Check the recorded calculated percentage of ethanol in the fuel.
- **Is the calculated percentage of ethanol in the fuel less than 25%?**

Yes	No
GO to HC12.	REPAIR as necessary. ADVISE the customer of the correct fuel type required for this vehicle. REFER to the Owner's Literature for additional information. CLEAR the DTCs. REPEAT the self-test.

HC12 CHECK THE FUEL PRESSURE LEAKDOWN

NOTE: When the fuel pump is commanded off, the fuel pressure may substantially decrease and then stabilize.

NOTE: During output state control, the fuel pump stays commanded on for only about 5 seconds.

- Mechanical fuel pressure gauge connected.
- Key ON, engine OFF.
- Access the PCM and control the FP PID.
- Run the fuel pump to obtain maximum fuel pressure.
- Command the fuel pump off.
- Allow the fuel pressure to stabilize.
- Record the stabilized reading.
- Monitor the fuel pressure for 1 minute.
- **Does the fuel pressure remain within 34 kPa (5 psi) of the recorded reading (MRFS) or greater than 275 kPa (40 psi) (ERFS) after 1 minute?**

Yes	No
For ERFS, GO to HC14. For MRFS, GO to HC15.	GO to HC13.

HC13 CHECK THE FUEL INJECTOR FLOW AND LEAKAGE

NOTE: Observe the Warnings, Cautions, and Notes.

- Check the fuel injectors for leakage and flow rate using the injector flow tester or other method such as inspecting the intake manifold for fuel.
- **Are the test results satisfactory?**

Yes	No
For ERFS, GO to HC14. For MRFS, GO to HC15.	INSTALL a new fuel injector as necessary. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . RESET the keep alive memory (KAM). REFER

	to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

HC14 COMPARE THE FRP PID TO THE MECHANICAL GAUGE

NOTE: Most mechanical gauges are referenced to atmospheric pressure. The FRPT sensor is referenced to manifold pressure. In order to make a valid comparison, the engine must be off.

NOTE: The vehicle may exhibit a long crank until the fuel system is pressurized.

- Key in OFF position.
- Relieve the fuel pressure. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure.
- Disable the fuel pump.
- Key ON, engine OFF.
- Monitor the mechanical gauge.
- Access the PCM and monitor the FRP PID.
- Compare the FRP PID value to the mechanical gauge.
- Key in OFF position.
- Pressurize the fuel system. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for the Fuel System Pressure Release procedure to pressurize the fuel system.
- Key ON, engine running.
- Allow the fuel pressure to stabilize.
- Key in OFF position.
- Key ON, engine OFF.
- Compare the FRP PID value to the mechanical gauge.
- **Are the FRP PID values within 34 kPa (5 psi) of the mechanical gauge readings?**

Yes	No
GO to HC15.	INSTALL a new FRPT sensor. REFER to the fuel system WARNING information at the beginning of this pinpoint test. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HC15 MONITOR THE FUEL PRESSURE WHILE ROAD TESTING THE VEHICLE

WARNING: **Strict observance of posted speed limits and attention to driving**

conditions are mandatory when carrying out the road test. Failure to follow these instructions may result in personal injury.

NOTE: Some concerns may only be present during certain fuel level conditions. Determine the fuel level at the time of the concern. Access the information from the customer information worksheet and the customer.

- Key in OFF position.
- Securely route the mechanical gauge so that the gauge is viewable while road testing the vehicle.
- Key ON, engine running.
- Engine at normal operating temperature.
- Monitor the mechanical gauge.
- From a stop, accelerate to 89 km/h (55 mph) at full throttle. Repeat this 3 times.
- **Is the fuel pressure always greater than 240 kPa (35 psi)?**

Yes	No
For misfire DTC diagnosis, GO to HD8. For symptoms without DTCs, the concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** for further direction. For all others, unable to duplicate or identify the concern at this time.	GO to HC16.

HC16 CHECK THE FUEL SUPPLY LINE FOR RESTRICTION

NOTE: Observe the Warnings, Cautions, and Notes.

- Key in OFF position.
- Disconnect the fuel supply line at the fuel rail.
- Disconnect the fuel supply line at the fuel pump.
- Check the fuel supply line for restriction.
- Apply 21 to 34 kPa (3 to 5 psi) air pressure to the fuel supply line.
- **Does air flow freely through the line?**

Yes	No
INSTALL a new Fuel Filter assembly. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . GO to HC17.	REPAIR the cause of the restriction. CLEAR the DTCs. REPEAT the self-test.

HC17 VERIFY THE REPAIR

WARNING: **Strict observance of posted speed limits and attention to driving conditions are mandatory when carrying out the road test. Failure to follow these instructions may result in personal injury.**

- Key ON, engine running.
- Engine at normal operating temperature.
- Monitor the mechanical gauge.
- From a stop, accelerate to 89 km/h (55 mph) at full throttle. Repeat this 3 times.
- **Is the fuel pressure always greater than 240 kPa (35 psi)?**

Yes	No
The test is complete and no concerns are present.	INSTALL a new FP module. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HC18 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** .	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HD: MISFIRE DETECTION MONITOR

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

NOTE: **Mechanical noise caused by the front end accessory drive components, mechanically driven cooling fans, or rough roads at high RPM with light load conditions may produce a nonsymmetrical loss of cylinder acceleration, which**

may result in a misfire.

This pinpoint test is intended to diagnose the misfire detection monitor.

Clearing the powertrain control module (PCM) diagnostic trouble codes (DTCs) erases any PCM recorded freeze frame data. Make sure to record any PCM freeze frame information before proceeding. Refer to**FREEZE FRAME DATA** .

TEST PROCEDURE

HD1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0309, P0310, P0315, or P0316 present?**

Yes	No
For DTCs P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0309, P0310 or P0316, GO to HD2. For DTC P0315, GO to HD21.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HD2 DTCS P0300 THROUGH P0310 AND P0316: VIEW THE PCM MISFIRE FREEZE FRAME DATA

NOTE: **The misfire freeze frame data may be used to determine the operating conditions when the misfire DTC was set.**

- Retrieve and record any available misfire freeze frame data PID values from the PCM.
- Compare recorded freeze frame data PID values to the typical reference values in the **REFERENCE VALUES** article.
- **Are any values out of range?**

Yes	No

REFER to the table in Pinpoint Test Z to find corresponding circuit, and proceed with the intermittent diagnosis. refer to **PINPOINT TEST Z**.	GO to HD3.

HD3 CHECK FOR OTHER NON-MISFIRE CONTINUOUS MEMORY DTCS

- Retrieve all continuous memory DTCs.
- **Are there any non-misfire continuous memory DTCs present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to HD4.

HD4 CHECK FOR ANY KOEO SELF-TEST DTCS

- Carry out the KOEO self-test.
- **Are any KOEO DTCs present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to HD5.

HD5 CHECK FOR ANY KOER DTCS

- Carry out the KOER self-test.
- **Are any KOER DTCs present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to HD6.

HD6 CHECK THE IGNITION SYSTEM FOR CONCERNS

- For ignition coil on plug (COP) equipped vehicles, refer to **PINPOINT TEST JB** and follow the pinpoint test direction.
- For ignition coil pack equipped vehicles, refer to **PINPOINT TEST JC** and follow the pinpoint test direction.
- **Is an ignition related concern present?**

Yes	No

REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HD7.

HD7 CHECK THE FUEL SYSTEM FOR CONCERNS

- refer to **PINPOINT TEST HC** and follow the pinpoint test direction.
- **Is a fuel system related concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HD8.

HD8 CHECK THE VACUUM SYSTEM

NOTE: Some vacuum leaks can be heard.

- Visually inspect the vacuum hoses for signs of damage or deterioration. A collapsed vacuum hose may cause a blockage to one of the various actuators or sensors. If a blockage is found remove the blockage or install new parts as necessary.
- **Is the vehicle vacuum system OK?**

Yes	No
For vehicles equipped with a differential pressure feedback EGR system, GO to HD9. For vehicles equipped with an electric EGR (EEGR) system, GO to HD10. For vehicles equipped with an EGR system module (ESM) EGR system, GO to HD11. For all others, GO to HD15.	REPAIR the vacuum system. CLEAR the DTCs. REPEAT the self-test.

HD9 MONITOR THE DIFFERENTIAL PRESSURE FEEDBACK EGR SYSTEM RELATED PIDS

- Key ON, engine running.
- Bring the engine to normal operating temperature.
- Access the PCM and monitor the DPFEGR PID.
- Access the PCM and monitor the EGRVR PID.
- Record the PID values with the engine idling.
- Key ON, engine OFF.
- Record the PID values with the engine off.
- Compare the recorded PID values to the typical reference values in the **REFERENCE VALUES** article.
- **Are any values out of range?**

Yes	No
refer to **PINPOINT TEST HE** and diagnose the EGR system.	GO to HD12.

HD10 MONITOR THE EEGR SYSTEM RELATED PIDS

- Key ON, engine running.
- Bring the engine to normal operating temperature.
- Access the PCM and monitor the EGRMC1F, EGRMC2F, EGRMC3F and EGRMC4F PIDs.
- Access the PCM and monitor the MAP PID.
- Record the PID values with the engine idling.
- Key ON, engine OFF.
- Record the PID values with the engine off.
- Compare the recorded PID values to the typical reference values in the **REFERENCE VALUES** article.
- **Are any values out of range?**

Yes	No
refer to **PINPOINT TEST KD** and diagnose the EGR system.	GO to HD13.

HD11 MONITOR THE ESM SYSTEM RELATED PIDS

- Key ON, engine running.
- Bring the engine to normal operating temperature.
- Access the PCM and monitor the DPFEGR PID.
- Access the PCM and monitor the EGRVR PID.
- Access the PCM and monitor the MAP PID.
- Record the PID values with the engine idling.
- Key ON, engine OFF.
- Record the PID values with the engine off.
- Compare the recorded PID values to the typical reference values in the **REFERENCE VALUES** article.
- **Are any values out of range?**

Yes	No
refer to **PINPOINT TEST HH** and diagnose the EGR system.	GO to HD14.

HD12 RECREATE THE MISFIRE SYMPTOM WITH THE DIFFERENTIAL PRESSURE FEEDBACK EGR SYSTEM DISABLED

NOTE: The PCM may store EGR system related DTCs during this procedure.

NOTE: To recreate the original conditions that set the DTC or caused the symptom, the vehicle may require driving.

- Key in OFF position.
- EGR Vacuum Regulator Solenoid connector disconnected.
- Access the misfire freeze frame data (if available) and record the operating conditions.
- Obtain information from the customer information worksheet or any other available data from the customer.
- Recreate the misfire symptom using the freeze frame and customer information.
- **Can the symptom be recreated?**

Yes	No
GO to HD15.	REMOVE and INSPECT the EGR valve for signs of contamination, unusual wear, carbon deposits, binding or other damage. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** for more EGR system information. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

HD13 RECREATE THE MISFIRE SYMPTOM WITH EEGR SYSTEM DISABLED

NOTE: The PCM may store EGR system related DTCs during this procedure.

NOTE: To recreate the original conditions that set the DTC or caused the symptom, the vehicle may require driving.

- Key in OFF position.
- EEGR Assembly connector disconnected.
- Access the misfire freeze frame data (if available) and record the operating conditions.
- Obtain information from the customer information worksheet or any other available data from the customer.
- Recreate the misfire symptom using the freeze frame and customer information.
- **Can the symptom be recreated?**

Yes	No
GO to HD15.	REMOVE and INSPECT the EEGR for signs of contamination, unusual wear, carbon deposits, binding or other damage. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** for more EGR system information. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

HD14 RECREATE THE MISFIRE SYMPTOM WITH THE ESM SYSTEM DISABLED

NOTE: The PCM may store EGR system related DTCs during this procedure.

NOTE: To recreate the original conditions that set the DTC or caused the symptom, the vehicle may require driving.

- Key in OFF position.
- ESM connector disconnected.
- Access the misfire freeze frame data (if available) and record the operating conditions.
- Obtain information from the customer information worksheet or any other available data from the customer.
- Recreate the misfire symptom using the freeze frame and customer information.
- **Can the symptom be recreated?**

Yes	No
GO to HD15.	REMOVE and INSPECT the ESM for signs of contamination, unusual wear, carbon deposits, binding or other damage. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** for more EGR system information. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

HD15 CHECK FOR BASE ENGINE CONCERNS

NOTE: The engine temperature may affect the results.

- This step determines if there are any base engine concerns that may have caused the misfire DTC or drive concern.
- Key in OFF position.
- Carry out the following tests in order to evaluate base engine integrity:
  - For vehicles equipped with mechanically driven cooling fans only, rotate the cooling fan by hand. The cooling fan should rotate freely, with no abnormal binding or interference. If binding or interference is present, remove any foreign materials or repair the cooling fan as necessary.
  - Refer to the **ACCESSORY DRIVE -- E-SERIES** and carry out checks in the Visual Inspection Chart.
  - Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** and carry out the Compression Test and Cylinder Leakage Detection.
  - Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** and carry out the Valve Train Analysis.
  - Visually inspect the positive crankcase ventilation (PCV) valve and tube for leaks.
  - Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** and carry out Component Tests.
- **Is a concern present?**

Yes	No
REPAIR as necessary. REFER to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to HD19.

HD16 DTC P1336: IDENTIFY THE CMP SENSOR TYPE

NOTE: The variable reluctance (VR) sensors have 2-wire connectors, Hall-effect sensors have 3-wire connectors.

- Identify which type of CMP sensor the vehicle uses.
- **Does the vehicle use a Hall-effect sensor?**

Yes	No
GO to HD17.	GO to HD18.

HD17 CHECK THE CMP SENSOR LOW RANGE OUTPUT VOLTAGE

- Key in OFF position.
- CMP Sensor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A CMP Sensor Connector, Harness Side	Point B CMP Sensor Connector, Component Side
VPWR	VPWR
PWRGND	PWRGND

- Key ON, engine running.
- Digital multimeter (DMM) on low voltage DC scale.
- Measure the voltage between:

(+) CMP Sensor Connector, Component Side	(-) 12 Volt Vehicle Battery
CMP	Negative terminal

- **Does the voltage switch between LOW (less than 2 volts DC) and HIGH (greater than 8 volts DC)?**

Yes	No
A Hall-effect CMP sensor that is installed out of synchronization may produce a DTC. To verify the correct CMP sensor installation, REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** , Engine Synchronizer. If the CMP sensor is installed	INSTALL a new CMP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

properly, GO to HD19.	

HD18 CHECK THE CMP SENSOR OUTPUT VOLTAGE

- Key in OFF position.
- PCM connector connected.
- CMP Sensor connector disconnected.
- DMM on low voltage AC scale.
- Key ON, engine running.
- Measure the voltage between:

(+) CMP Sensor Connector, Component Side	(-) CMP Sensor Connector, Component Side
CMP	SIGRTN

- Run the engine at approximately 2,500 RPM.
- **Is the voltage greater than 0.25 V?**

Yes	No
GO to HD19.	INSTALL a new CMP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HD19 CHECK THE GENERATOR FOR EXCESSIVE ELECTRICAL NOISE

NOTE: **If the generator/regulator is electrically noisy, the noise decreases when the B+ connector is disconnected.**

- Key ON, engine running.
- Monitor the generator for an audible electric noise.
- Key in OFF position.
- Generator/regulator B+ connector disconnected.
- Key ON, engine running.
- With the engine running, determine if the generator is still noisy.
- **Does the noise remain constant when the B+ connector is disconnected?**

Yes	No
GO to HD20.	REFER to the **GENERATOR AND REGULATOR -- E-SERIES** and diagnose the generator is noisy symptom.

HD20 CHECK THE CKP HARNESS FOR INTERMITTENT CONCERNS

NOTE: Chafed CKP wires or other physical damage to the harness may cause an intermittent short in the CKP circuit.

- Key in OFF position.
- Visually check for chafed CKP wires or other physical damage to the CKP harness.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HD21.

HD21 DTC P0315: CHECK THE PHYSICAL CONDITION OF THE CRANKSHAFT PULSE WHEEL

NOTE: DTC P0315 is set when the PCM is unable to learn and correct for the mechanical variations in the crankshaft pulse wheel tooth spacing (the allowable correction tolerances are exceeded).

- Inspect the crankshaft pulse wheel for damaged teeth.
- Inspect the crankshaft pulse wheel for wobble.
- Check for a loose crankshaft pulse wheel.
- Check the CKP sensor for damage.
- **Are the CKP sensor and crankshaft pulse wheel OK?**

Yes	No
If the CKP is installed properly, GO to HD22.	REPAIR as necessary. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** and check for correct CKP sensor installation. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . COMPLETE the Misfire and Fuel Monitors drive cycle procedure to learn the profile. Refer to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . To verify the repair RECREATE the original conditions that set the misfire DTC or caused the symptom using the freeze frame data and customer information. MONITOR the cylinder misfire data in Mode 6 - On Board Test Results and VERIFY the misfire count is below 10. REFER to the scan tool manufacturer's article for specific information on the Mode 6 - On Board Test Results.

HD22 CHECK THE DAMPER AND PULLEY ASSEMBLY

NOTE: For engines that have damper mounted pulse rings, it may be necessary to remove the front cover or other components to observe the crank pulley.

- Observe the crank pulley for wobble.
- Examine the electronic ignition (EI) pulse ring fastened to the harmonic dampener.
- **Does the crank pulley wobble or is the pulse ring loose or damaged?**

Yes	No
INSTALL a new pulley or damper assembly. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . COMPLETE the Misfire and Fuel Monitors drive cycle procedure to learn the profile. Refer to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . To verify the repair RECREATE the original conditions that set the misfire DTC or caused the symptom using the freeze frame data and customer information. MONITOR the cylinder misfire data in Mode 6 - On Board Test Results and VERIFY the misfire count is below 10. REFER to the scan tool manufacturer's article for specific information on the Mode 6 - On Board Test Results.	GO to HD23.

HD23 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HE: EXHAUST GAS RECIRCULATION (EGR) SYSTEMS

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- differential pressure feedback exhaust gas recirculation (EGR) sensor (9J460)
- EGR valve (9D460) (9D475)
- EGR vacuum regulator solenoid (9J459)
- orifice tube assembly (9D477)
- differential pressure feedback EGR sensor pressure hoses
- vacuum lines
- harness circuits: VREF, DPFE, SIGRTN, EVR, VPWR, VREF and PWRGND
- powertrain control module (PCM) (12A650)

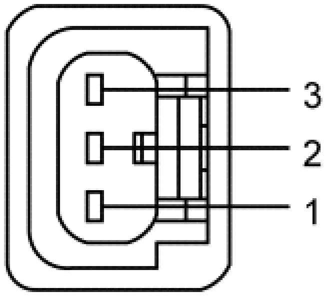

Fig. 115: Differential Pressure Feedback EGR Sensor Connector - A
Courtesy of FORD MOTOR CO.

Ranger	170 Pin	B47 E63 E57 E58 E21	PWRGND EVR VREF SIGRTN DPFE

TEST PROCEDURE

HE1 CHECK FOR DTCS

- **Are DTCs P0401, P0402, P0403, P0405, P0406, P1405, P1406, P1408, or P1409 present?**

Yes	No
For DTCs P0401 and P1408, GO to HE36. For DTC P0402, GO to HE13. For KOEO and KOER DTCs P0403 and P1409, GO to HE59. For continuous memory DTCs P0403 and P1409, GO to HE64. For DTC P0405, GO to HE2. For DTC P0406, GO to HE6. For DTC P1405, GO to HE27. For DTC P1406, GO to HE31.	For symptoms without DTCs, GO to HE57. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HE2 DTC P0405: DETERMINE THE PRESENT DPFEGR PID VOLTAGE

NOTE: Depending on the application, verify a prior repair has not resulted in the differential pressure feedback EGR sensor being installed backwards or the vacuum hoses being installed on the opposite ports.

- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the voltage less than 0.05 V?**

Yes	No
GO to HE3.	An intermittent concern is suspected in the EGR

	system. GO to HE12.

HE3 CHECK THE VREF AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Differential Pressure Feedback EGR Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Differential Pressure Feedback EGR Sensor Connector, Harness Side	(-) Differential Pressure Feedback EGR Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 5.5 V?**

Yes	No
GO to HE4.	refer to **PINPOINT TEST C**.

HE4 CHECK THE DPFE CIRCUIT(S) FOR A SHORT TO SIGRTN OR GND IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
DPFE	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
DPFE	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HE5.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE5 INDUCE THE OPPOSITE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR VOLTAGE

- PCM connector connected.
- Key ON, engine OFF.

- Access the PCM and monitor the DPFEGR PID.
- **Is the voltage between 4 - 5.5 V?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.	GO to HE66.

HE6 DTC P0406: DETERMINE THE PRESENT DPFEGR PID VOLTAGE

- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the voltage greater than 4 V?**

Yes	No
GO to HE7.	An intermittent concern is suspected in the EGR system. GO to HE12.

HE7 CHECK THE VREF VOLTAGE TO THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR

- Key in OFF position.
- Differential Pressure Feedback EGR Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Differential Pressure Feedback EGR Sensor Connector, Harness Side	(-) Differential Pressure Feedback EGR Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 5.5 V?**

Yes	No
GO to HE8.	refer to **PINPOINT TEST C**.

HE8 CHECK THE DPFE AND SIGRTN CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Differential Pressure Feedback EGR Sensor Connector, Harness Side
DPFE	DPFE
SIGRTN	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to HE9.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HE9 CHECK THE DPFE CIRCUIT FOR A SHORT TO VREF

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	DPFE

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HE10.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE10 CHECK THE DPFE CIRCUIT FOR A SHORT TO VOLTAGE

- Key ON, engine OFF.
- Measure the voltage between:

(+) Differential Pressure Feedback EGR Sensor Connector, Harness Side	(-) Vehicle Battery
DPFE	Negative terminal

- **Is the voltage less than 0.2 V?**

Yes	No
GO to HE11.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE11 CHECK THE DPFEGR PID

- Key in OFF position.
- PCM connector connected.

- Connect a 5 amp fused jumper wire between the following:

Point A Differential Pressure Feedback EGR Sensor Connector, Harness Side	Point B
DPFE	Ground

- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the DPFEGR PID greater than 4.5 V with the jumper wire removed and is the DPFEGR PID less than 0.1 V with the jumper wire installed?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. CLEAR the DTCs. REPEAT the self-test.	GO to HE66.

HE12 CARRY OUT A THOROUGH WIGGLE TEST ON THE DIFFERENTIAL PRESSURE FEEDBACK EGR HARNESS

- Access the PCM and monitor the DPFEGR PID.
- Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **Is there any change in the voltage reading, or is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

HE13 DTCS P0402 AND P1405: CHECK FOR SIMULTANEOUS PRESENCE

- **Is DTC P0402 present with DTC P1405?**

Yes	No
GO to HE28.	GO to HE14.

HE14 DTC P0402: CHECK FOR EGR FLOW AT IDLE WITH THE EGR VACUUM HOSE DISCONNECTED

NOTE: **A pinched or plugged EGR vacuum hose can trap vacuum between the EGR vacuum regulator solenoid and EGR valve, not allowing the EGR valve to close.**

NOTE: **Disregard DTC P1408 if it is generated as a result of carrying out the KOER self-test with the EGR vacuum source hose disconnected.**

- Trace each vacuum hose from the EGR vacuum regulator solenoid and verify each hose is connected correctly.
- Verify the EGR vacuum hose is not pinched or plugged and is routed correctly.
- Disconnect and plug the vacuum hose connected to the EGR valve.
- Carry out the KOER self-test.
- **Does KOER DTC P0402 appear or are you unable to run the KOER self-test due to an engine stall or no start?**

Yes	No
INSPECT the pressure hoses for correct routing, pinching, icing or other blockage. If OK, REMOVE and INSPECT the EGR valve and tube for signs of contamination, unusual wear, carbon deposits, binding or other damage. REPAIR as necessary. GO to HE15.	CONNECT the EGR valve vacuum hose. GO to HE16.

HE15 CARRY OUT THE KOER SELF-TEST

- Clear the DTCs.
- Carry out the KOER self-test.
- **Is DTC P0402 present?**

Yes	No
GO to HE18.	The test is complete and no concerns are found. CLEAR the DTCs. REPEAT the self-test.

HE16 CHECK FOR EGR FLOW AT IDLE WITH THE EGR VACUUM HOSE CONNECTED

- Key in OFF position.
- Connect the EGR valve vacuum hose.
- Carry out the KOER self-test.
- **Does KOER DTC P0402 appear or are you unable to run the KOER self-test due to an engine stall or no start?**

Yes	No
GO to HE17.	INSPECT the pressure hoses for pinching, icing or other blockage. REPAIR as necessary. GO to HE23.

HE17 CHECK THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR OUTPUT BY APPLYING VACUUM WITH THE HAND PUMP

- Disconnect the pressure hoses at the differential pressure feedback EGR sensor.

- Connect the vacuum pump to the downstream connection at the sensor (intake manifold side of the sensor or the smaller diameter pickup tube).
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release vacuum.
  - The DPFEGR PID voltage must be between 0.2 and 1.3 volt with the key ON and no vacuum applied.
  - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.	GO to HE18.

HE18 CHECK EGR FLOW AT IDLE WITH THE EGR VACUUM REGULATOR HARNESS CONNECTOR OFF

- Differential Pressure Feedback EGR Sensor connector connected.
- Disconnect the vacuum hose at the EGR valve and connect the hose to the vacuum gauge.
- Start the engine.
- EGR Vacuum Regulator Solenoid connector disconnected.
- Observe the vacuum gauge:
  - The EGR valve requires vacuum greater than 5.4 kPa (1.6 in-Hg) to begin to open.
  - If the vacuum reading remains greater than 5.4 kPa (1.6 in-Hg) after the EGR vacuum regulator solenoid is disconnected, a concern may be present in the EGR vacuum regulator solenoid.
- **Does the EGR vacuum remain greater than 5.4 kPa (1.6 in-Hg) at idle after the EGR vacuum regulator is disconnected?**

Yes	No
GO to HE19.	GO to HE20.

HE19 INSPECT THE EGR VACUUM REGULATOR SOLENOID VENT FOR BLOCKAGE

NOTE: When the EGR valve is closed, the EGR vacuum regulator solenoid vacuum is vented through the solenoid vent to the atmosphere. A plugged EGR vacuum regulator solenoid vent does not allow EGR vacuum to vent to the atmosphere.

- Key in OFF position.
- Remove the EGR vacuum regulator solenoid vent cap.
- Remove the filter and inspect for blockage or icing.
- **Is the EGR vacuum regulator solenoid vent or vent filter plugged or restricted?**

Yes	No
REPAIR the vent, or if not repairable, INSTALL a new EGR vacuum regulator solenoid. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	INSTALL a new EGR Vacuum Regulator solenoid. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HE20 CHECK THE EGR VACUUM REGULATOR SOLENOID COIL RESISTANCE

- Key in OFF position.
- Measure the resistance between:

(+) EGR Vacuum Regulator Solenoid Connector, Component Side	(-) EGR Vacuum Regulator Solenoid Connector, Component Side
VPWR - Pin 1	EVR - Pin 2

- **Is the resistance between 26 - 40 ohms?**

Yes	No
GO to HE21.	INSTALL a new EGR Vacuum Regulator solenoid. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HE21 CHECK THE EGR VACUUM REGULATOR CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
EVR	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HE22.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE22 CHECK THE EGR VACUUM REGULATOR CIRCUIT FOR SHORT TO VREF

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
EVR	VREF

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HE66.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE23 CHECK THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR OUTPUT BY APPLYING VACUUM WITH THE HAND PUMP

- Disconnect the pressure hoses at the differential pressure feedback EGR sensor.
- Connect the vacuum pump to the downstream connection at the sensor (intake manifold side of the sensor or the smaller diameter pickup tube).
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release the vacuum.
  - The DPFEGR PID voltage must be between 0.25 and 1.3 volts with the key ON and no vacuum applied.
  - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402.	GO to HE24.

CLEAR the DTCs. REPEAT the self-test.	

HE24 CHECK THE EGR VALVE OPERATION

NOTE: Typical sensor voltage with no EGR flow is between 0.25 volt and 1.3 volts.

NOTE: A higher voltage at idle may be due to a non-seating or heavily carbon EGR valve pintle.

NOTE: DPFEGR PID voltage must increase as the valve opens and decrease as the valve closes. A slow return voltage is an indication of a binding or slow closing EGR valve.

- Differential Pressure Feedback EGR Sensor connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Disconnect the vacuum hose at the EGR valve and plug the hose.
- Connect the vacuum pump to the EGR valve.
- Start the engine.
- Observe the DPFEGR PID at idle and compare it to the KOEO voltage.
- Apply just enough vacuum to the EGR valve to open it without stalling the engine.
- Quickly release the vacuum.
- Repeat this 3 times.
- Observe the DPFEGR PID.
- **Does the DPFEGR PID voltage indicate an open, binding or slow closing EGR valve?**

Yes	No
REMOVE and INSPECT the EGR valve for signs of contamination, unusual wear, carbon deposits, binding or other damage. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HE25.

HE25 CARRY OUT A THOROUGH WIGGLE TEST ON THE EGR VACUUM REGULATOR HARNESS

NOTE: An intermittent short to GND in the EGR vacuum regulator circuit causes the vacuum applied to the EGR valve to be higher than normal when the short is present. The vacuum available at the EGR valve at idle is normally below 3.4 kPa (1.6 in-Hg) for the valve to begin to open.

NOTE: A concern is indicated by a sudden jump in the vacuum reading during the

wiggle test.

- Key in OFF position.
- Remove the vacuum pump.
- Connect the vacuum gauge to the EGR valve vacuum hose.
- Connect a vacuum gauge to the EGR valve vacuum hose using a vacuum tee.
- Key ON, engine running.
- Observe the vacuum gauge.
  - Lightly tap on the EGR vacuum regulator solenoid.
  - Carry out a thorough wiggle test on the EGR vacuum regulator harness.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	CONNECT the vacuum hose(s). GO to HE26.

HE26 INSPECT THE EGR VACUUM REGULATOR SOLENOID AND VACUUM HOSES FOR PLUGGING

- Key in OFF position.
- Remove the EGR vacuum regulator solenoid vent cap.
- Remove the filter and inspect for blockage or icing.
- Inspect the pressure hoses for pinching, icing or other blockage.
- **Is the EGR vacuum regulator solenoid vent or vent filter plugged or restricted?**

Yes	No
REPAIR, or if not repairable, INSTALL a new EGR vacuum regulator solenoid. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

HE27 DTC P1405: INSPECT THE UPSTREAM PRESSURE HOSE CONNECTIONS

- Inspect the upstream hose at the differential pressure feedback EGR sensor and orifice tube assembly for a disconnect or a poor connection.

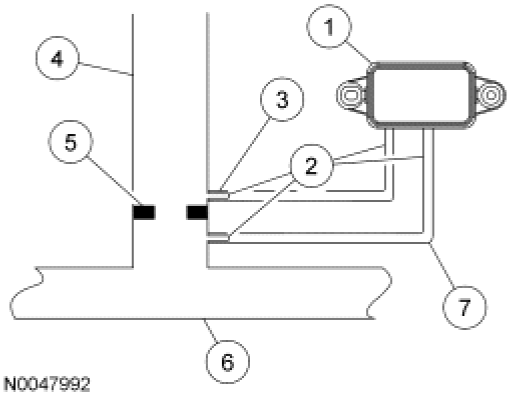

Fig. 118: Typical Differential Pressure Feedback EGR System
Courtesy of FORD MOTOR CO.

TYPICAL DIFFERENTIAL PRESSURE FEEDBACK EGR SYSTEM

Item Number	Description
1	Differential Pressure Feedback EGR Sensor
2	Pickup Tubes
3	Upstream Pressure Hose
4	To EGR Valve
5	Orifice Tube Assembly
6	Exhaust Manifold
7	Downstream Pressure Hose

- **Is vacuum hose off or poorly connected?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HE28.

HE28 INSPECT THE UPSTREAM PRESSURE HOSE FOR PLUGGING

NOTE: It is essential that only the correct Ford replacement pressure hose be used.

- Visually inspect the upstream pressure hose routing. The hose must not be pinched or have dips in it where water could settle or freeze.
- Remove the upstream pressure hose and carefully inspect for plugging, water, or leaks.
- **Is a concern present?**

Yes	No
REPAIR or INSTALL a new pressure hose as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HE29.

HE29 CHECK THE ORIFICE TUBE ASSEMBLY AND THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR

- Inspect the upstream connection on the differential pressure feedback EGR sensor for damage or plugging at the sensor.
- Inspect the exhaust manifold side pressure tube at the orifice tube assembly for plugging or damage.
- **Is the differential pressure feedback EGR sensor or orifice tube assembly plugged or damaged?**

Yes	No
REPAIR or INSTALL a new Differential Pressure Feedback EGR sensor or orifice tube assembly as necessary. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.	GO to HE30.

HE30 CHECK THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR OUTPUT BY APPLYING VACUUM WITH THE HAND PUMP

- Disconnect the pressure hoses at the differential pressure feedback EGR sensor.
- Connect the vacuum pump to the downstream connection at the sensor (intake manifold side of the sensor or the smaller diameter pickup tube).
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release the vacuum.
  - The DPFEGR PID voltage must be between 0.25 and 1.3 volts with the key ON and no vacuum applied.
  - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. After installing the new differential pressure	refer to **PINPOINT TEST Z**.

feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.	

HE31 DTC P1406: INSPECT THE DOWNSTREAM PRESSURE HOSE CONNECTIONS

NOTE: **If the concern is currently present, DTC P1408 appears when running the KOER self-test.**

- Verify the EGR valve is securely attached and exhaust gases are not leaking from the sealing surface.
- Inspect the downstream hose at the differential pressure feedback EGR sensor and orifice tube assembly for a disconnect or a poor connection.

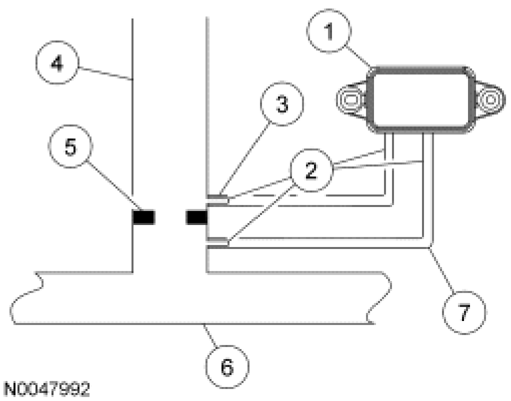

Fig. 119: Typical Differential Pressure Feedback EGR System
Courtesy of FORD MOTOR CO.

TYPICAL DIFFERENTIAL PRESSURE FEEDBACK EGR SYSTEM

Item Number	Description
1	Differential Pressure Feedback EGR Sensor
2	Pickup Tubes
3	Upstream Pressure Hose
4	To EGR Valve
5	Orifice Tube Assembly
6	Exhaust Manifold
7	Downstream Pressure Hose

- **Is vacuum hose off or poorly connected?**

Yes	No

REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HE32.

HE32 INSPECT THE DOWNSTREAM PRESSURE HOSE FOR PLUGGING

NOTE: It is essential that only the correct Ford replacement pressure hose be used.

- Visually inspect the downstream pressure hose routing.
- Remove the upstream pressure hose and carefully inspect for plugging, water, or leaks.
- **Is a concern present?**

Yes	No
REPAIR or INSTALL a new pressure hose as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HE33.

HE33 CHECK THE ORIFICE TUBE ASSEMBLY AND THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR

- Inspect the connections at the differential pressure feedback EGR sensor for plugging or damage.
- Inspect the intake manifold side pressure tube at the orifice tube assembly for plugging or damage.
- **Is the differential pressure feedback EGR sensor or orifice tube assembly plugged or damaged?**

Yes	No
REPAIR or INSTALL a new Differential Pressure Feedback EGR sensor or orifice tube assembly as necessary. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.	GO to HE34.

HE34 CHECK THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR OUTPUT BY APPLYING VACUUM WITH THE HAND PUMP

- Disconnect the pressure hoses at the differential pressure feedback EGR sensor.
- Connect the vacuum pump to the downstream connection at the sensor (intake manifold side of the sensor or the smaller diameter pickup tube).
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.

- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release the vacuum.
  - The DPFEGR PID voltage must be between 0.25 and 1.3 volts with the key ON and no vacuum applied.
  - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
GO to HE35.	refer to **PINPOINT TEST Z**.

HE35 CHECK THE DPFE CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Differential Pressure Feedback EGR Sensor Connector, Harness Side
DPFE	DPFE
SIGRTN	SIGRTN
VREF	VREF

- **Are the resistances greater than 5 ohms?**

Yes	No
REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.	INSTALL a new Differential Pressure Feedback EGR sensor. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.

HE36 DTC P0401: CARRY OUT THE KOER SELF-TEST

- Carry out the KOER self-test.
- **Does DTC P1408 appear?**

Yes	No

GO to HE37.	GO to HE53.

HE37 KOER AND CONTINUOUS MEMORY DTC P1408: RETRIEVE CONTINUOUS MEMORY DTCS

NOTE: If any DTC other than P1406 appears, note the DTC and refer toDIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS after carrying out this pinpoint test.

- Retrieve all continuous memory DTCs.
- **Is DTC 1406 present?**

Yes	No
GO to HE31.	GO to HE38.

HE38 INSPECT THE DIFFERENTIAL PRESSURE FEEDBACK EGR PRESSURE HOSES

- Inspect the pressure hoses for a reverse connection at the differential pressure feedback EGR sensor or at the orifice tube assembly.
- Inspect the hoses for incorrect routing.
- Inspect both hoses for leaks and blockage.
- Inspect the differential pressure feedback EGR sensor and orifice tube assembly for blockage or damage at the pick-up tubes.

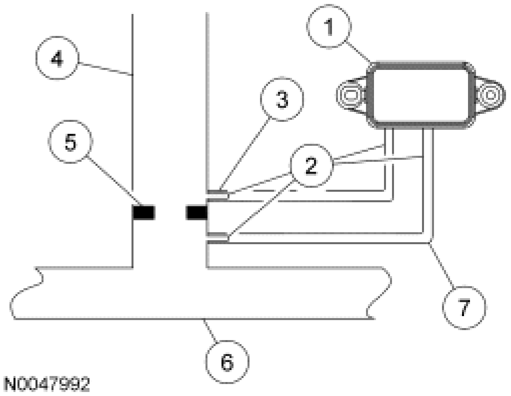

Fig. 120: Typical Differential Pressure Feedback EGR System
Courtesy of FORD MOTOR CO.

TYPICAL DIFFERENTIAL PRESSURE FEEDBACK EGR SYSTEM

Item Number	Description
1	Differential Pressure Feedback EGR Sensor
2	Pickup Tubes
3	Upstream Pressure Hose
4	To EGR Valve
5	Orifice Tube Assembly

6	Exhaust Manifold
7	Downstream Pressure Hose

- **Is a concern present?**

Yes	No
REPAIR or INSTALL a new pressure hose as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HE39.

HE39 CHECK THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR OUTPUT BY APPLYING VACUUM WITH THE HAND PUMP

- Disconnect the pressure hoses at the differential pressure feedback EGR sensor.
- Connect the vacuum pump to the downstream connection at the sensor (intake manifold side of the sensor or the smaller diameter pickup tube).
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release the vacuum.
  - The DPFEGR PID voltage must be between 0.25 and 1.3 volts with the key ON and no vacuum applied.
  - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.	CONNECT all the hoses. GO to HE40.

HE40 CHECK THE VREF VOLTAGE TO THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR

- Key in OFF position.

- Differential Pressure Feedback EGR Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Differential Pressure Feedback EGR Sensor Connector, Harness Side	(-) Differential Pressure Feedback EGR Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 5.5 V?**

Yes	No
GO to HE41.	refer to **PINPOINT TEST C**.

HE41 CHECK THE DPFE CIRCUIT FOR A SHORT TO VREF

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	DPFE

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HE42.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE42 CARRY OUT THE KOER SELF-TEST WHILE MONITORING THE EGR VACUUM

NOTE: **Since the EGR vacuum hose is disconnected, ignore the DTCs during this KOER self-test.**

- PCM connector connected.
- Differential Pressure Feedback EGR Sensor connector connected.
- Disconnect the vacuum hose at the EGR valve and connect the hose to the vacuum gauge.
- Carry out the KOER self-test.
- Monitor the vacuum gauge. Approximately 30 seconds into the test, EGR flow will be requested for a few seconds. Vacuum at this time should increase to greater than 5.4 kPa (1.6 in-Hg) to open the valve.
- **Does the vacuum increase to 10 kPa (3.0 in-Hg) or greater at any time during the KOER self-test?**

Yes	No
GO to HE43.	GO to HE44.

HE43 CHECK THE EGR VALVE FUNCTION BY APPLYING VACUUM WITH THE HAND PUMP

- Key in OFF position.
- Disconnect the vacuum hose at the EGR valve and plug the hose.
- Connect the vacuum pump to the EGR valve.
- Key ON, engine running.
- Access the PCM and monitor the RPM PID.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds. If the engine wants to stall, increase the engine speed to approximately 1,000 RPM and hold steady.
- Monitor for the following:
  - The EGR valve starts opening at about 5.4 kPa (1.6 in-Hg) vacuum, indicated by an increasing DPFEGR PID voltage.
  - The DPFEGR PID voltage increases until the valve is fully open. The DPFEGR PID voltage must read at least 2.5 volts with full vacuum applied.
  - The DPFEGR PID voltage remains steady with steady vacuum. If voltage drops within a few seconds, the EGR valve or vacuum source may be leaking.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate the EGR valve is operating as described in the test step?**

Yes	No
GO to HE47.	GO to HE44.

HE44 PHYSICALLY INSPECT ALL VACUUM LINES BETWEEN THE EGR VALVE, EGR VACUUM REGULATOR AND VACUUM SOURCE

- Key in OFF position.
- Inspect all vacuum lines for leaks, kinks, pinches, disconnects, blockage, misrouting or physical damage of any type.
- Inspect the EGR vacuum regulator for cracks or other physical damage.
- **Is a concern present?**

Yes	No
REPAIR as necessary. If the EGR vacuum regulator is damaged, INSTALL a new EGR vacuum regulator. REFER to the **ENGINE EMISSION CONTROL --**	GO to HE45.

E-SERIES . CLEAR the DTCs. REPEAT the self-test.	

HE45 PHYSICALLY INSPECT THE EGR VALVE

- Remove and inspect the EGR valve for signs of contamination, unusual wear, carbon deposits, binding or other damage.
- **Is a concern present?**

Yes	No
REPAIR as necessary. If repair is not possible, INSTALL a new EGR valve. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to HE46.

HE46 CHECK THE ENGINE VACUUM

- EGR vacuum regulator vacuum hoses disconnected.
- Connect a hand held vacuum gauge to the vacuum source.
- Key ON, engine running.
- Engine warm and at idle.
- Observe the vacuum gauge.
- **Is the vacuum gauge steadily reading at least 51 kPa (15 in-Hg)?**

Yes	No
GO to HE47.	ISOLATE the base engine concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

HE47 CHECK THE VPWR VOLTAGE TO THE EGR VACUUM REGULATOR SOLENOID

- Key in OFF position.
- EGR Vacuum Regulator Solenoid connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) EGR Vacuum Regulator Solenoid Connector, Harness Side	(-) Vehicle Battery
VPWR - Pin 1	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No

GO to HE48.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HE48 CHECK THE EGR VACUUM REGULATOR SOLENOID COIL RESISTANCE

- Key in OFF position.
- Measure the resistance between:

(+) EGR Vacuum Regulator Solenoid Connector, Component Side	(-) EGR Vacuum Regulator Solenoid Connector, Component Side
VPWR - Pin 1	EVR - Pin 2

- **Is the resistance between 26 - 40 ohms?**

Yes	No
GO to HE49.	INSTALL a new EGR Vacuum Regulator solenoid. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HE49 CHECK THE EGR VACUUM REGULATOR CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
EVR	Negative terminal

- **Is the voltage greater than 1 V?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to HE50.

HE50 CHECK THE EGR VACUUM REGULATOR CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) EGR Vacuum Regulator Solenoid Connector, Harness Side
EVR	EVR - Pin 2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HE51.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HE51 INSPECT THE EGR SYSTEM FOR LEAKS, RESTRICTIONS AND POOR CONNECTIONS

- EGR Vacuum Regulator Solenoid connector connected.
- PCM connector connected.
- Visually inspect the EGR system for signs of intermittent failure.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HE52.

HE52 CHECK THE EGR VACUUM REGULATOR SOLENOID VACUUM FLOW BY GROUNDING THE EVR CIRCUIT

NOTE: If the EGR vacuum regulator does not react within 2 seconds, an EGR vacuum regulator concern may be present.

- Disconnect the vacuum hose at the EGR valve and connect the hose to the vacuum gauge.
- Key ON, engine running.
- Engine warm and at idle.
- Connect a 5 amp fused jumper wire between the following:

Point A EGR Vacuum Regulator Solenoid Connector, Harness Side	Point B Vehicle Battery
EVR - Pin 2	Negative terminal

- **Does the vacuum gauge indicate 13.5 kPa (4.0 in-Hg) or greater within 2 seconds?**

Yes	No
GO to HE66.	INSTALL a new EGR Vacuum Regulator solenoid. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HE53 INSPECT THE DIFFERENTIAL PRESSURE FEEDBACK EGR PRESSURE HOSES

- Visually inspect the upstream pressure hose routing.
- Visually inspect the downstream pressure hose routing.

- Inspect for a reversed connection at the differential pressure feedback EGR sensor or orifice tube assembly.
- The hose must not be pinched or have dips in it where water could settle or freeze.
- Inspect both hoses for leaks and blockage.
- Inspect the differential pressure feedback EGR sensor and orifice tube assembly for blockage or damage at the pick-up tubes.

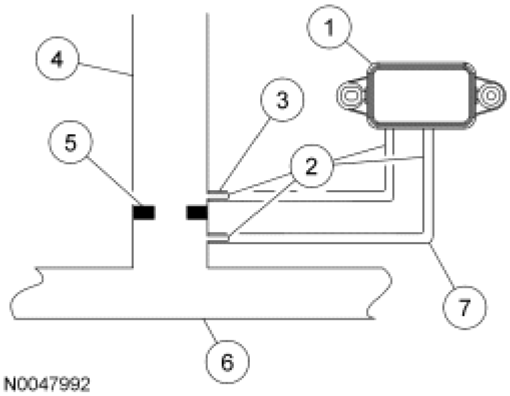

Fig. 121: Typical Differential Pressure Feedback EGR System
Courtesy of FORD MOTOR CO.

TYPICAL DIFFERENTIAL PRESSURE FEEDBACK EGR SYSTEM

Item Number	Description
1	Differential Pressure Feedback EGR Sensor
2	Pickup Tubes
3	Upstream Pressure Hose
4	To EGR Valve
5	Orifice Tube Assembly
6	Exhaust Manifold
7	Downstream Pressure Hose

- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HE54.

HE54 CHECK THE EGR VALVE FUNCTION BY APPLYING VACUUM WITH THE HAND PUMP

- Disconnect the pressure hoses at the differential pressure feedback EGR sensor.
- Connect the vacuum pump to the downstream connection at the sensor (intake manifold side of the sensor or the smaller diameter pickup tube).
- Key ON, engine OFF.

- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release the vacuum.
  - The DPFEGR PID voltage must be between 0.25 and 1.3 volts with the key ON and no vacuum applied.
  - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. After installing the new differential pressure feedback EGR sensor, TURN the key to the ON position for approximately 5 seconds before starting. This allows the PCM to calibrate itself to the new differential pressure feedback EGR sensor. Failure to do this may result in an incorrect DTC P0402. CLEAR the DTCs. REPEAT the self-test.	CONNECT all the hoses. GO to HE55.

HE55 CHECK THE EGR VALVE FUNCTION BY APPLYING VACUUM WITH THE HAND PUMP

- Disconnect the vacuum hose at the EGR valve and plug the hose.
- Connect the vacuum pump to the EGR valve.
- Key ON, engine running.
- Access the PCM and monitor the RPM PID.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds. If the engine wants to stall, increase the engine speed to approximately 1,000 RPM and hold steady.
- Monitor for the following:
  - The EGR valve starts opening at about 5.4 kPa (1.6 in-Hg) vacuum, indicated by an increasing DPFEGR PID voltage.
  - The DPFEGR PID voltage increases until the valve is fully open. The DPFEGR PID voltage must read at least 2.5 volts with full vacuum applied.
  - The DPFEGR PID voltage remains steady with steady vacuum. If voltage drops within a few seconds, the EGR valve or vacuum source may be leaking.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.

- **Does the DPFEGR PID voltage indicate the EGR valve is operating as described in the test step?**

Yes	No
GO to HE56.	REMOVE and INSPECT the EGR valve for signs of contamination, unusual wear, carbon deposits, binding or other damage. If OK, REMOVE and INSPECT the EGR valve and tube for signs of contamination, unusual wear, carbon deposits, binding or other damage. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

HE56 INSPECT THE EGR VACUUM SIGNAL SUPPLY FOR AN INTERMITTENT CONCERN

- Key in OFF position.
- Remove the vacuum hose from the EGR valve and connect to a vacuum gauge.
- Key ON, engine running.
- Connect a 5 amp fused jumper wire between the following:

Point A EGR Vacuum Regulator Solenoid Connector, Harness Side	Point B Vehicle Battery
EVR - Pin 2	Negative terminal

- The solenoid is full ON.
- Vacuum gauge should read above 13.5 kPa (4 in-Hg).
- Observe the vacuum gauge.
- Look for a concern while carrying out the following checks:
  - Lightly tap on the EGR vacuum regulator solenoid.
  - Carry out a thorough wiggle test on the EGR vacuum regulator harness.
  - Inspect the EGR vacuum signal supply for an intermittent concern.
  - Inspect the EGR vacuum regulator solenoid and vacuum hoses for plugging.
  - A concern is indicated by a sudden drop in the vacuum reading.
- **Is a concern indicated?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. Note: In cold climates, the EGR valve may temporarily freeze shut and thaw when the engine warms. refer to **PINPOINT TEST Z**.

HE57 EGR DIAGNOSIS BY SYMPTOM: CHECK FOR EGR FLOW WITH THE EGR VACUUM HOSE DISCONNECTED AND PLUGGED

- Carry out the KOER self-test. Repair any other DTCs.
- Possible causes for EGR flow at idle with no related DTCs:
  - EGR valve not fully seating
  - EGR vacuum regulator solenoid vent restricted
  - Damaged EGR vacuum regulator solenoid
- Disconnect and plug the vacuum hose connected to the EGR valve.
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Note the voltage.
- Key ON, engine running.
- With the engine at idle, observe the DPFEGR PID voltage. Compare to engine OFF voltage.
- An increase in voltage at idle indicates the differential pressure feedback EGR sensor is sensing EGR flow.
- **Is the DPFEGR PID voltage greater at idle by 0.15 V than with the engine off?**

Yes	No
REMOVE and INSPECT the EGR valve for signs of contamination, unusual wear, carbon deposits, binding or other damage. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Inspect the EGR vacuum regulator solenoid and vacuum hoses for plugging. INSPECT the EGR vacuum regulator solenoid vent for blockage. GO to HE58.

HE58 DETERMINE THE EGR VALVE VACUUM SUPPLY

- **Is a concern present in the EGR valve vacuum supply?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	INSTALL a new EGR Vacuum Regulator solenoid. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HE59 DTCS P0403 AND P1409: CHECK THE EGR VACUUM REGULATOR SOLENOID COIL RESISTANCE

- Key in OFF position.
- EGR Vacuum Regulator Solenoid connector disconnected.
- Measure the resistance between:

(+) EGR Vacuum Regulator Solenoid Connector, Component Side	(-) EGR Vacuum Regulator Solenoid Connector, Component Side

VPWR - Pin 1	EVR - Pin 2

- **Is the resistance between 26 - 40 ohms?**

Yes	No
GO to HE60.	INSTALL a new EGR Vacuum Regulator solenoid. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HE60 CHECK THE VPWR VOLTAGE TO EGR VACUUM REGULATOR SOLENOID

- Key ON, engine OFF.
- Measure the voltage between:

(+) EGR Vacuum Regulator Solenoid Connector, Harness Side	(-) Vehicle Battery
VPWR - Pin 1	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to HE61.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HE61 CHECK THE EGR VACUUM REGULATOR CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) EGR Vacuum Regulator Solenoid Connector, Harness Side
EVR	EVR - Pin 2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HE62.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HE62 CHECK THE EGR VACUUM REGULATOR CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.

- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
EVR	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to HE63.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE63 CHECK THE EGR VACUUM REGULATOR CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
EVR	PWRGND

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HE66.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HE64 CHECK FOR THE PRESENCE OF KOER DTCS P0403 OR P1409

- Carry out the KOER self-test.
- **Are DTCs P0403 or P1409 present?**

Yes	No
GO to HE59.	GO to HE65.

HE65 CARRY OUT A THOROUGH WIGGLE TEST ON THE EGR VACUUM REGULATOR HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
EVR	PWRGND

- Lightly tap on the EGR vacuum regulator solenoid. Wiggle the EGR vacuum regulator solenoid connector. Carry out a thorough wiggle test on the harness. A concern is indicated by a voltage drop during the wiggle test.
- **Is the voltage greater than 10 V?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

HE66 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HF: CATALYST EFFICIENCY MONITOR AND EXHAUST SYSTEMS

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- catalytic converter
- exhaust system

TEST PROCEDURE

HF1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0420 or P0430 present?**

Yes	No
GO to HF2.	For symptoms without DTCs, GO to HF6. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HF2 CHECK FOR OTHER DTCS

NOTE: **Internal deterioration of a catalytic converter is usually caused by abnormal engine operation upstream of the catalyst. Events that can produce higher than normal temperatures in the catalyst are particularly suspect. For example, misfiring can cause higher than normal catalyst operating temperatures.**

NOTE: **Make sure the customer has not:**

- **refueled the vehicle with leaded gasoline.**
- **noticed a high vehicle oil consumption. An engine that consumes oil at a high rate deposits high levels of phosphorus on the catalyst and reduces the catalyst efficiency.**

- Check for self-test DTCs.
- **Are any DTCs present other than the following: P0420, P0430?**

Yes	No
GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** for pinpoint test direction and REPAIR the misfire DTCs. CLEAR the DTCs. REPEAT the self-test.	GO to HF3.

HF3 CHECK THE ELECTRONIC ENGINE CONTROL (EEC) WIRING HARNESS

NOTE: **Check the HO2S electrical connectors to make sure the correct HO2S is connected to the correct electrical connector. The electrical connectors are color coded to make sure the correct connection is made.**

If the electrical connection of the rear HO2S are interchanged/crossed, the catalyst efficiency monitor test fails.

- Visually inspect the HO2S harness connectors for any indication of crossed wiring.
- Visually inspect the harness for exposed wiring, corrosion and correct routing.
- Visually inspect the PCM connectors for damaged, or pushed out pins, corrosion and loose wires.
- **Are there any concerns with the wiring or the PCM connection?**

Yes	No

REPAIR as necessary. CLEAR the DTCs. CARRY OUT the catalyst monitor drive cycle to verify the repairs.	GO to HF4.

HF4 CHECK THE FUEL PRESSURE

WARNING: **The fuel system remains pressurized when the engine is not running. To prevent injury or fire, use caution when working on the fuel system. Failure to follow these instructions may result in personal injury.**

WARNING: **Before repairing or installing a new component in the fuel system, reduce the possibility of injury or fire by following the warning, caution, and handling directions in pinpoint test HC. refer to PINPOINT TEST HC. Failure to follow these instructions may result in personal injury.**

NOTE: Fuel pressure above specification can produce an abnormally rich air/fuel mixture. This rich air/fuel mixture can cause higher than normal catalyst operating temperatures.

NOTE: On electronic returnless fuel system (ERFS), the fuel pressure can be monitored by the scan tool using the fuel rail pressure (FRP) PID.

- Mechanical returnless fuel systems (MRFS):
  - If applicable, inspect the vacuum hose going to the fuel rail pulse damper for proper installation and cracks. Repair as necessary.
- Connect a Rotunda fuel pressure gauge or equivalent.
- Access the PCM and monitor the FRP PID.
- Start the engine. Record the fuel pressure.
- Compare the recorded fuel pressure reading to the Fuel System Specification Chart found at the beginning of Pinpoint Test HC. refer to **PINPOINT TEST HC**.
- Key in OFF position.
- **Is the fuel pressure within specifications?**

Yes	No
The fuel pressure is OK. If applicable, REMOVE the fuel pressure gauge. GO to HF5.	The fuel pressure is out of specification. GO to HC3.

HF5 CHECK FOR LEAKS IN THE EXHAUST SYSTEM

NOTE: If a catalyst is in series with a leaking exhaust system, it can fail the

catalyst efficiency monitor test.

- Inspect the exhaust system for leaks, cracks, loose connections, punctures, or non-factory modifications.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. CARRY OUT the catalyst monitor drive cycle to verify the repairs.	GO to HF10.

HF6 CHECK FOR RESTRICTIONS IN THE EXHAUST SYSTEM

NOTE: **A slight pressure in the exhaust system is normal, but excessive exhaust back pressure seriously affects engine operation.**

- Inspect the following for damage or restrictions:
  - front and rear exhaust pipes
  - catalytic converter
  - muffler and tailpipe assembly
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HF7.

HF7 CHECK FOR EXCESSIVE EXHAUST BACK PRESSURE

- The internal condition of exhaust system and its ability to flow can be checked with an exhaust back pressure tool.
- **Is an exhaust back pressure tester available?**

Yes	No
GO to HF8.	GO to HF9.

HF8 CHECK FOR EXCESSIVE EXHAUST BACK PRESSURE WITH EXHAUST BACK PRESSURE TOOL

NOTE: **Typical exhaust back pressure, when measured near the exhaust manifold and at normal engine operating temperature, should not exceed 20.7 kPa (3 psi) at idle and 55.2 kPa (8 psi) at wide open throttle (WOT) under load.**

- Install an exhaust back pressure tester and follow the tool manufacturer installation and testing

instructions.

- **Does the exhaust back pressure test indicate a restriction?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. To continue diagnosis of a symptom (lack of power, loss of power, or no start), REFER to the **SYMPTOM CHARTS** article Symptom Charts.	No indication of restrictions or leaks has been detected in the exhaust system. To continue diagnosis of a symptom (lack of power, loss of power, or no start), REFER to the **SYMPTOM CHARTS** article Symptom Charts.

HF9 CHECK MANIFOLD VACUUM FOR AN INDICATION OF EXCESSIVE EXHAUST SYSTEM RESTRICTION

NOTE: **When the engine is first started and is idled, the reading may be normal 51-74 kPa (15-22 in-Hg), but as the engine RPM is increased, the back pressure caused by a clogged exhaust system causes the needle to slowly drop to 0 kPa (0 in-Hg). The needle then may slowly rise. Excessive exhaust restriction causes the needle to drop to a low point even if the engine is only idling.**

- Attach a vacuum gauge to the intake manifold vacuum source.
- Observe the vacuum gauge while increasing the engine RPM.
- **Does the vacuum gauge indicate an exhaust restriction concern?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. To continue diagnosis of a symptom (lack of power, loss of power, or no start), REFER to the **SYMPTOM CHARTS** article Symptom Charts.	No indication of restrictions or leaks has been detected in the exhaust system. To continue diagnosis of a symptom (lack of power, loss of power, or no start), REFER to the **SYMPTOM CHARTS** article Symptom Charts.

HF10 CARRY OUT THE CATALYST MONITOR DRIVE CYCLE

- Carry out the catalyst monitor drive cycle. Refer to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** .
- Retrieve the continuous memory DTCs.
- **Are DTCs P0420 or P0430 present?**

Yes	No
INSTALL a new catalyst between the monitored HO2S sensors, only for the bank referenced, (P0420 Bank 1), (P0430 Bank 2). Do not install a new unmonitored catalyst unless it is repaired as an assembly. REFER to the **EXHAUST SYSTEM -- E-SERIES** .	The test is complete and no concerns are present.

CLEAR the DTCs. REPEAT the self-test.	

PINPOINT TEST HG: POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- positive crankcase ventilation (PCV) valve (6A666) and related vacuum lines
- electrically heated PCV valve (6A666) and heater circuit, both PCM and non-PCM controlled
- electrically heated PCV tube (9F624) and heater circuit, both PCM and non-PCM controlled
- powertrain control module (PCM) (12A650)
- PCV thermal extension harness (12A580)

NOTE: **For the electrically heated PCV system only, refer to <u>POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM</u> .**

Electrically Heated PCV

This table is only for vehicles equipped with a PCM controlled PCV heater.

Vehicle	Connector	Pin	Circuit
E-Series, F-Super Duty	170 Pin	E2	PCVHC
F-150	190 Pin	E3	PCVHC
Fusion, Milan	140 Pin	E2	PCVHC
Mustang 5.4L	170 Pin	E67	PCVHC
All other vehicles	170 Pin	E3	PCVHC

TEST PROCEDURE

HG1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- Check for DTCs P053A, P145E or P1489.
- **Are any of the above listed DTCs present?**

Yes	No
GO to HG5.	For all other symptoms without DTCs, GO to HG2.

HG2 VISUAL INSPECTION OF THE PCV VALVE

NOTE: If the PCV valve or tube is electrically heated, verify the electrical connection. On some applications the vehicle may be equipped with a thermal harness that only provides electrical continuity when the temperature is less than 5°C (40°F) +/- 4°C (+/- 7°F). Typically this harness is located close to the PCV valve or tube.

NOTE: If the PCV valve is water heated, verify the coolant hose and clip connections.

- Check the PCV valve, hoses and connections for leaks or restrictions.
- Verify the PCV valve maintenance schedule has been followed.
- Verify the proper PCV valve part number.
- Verify the PCV valve is clean.
- Verify the fresh air tube and related hoses are clean and routed correctly.
- **Is a concern present?**

Yes	No
REPAIR as necessary. VERIFY the symptom no longer exists.	For an electrically heated PCV tube, GO to HG4. For all others, GO to HG3.

HG3 STUCK PCV VALVE CHECK

- Disconnect the PCV valve from the valve cover.
- Shake the PCV valve.
- **Does the PCV valve rattle when shaken?**

Yes	No
REINSTALL the PCV valve. For PCV systems with electrical heating, GO to HG4. For PCV systems without electrical heating, GO to HG12.	The PCV valve is sticking. INSTALL a new PCV valve. VERIFY the symptom no longer exists.

HG4 CHECK FOR A PCM CONTROLLED PCV HEATER

NOTE: If a thermal extension harness is present then the PCV is non-PCM controlled. Refer to POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM .

- Check if the PCV heater is PCM controlled.
- **Is the PCV heater PCM controlled?**

Yes	No
GO to HG5.	GO to HG8.

HG5 CHECK THE HARNESS VOLTAGE TO THE PCM CONTROLLED PCV HEATER

- Suspect PCV connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCVHF Connector, Harness Side	(-)
IGN START/RUN - Pin 2	Ground

- Measure the voltage between:

(+) PCV Connector, Harness Side	(-)
IGN START/RUN	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to HG6.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HG6 CHECK THE HARNESS CIRCUIT TO THE PCM CONTROLLED PCV HEATER

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCVHF Connector, Harness Side
PCVHF	PCVHF - Pin 1

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCV Connector, Harness Side
PCVHC	PCVHC

- **Is the resistance greater than 5 ohms?**

Yes	No
GO to HG7.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HG7 CHECK THE RESISTANCE OF THE PCM CONTROLLED PCV VALVE OR TUBE HEATER

- Measure the resistance between:

(+) PCVHF Connector, Component Side	(-) PCVHF Connector, Component Side
IGN START/RUN - Pin 2	PCVHF - Pin 1

- Measure the resistance between:

(+) PCV Connector, Component Side	(-) PCV Connector, Component Side
IGN START/RUN	PCVHC

- **Is the resistance between 10 - 35 ohms?**

Yes	No
GO to HG13.	INSTALL a new PCV valve or tube. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HG8 CHECK THE VOLTAGE AND GROUND AT THE HARNESS ELECTRICALLY HEATED PCV VALVE OR TUBE NON-PCM CONTROLLED

- PCV connector disconnected.
- PCVTE-Harness Side connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCVTE-Harness Side, Harness Side	(-) PCVTE-Harness Side, Harness Side
IGN START/RUN - Pin 1	GND - Pin 2

- **Is the voltage greater than 10 V?**

Yes	No
For vehicles with a thermal extension harness, GO to HG10. For all others, GO to HG11.	GO to HG9.

HG9 CHECK THE VOLTAGE CIRCUIT

- PCV connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCV Connector, Harness Side	(-)
IGN START/RUN	Ground

- **Is the voltage greater than 10 V?**

Yes	No
REPAIR the open GND circuit. TEST the system for normal operation.	REPAIR the open PWR circuit TEST the system for normal operation.

HG10 VALVE RESISTANCE CHECK WITHOUT AN EXTENSION HARNESS

NOTE: On some applications the vehicle may be equipped with a thermal harness that only provides electrical continuity when the temperature is less than 5°C (40°F) +/- 4°C (+/- 7°F). Typically this harness is located close to the PCV valve or tube.

- Disconnect the thermal extension harness from the PCV valve.
- Measure the resistance between:

(+) PCV Connector, Component Side	(-) PCV Connector, Component Side
IGN START/RUN	PCVHC

- **Is the resistance between 10 - 35 ohms?**

Yes	No
INSTALL a new thermal extension harness PCV. TEST the system for normal operation.	INSTALL a new PCV.

HG11 CHECK THE RESISTANCE OF THE ELECTRICALLY HEATED PCV VALVE OR TUBE

- Measure the resistance between:

(+) PCV Connector, Component Side	(-) PCV Connector, Component Side
IGN START/RUN	GND

- **Is the resistance between 10 - 35 ohms?**

Yes	No
GO to HG12.	INSTALL a new PCV valve or tube. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** .

HG12 PCV SYSTEM CHECK

- Start the engine and warm it until engine temperature is stable.
- Disconnect the closure (fresh air) hose from the remote air cleaner or air outlet tube (the tube connecting the mass air flow sensor and the throttle body).
- Place a stiff piece of paper over the hose end. Wait 1 minute.
- **Does vacuum hold the paper in place?**

Yes	No
The PCV system is OK. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	CHECK for vacuum leaks/obstruction in the PCV system (such as oil cap, PCV valve, hoses, cut grommets, valve cover bolt torque/gasket leak). REFER to the vehicle emissions control information (VECI) label for PCV system components and routing. REPAIR as necessary.

HG13 CHECK IF A CONCERN OR DTC IS STILL PRESENT

- Connect the PCV system.
- Clear the DTCs.
- Carry out the self-test.
- **Is the concern or DTC is still present?**

Yes	No
GO to HG14.	Unable to duplicate or identify the concern at this time. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.

HG14 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HH: EXHAUST GAS RECIRCULATION SYSTEM MODULE (ESM)

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- ESM (9Y456)
- orifice tube assembly (9D477)
- differential pressure feedback exhaust gas recirculation (EGR) sensor pressure hoses
- vacuum lines
- harness circuits: DPFE, SIGRTN, EVR, VPWR and VREF
- powertrain control module (PCM) (12A650)

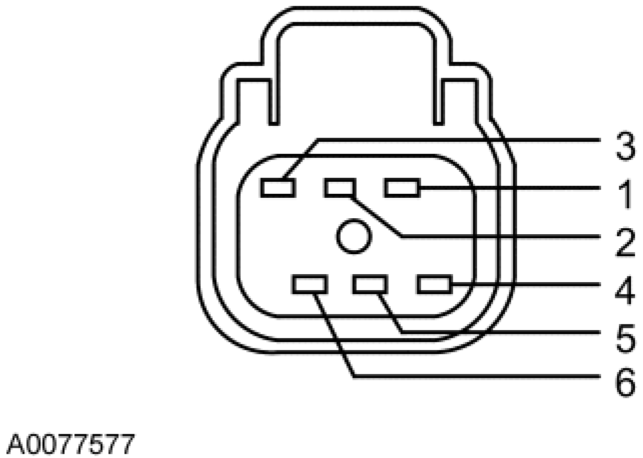

Fig. 127: EGR System Module (ESM) Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
1	EVR (EGR Vacuum Regulator)
4	VPWR (Vehicle Power)
6	SIGRTN (Signal Return)
5	DPFE (Differential Pressure Feedback EGR)
2	VREF (Reference Voltage)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
E-Series, F-Super Duty	170 Pin	E63 E58 E57 E58 E21	EVR SIGRTN VREF SIGRTN DPFE
F-150	190 Pin	E63 E58 B29, E57 B58, E58, T43	EVR SIGRTN VREF SIGRTN

		E21	DPFE
Mustang	170 Pin	E63 E58 B40, E57 B41, E58, T41 E21	EVR SIGRTN VREF SIGRTN DPFE
All other vehicles	170 Pin	E63 E58 E57 B41, E58, T41 E21	EVR SIGRTN VREF SIGRTN DPFE

TEST PROCEDURE

HH1 CHECK FOR DTCS

- **Are DTCs P0401, P0402, P0403, P0405, P0406, P1408, or P1409 present?**

Yes	No
For DTC P0401, GO to HH16. For DTC P0402, GO to HH12. For DTCs P0403 and P1409, GO to HH22. For DTC P0405, GO to HH2. For DTC P0406, GO to HH5. For DTC P1408, GO to HH17.	For symptoms without DTCs, GO to HH28. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HH2 DTC P0405: DETERMINE THE PRESENT DPFEGR PID VOLTAGE

- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the voltage less than 0.05 V?**

Yes	No
GO to HH3.	GO to HH11.

HH3 INDUCE THE OPPOSITE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR SIGNAL

- Key in OFF position.
- ESM connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the voltage between 4 - 6 V?**

Yes	No
INSTALL a new Differential Pressure Feedback	GO to HH4.

EGR sensor. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	

HH4 CHECK THE DPFE CIRCUIT FOR A SHORT TO SIGRTN OR GND IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
DPFE	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
DPFE	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HH29.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HH5 DTC P0406: DETERMINE THE PRESENT DPFEGR PID VOLTAGE

- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the voltage greater than 4 V?**

Yes	No
GO to HH6.	GO to HH11.

HH6 CHECK THE VREF VOLTAGE TO THE ESM

- Key in OFF position.
- ESM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ESM Connector, Harness Side	(-) Vehicle Battery
VREF - Pin 2	Negative terminal

- **Is the voltage between 4 - 5.5 V?**

Yes	No
GO to HH7.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HH7 CHECK THE DPFE CIRCUIT FOR A SHORT TO VOLTAGE

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ESM Connector, Harness Side	(-) Vehicle Battery
DPFE - Pin 5	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to HH8.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HH8 CHECK THE DPFE CIRCUIT FOR A SHORT TO VREF

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	DPFE

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HH9.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HH9 CHECK THE DPFE AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) ESM Connector, Harness Side
DPFE	DPFE - Pin 5
SIGRTN	SIGRTN - Pin 6

- **Are the resistances less than 5 ohms?**

Yes	No

GO to HH10.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HH10 INDUCE THE OPPOSITE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR VOLTAGE

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A ESM Connector, Harness Side	Point B ESM Connector, Harness Side
DPFE - Pin 5	SIGRTN - Pin 6

- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- **Is the voltage less than 0.1 V?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to HH29.

HH11 CARRY OUT A THOROUGH WIGGLE TEST ON THE ESM HARNESS

- Access the PCM and monitor the DPFEGR PID.
- Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.
- **Is there any change in the voltage reading, or is a concern found?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

HH12 DTC P0402: CHECK THE VREF VOLTAGE TO THE ESM

NOTE: **Diagnose and repair all circuit concern DTCs before diagnosing range/performance or flow concerns. For circuit concern DTC diagnosis, refer to DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS .**

- Key in OFF position.
- ESM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ESM Connector, Harness Side	(-) Vehicle Battery
VREF - Pin 2	Negative terminal

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to HH13.	refer to **PINPOINT TEST C**.

HH13 SIMULATE THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR SIGNAL WITH A VACUUM PUMP

- Disconnect the downstream differential pressure feedback EGR sensor port hose at the ESM.
- Verify the hose and port are clear and free of obstructions.
- Connect a vacuum pump to the downstream differential pressure feedback EGR sensor port.
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release the vacuum.
  - The DPFEGR PID voltage must be between 0.25 and 1.3 volts with the key ON and no vacuum applied.
  - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to HH14.

HH14 INSPECT THE EGR VACUUM REGULATOR SOLENOID VENT FOR BLOCKAGE

NOTE: **When the EGR valve is closed, the EGR vacuum regulator solenoid vacuum is vented through the solenoid vent to the atmosphere. A plugged EGR vacuum regulator solenoid vent does not allow EGR vacuum to vent to the atmosphere.**

- EGR vacuum regulator vacuum hoses disconnected.
- Connect a hand vacuum pump to the EGR vacuum regulator source port.
- Apply 34 to 51 kPa (10 to 15 in-Hg) vacuum.

- **Does the EGR vacuum regulator solenoid vacuum bleed off?**

Yes	No
GO to HH15.	INSTALL a new EGR vacuum regulator solenoid. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HH15 CHECK THE EGR VALVE FOR CARBON BUILD-UP

- Remove the ESM.
- Visually inspect the EGR valve and valve seat for correct seating, carbon build-up and debris.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time.

HH16 DTC P0401: CARRY OUT THE KOER SELF-TEST

NOTE: Diagnose and repair all circuit concern DTCs before diagnosing range/performance or flow concerns.

- Carry out the KOER self-test.
- **Is DTC P1408 present?**

Yes	No
GO to HH17.	GO to HH18.

HH17 DTC P1408: CHECK THE VREF VOLTAGE TO THE ESM

- Key in OFF position.
- ESM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ESM Connector, Harness Side	(-) Vehicle Battery
VREF - Pin 2	Negative terminal

- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
GO to HH18.	refer to **PINPOINT TEST C**.

HH18 CHECK THE EGR VACUUM REGULATOR SOLENOID VACUUM

- ESM connector connected.
- Disconnect the EGR vacuum regulator vacuum source hose.
- Connect a vacuum gauge to the EGR vacuum regulator vacuum source hose.
- Key ON, engine running.
- Monitor the vacuum gauge.
- **Is the manifold vacuum greater than 34 kPa (10 in-Hg)?**

Yes	No
GO to HH19.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

HH19 SIMULATE THE DIFFERENTIAL PRESSURE FEEDBACK EGR SENSOR SIGNAL WITH A VACUUM PUMP

- Key in OFF position.
- Disconnect the downstream differential pressure feedback EGR sensor port hose at the ESM.
- Verify the hose and port are clear and free of obstructions.
- Connect a vacuum pump to the downstream differential pressure feedback EGR sensor port.
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Apply 27 - 30 kPa (8 - 9 in-Hg) vacuum to the differential pressure feedback EGR sensor and hold for 10 seconds.
- Quickly release the vacuum.
  - The DPFEGR PID voltage must be between 0.25 and 1.3 volts with the key ON and no vacuum applied.
  - The DPFEGR PID voltage must increase to greater than 4 volts with the vacuum applied.
  - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when the vacuum is released.
- **Does the DPFEGR PID voltage indicate a concern in the differential pressure feedback EGR sensor?**

Yes	No
INSTALL a new Differential Pressure Feedback EGR sensor. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	CONNECT all the hoses. GO to HH20.

HH20 CHECK THE EGR VACUUM REGULATOR SOLENOID OPERATION

- Key ON, engine running.
- Engine at normal operating temperature.
- Allow the engine idle to stabilize.

- Access the PCM and monitor the RPM PID.
- Access output state control.
- Increase the EGR vacuum regulator duty cycle while monitoring the RPM PID.
- **Does the RPM decrease or the engine stall as the EGR vacuum regulator duty cycle is increased?**

Yes	No
Unable to duplicate or identify the concern at this time.	GO to HH21.

HH21 CHECK FOR THE PRESENCE OF CARBON BUILD-UP IN THE EGR PASSAGE

NOTE:	**In certain vehicle applications, carbon build-up may occur downstream of the ESM. An inspection is required to make sure the passage in the upper intake manifold plenum chamber behind the ESM is open to allow exhaust gas flow.**

- Key in OFF position.
- Remove the ESM. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** .
- Disconnect the air inlet tube from the throttle body.
- Prop open the throttle body.
- Apply regulated shop air to the EGR port at the location where the ESM attaches to the upper intake manifold.
- **Is a restriction concern present?**

Yes	No
CLEAN the EGR port as necessary and INSTALL the ESM. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	INSTALL a new ESM. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HH22 DTCS P0403 AND P1409: CHECK THE EGR VACUUM REGULATOR SOLENOID OPERATION

- Key ON, engine running.
- Engine at normal operating temperature.
- Allow the engine idle to stabilize.
- Access the PCM and monitor the RPM PID.
- Access output state control.
- Increase the EGR vacuum regulator duty cycle while monitoring the RPM PID.
- **Does the RPM decrease or the engine stall as the EGR vacuum regulator duty cycle is increased?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	GO to HH23.

HH23 CHECK THE VPWR VOLTAGE TO THE EGR VACUUM REGULATOR SOLENOID

- Key in OFF position.
- ESM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) ESM Connector, Harness Side	(-) Vehicle Battery
VPWR - Pin 4	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to HH24.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HH24 CHECK THE EGR VACUUM REGULATOR SOLENOID COIL RESISTANCE

- Key in OFF position.
- Measure the resistance between:

(+) ESM Connector, Component Side	(-) ESM Connector, Component Side
VPWR - Pin 4	EVR - Pin 1

- **Is the resistance between 26 - 40 ohms?**

Yes	No
GO to HH25.	INSTALL a new EGR Vacuum Regulator solenoid. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HH25 CHECK THE EVR CIRCUIT FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) ESM Connector, Harness Side	(-) PCM Connector, Harness Side
EVR - Pin 1	EVR

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HH26.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HH26 CHECK THE EVR CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
EVR	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to HH27.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HH27 CHECK THE EVR CIRCUIT FOR A SHORT TO GND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
EVR	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HH29.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HH28 EGR DIAGNOSIS BY SYMPTOM: CHECK FOR EGR FLOW WITH THE EGR VACUUM REGULATOR VACUUM HOSE DISCONNECTED AND PLUGGED

NOTE: An increase in DPFEGR PID voltage at idle indicates EGR flow.

- Carry out the KOER self-test. Repair any other DTCs.
- Possible causes for EGR flow at idle with no related DTCs:
  - EGR valve not fully seating
  - EGR vacuum regulator solenoid vent restricted
  - Damaged EGR vacuum regulator solenoid

- Disconnect and plug the EGR vacuum regulator vacuum source hose.
- Key ON, engine OFF.
- Access the PCM and monitor the DPFEGR PID.
- Record the PID voltage.
- Key ON, engine running.
- With the engine at idle, observe the DPFEGR PID voltage. Compare to engine OFF voltage.
- **Is the idle DPFEGR PID voltage greater than 0.15 V when compared to the KOEO DPFEGR PID voltage?**

Yes	No
REMOVE and INSPECT the ESM for signs of contamination, unusual wear, carbon deposits, binding or other damage. REPAIR as necessary. If no concerns are present, INSTALL a new ESM. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	INSPECT the EGR vacuum regulator solenoid vent for blockage. To continue symptom diagnosis, REFER to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS** .

HH29 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
    - pushed out pins
    - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HK: VARIABLE CAMSHAFT TIMING (VCT)

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- VCT solenoid (6L713) or (6B297)

- spider assembly right bank (6C260), or left bank (6C261)
- harness circuits: VPWR and VCT
- powertrain control module (PCM) (12A650)

TEST PROCEDURE

HK1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0010, P0011, P0012, P0016, P0018, P0020, P0021, P0022, P052A, P052B, P052C or P052D present?**

Yes	No
For DTCs P0010 or P0020, GO to HK2. For DTCs P0011, P0012, P0021, P0022, P052A, P052B, P052C or P052D, GO to HK17. For DTCs P0016 and P0018 with or without P0011, P0012, P0021, P0022, P052A, P052B, P052C or P052D, GO to HK16.	For symptoms without DTCs, GO to HK17. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HK2 DTCS P0010 OR P0020: CHECK FOR VCT DTCS

NOTE: The engine should be at operating temperature before running the self-test.

- Clear the DTCs.
- Carry out the KOER self-test.
- **Are DTCs P0010 or P0020 present?**

Yes	No
For KOER DTC P0010, GO to HK4. For KOER DTC P0020, GO to HK10.	GO to HK3.

HK3 CARRY OUT A THOROUGH WIGGLE TEST ON THE VCT HARNESS

- Carry out a thorough wiggle test on the VCT harness.
- Carry out the KOER self-test.
- **Are DTCs P0010 or P0020 present?**

Yes	No
For KOER DTC P0010, GO to HK4. For KOER DTC P0020, GO to HK10.	refer to **PINPOINT TEST Z**.

HK4 CHECK THE VCT1 SOLENOID RESISTANCE

- Key in OFF position.
- VCT1 Solenoid connector disconnected.
- Measure the resistance between:

(+) VCT1 Solenoid Connector, Component Side	(-) VCT1 Solenoid Connector, Component Side
VCT1	VPWR

- **Is the resistance between 5 - 14 ohms?**

Yes	No
GO to HK5.	INSTALL a new VCT1 solenoid. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HK5 CHECK THE VCT1 SOLENOID FOR INTERNAL SHORTS

- Measure the resistance between:

(+) VCT1 Solenoid Connector, Component Side	(-)
VCT1	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HK6.	INSTALL a new VCT1 solenoid. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HK6 CHECK THE VPWR CIRCUIT FOR AN OPEN IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) VCT1 Solenoid Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to HK7.	REPAIR the open circuit. CLEAR the DTCs.

	REPEAT the self-test.

HK7 CHECK THE VCT1 CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) VCT1 Solenoid Connector, Harness Side	(-)
VCT1	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to HK8.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HK8 CHECK THE VCT1 CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) VCT1 Solenoid Connector, Harness Side	(-) PCM Connector, Harness Side
VCT1	VCT1

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HK9.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HK9 CHECK THE VCT1 CIRCUIT FOR A SHORT TO GND IN THE HARNESS

- Measure the resistance between:

(+) VCT1 Solenoid Connector, Harness Side	(-)
VCT1	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HK18.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HK10 DTC P0020: CHECK THE VCT2 SOLENOID RESISTANCE

- Key in OFF position.
- VCT2 Solenoid connector disconnected.
- Measure the resistance between:

(+) VCT2 Solenoid Connector, Component Side	(-) VCT2 Solenoid Connector, Component Side
VCT2	VPWR

- **Is the resistance between 5 - 14 ohms?**

Yes	No
GO to HK11.	INSTALL a new VCT2 solenoid. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HK11 CHECK THE VCT2 SOLENOID FOR INTERNAL SHORTS

- Measure the resistance between:

(+) VCT2 Solenoid Connector, Component Side	(-)
VCT2	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HK12.	INSTALL a new VCT2 solenoid. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HK12 CHECK THE VPWR CIRCUIT FOR AN OPEN IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) VCT2 Solenoid Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to HK13.	REPAIR the open circuit. CLEAR the DTCs.

	REPEAT the self-test.

HK13 CHECK THE VCT2 CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) VCT2 Solenoid Connector, Harness Side	(-)
VCT2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to HK14.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HK14 CHECK THE VCT2 CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) VCT2 Solenoid Connector, Harness Side	(-) PCM Connector, Harness Side
VCT2	VCT2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HK15.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HK15 CHECK THE VCT2 CIRCUIT FOR A SHORT TO GND IN THE HARNESS

- Measure the resistance between:

(+) VCT2 Solenoid Connector, Harness Side	(-)
VCT2	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HK18.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HK16 CONTINUOUS DTCS P0016, P0018 WITH OR WITHOUT P0011, P0012, P0021, P0022, P052A, P052B, P052C, P052D: CHECK THE FUNCTIONALITY OF THE VCT SYSTEM

NOTE: **On 4.6L 3V and 5.4L 3V engines, the VCTADV PID indicates a positive value. For all others, the VCTADV PID indicates a negative value.**

- Engine at normal operating temperature.
- Clear the DTCs.
- For DTC P0016.
- Access the PCM and monitor the VCTADV PID.
- For DTC P0018.
- Access the PCM and monitor the VCTADV2 PID.
- Run the engine at idle for 1 minute while monitoring the VCTADV (P0016) or VCTADV2 (P0018) PID.
- Retrieve the continuous memory DTCs.
- **Are DTCs P0016 or P0018 present?**

Yes	No
For a VCTADV PID value between -16 and -46 degrees (2.3L, 3.5L), -14 and -36 degrees (3.0L), or 24 and 73 degrees (4.6L 3V, 5.4L 3V), INSTALL a new VCT solenoid. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test. For all others, REFER to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** , Timing Drive Components, to verify the engine timing.	Unable to duplicate or identify the concern at this time.

HK17 CONTINUOUS DTCS P0011, P0012, P0021, P0022, P052A, P052B, P052C OR P052D: CHECK THE OPERATION OF THE VCT SYSTEM

NOTE: **Some vehicles require higher RPMs and loads to actuate the VCT system than others. The VCTERR PID should be close to 0 whether actuating or not. During rapid VCT movements, the VCTERR PID may momentarily deviate from 0.**

- For DTCs P0011, P0012, P052A or P052B.
- Access the PCM and monitor the VCTADV PID.
- Access the PCM and monitor the VCTADVERR PID.
- For DTCs P0021, P0022, P052C or P052D.
- Access the PCM and monitor the VCTADV2 PID.
- Access the PCM and monitor the VCTADVERR2 PID.

- Drive the vehicle exercising the throttle to induce VCT movement.
- **Does the VCTADV PID indicate VCT movement while the VCTERR PID maintain close to 0?**

Yes	No
Unable to duplicate or identify the concern at this time.	INSTALL a new VCT solenoid. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HK18 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HM: SECONDARY AIR INJECTION (AIR) SYSTEM

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- secondary air injection system relay (14B192)
- electric air injection pump (9A486)
- secondary air injection bypass solenoid (9H465)
- harness circuits: B+, VPWR, AIR, AIRM, ground
- powertrain control module (PCM) (12A650)

- secondary air injection diverter valve (9F491)
- vacuum supply
- hoses

- partial restricted exhaust

Refer to the Wiring Diagrams article for schematic and connector information.

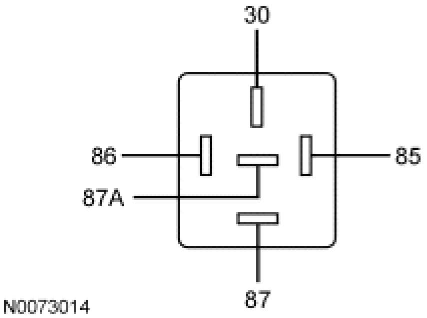

Fig. 133: Powertrain Control Module Power (PCM Power) Relay Connector - B

TEST PROCEDURE

HM1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

- **Are DTCs P0410, P0412, P0491, P2257, P2258, or P2448 present?**

Yes	No
GO to HM2.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HM2 VISUALLY INSPECT THE SECONDARY AIR SYSTEM COMPONENTS AND HOSES

- Visually inspect the secondary AIR system components, connectors and hoses for:
  - damaged hoses
  - obstructions
  - exhaust damage
  - restricted secondary AIR pump inlet
  - water or ice
- **Are the secondary AIR system components and hoses OK?**

Yes	No
GO to HM3.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

HM3 CHECK THE VPWR VOLTAGE TO THE SECONDARY AIR RELAY

- Secondary AIR relay removed.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Secondary AIR Relay Connector, Harness Side	(-)
VPWR - Pin 85	Ground
B+ - Pin 30	Ground

- **Are the voltages greater than 10 V?**

Yes	No
GO to HM4.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HM4 CHECK THE SECONDARY AIR RELAY

- Key in OFF position.
- Carry out the relay component test. Refer to the Wiring Diagrams Cell 149 Component Testing.
- **Does the relay pass the component test?**

Yes	No
GO to HM5.	INSTALL a new secondary AIR relay. CLEAR the DTCs. REPEAT the self-test.

HM5 CHECK THE SECONDARY AIR PUMP GROUND CIRCUIT FOR AN OPEN IN THE HARNESS

- Secondary AIR Pump Motor connector disconnected.
- Measure the resistance between:

(+) Secondary Air Pump Connector, Harness Side	(-)
AIR_GND - Pin 1	Ground

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HM6.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HM6 CHECK THE SECONDARY AIR PUMP CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) Secondary AIR Relay Connector, Harness Side	(-) Secondary Air Pump Connector, Harness Side
AIR_PWR - Pin 87	AIR_PWR - Pin 2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HM7.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HM7 CHECK THE SECONDARY AIR CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Secondary AIR Relay Connector, Harness Side
AIR - Pin B1	AIR - Pin 86
AIRM - Pin B50	AIR_PWR - Pin 87

- **Are the resistances less than 5 ohms?**

Yes	No
GO to HM8.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HM8 CHECK THE SECONDARY AIR MONITOR CIRCUIT AND THE SECONDARY AIR PUMP VOLTAGE CIRCUIT FOR A SHORT TO GROUND

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
AIRM - Pin B50	Ground
AIR - Pin B1	Ground

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to HM9.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HM9 CHECK THE SECONDARY AIR MONITOR CIRCUIT AND THE SECONDARY AIR PUMP VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
AIRM - Pin B50	Ground
AIR - Pin B1	Ground

- **Is any voltage present?**

Yes	No
REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.	GO to HM10.

HM10 MEASURE THE VACUUM AT THE SECONDARY AIR SOLENOID VALVE

CAUTION: Running the secondary AIR pump with OTM longer than 2 minutes may overheat and damage the secondary AIR pump. Refer to{Output Test Mode}.

- Key in OFF position.
- Secondary AIR relay installed.
- Secondary AIR Solenoid connector connected.
- PCM connector connected.
- Key ON, engine OFF.
- Connect a vacuum gauge to the control vacuum outlet at the secondary AIR valve.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Observe the vacuum gauge reading at the secondary AIR valve.
- Command the outputs OFF.
- Exit output test mode.
- **Is vacuum present at the secondary AIR diverter valve?**

Yes	No
GO to HM11.	INSTALL a new secondary AIR valve. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HM11 CHECK THE SECONDARY AIR PUMP OPERATION

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Disconnect the inlet hose from the secondary AIR valve.
- Command the outputs ON.
- Place your hand over the secondary AIR valve inlet hose.
- Command the outputs OFF.
- Exit output test mode.
- **Is there any air flow from the secondary AIR inlet valve hose?**

Yes	No
INSTALL a new secondary AIR valve. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	INSTALL a new secondary AIR pump. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST HU: INTAKE AIR SYSTEMS

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- accelerator cable linkage to throttle body (9C799)
- air cleaner assembly (including air cleaner element) (9600)
- air inlet tube (9F843)
- clean air tube hose and resonator (9R504) and (9F593)
- intake manifold runner control (IMRC) housing assembly (9U531), (9U524) and (9J447)
- IMRC actuator assembly (9J559)
- IMRC (9G730)
- intake manifold tuning valve (IMTV) (9L490)
- IMTV electric actuator assembly (9L490)
- speed control cable (9A825)
- throttle body assembly (9E926)
- harness circuits: IMRC, MONITOR, SIGNAL, SIGRTN, PWRGND, and VPWR
- harness circuits: IMTV, MONITOR, SIGNAL, and VPWR
- powertrain control module (PCM) (12A650)

IMRCM VOLTAGE VALUES

VEHICLE	IMRC OFF	IMRC ON
Focus, 2.0L	0	5
F-150 5.4L, Mark LT	5	0
All Others	2.5	0

TEST PROCEDURE

HU1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0505, P0506, P0660, P0663, P1512, P1513, P1516, P1517, P1518, P1519, P151A, P1520, P1537, P1538, P1549, P2004, P2005, P2006, P2007, P2008, P2014, P2015, P2019, P2020, P2070, or P2071 present?**

Yes	No
For DTCs P0505 or P0506, on vehicles with electronic throttle control (ETC), GO to HU51. For DTCs P0505 or P0506, on vehicles without ETC, GO to HU2. For DTCs P0660, P0663, P1549, P2070 or P2071,	For vehicles equipped with electronic throttle control (ETC) that have low idle concerns, difficulty starting, hesitation, loss of RPM, GO to HU51. For lack/loss of power, GO to HU42. For all other symptoms without DTCs, GO to HU2.

GO to HU42. For DTC P151A, Mustang 4.6L, Explorer 4.6L, Explorer Sport Trac 4.6L, and Mountaineer 4.6L. GO to HU18. For DTC P151A, all others, GO to HU17. For DTCs P1512, P1513, P1516, P1517, P1518, P1519, P1520, P1537, P1538, P2004, P2005, P2006, P2007, P2008, P2014, P2015, P2019 or P2020, GO to HU15.	

HU2 PART THROTTLE SYMPTOM

- **Are any part throttle concerns present?**

Yes	No
GO to HU7.	GO to HU3.

HU3 CHECK THE BASE IDLE SPEED

NOTE: The vehicle must be at operating temperature and at idle for a minimum of 1 minute.

- Key ON, engine running.
- Determine if the idle speed is incorrect. Refer to the **REFERENCE VALUES** article Typical Reference Value Charts, if necessary.
- Access the PCM and monitor the RPM PID.
- If equipped, read the vehicle tachometer.
- **Is vehicle idle speed correct?**

Yes	No
GO to HU5.	GO to HU4.

HU4 CHECK THE THROTTLE ARM CONTACTS

- Key in OFF position.
- Check that the throttle arm contacts the return stop.
- **Is the idle speed high?**

Yes	No
GO to HU9.	GO to HU10.

HU5 CHECK FOR BINDING OR STICKING IN THE THROTTLE SYSTEM

- Gently cycle the throttle from fully closed to fully open and back to fully closed. Check for sticking or binding during rotation.

- **Is a stick and bind condition present?**

Yes	No
GO to HU6.	GO to HU7.

HU6 ISOLATE THE BINDING AND/OR STICKING CONCERN

NOTE: **Do not attempt to clean the throttle bore and plate area. Cleaning damages the throttle body assembly.**

NOTE: **The sticking or binding condition can either be within the cables or throttle body assembly.**

- Disconnect the accelerator cable and speed control cable from the throttle body linkage.
- Rotate the throttle body linkage.
- **Does the throttle body rotate freely without a sticking, binding or grabbing condition?**

Yes	No
REPAIR the cable(s) causing the concern. CLEAR the DTCs. REPEAT the self-test.	INSTALL a new throttle body assembly. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HU7 CHECK THE FUNCTIONALITY OF THE THROTTLE POSITION (TP) SENSOR

- Key ON, engine OFF.
- Access the PCM and monitor the TP PID.
- Gently cycle the throttle from fully closed to fully open and back to fully closed.
- **Does the TP PID display a smooth voltage reading?**

Yes	No
GO to HU8.	INSTALL a new TP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HU8 CHECK THE INTAKE AIR SYSTEM FOR LEAKS, OBSTRUCTIONS AND DAMAGE

NOTE: **The Focus air cleaner element is integral to the air cleaner assembly. Inspect the air restriction gauge (if equipped) for a restriction indication.**

- Key in OFF position.

- Remove the air cleaner element. Check the air cleaner for blockage.
- Check for restrictions between the air inlet and the throttle body.
- **Are any restriction concerns present?**

Yes	No
REMOVE the restriction. INSTALL a new air cleaner element. Refer to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	REINSTALL the air cleaner element. GO to HU9.

HU9 CHECK THE POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM

NOTE: A high idle may indicate an incorrect PCV valve size or a vacuum leak.

- Check that no cracks or leaks are present.
- Remove the PCV valve.
    - Verify a clean PCV valve.
    - Verify the proper PCV valve part number.
- **Are any PCV system concerns present?**

Yes	No
INSTALL a new PCV valve. REPAIR as necessary. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	For high idle, GO to HU13. For all others, CONNECT the PCV valve. GO to HU10.

HU10 CHECK THE IDLE AIR CONTROL (IAC) VALVE RESPONSE

- Key ON, engine running.
- The vehicle must be at operating temperature and at idle for a minimum of 1 minute.
- IAC connector disconnected.
- **Does the RPM drop or the engine stall?**

Yes	No
GO to HU12.	GO to HU11.

HU11 CHECK THE IAC VALVE RESPONSE

- **Is the idle speed high?**

Yes	No
GO to HU13.	INSTALL a new IAC. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-**

	SERIES . CLEAR the DTCs. REPEAT the self-test.

HU12 INSPECT THE THROTTLE BODY PLATE HOLE FOR PLUGGING

NOTE: **Only some applications have a throttle plate hole. If not equipped go to the SYMPTOM CHARTS article, Symptom Charts.**

- Key in OFF position.
- Remove the resonator from the throttle body assembly.
- Inspect the throttle plate hole for any restrictions.
- **Are any restriction concerns present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	The concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** , to diagnose performance while driving concerns.

HU13 CHECK FOR VACUUM LEAKS

- Listen for vacuum leaks.
- Inspect the entire intake air system from the mass air flow (MAF) sensor to the intake manifold for leaks such as:
  - cracked or punctured inlet air tube
  - loose connections on the inlet air tube at the air cleaner housing or throttle body
  - IAC valve assembly or gasket
  - EGR valve gasket leak to intake manifold
  - intake manifold assembly or gasket
  - EGR valve diaphragm or control solenoid
  - vacuum supply connectors and hose
- **Are any leaks present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HU14.

HU14 CHECK THE THROTTLE BODY FOR EXCESSIVE WEAR

- Key in OFF position.
- Remove the throttle body assembly. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** for removal and inspection.
- Check the following:

- excessive wear or grooving in the throttle bore
- misaligned or worn throttle plate
- excessive gap between the throttle bore and plate

- **Are any concerns present?**

Yes	No
INSTALL a new throttle body assembly. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	The concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** , to diagnose performance while driving concerns.

HU15 DTCS P1512, P1513, P1516, P1517, P1518, P1519, P1520, P1537, P1538, P2004, P2005, P2006, P2007, P2008, P2014, P2015, P2019 OR P2020: VISUAL INSPECTION

NOTE: **If unable to fully carry out the following inspections, answer NO to the question in this step.**

NOTE: **The IMRC return spring is strong on vacuum systems. Make sure the vacuum system operates correctly and the plates open and close fully. On vacuum operated systems the engine must run for 20 seconds to restore vacuum then return to KOEO for testing.**

Some IMRC electrical systems are driven in both directions by the solenoid and do not use a return spring. They can not be opened manually.

- Visually inspect the linkage for possible causes of binding or obstructions. Check the lever/linkage for movement. There may be some tension in one direction but there should be full travel.
- Manually open and close the IMRC plates at the intake manifold while checking for sticking or binding.
- **Is a mechanical concern present?**

Yes	No
GO to HU16.	For Explorer 4.6L, Explorer Sport Trac 4.6L, Mountaineer 4.6L, and Mustang 4.6L, GO to HU18. For all others, GO to HU17.

HU16 CHECK THE IMRC FOR MECHANICAL OPERATION

NOTE: **The IMRC return spring is strong - approximately 0.34 to 0.45 Nm (3 to 4 in-lb).**

NOTE: Some electric motor applications do not use a return spring and should move freely when open and closed.

- Disconnect the IMRC linkage or remove the actuator assembly from the manifold.
- Rotate the IMRC plate lever to fully open and to fully closed, contacting both limits.
- Check for sticking or binding during rotation.
- **Is a mechanical concern present?**

Yes	No
REPAIR as necessary or INSTALL a new IMRC. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	CONNECT the IMRC linkage. For Explorer 4.6L, Explorer Sport Trac 4.6L, Mountaineer 4.6L, and Mustang 4.6L, GO to HU18. For all others, GO to HU17.

HU17 DTC P151A: CHECK THE FUNCTIONALITY OF THE IMRC

WARNING: Keep fingers clear of the mechanism. Failure to follow these instructions may result in personal injury.

NOTE: The vehicle must be at operating temperature and at idle for a minimum of 1 minute.

- Key ON, engine running.
- Access the PCM and control the IMRC PID.
- Access the PCM and monitor the IMRC1M PID.
- Command IMRC ON then OFF.

IMRCM VOLTAGE VALUES

VEHICLE	IMRC OFF	IMRC ON
Focus, 2.0L	0	5
F-150 5.4L, Mark LT	5	0
All Others	2.5	0

- **Using the table for reference, do the IMRCM voltage values correctly change while the IMRC is cycled?**

Yes	No
refer to **PINPOINT TEST Z**.	GO to HU19.

HU18 CHECK THE FUNCTIONALITY OF BI-DIRECTIONAL IMRC

WARNING: **Keep fingers clear of the mechanism. Failure to follow these instructions may result in personal injury.**

NOTE: **The vehicle must be at operating temperature and at idle for a minimum of 1 minute.**

- Key ON, engine running.
- Access the PCM and control the IMRC PID.
- Access the PCM and monitor the IMRC_F PID.
- Command IMRC ON then OFF.
- **Do the IMRC values correctly change from off to on while the IMRC is cycled and is the IMRCF PID no?**

Yes	No
refer to **PINPOINT TEST Z**.	GO to HU19.

HU19 CHECK THE FUNCTIONALITY OF THE IMRC

WARNING: **Keep fingers clear of the mechanism. Failure to follow these instructions may result in personal injury.**

NOTE: **The vehicle must be at operating temperature and at idle for a minimum of 1 minute.**

- Key ON, engine running.
- Physically monitor the IMRC actuator.
- Access the PCM and control the IMRC PID.
- Command the outputs ON.
- **Do the IMRC levers cycle from fully closed and remain fully open while the outputs are on?**

Yes	No
GO to HU28.	GO to HU20.

HU20 CHECK THE VPWR CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- IMRC Actuator connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) IMRC Actuator Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to HU21.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HU21 CHECK THE GROUND CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the voltage between:

(+) IMRC Actuator Connector, Harness Side	(-) IMRC Actuator Connector, Harness Side
VPWR	PWRGND

- **Is the voltage greater than 10 V?**

Yes	No
GO to HU22.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HU22 VERIFY THE DRIVER CIRCUIT FUNCTION

- Connect a non-powered test lamp between:

(+) IMRC Actuator Connector, Harness Side	(-) IMRC Actuator Connector, Harness Side
VPWR	IMRC

- **Does the test lamp illuminate?**

Yes	No
GO to HU27.	GO to HU23.

HU23 VERIFY THE DRIVER CIRCUIT FUNCTION WHILE COMMANDING ON IMRC

- Key ON, engine running.
- Access the PCM and control the IMRC PID.
- Connect a non-powered test lamp between:

(+) IMRC Actuator Connector, Harness Side	(-) IMRC Actuator Connector, Harness Side
VPWR	IMRC

- Command the outputs ON.
- **Does the test lamp illuminate?**

Yes	No
GO to HU26.	GO to HU24.

HU24 CHECK THE IMRC CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) IMRC Actuator Connector, Harness Side	(-) PCM Connector, Harness Side
IMRC	IMRC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HU25.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HU25 CHECK THE IMRC CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) IMRC Actuator Connector, Harness Side	(-)
IMRC	Ground

- **Is the voltage less than 10 V?**

Yes	No
GO to HU53.	REPAIR the short circuit to voltage. CLEAR the DTCs. REPEAT the self-test.

HU26 CHECK FOR SHORTS BETWEEN CIRCUITS IN THE IMRC HARNESS

- Key in OFF position.
- PCM connector connected.
- Measure the resistance between:

(+) IMRC Actuator Connector, Harness Side	(-) IMRC Actuator Connector, Harness Side
IMRC	IMRCM
IMRC	PWRGND

- **Are the resistances greater than 10K ohms?**

Yes	No
INSTALL a new IMRC actuator. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-**	GO to HU27.

SERIES as necessary. CLEAR the DTCs. REPEAT the self-test.	

HU27 CHECK FOR SHORTS BETWEEN CIRCUITS IN THE IMRC HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) IMRC Actuator Connector, Harness Side	(-) IMRC Actuator Connector, Harness Side
IMRC	IMRCM
IMRC	PWRGND

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to HU53.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test. GO to HU41.

HU28 CHECK THE IMRCM PID

- Key ON, engine OFF.
- Access the PCM and monitor the IMRC1M PID.
- **Is the IMRCM PID displaying either VREF or approximately 2.5 volts?**

Yes	No
GO to HU29.	GO to HU33.

HU29 CHECK THE IMRCM CIRCUIT FOR A SHORT TO VPWR

NOTE: **The vehicle must be at operating temperature and at idle for a minimum of 1 minute.**

- Key ON, engine running.
- Access the PCM and control the IMRC PID.
- Command the outputs ON.
- Access the PCM and monitor the IMRC1M PID.
- **Is the voltage less than 1 V?**

Yes	No
GO to HU35.	GO to HU35.

HU30 CHECK THE IMRCM CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Key ON, engine OFF.

- IMRCM Sensor connector disconnected.
- Measure the voltage between:

(+) IMRCM Sensor Connector, Harness Side	(-)
IMRCM	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to HU31.	GO to HU32.

HU31 CHECK THE IMRCM CIRCUIT FOR A SHORT TO VOLTAGE IN THE CONTROL MODULE

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) IMRCM Sensor Connector, Harness Side	(-)
IMRCM	Ground

- **Is the voltage greater than 10 V?**

Yes	No
REPAIR the short circuit to voltage. CLEAR the DTCs. REPEAT the self-test.	GO to HU53.

HU32 CHECK THE IMRCM CIRCUIT FOR A SHORT TO VPWR

- Key in OFF position.
- Measure the resistance between:

(+) IMRCM Sensor Connector, Component Side	(-) IMRCM Sensor Connector, Component Side
IMRCM	VPWR

- **Is the resistance greater than 10K ohms?**

Yes	No
CHECK for an intermittent concern. refer to **PINPOINT TEST Z**.	INSTALL a new IMRCM sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** as necessary. CLEAR the DTCs. REPEAT the self-test. GO to HU41.

HU33 CHECK THE IMRCM CIRCUIT FOR A SHORT TO GROUND

- Key ON, engine OFF.
- Access the PCM and monitor the IMRC1M PID.
- IMRCM Sensor connector disconnected.
- **Does voltage change from less than 1 volt to VREF when disconnecting the IMRCM harness connector?**

Yes	No
INSTALL a new IMRCM sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** as necessary. CLEAR the DTCs. REPEAT the self-test. GO to HU41.	GO to HU34.

HU34 CHECK THE IMRCM CIRCUIT(S) FOR A SHORT TO GROUND IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) IMRCM Sensor Connector, Harness Side	(-) IMRCM Sensor Connector, Harness Side
IMRCM	PWRGND

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HU53.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test. GO to HU41.

HU35 CHECK THE MONITOR CIRCUIT RESPONSE

- IMRCM Sensor connector disconnected.
- Access the PCM and monitor the IMRC1M PID.
- Connect a 5 amp fused jumper wire between the following:

Point A IMRCM Sensor Connector, Harness Side	Point B
IMRCM	Ground

- **Does voltage change from less than 1 volt to VREF when disconnecting the IMRCM harness connector?**

Yes	No
GO to HU36.	GO to HU39.

HU36 CHECK THE PWRGND CIRCUIT FOR CONTINUITY TO CHASSIS GND

- Key in OFF position.
- Remove the jumper wire(s).
- PCM connector connected.
- Measure the resistance between:

(+) IMRCM Sensor Connector, Harness Side	(-) Vehicle Battery
PWRGND	Negative terminal

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HU37.	GO to HU38.

HU37 CHECK THE MONITOR CIRCUIT FOR AN INTERMITTENT OPEN

- PCM connector disconnected.
- Measure the resistance between:

(+) IMRCM Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
IMRCM	IMRCM

- Wiggle, shake, and bend small sections of the wiring harness while working from the component to the module.
- **Is the resistance fluctuating while checking the harness?**

Yes	No
REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test. GO to HU41.	INSTALL a new IMRCM sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** as necessary. CLEAR the DTCs. REPEAT the self-test. GO to HU41.

HU38 CHECK THE HARNESS PWRGND CIRCUIT FOR CONTINUITY

- PCM connector disconnected.
- Measure the resistance between:

(+) IMRCM Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
PWRGND	PWRGND

- **Is the resistance less than 5 ohms?**

Yes	No

CHECK the circuit for an intermittent concern. refer to **PINPOINT TEST Z**.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test. GO to HU41.

HU39 CHECK THE IMRCM CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Remove the jumper wire(s).
- PCM connector disconnected.
- Measure the resistance between:

(+) IMRCM Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
IMRCM	IMRCM

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HU40.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test. GO to HU41.

HU40 CHECK THE MONITOR CIRCUIT FOR AN INTERMITTENT OPEN

- Measure the resistance between:

(+) IMRCM Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
IMRCM	IMRCM

- Wiggle, shake, and bend small sections of the wiring harness while working from the component to the module.
- **Is the resistance fluctuating while checking the harness?**

Yes	No
REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test. GO to HU41.	GO to HU53.

HU41 VERIFY THE REPAIR

- Key ON, engine OFF.
- Clear the PCM DTCs.
- Access the PCM and monitor the IMRC and IMRC_F PIDs.
- Access the PCM and monitor the IMRC1M PID.
- Key ON, engine running.
- Drive the vehicle, obeying all traffic and safety laws.

- Safely carry out 3 acceleration runs from a stop or roll to between 3,000 and 4,000 RPM.
- Watch for any PID change.
- Carry out the PCM self-test.
- **Are any DTCs received?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	The test completed successfully.

HU42 DTCS P0660, P0663, P1549, P2070 OR P2071: VISUAL INSPECTION OF INTAKE MANIFOLD TUNING VALVE

- Inspect the component for signs of damage.
- Check the harness and connection.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HU43.

HU43 CHECK THE VPWR CIRCUIT FOR AN OPEN IN THE HARNESS

- IMTV Actuator connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) IMTV Actuator Connector, Harness Side	(-) Vehicle Battery
VPWR	Negative terminal

- **Is the voltage greater than 10.5 V?**

Yes	No
GO to HU44.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HU44 CHECK THE IMTV CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) IMTV Actuator Connector, Harness Side	(-) PCM Connector, Harness Side
IMTV	IMTV

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HU45.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HU45 CHECK THE IMTV CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
IMTV	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HU46.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HU46 CHECK THE IMTV CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
IMTV	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to HU47.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HU47 CHECK THE IMTV DRIVER CIRCUIT WITH THE PCM CONNECTED

- IMTV Actuator connector disconnected.
- PCM connector connected.
- Key ON, engine OFF.
- Connect a non-powered test lamp between:

(+) IMTV Actuator Connector, Harness Side	(-) IMTV Actuator Connector, Harness Side
VPWR	IMTV

- **Does the test lamp illuminate?**

Yes	No

GO to HU53.	GO to HU48.

HU48 CHECK THE IMTV PCM DRIVER CIRCUIT WHEN COMMANDED ON

- Connect a non-powered test lamp between:

(+) IMTV Actuator Connector, Harness Side	(-) IMTV Actuator Connector, Harness Side
VPWR	IMTV

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Command the outputs OFF.
- Exit output test mode.
- **Does the test lamp illuminate?**

Yes	No
GO to HU49.	GO to HU53.

HU49 CHECK THE IMTV FOR DAMAGE

- Key in OFF position.
- Remove the IMTV. Refer to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** .
- Visually inspect the shutter for damage.
- Manually rotate the shutter.
- **Is a concern present?**

Yes	No
INSTALL a new IMTV actuator. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to HU50.

HU50 CHECK THE IMTV FOR FUNCTIONALITY WHEN COMMANDED ON

- IMTV Actuator connector connected.
- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Command the outputs OFF.
- Exit output test mode.
- **Does the IMTV shutter rotate?**

Yes	No

The concern is an intermittent. refer to **PINPOINT TEST Z**.	INSTALL a new IMTV actuator. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** as necessary. CLEAR the DTCs. REPEAT the self-test.

HU51 PRELIMINARY DIAGNOSIS FOR DIAGNOSTIC TROUBLE CODES (DTCS) P0505 OR P0506

- Key ON, engine OFF.
- **Are any DTCs present other than P0505 or P0506?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to HU52.

HU52 MONITOR THE INTAKE AIR SYSTEM RELATED PIDS

NOTE: Verify that the vehicle has reached the normal engine coolant operating temperature of 77°C (170°F). Allow the engine to idle an additional 5 minutes.

NOTE: The ETC_TRIM PID may not be available on all vehicles.

- Access the PCM and monitor the ECT PID.
- Access the PCM and monitor the ETC_TRIM PID.
- Access the PCM and monitor the IACTRIM and IACKAM2 PIDs.
- Mathematically add and record the value of the IACTRIM PID to the IACKAM2 PID value, for the total IAC value at idle.
- **Is the ETC_TRIM PID angle equal to 3.5 degrees or is the total IAC value greater than 0.5 lb/min?**

Yes	No
INSTALL a new throttle body assembly. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** to INSTALL a new throttle body. CLEAR the DTCs. REPEAT the self-test.	RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.

HU53 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins

    - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HV: COOLING FAN CLUTCH

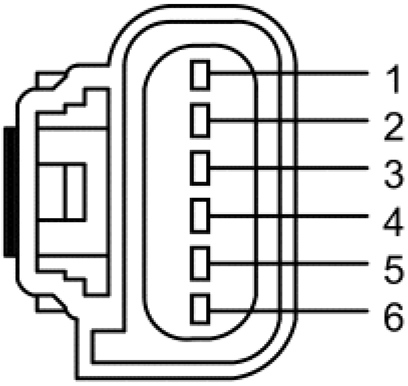
INTRODUCTION

WARNING: **To avoid the possibility of personal injury or damage to the vehicle, do not operate the engine until the fan blade has been first examined for possible cracks and separation. Failure to follow these instructions may result in personal injury or death.**

NOTE: **Before starting this pinpoint test, turn the clutch fan assembly by hand and check for mechanical binding around the fan shroud or surrounding components. If binding is present, correct the problem then continue with the pinpoint test. If no binding is present, start the engine and warm up to normal operating temperature then continue with the pinpoint test.**

This pinpoint test is intended to diagnose the following:

- cooling fan clutch
- harness circuits: fan speed sensor (FSS), FSS PWRGND, FSS VPWR, fan control variable (FCV), and FCV VPWR
- powertrain control module (PCM) (12A650)



A0077520

Fig. 143: Electronic Throttle Body Throttle Position Sensor (ETBTPS) Connector - A
Courtesy of FORD MOTOR CO.

Pin	Circuit
4	FSS (Fan Speed Sensor)
5	PWRGND (Power Ground)
2	VBPWR (Vehicle Buffered Power)
3	VPWR (Vehicle Power)
6	FCV (Fan Control Variable)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Pin	Circuit
Expedition, Navigator	B51, B52, B53 B45 B67, B68, B69, B70 B20 B48	VPWR FSS PWRGND VBPWR FCV
F-150	B51, B52, B53 E24 B67, B68, B69, B70 B20 B48	VPWR FSS PWRGND VBPWR FCV
All other vehicles	B35, B36 E24 B47, B48, B49, B50 E20 E7	VPWR FSS PWRGND VBPWR FCV

TEST PROCEDURE

HV1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0480, P0483 or P0528 present?**

Yes	No
For KOEO and KOER DTC P0480, GO to HV4. For KOEO and KOER DTCs P0483 or P0528, GO to HV2. For continuous memory DTCs P0480 or P0528, GO to HV10.	GO to HV2.

HV2 CHECK THE COOLING FAN CLUTCH FOR MECHANICAL BINDING

NOTE: The cooling fan clutch uses a viscous coupling. The viscous drag should be smooth during fan rotation. The amount of resistance is dependent upon the final cooling fan operational state before engine shutdown.

- Key in OFF position.
- Manually rotate the cooling fan.
- **Does the cooling fan clutch rotation feel rough or binding?**

Yes	No
INSTALL a new cooling fan clutch. REFER to the **ENGINE COOLING -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to HV3.

HV3 CHECK THE COOLING FAN CLUTCH OPERATION

- Key ON, engine running.
- Set the heater controls to OFF.
- Access the PCM and monitor the FANSS PID.
- **Does the FANSS PID indicate any RPM?**

Yes	No
GO to HV4.	GO to HV11.

HV4 KOEO AND KOER DTC P0480: CHECK THE COOLING FAN CLUTCH ACTUATOR VALVE SOLENOID RESISTANCE

NOTE: If necessary, install terminal adapters on the component side pins to carry out the resistance measurement.

- Key in OFF position.
- Cooling Fan Clutch connector disconnected.
- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Component Side	(-) Cooling Fan Clutch Connector, Component Side
FCV - Pin 6	VPWR - Pin 3

- **Is the resistance between 6 - 12 ohms?**

Yes	No
GO to HV5.	INSTALL a new cooling fan clutch. REFER to the **ENGINE COOLING -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HV5 CHECK THE COOLING FAN CLUTCH ACTUATOR VALVE SOLENOID RESISTANCE

- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Component Side	(-)
FCV - Pin 6	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HV6.	INSTALL a new cooling fan clutch. REFER to the **ENGINE COOLING -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HV6 CHECK THE VPWR VOLTAGE TO THE COOLING FAN CLUTCH ACTUATOR VALVE SOLENOID

- Key ON, engine OFF.
- Measure the voltage between:

(+) Cooling Fan Clutch Connector, Harness Side	(-)
VPWR - Pin 3	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to HV7.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HV7 CHECK THE FCV CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.

- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Harness Side	(-) PCM Connector, Harness Side
FCV - Pin 6	FCV

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HV8.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HV8 CHECK THE FCV CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Harness Side	(-)
FCV - Pin 6	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HV9.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HV9 CHECK THE FCV CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) Cooling Fan Clutch Connector, Harness Side	(-)
FCV - Pin 6	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to HV19.

HV10 CONTINUOUS MEMORY DTCS P0480 OR P0528: INTERMITTENT CHECK

NOTE: **Keep the coil arm of the cooling fan clutch secure while checking the wiring harness. If the coil arm rotates, faulty readings may occur.**

- Key ON, engine OFF.
- Access the PCM and monitor the FANSS PID.
- Access the PCM and monitor the FANVAR_F PID.
- While observing the PID wiggle, shake, and bend small sections of the wiring harness while working from the cooling fan clutch to the PCM.
- Check the cooling fan clutch and the PCM connectors for damage and corrosion.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary.	DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HV11 KOEO AND KOER DTC P0528: CHECK THE VOLTAGE AND GROUND TO THE FSS SENSOR

- Cooling Fan Clutch connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Cooling Fan Clutch Connector, Harness Side	(-) Cooling Fan Clutch Connector, Harness Side
VBPWR - Pin 2	PWRGND - Pin 5

- **Is the voltage greater than 10 V?**

Yes	No
GO to HV15.	GO to HV12.

HV12 CHECK THE VOLTAGE TO THE FSS SENSOR

- Measure the voltage between:

(+) Cooling Fan Clutch Connector, Harness Side	(-)
VBPWR - Pin 2	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to HV14.	GO to HV13.

HV13 CHECK THE VOLTAGE CIRCUIT TO THE FSS SENSOR FOR AN OPEN IN THE

HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Harness Side	(-) PCM Connector, Harness Side
VBPWR - Pin 2	VBPWR

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HV19.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HV14 CHECK THE GROUND CIRCUIT TO THE FSS SENSOR FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Harness Side	(-) PCM Connector, Harness Side
PWRGND - Pin 5	PWRGND

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HV19.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HV15 CHECK THE FSS CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Harness Side	(-) PCM Connector, Harness Side
FSS - Pin 4	FSS

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HV16.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HV16 CHECK THE FSS CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) Cooling Fan Clutch Connector, Harness Side	(-)
FSS - Pin 4	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HV17.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HV17 CHECK THE FSS CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) Cooling Fan Clutch Connector, Harness Side	(-)
FSS - Pin 4	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to HV18.

HV18 CHECK THE FUNCTIONALITY OF THE FSS CIRCUIT

- Key in OFF position.
- PCM connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Cooling Fan Clutch Connector, Harness Side	(-)
FSS - Pin 4	Ground

- **Is the voltage greater than 10 V?**

Yes	No
INSTALL a new cooling fan clutch. REFER to the **ENGINE COOLING -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to HV19.

HV19 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
    - pushed out pins
    - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HX: EVAPORATIVE EMISSION (EVAP) SYSTEM AND MONITOR

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

WARNING: **Before repairing or installing a new component in the fuel system, reduce the possibility of injury or fire by following the warning, caution, and handling directions in pinpoint test HC. Failure to follow these instructions may result in personal injury.**

NOTE: **Use this pinpoint test only when directed here.**

The use of a soap solution around the fuel filler cap or capless fuel tank filler pipe (if equipped) or the use of the hydrocarbon emission analyzer to determine an evaporative emission system leak is not recommended. The mandatory Rotunda Evaporative Emission System Leak Tester for On Board Diagnostic (OBD) (including the ultrasonic tester) and the Rotunda Vacutec 522 Leak Detector Smoke Machine are the only devices to be used at this time for

evaporative emission system leak detection.

When using the smoke machine, the fuel level in the fuel tank must be less than 85% full.

This pinpoint test is intended to diagnose the following:

- canister vent (CV) solenoid (9F945)
- fuel filler cap (9030)
- capless fuel tank filler pipe (9034)
- fuel tank pressure (FTP) sensor (9C052)
- EVAP canister purge (EVAPCP) valve (9C915). Also known as the vapor management valve (VMV).
- EVAP system leaks using the Rotunda Vacutec Leak Detector Smoke Machine.
- harness circuits: B+, CV, EVAPCP, FTP, FTPREF, SIGRTN, VPWR, VREF and CASE GND
- powertrain control module (PCM) (12A650)

For additional information on the EVAP system, refer to**EVAPORATIVE EMISSION (EVAP) SYSTEMS** , or the **EVAPORATIVE EMISSIONS -- E-SERIES** .

For applications that use the engine off natural vacuum (EONV) EVAP leak check monitor, KAPWR provides voltage to the CV solenoid instead of VPWR.

TEST PROCEDURE

HX1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0442, P0443, P0446, P0451, P0452, P0453, P0455, P0456, P0457, P0460, P0461, P0462, P0463, P144A, P1450, P1451, or P260F present?**

Yes	No
For DTCs P0442 or P0456, GO to HX46. For DTC P0443, GO to HX2. For DTCs P0446 or P1451, GO to HX30. For DTC P0451, GO to HX39. For DTC P0452, GO to HX18. For DTC P0453, GO to HX23. For DTCs P0455 or P0457, GO to HX40. For DTC P0460, GO to HX38. For DTCs P0461 through P0463, GO to HX36. For DTC P144A, GO to HX49. For DTC P1450, GO to HX8. For DTC P260F, GO to HX50.	For symptoms without DTCs, GO to HX13. For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

HX2 DTC P0443: CHECK THE PCM OUTPUT TO EVAP CANISTER PURGE VALVE

- Key in OFF position.
- EVAPCP Valve connector disconnected.
- Connect a non-powered test lamp between:

(+) EVAPCP Valve Connector, Harness Side	(-) EVAPCP Valve Connector, Harness Side

VPWR - Pin 1	EVAPCP - Pin 2

- Key ON, engine OFF.
- Enter output test mode. Refer to **OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Command the outputs OFF.
- Exit output test mode.
- **Does the test lamp turn on and off when the output(s) is commanded on and off?**

Yes	No
GO to HX3.	GO to HX4.

HX3 CHECK THE EVAP CANISTER PURGE VALVE SOLENOID RESISTANCE

- Key in OFF position.
- EVAPCP Valve connector disconnected.
- Measure the resistance between:

(+) EVAPCP Valve Connector, Component Side	(-) EVAPCP Valve Connector, Component Side
EVAPCP - Pin 2	VPWR - Pin 1

- **Is the resistance between 2.5 - 7 ohms?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	INSTALL a new EVAPCP valve. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HX4 CHECK THE VPWR VOLTAGE TO THE EVAP CANISTER PURGE VALVE

- Key ON, engine OFF.
- Measure the voltage between:

(+) EVAPCP Valve Connector, Harness Side	(-) Vehicle Battery
VPWR - Pin 1	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to HX5.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HX5 CHECK THE EVAP CANISTER PURGE VALVE CIRCUIT FOR AN OPEN IN THE

HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) EVAPCP Valve Connector, Harness Side
EVAPCP	EVAPCP - Pin 2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HX6.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HX6 CHECK THE EVAP CANISTER PURGE VALVE CIRCUIT FOR A SHORT TO PWRGND IN THE HARNESS

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
EVAPCP	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HX7.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HX7 CHECK THE EVAP CANISTER PURGE VALVE CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) EVAPCP Valve Connector, Harness Side	(-)
EVAPCP - Pin 2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to HX54.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HX8 DTC P1450: CHECK FOR VISUAL CAUSES OF EXCESSIVE FUEL TANK VACUUM

NOTE: If the CV solenoid and the fuel tank assemblies are not accessible during this step, refer to the EVAPORATIVE EMISSIONS -- E-SERIES and FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES for removal instructions.

- Check for kinks or bends in the fuel vapor hoses/tubes (EVAPCP outlet tube and EVAP canister tube).
- Visually inspect the EVAP canister inlet port, CV solenoid filter, and canister vent hose assembly for contamination or debris.
- Check the CV solenoid filter for blockage or contamination.
- **Is a concern present?**

Yes	No
REMOVE any contamination or debris around the fuel vapor hose/tubes and CV solenoid assembly. REMOVE kinks or bends in the EVAPCP outlet tube, EVAP canister tube, and canister vent hose assembly. CLEAR the DTCs. For repair verification, CARRY OUT the evaporative emission leak check monitor repair verification drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** .	GO to HX9.

HX9 CHECK THE FTP SENSOR VOLTAGE WITH THE FUEL FILLER CAP REMOVED OR THE CAPLESS FUEL TANK FILLER PIPE OPENED

NOTE: For vehicles with a capless fuel filler pipe, instead of removing the fuel filler cap, install the supplemental refueling adaptor provided with the vehicle to open the capless fuel tank filler pipe.

- Remove the fuel filler cap.
- Key ON, engine OFF.
- Access the PCM and monitor the FTP PID.
- **Is the voltage between 2.4 - 2.8 V?**

Yes	No
GO to HX13.	GO to HX10.

HX10 CHECK FOR ANY OTHER DTCS

- Check for other 3-wire sensor DTCs (KOEO, KOER, or continuous memory) present with the DTC P1450.
- **Are any other DTCs present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to HX11.

HX11 CHECK THE VOLTAGE TO THE FTP SENSOR

- Key in OFF position.
- FTP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FTP Sensor Connector, Harness Side	(-) FTP Sensor Connector, Harness Side
VREF	SIGRTN
FTPREF	SIGRTN

- **Are the voltages between 4 - 6 V?**

Yes	No
INSTALL a new FTP sensor. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . For some vehicles, the FTP sensor is integral to the fuel vapor tube assembly. CLEAR the DTCs. For repair verification, CARRY OUT the evaporative emission leak check monitor repair verification drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** .	GO to HX12.

HX12 CHECK THE FTPREF OR VREF AND SIGRTN CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) FTP Sensor Connector, Harness Side
VREF	VREF
SIGRTN	SIGRTN
FTPREF	FTPREF

- **Are the resistances less than 5 ohms?**

Yes	No

GO to HX54.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HX13 CHECK IF THE ENGINE IDLES

- Key ON, engine running.
- **Does the engine stall or is it unable to maintain idle?**

Yes	No
GO to HX14.	GO to HX15.

HX14 CHECK THE EVAP SYSTEM FOR A STUCK OPEN VALVE

- Key in OFF position.
- Disconnect the fuel vapor to intake manifold line at the EVAPCP valve and cap the line at the EVAPCP valve.
- Key ON, engine running.
- **Does the engine stall or is it unable to maintain idle?**

Yes	No
The EVAP system is not the cause of the symptom. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	INSTALL a new EVAPCP valve. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HX15 CHECK FOR BLOCKAGE IN THE FUEL TANK VENT SYSTEM

NOTE: The CV is normally open and venting to the atmosphere.

- Access the PCM and monitor the EVMV PID.
- Access the PCM and monitor the FTP PID.
- Access the PCM and monitor the EVAPCV PID.
- While monitoring the FTP PID, ramp open the EVAPCP valve by incrementally commanding the EVMV PID to a 1,000 mA.
- **Does the FTP sensor voltage drop below 2 volts when the EVAPCP valve is commanded fully open?**

Yes	No
CHECK for blockage in the vapor line to the CV solenoid. CHECK the CV solenoid filter for blockage or contamination. CHECK the carbon canister for blockage. If OK, INSTALL a new CV solenoid. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to HX16.

HX16 CHECK THE EVAP SYSTEM FOR A STUCK OPEN VALVE

- Key ON, engine running.
- Access the PCM and control the EVMV PID.
- Close the EVAPCP by commanding the EVMV PID to 0 mA.
- Access the PCM and control the EVAPCV PID.
- Close the CV solenoid by commanding the EVAPCV PID to ON (100% duty cycle).
- **Does the FTPV PID decrease, the engine RPM change, or the engine stall, as an indication that the EVAPCP valve is stuck open?**

Yes	No
INSTALL a new EVAPCP valve. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to HX17.

HX17 EVAP CANISTER PURGE VALVE TEST

- Key ON, engine running.
- Access the PCM and control the EVAPCV PID.
- Close the CV solenoid by commanding the EVAPCV PID to ON (100% duty cycle).
- Access the PCM and control the EVMV PID.
- While monitoring the FTP PID, ramp open the EVAPCP valve by incrementally commanding the EVMV PID to a 1,000 mA.
- **Does the FTP PID decrease, the engine RPM change, or the engine stall as an indication that the EVAPCP valve is opening?**

Yes	No
For DTC P1450, unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**. For all others, CHECK the EVAP system for leaks.	CHECK for blockages between the fuel tank, the EVAPCP valve, and the engine intake manifold. CHECK for obstructions in the EVAPCP valve diaphragm and ports. If OK, INSTALL a new EVAPCP valve. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HX18 DTC P0452: CHECK FOR FUEL TANK PRESSURE SENSOR CONNECTOR CONTAMINATION

- Key in OFF position.
- Visually check for liquid fuel contamination of the FTP sensor electrical connector.
- Check for a completely submerged FTP sensor (tank-mounted type only) in the liquid fuel. This can affect the correct FTP voltage reading.
- **Does the FTP sensor and its connector show any signs of fuel contamination?**

Yes	No

REPAIR as necessary. ADJUST the fuel tank overfill. CLEAR the DTCs. REPEAT the self-test.	GO to HX19.

HX19 CHECK FOR LOW FTP SENSOR VOLTAGE

NOTE: The FTP sensor voltage with no pressure/vacuum on the fuel tank is between 2.4 and 2.8 volts.

- Key ON, engine OFF.
- Access the PCM and monitor the FTP PID.
- **Is the voltage less than 0.22 V?**

Yes	No
GO to HX20.	The concern that produced the DTC P0452 is intermittent. refer to **PINPOINT TEST Z**.

HX20 CHECK THE OPPOSITE INDUCED HIGH FTP SENSOR SIGNAL

- Key in OFF position.
- FTP Sensor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A FTP Sensor Connector, Harness Side	Point B FTP Sensor Connector, Harness Side
VREF	FTP

- Key ON, engine OFF.
- Access the PCM and monitor the FTP PID.
- **Is the voltage between 4 - 6 V?**

Yes	No
INSTALL a new FTP sensor. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . For some vehicles, the FTP sensor is integral to the fuel vapor tube assembly. CLEAR the DTCs. REPEAT the self-test.	GO to HX21.

HX21 CHECK THE VREF VOLTAGE TO THE FTP SENSOR

- Remove the jumper wire(s).
- Key ON, engine OFF.
- Measure the voltage between:

(+) FTP Sensor Connector, Harness Side	(-) FTP Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 6 V?**

Yes	No
GO to HX22.	refer to **PINPOINT TEST C**.

HX22 CHECK THE FTP CIRCUIT(S) FOR A SHORT TO SIGRTN OR GND IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
FTP	SIGRTN

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
FTP	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HX54.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HX23 DTC P0453: CHECK FOR HIGH FTP SENSOR VOLTAGE

NOTE: **The FTP sensor voltage with no pressure/vacuum on the fuel tank is between 2.4 and 2.8 volts.**

- Key ON, engine OFF.
- Access the PCM and monitor the FTP PID.
- **Is the voltage greater than 4.5 V?**

Yes	No
GO to HX24.	The concern that produced the DTC P0453 is intermittent. refer to **PINPOINT TEST Z**.

HX24 CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS AT THE FTP SENSOR VEHICLE HARNESS CONNECTOR

- Key in OFF position.
- FTP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FTP Sensor Connector, Harness Side	(-) FTP Sensor Connector, Harness Side
VREF	SIGRTN

- **Is the voltage between 4 - 6 V?**

Yes	No
GO to HX25.	refer to **PINPOINT TEST C**.

HX25 CHECK THE FTP CIRCUIT FOR A SHORT TO VOLTAGE

- Measure the voltage between:

(+) FTP Sensor Connector, Harness Side	(-) Vehicle Battery
FTP	Negative terminal

- **Is the voltage less than 10 V?**

Yes	No
GO to HX27.	GO to HX26.

HX26 CHECK THE FTP CIRCUIT FOR A SHORT TO VPWR IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
FTP	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to HX54.

HX27 CHECK THE FTP CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) FTP Sensor Connector, Harness Side
FTP	FTP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HX28.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HX28 CHECK THE FTP CIRCUIT FOR A SHORT TO VREF

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	FTP

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HX29.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HX29 CHECK THE OPPOSITE INDUCED LOW FTP SIGNAL

- PCM connector connected.
- Connect a 5 amp fused jumper wire between the following:

Point A FTP Sensor Connector, Harness Side	Point B FTP Sensor Connector, Harness Side
FTP	SIGRTN

- Key ON, engine OFF.
- Access the PCM and monitor the FTP PID.
- **Is the voltage less than 0.1 V?**

Yes	No
INSTALL a new FTP sensor. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . For some vehicles, the FTP sensor is integral to the fuel vapor tube assembly. CLEAR the DTCs. REPEAT the self-test.	GO to HX54.

HX30 DTCS P0446 OR P1451: CHECK THE PCM OUTPUT TO THE CV SOLENOID

NOTE: For applications that use the engine off natural vacuum (EONV) EVAP leak check monitor, KAPWR provides voltage to the CV solenoid instead of VPWR.

- Key in OFF position.
- CV Solenoid connector disconnected.
- Connect a non-powered test lamp between:

(+) CV Solenoid Connector, Harness Side	(-) CV Solenoid Connector, Harness Side
VPWR	CANV
KAPWR	CANV

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Command the outputs OFF.
- Exit output test mode.
- **Does the test lamp turn on and off when the output(s) is commanded on and off?**

Yes	No
GO to HX31.	GO to HX32.

HX31 CHECK THE CV SOLENOID RESISTANCE

NOTE: For applications that use the engine off natural vacuum (EONV) EVAP leak check monitor, KAPWR provides voltage to the CV solenoid instead of VPWR.

- Key in OFF position.
- Measure the resistance between:

(+) CV Solenoid Connector, Component Side	(-) CV Solenoid Connector, Component Side
KAPWR	CANV
VPWR	CANV

- **Are the resistances between 48 - 65 ohms?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	INSTALL a new CV solenoid. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HX32 CHECK THE VPWR VOLTAGE TO THE CV SOLENOID

NOTE: **For applications that use the engine off natural vacuum (EONV) EVAP leak check monitor, KAPWR provides voltage to the CV solenoid instead of VPWR.**

- Measure the voltage between:

(+) CV Solenoid Connector, Harness Side	(-)
KAPWR	Ground
VPWR	Ground

- **Are the voltages greater than 10 V?**

Yes	No
GO to HX33.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HX33 CHECK THE CANV CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) CV Solenoid Connector, Harness Side
CANV	CANV

- **Is the resistance less than 5 ohms?**

Yes	No
GO to HX34.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

HX34 CHECK THE CANV CIRCUIT FOR A SHORT TO PWRGND IN THE HARNESS

- Measure the resistance between:

(+) CV Solenoid Connector, Harness Side	(-) Vehicle Battery
CANV	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to HX35.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HX35 CHECK THE CANV CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) CV Solenoid Connector, Harness Side	(-)
CANV	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to HX54.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

HX36 DTCS P0461, P0462 AND P0463: CHECK THE INSTRUMENT CLUSTER (IC) MODULE FOR DTCS

- Key ON, engine OFF.
- Carry out the IC self-test.
- **Are any DTCs present?**

Yes	No
REFER to the **INSTRUMENT CLUSTER (IC) AND WARNING CHIMES -- E-SERIES** to continue diagnosis.	GO to HX37.

HX37 CHECK THE FLI PID

- Key ON, engine running.
- Access the PCM and monitor the FLI PID.
- **Does the FLI PID match the fuel gauge?**

Yes	No
GO to HX38.	GO to HX54.

HX38 DTC P0460: CHECK FOR FUEL TANK FLOAT LEVEL RESPONSE

NOTE: **A dual-container (saddle type) fuel tank has 2 fuel level sensors. The FLI PID in the PCM is the average value of both fuel level sensors. Some dual-container tanks may require the fuel level to be greater 3/4 full before the fuel level equalizes.**

- Key ON, engine running.
- Access the PCM and monitor the FLI PID.
- Key in OFF position.

- If the fuel level is less than 1/4 (25% on FLI), add approximately 1/4 tank of fuel.
- If the fuel level is greater than 3/4 (75% on FLI), drain approximately 1/4 tank of fuel.
- Key ON, engine running.
- Access the PCM and monitor the FLI PID.
- **Does the FLI PID indicate a movement upward or downward as fuel is either added or drained?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	REFER to the **INSTRUMENT CLUSTER (IC) AND WARNING CHIMES -- E-SERIES** to diagnose the incorrect fuel gauge indication symptom.

HX39 DTC P0451: CHECK THE FTP SENSOR FOR CORRECT OPERATION

NOTE: **For vehicles with a capless fuel filler pipe, instead of removing the fuel filler cap, install the supplemental refueling adaptor provided with the vehicle to open the capless fuel tank filler pipe.**

- Key in OFF position.
- Remove the fuel filler cap.
- Key ON, engine OFF.
- Access the PCM and monitor the FTP PID.
- **Is the pressure between -0.42 and 0.42 kPa (-1.7 and 1.7 in-H2O)?**

Yes	No
CHECK for kinks or bends in the fuel vapor hoses/tubes between the fuel tank and dust separator. CHECK the EVAP canister ports and canister vent hose assembly for contamination or debris. CHECK the dust separator for blockage. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	INSTALL a new FTP sensor. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . For some vehicles, the FTP sensor is integral to the fuel vapor tube assembly. CLEAR the DTCs. REPEAT the self-test.

HX40 DTCS P0455 OR P0457: CHECK THE FUEL FILLER CAP OF CAPLESS FUEL TANK FILLER PIPE

NOTE: **If the fuel filler cap or capless fuel tank filler pipe is suspected as an EVAP leak source during visual inspection, do not disturb the fuel filler cap or capless fuel tank filler pipe until the repair verification method is complete. If the repair verification method fails, reposition or install a new fuel filler cap and repeat the test. For vehicles with a capless fuel tank filler pipe, install and remove the supplemental refueling adaptor provided with the vehicle to reseal the capless fuel tank filler pipe and repeat the test. This**

action isolates the fuel filler cap or capless fuel tank filler pipe from the rest of the EVAP system as a potential concern.

- For vehicles with a fuel filler cap, visually inspect the fuel filler cap without initially disturbing it.
  - Verify the fuel filler cap tether is visible and free to move.
  - Check for missing or loose fuel filler cap.
  - Check the fuel filler cap for damage.
- For vehicles with a capless fuel tank filler pipe, visually inspect the capless fuel tank filler pipe inlet without initially disturbing it.
  - Check the capless fuel tank filler pipe inlet for an obstruction that prevents it from sealing.
  - Check the capless fuel tank filler pipe for damage.
- **Is a concern present?**

Yes	No
For repair verification, CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test. REPAIR as necessary. GO to HX46.	GO to HX41.

HX41 CHECK FOR FLI DTCS

- Key ON, engine OFF.
- Carry out the self-test.
- **Are DTCs P0460, P0461, P0462 or P0463 present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to HX42.

HX42 CHECK THE OPERATION OF THE FUEL GAUGE

NOTE: **A fuel gauge that always indicates a fuel level less than a 1/2 tank or always a full tank, may be caused by a fuel level input (FLI) concern.**

- Check operation of the fuel gauge.
- **Is the fuel gauge functioning properly?**

Yes	No
GO to HX43.	CHECK the functionality of the FLI circuit. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.

HX43 EVAPORATIVE EMISSION SYSTEM VISUAL INSPECTION

- Key in OFF position.
- Visually inspect for:
  - EVAP system lines/hoses (check for proper connections, damage or blockage)
  - loose fuel vapor hose/tube connections to the EVAP system components
  - blocked vacuum hose between the EVAPCP valve and the engine intake manifold
  - damaged fuel tank or fuel filler pipe
- **Are there any concerns found during the visual inspection?**

Yes	No
REPAIR as necessary. For repair verification, CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test. GO to HX46.	GO to HX44.

HX44 CHECK THE FTP SENSOR VOLTAGE WITH THE FUEL FILLER CAP REMOVED OR THE CAPLESS FUEL TANK FILLER PIPE OPENED

NOTE: For vehicles with a capless fuel filler pipe, instead of removing the fuel filler cap, install the supplemental refueling adaptor provided with the vehicle to open the capless fuel tank filler pipe.

- Remove the fuel filler cap.
- Key ON, engine OFF.
- Access the PCM and monitor the FTP PID.
- **Is the voltage between 2.4 - 2.8 V?**

Yes	No
GO to HX45.	INSTALL a new FTP sensor. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . For some vehicles, the FTP sensor is integral to the fuel vapor tube assembly. REPEAT the test and VERIFY the results. For repair verification, CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test. GO to HX46.

HX45 EVAP CANISTER PURGE VALVE TEST

- Key in OFF position.
- Install the fuel filler cap or remove the supplemental refueling adaptor.
- Key ON, engine running.

- Access the PCM and monitor the EVAPCV PID.
- Access the PCM and monitor the EVMV PID.
- Access the PCM and monitor the FTP PID.
- Close the CV solenoid by commanding the EVAPCV PID to ON (100% duty cycle).
- While monitoring the FTP PID, ramp open the EVAPCP valve by incrementally commanding the EVMV PID to a 1,000 mA.
- **Does the FTP PID decrease, the engine RPM change, or the engine stall as an indication that the EVAPCP valve is opening?**

Yes	No
GO to HX46.	INSTALL a new EVAPCP valve. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . REPEAT the test and VERIFY the results. For repair verification, CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test. GO to HX46.

HX46 DTCS P0442 OR P0456: HOOK UP THE SMOKE MACHINE (ROTUNDA VACUTEC)

NOTE: **Removing the Schrader valve from the test port permanently damages the valve.**

NOTE: **The smoke and air flow from the smoke machine will not pass through liquid fuel. Liquid fuel may be present in the fuel tank filler pipe.**

NOTE: **Some vehicles are not equipped with an evaporative emission test port. Use a suitable hose adapter in the following diagnostic procedures.**

- Key in OFF position.
- Connect the smoke machine power cables to the vehicle battery. Check to see that the smoke machine power indicator lamp is on, indicating a good battery contact.
- For vehicles not equipped with an evaporative emission test port:
    - Disconnect the fuel vapor to intake manifold line at the EVAPCP valve and cap the line.
    - Connect a suitable hose adapter to the fuel vapor to intake manifold connection at the EVAPCP valve.
- For vehicles equipped with an evaporative emission test port:
    - Locate the evaporative emission test port and remove the green cap. The cap is located on or close to the EVAPCP valve.
    - Install the EVAP test port adapter (provided with the Vacutec Smoke Machine) to the test port.
- **Is the smoke machine hook up complete?**

Yes	No
For leak detection, GO to HX47. For leak repair verification, GO to HX48.	REFER to the smoke machine operator article for additional instructions and for helpful tips.

HX47 CARRY OUT SMOKE MACHINE PHASE 2 - LEAK DETECTION SMOKE TEST

NOTE: **If the leak is not detected from the top, check the EVAP system for leaks from under the vehicle.**

- **Check the EVAP hoses, EVAPCP valve, CV solenoid, EVAP canister, fuel tank, fuel filler pipe, around the fuel tank area, and at the fuel filler cap or capless fuel tank filler pipe inlet.**
- **Wiggle the components and connections to simulate road bumps while looking for signs of leaking smoke.**

If the leak is in the fuel tank filler pipe between the check valve and the fuel filler cap or capless fuel tank filler pipe inlet, smoke under pressure may not reach the leak. If leaking smoke is not found, a thorough visual inspection of the fuel tank filler pipe and fuel filler cap or capless fuel tank filler pipe inlet should be done.

- Set the smoke machine to SMOKE.
- Remove the fuel filler cap or install the supplemental refueling adaptor.
- Connect the smoke supply hose nozzle tip into the EVAP service port or suitable hose adapter.
- Key ON, engine OFF.
- Access the PCM and control the EVAPCV PID.
- Close the CV solenoid by commanding the EVAPCV PID to ON (100% duty cycle).
- For vehicles not equipped with an evaporative emission test port:
    - Start the smoke machine and verify the connection at the EVAPCP valve is correct and not leaking
    - Open the EVAPCP valve by commanding the EVMV PID to 1,000 mA
- Start the smoke machine. If smoke does not exit the fuel tank filler pipe after the system is pressurized, command the EVAPCV PID open to allow air to purge the CV solenoid. Once smoke is seen at the CV solenoid, command the EVAPCV PID close.
    - Install the fuel filler cap or remove the supplemental refueling adaptor once smoke is observed exiting the fuel tank neck area.
    - Continue to smoke the system for 60 seconds to obtain pressure.
    - Press and release the remote starter button in intervals of approximately 15 seconds on and 15 seconds off while checking for exiting smoke.
    - Use the halogen spotlight provided with the smoke machine to follow the EVAP system path and look for smoke exiting at the source of the leak(s).
- **Is the source of the EVAP leak located?**

Yes	No
REPAIR as necessary. CONNECT all the disconnected components. For repair verification, CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test. GO to HX48.	The test passed. CONNECT all the disconnected components. CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test. GO to HX48.

HX48 CARRY OUT THE SMOKE MACHINE PHASE 1 - LEAK VERIFICATION PRESSURE TEST

- Position the control lever located on the smoke machine to METER.
- Calibrate the smoke machine flow meter using the 0.020 (DTC P0456) or 0.040 (DTC P0442) standard as follows:
  - Insert the air supply hose (transparent hose) nozzle tip into the appropriate EVAP system standard located on the front of the smoke machine.
  - Press the remote starter button on the smoke machine. Observe the position of the flow meter indicator ball.
  - Position the flow meter red pointer flag so that it aligns with the measurement of the indicator ball.
  - Release the button and remove the air supply hose nozzle tip from the EVAP system standard.
- Connect the air supply hose (transparent hose) nozzle tip into the EVAP test port or suitable hose adapter.
- Key ON, engine OFF.
- Access the PCM and control the EVAPCV PID.
- Close the CV solenoid by commanding the EVAPCV PID to ON (100% duty cycle).
- For vehicles not equipped with an evaporative emission test port, open the EVAPCP valve by commanding the EVMV PID to 1,000 mA.
- Press the remote starter button on the smoke machine. Notice that the ball in the flow meter is all the way at the top. This indicates the system is being pressurized.
- Continue to press the remote starter button until the ball stops descending. Once the ball stops descending, observe if it is above or below the red pointer flag. If the measurement is below the indicator flag, the system has passed the pressure test. If the measurement is above the indicator flag, the EVAP system has an unacceptable leak.
- **Does the EVAP system pass the smoke machine leak verification pressure test?**

Yes	No
The test passed and no concerns are present. CLEAR the DTCs. REPEAT the self-test.	GO to HX47.

HX49 DTC P144A: CHECK FOR A BLOCKED FUEL VAPOR TUBE BETWEEN THE FTP SENSOR AND THE FUEL TANK

- Key in OFF position.

- Remove the fuel vapor tube assembly. Refer to the **EVAPORATIVE EMISSIONS -- E-SERIES** .
- Visually inspect the fuel vapor tube for a blockage between the FTP sensor and the connection to the fuel tank or fuel pump module.
- Visually inspect the connection at the fuel tank or fuel pump module for a blockage.
- Attempt to manually remove the blockage.
- **Is the blockage visible and can be removed?**

Yes	No
REMOVE the blockage. INSTALL the Fuel Vapor Tube assembly. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	INSTALL a new Fuel Vapor Tube assembly. REFER to the **EVAPORATIVE EMISSIONS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

HX50 DTC P260F: CHECK FOR THE PRESENCE OF ANY MODULE COMMUNICATION CONCERNS

- Key ON, engine OFF.
- Check for self-test DTCs in all of the vehicle modules.
- **Are any communication concerns or communication DTCs present?**

Yes	No
For communication concerns in the PCM, DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** . For communication concerns in other modules, REFER to the applicable Workshop article part to diagnose the communication DTC.	GO to HX51.

HX51 CHECK THE PERFORMANCE OF THE PROCESSOR

- Key in OFF position.
- Disconnect the battery and wait for 1 minute. Refer to the **BATTERY, MOUNTING AND CABLES -- E-SERIES** .
- Connect the battery.
- Key ON, engine running.
- Allow the engine idle to stabilize.
- Access the PCM and monitor the FTP PID.
- **Is the pressure equal to 0 kPa (0 psi)?**

Yes	No
GO to HX53.	GO to HX52.

HX52 CHECK FOR SELF-TEST DTC P260F

- Idle the engine for 2 minutes.
- Carry out the self-test.
- **Is DTC P260F present?**

Yes	No
GO to HX53.	RETURN the vehicle to the customer.

HX53 CHECK THE PCM FOR THE LATEST CALIBRATION

- Program the PCM to the latest calibration.
- Key ON, engine running.
- Idle the engine for 2 minutes.
- Carry out the self-test.
- **Is DTC P260F present?**

Yes	No
GO to HX54.	RETURN the vehicle to the customer.

HX54 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
    - pushed out pins
    - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HY: GENERATOR/REGULATOR SYSTEM

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- generator/regulator (10346)

- powertrain control module (PCM) (12A650)

TEST PROCEDURE

HY1 CHECK THE GENERATOR CIRCUITRY AND OPERATION

NOTE: **If the concern is still present after checking the generator circuitry in the workshop article, return to the PC/ED to continue generator diagnosis.**

- Check for any generator related DTCs. Refer to the **GENERATOR AND REGULATOR -- E-SERIES** to diagnose any generator related DTCs.
- **Is the charging system diagnosed and repaired in the GENERATOR AND REGULATOR -- E-SERIES ?**

Yes	No
The system is operating correctly at this time.	GO to HY2.

HY2 CHECK THE GENERATOR MONITOR SIGNAL

- Key ON, engine running.
- Access the PCM and monitor the GENMON PID.
- **Is the duty cycle between 5% and 97% and not excessively fluctuating?**

Yes	No
The system is operating correctly at this time.	GO to HY3.

HY3 CHECK FOR CORRECT PCM OPERATION

NOTE: **When the battery (or PCM) is disconnected and connected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The charging system set point may also vary. The vehicle may need to be driven to relearn its strategy.**

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH**	The system is operating correctly at this time. The

ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	concern may have been caused by a loose or corroded connector.

PINPOINT TEST JB: SECONDARY IGNITION (COP)

INTRODUCTION

NOTE:	**A malfunctioning ignition system may cause high catalyst temperatures. Check the components next to the catalyst and muffler for heat damage.**

This pinpoint test is intended to diagnose the following:

- spark plugs (12405)
- secondary side of the coil

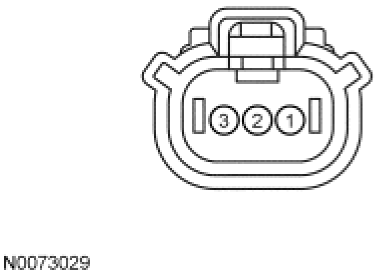

Fig. 149: Coil On Plug (COP) Connector - A
Courtesy of FORD MOTOR CO.

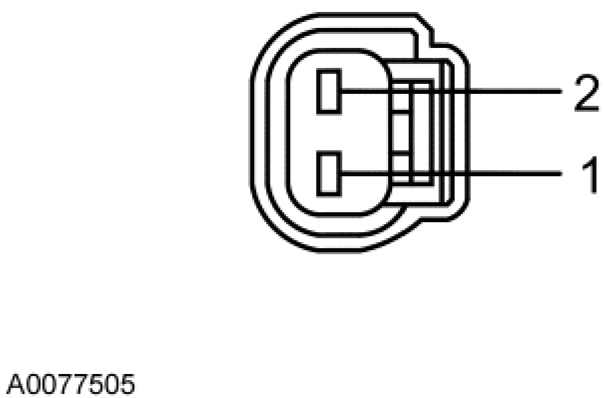

Fig. 150: Coil On Plug (COP) Connector - B
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Edge, MKX, MKZ, Taurus, Taurus X, Sable	A	3	IGN START/RUN
Escape/Mariner, Focus, Fusion, Milan, Mustang 5.4L	B	2	IGN START/RUN
All other vehicles	B	1	IGN START/RUN

Vehicle	Firing Order for Coil On Plug Applications
BASE, 4-cylinder applications	1 3 4 2
BASE, 6-cylinder applications	1 4 2 5 3 6
BASE, 8-cylinder applications	1 3 7 2 6 5 4 8
BASE, 10-cylinder applications	1 6 5 10 2 7 3 8 4 9

TEST PROCEDURE

JB1 CHECK FOR DTCS

- **Are DTCs P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0309, P0310, or P050B present?**

Yes	No
For DTCs P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0309, P0310 or P0316, GO to JB3. For DTC P050B, GO to JB13.	For symptoms without DTCs, GO to JB2. For all other DTCs, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

JB2 VISUAL INSPECTION OF THE IGNITION SYSTEM

- Visually inspect the engine compartment to make sure all coils are properly and securely connected.
- Examine all the wiring harnesses and connectors for damaged, burned, or overheated insulation, and loose or broken conditions.
- Make sure the vehicle battery is in good condition and all of the accessories are turned off.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to JB3.

JB3 DTC P0301 THROUGH P0310: MISFIRE ON CYLINDERS 1 THROUGH 10

- **Are DTCs P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0309, or P0310 present?**

Yes	No
For Edge, Escape/Mariner 3.0L, Explorer 4.6L, Explorer Sport Trac 4.6L, F-150 4.6L, F-150 5.4L, Fusion, Milan, MKX, Sable, Taurus, and Taurus X, GO to JB4. For all others, GO to JB5.	GO to JB6.

JB4 CHECK SPARK DURATION RELATIVENESS

- Monitor the spark duration PIDs.
- **Are the PIDs relative to each other?**

Yes	No
GO to JB10.	INSPECT the coil boot(s) for the missing cylinder (s). INSTALL a new coil boot(s) if necessary. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** , Spark Plugs, and INSPECT the spark plug(s) for the missing cylinder (s). MEASURE the resistance of the spark plug(s). INSTALL a new spark plug(s) if the resistance is lower than 2,000 ohms or higher than 20,000 ohms. If the coil boot(s) and spark plugs are OK, INSTALL a new COP(s) for the missing cylinders. CLEAR the DTCs. REPEAT the self-test.

JB5 CHECK FOR SPARK AT THE CYLINDER(S) INDICATED BY THE DTC(S)

- Key in OFF position.
- Disconnect the ignition coil(s) from the spark plug(s).
- Connect the Air Gap spark tester 303-D037 (D81P-6666-A) or its equivalent to the suspect coil.
- Crank the engine while the accelerator pedal is fully applied.
- Observe the spark tester while cranking the engine.
- **Is a bluish-white spark present?**

Yes	No
GO to JB8.	INSPECT the coil boot(s) for the missing cylinder (s). INSTALL a new coil boot(s) if necessary. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** , Spark Plugs, and INSPECT the spark plug(s) for the missing cylinder (s). MEASURE the resistance of the spark plug(s). INSTALL a new spark plug(s) if the resistance is lower than 2,000 ohms or higher than 20,000 ohms. GO to JB7.

JB6 CHECK FOR SPARK AT ALL CYLINDERS

- Key in OFF position.
- Disconnect the ignition coil(s) from the spark plug(s).
- Connect the Air Gap spark tester 303-D037 (D81P-6666-A) or its equivalent to the suspect coil.
- Crank the engine while the accelerator pedal is fully applied.
- Observe the spark tester at each cylinder while cranking the engine.
- **Is a bluish-white spark consistent between all cylinders?**

Yes	No
GO to JB8.	INSPECT the coil boot(s) for the missing cylinder (s). INSTALL a new coil boot(s) if necessary. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** , Spark Plugs, and INSPECT the spark plug(s) for the missing cylinder (s). MEASURE the resistance of the spark plug(s). INSTALL a new spark plug(s) if the resistance is lower than 2,000 ohms or higher than 20,000 ohms. RECORD the cylinder(s) with inconsistent spark. GO to JB7.

JB7 CHECK THE SECONDARY COIL RESISTANCE FOR THE MISSING CYLINDERS

- Key in OFF position.
- Suspect coil connector disconnected.
- Measure resistance between: Suspect coil connector, IGN START/RUN, component side and ignition coil spring, located in the ignition coil boot.
- **Is the resistance between 5,000 and 6,000 ohms?**

Yes	No
refer to **PINPOINT TEST Z**.	INSTALL a new COP. CLEAR the DTCs. REPEAT the self-test.

JB8 CHECK THE SPARK PLUGS

NOTE: **To determine the condition of the spark plugs, refer to the ENGINE - 4.6L AND 5.4L -- E-SERIES and carry out the Spark Plug Inspection.**

- Key in OFF position.
- Remove and inspect the plugs for damage, wear, carbon tracking or deposits and proper plug gap.
- **Are the plugs OK?**

Yes	No
GO to JB9.	REPAIR the plug(s). ADJUST the gap or INSTALL a new spark plug(s) as necessary. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

JB9 CHECK THE SPARK PLUG RESISTANCE

- Measure the spark plug resistance.
- **Is the resistance between 2,000 and 20,000 ohms?**

Yes	No
For Edge, Escape/Mariner 3.0L, Explorer 4.6L, Explorer Sport Trac 4.6L, F-150 4.6L, F-150 5.4L, Fusion, Milan, MKX, Sable, Taurus, and Taurus X, GO to JB14. For all others, GO to JB10.	INSTALL a new spark plug. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

JB10 TEST DIRECTION FOR SYMPTOM CHARTS

- **Were you directed to this pinpoint test?**

Yes	No
RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	GO to JB11.

JB11 TEST DIRECTION FOR PINPOINT TEST HD

- **Were you directed to this pinpoint test from pinpoint test step HD6?**

Yes	No

GO to HD7.	GO to JB12.

JB12 TEST DIRECTION FOR PINPOINT TEST A

- **Were you directed to this pinpoint test from pinpoint test step A8?**

Yes	No
GO to A9.	The concern is intermittent. refer to **PINPOINT TEST Z**.

JB13 DTC P050B: COLD START PERFORMANCE

- **Are any other codes besides P050B present?**

Yes	No
REPAIR all other powertrain related diagnostic trouble codes (DTCs) first.	GO to JB14.

JB14 CHECK THE SPARK CAPTURE CIRCUIT

- Access the PCM and monitor the IGNPCM_F PID.
- **Is a concern indicated?**

Yes	No
GO to JB16.	GO to JB15.

JB15 CHECK THE IGNITION TIMING PID

- Access the PCM and monitor the IGNX_F PIDs.
- **Is a concern indicated?**

Yes	No
Visually inspect the COP harness for damage, exposed wiring, water contamination, corrosion, and correct assembly. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to JB16.

JB16 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST JC: SECONDARY IGNITION (COIL PACK)

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- spark plugs (12405)
- spark plug wires (12280, 12281)

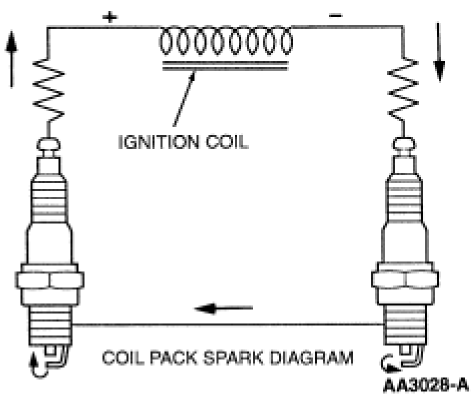

Fig. 151: Coil Pack Spark Diagram
Courtesy of FORD MOTOR CO.

Explorer 4.0L, Explorer Sport Trac 4.0L, F150 4.2L, Mountaineer 4.0L, Mustang 4.0L, Ranger.

TEST PROCEDURE

JC1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0300, P0301, P0302, P0303, P0304, P0305, P0306 or P050B present?**

Yes	No
For DTCs P0301, P0302, P0303, P0304, P0305 or P0306, GO to JC13. For DTC P0300, GO to JC2. For DTC P050B, GO to JC18.	For all other DTCs, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

JC2 VISUAL INSPECTION OF THE IGNITION SYSTEM

- Visually inspect the engine compartment to make sure all coils and spark plug wires are properly

and securely connected.

- Examine all wiring harnesses and connectors for damaged, burned or overheated insulation and loose or broken conditions.
- Make sure the vehicle battery is in good condition and all accessories are turned off.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	For a coil pack using an engine analyzer, GO to JC3. For a coil pack not using an engine analyzer, GO to JC12.

JC3 CONNECT THE ENGINE ANALYZER

- Obtain an engine analyzer to diagnose concerns in the secondary side of the ignition system.
- **Is the engine analyzer connected?**

Yes	No
GO to JC4.	REPEAT Step JC2.

JC4 CHECK FOR THE IGNITION PATTERN

- Observe the pattern on a scope while cranking the engine.

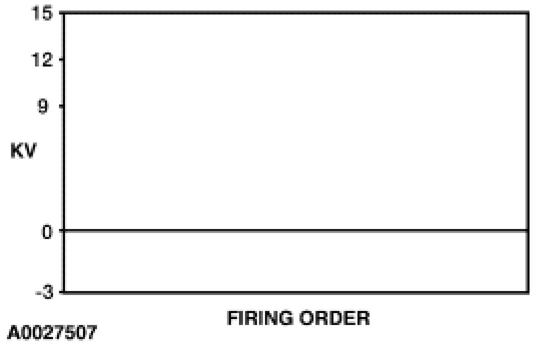

Fig. 152: Ignition Firing Pattern (No Spark)
Courtesy of FORD MOTOR CO.

- **Is the pattern flat, which indicates no spark on all cylinders?**

Yes	No
An IGN/START/RUN circuit concern. CHECK the condition of the related fuses/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the IGN START/RUN circuit for a short to ground. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to JC5.

JC5 CHECK FOR A NORMAL IGNITION PATTERN

NOTE: **Spark plugs may be fired more than once per combustion event. Multi-strike operating mode is RPM dependent.**

- Key ON, engine running. If no start, crank the engine.

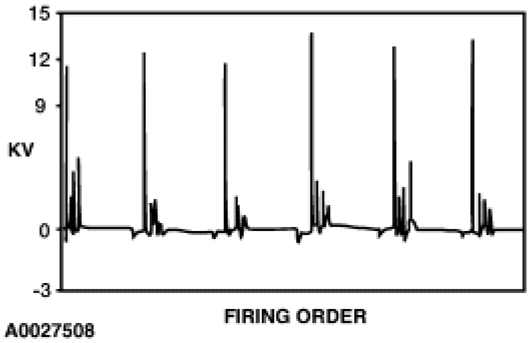

Fig. 153: Normal Ignition Firing Pattern
Courtesy of FORD MOTOR CO.

- **Are the patterns even and is the average value of spark plug firing voltage between 9 kV and 15 kV (higher during engine crank/no start)?**

Yes	No
refer to **PINPOINT TEST Z**.	GO to JC6.

JC6 IGNITION PATTERN EVALUATION

- **Is the ignition pattern normal?**

Yes	No
GO to JC7.	GO to JC8.

JC7 TEST DIRECTION

- **Were you directed to this pinpoint test from pinpoint test step A8?**

Yes	No
GO to A9.	GO to JC8.

JC8 CHECK FOR MISSING SPARK PATTERNS

- Observe for missing spark pattern.

Fig. 154: Identifying Missing Spark Pattern
Courtesy of FORD MOTOR CO.

- **Is the spark pattern inconsistent?**

Yes	No
INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wire if the resistance is greater than 7,000 ohms per 30.5 cm (1 foot). REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test. GO to JE2.	GO to JC9.

JC9 CHECK FOR A HIGH SPARK PLUG FIRING VOLTAGE

- Observe for a high spark plug firing voltage.

Fig. 155: Identifying High Spark Plug Firing Voltage
Courtesy of FORD MOTOR CO.

- **Is the average value of the spark plug firing voltage greater than 15 Kv?**

Yes	No
INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wire if the	GO to JC10.

resistance is greater than 7,000 ohms per 30.5 cm (1 foot). REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	

JC10 CHECK FOR LOW SPARK PLUG FIRING VOLTAGE

- Check the spark plug firing voltage average pattern.

Fig. 156: Identifying Low Spark Plug Firing Voltage Pattern
Courtesy of FORD MOTOR CO.

- **Is there consistently low spark plug firing voltage or sloping spark line on one or more cylinders?**

Yes	No
INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wire if the resistance is greater than 7,000 ohms per 30.5 cm (1 foot). MEASURE the resistance of the spark plug(s). INSTALL a new spark plug(s) if the resistance is lower than 2,000 or higher than 20,000 ohms. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to JC11.

JC11 CHECK FOR EVENESS BETWEEN CYLINDERS

- Check the spark plug firing voltage average pattern.

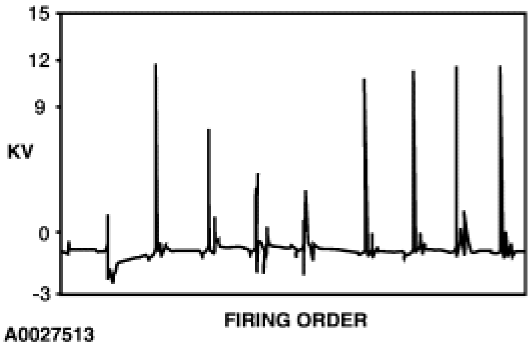

Fig. 157: Identifying Unevenness Between Cylinders Pattern
Courtesy of FORD MOTOR CO.

- **Is the evenness of spark plug firing voltage greater than 6 kV?**

Yes	No
INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wire if the resistance is greater than 7,000 ohms per 30.5 cm (1 foot). CHECK for damaged spark plugs or narrow spark plug gaps. MEASURE the resistance of the spark plug(s). INSTALL a new spark plug(s) if the resistance is lower than 2,000 or higher than 20,000 ohms. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

JC12 DTCS P0301 THROUGH P0306: MISFIRE ON CYLINDERS 1 THROUGH 6

- **Are DTCs P0300, P0301, P0302, P0303, P0304, P0305, or P0306 present?**

Yes	No
GO to JC13.	GO to JC14.

JC13 CHECK FOR SPARK AT THE CYLINDER(S) INDICATED BY THE DTC(S)

- Key in OFF position.
- Disconnect the spark plug wire(s) from the spark plug(s).
- Connect the Air Gap spark tester 303-D037 (D81P-6666-A) or its equivalent to a spark plug wire.
- Crank the engine while the accelerator pedal is fully applied.
- Check for spark while cranking the engine.
- **Is the bluish-white spark present?**

Yes	No
GO to JC16.	INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark

	plug wires. INSTALL a new spark plug wire(s) if the resistance is greater than 7,000 ohms per 30.5 cm (1 foot). REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . If the spark plug wires are OK, GO to JC15.

JC14 CHECK FOR SPARK AT ALL CYLINDERS

- Key in OFF position.
- Disconnect the spark plug wire(s) from the spark plug(s).
- Connect the Air Gap spark tester 303-D037 (D81P-6666-A) or its equivalent to a spark plug wire.
- Crank the engine while the accelerator pedal is fully applied.
- Check for spark while cranking the engine.
- **Is the bluish-white spark present?**

Yes	No
GO to JC16.	INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wire(s), if the resistance is greater than 7,000 ohms per 30.5 cm (1 foot). REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . If the spark plug wires are OK, GO to JC15.

JC15 CHECK THE SECONDARY COIL RESISTANCE FOR THE MISSING CYLINDERS

NOTE: **Two adjacent coil towers share a common coil and are called a matched pair. For 6-tower coil pack (6 cylinder) applications, the matched pairs are 1 and 5, 2 and 6, and 3 and 4. For Mustang the matched pairs are 1 and 4, 2 and 5, and 3 and 6. For 4-tower coil pack (4 cylinder) applications, the matched pairs are 1 and 4, and 2 and 3.**

- Key in OFF position.
- Ignition coil pack disconnected.
- Disconnect spark plug wires from the coil pack.
- Measure the resistance of each matched pair.
- **Is the resistance between 9,500 and 15,500 ohms?**

Yes	No
refer to **PINPOINT TEST Z**.	INSTALL a new ignition coil pack. CLEAR the DTCs. REPEAT the self-test.

JC16 CHECK THE SPARK PLUGS

- Key in OFF position.
- Check for damaged spark plugs or narrow spark plug gaps.
- **Are the plugs OK?**

Yes	No
GO to JC17.	REPAIR the spark plug(s). ADJUST the gap or INSTALL a new spark plug(s) as necessary. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

JC17 CHECK THE SPARK PLUG RESISTANCE

- Measure the spark plug resistance.
- **Is the resistance between 2,000 and 20,000 ohms?**

Yes	No
refer to **PINPOINT TEST Z**.	INSTALL a new spark plug(s). REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

JC18 DTC P050B: COLD START PERFORMANCE

- **Are any other codes besides P050B present?**

Yes	No
REPAIR all other powertrain related diagnostic trouble codes (DTCs) first.	GO to JC19.

JC19 CHECK THE SPARK CAPTURE CIRCUIT

- Access the PCM and monitor the IGNPCM_F PID.
- **Is a concern indicated?**

Yes	No
GO to JC21.	GO to JC20.

JC20 CHECK THE IGNITION TIMING PID

- Access the PCM and monitor the IGNX_F PIDs.
- **Is a concern indicated?**

Yes	No
Visually inspect the coil pack harness for damage,	GO to JC21.

exposed wiring, water contamination, corrosion, and correct assembly. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	

JC21 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST JD: CRANKSHAFT POSITION (CKP) SENSOR

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- crankshaft position (CKP) sensor (6C315)
- harness circuits: CKP(+) and CKP(-)
- powertrain control module (PCM) (12A650)

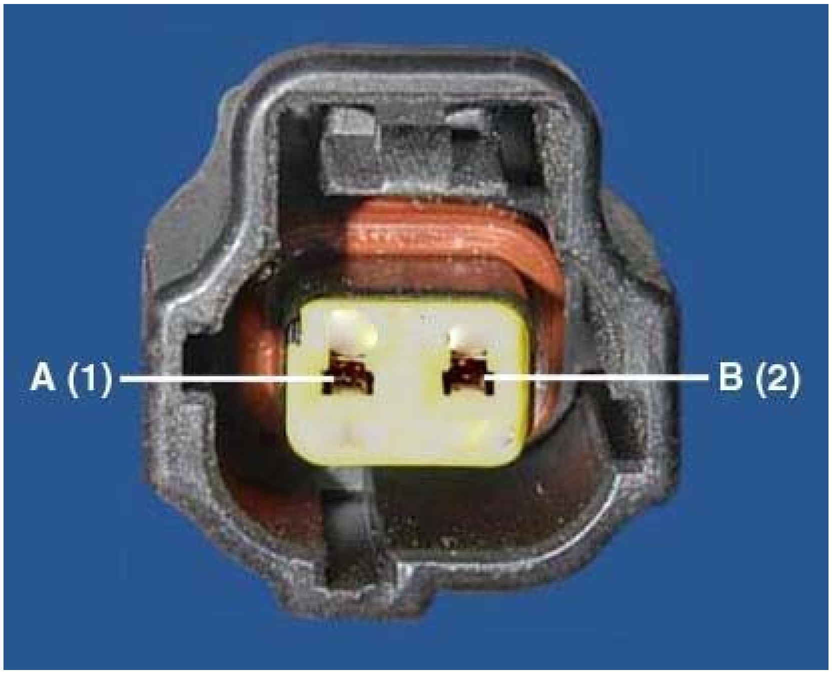

Fig. 158: Crankshaft Position (CKP) Sensor Connector - A
Courtesy of FORD MOTOR CO.

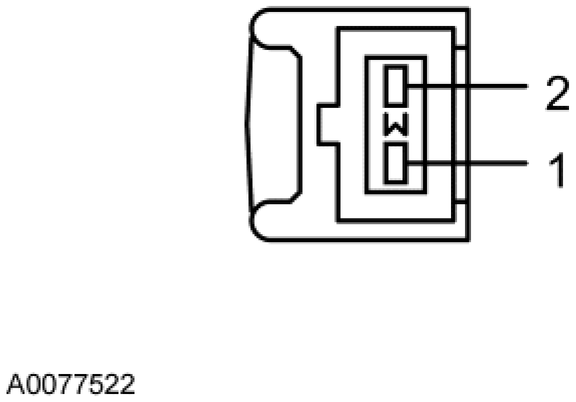

Fig. 159: Crankshaft Position (CKP) Sensor Connector - B
Courtesy of FORD MOTOR CO.

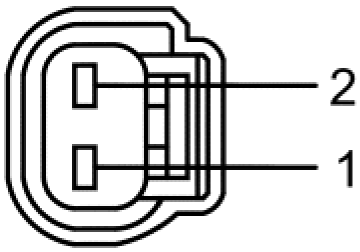

Fig. 160: Crankshaft Position (CKP) Sensor Connector - C
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Escape/Mariner 2.3L, Focus, Fusion 2.3L, Milan 2.3L, Ranger 2.3L	A	2 1	CKP- CKP+
Explorer 4.0L, Explorer Sport Trac 4.0L, Mountaineer 4.0L, Mustang 4.0L, Ranger 4.0L	B	2 1	CKP- CKP+
All other vehicles	C	1 2	CKP- CKP+

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Edge, F-150, Mark LT, MKX, Sable, Taurus, Taurus X	190 Pin	E47 E46	CKP+ CKP-
Escape/Mariner	150 (50-50-50) Pin	E34 E45	CKP+ CKP-
Expedition, Fusion,	140 Pin	E47 E46	CKP+ CKP-

Milan, MKZ, Navigator			
Focus	190 Pin	E58 E42	CKP+ CKP-
All other vehicles	170 Pin	E47 E46	CKP+ CKP-

TEST PROCEDURE

JD1 CHECK THE CKP SENSOR SIGNAL SENT TO THE PCM

NOTE: The battery should be fully charged and the starting system should be functioning properly.

- Disable the inertia switch.
- Key ON, engine OFF.
- Access the PCM and monitor the RPM PID.
- Crank the engine.
- **Is the RPM greater than 150 RPM?**

Yes	No
For DTC P1336 with no start, refer to **PINPOINT TEST A**. For DTC P1336, GO to HD16. For all others, the CKP, PCM, and harness are working properly. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	GO to JD2.

JD2 CHECK THE TIMING COVER, CKP SENSOR AND EXTERNAL TRIGGER WHEEL (OUTSIDE THE TIMING COVER) FOR OBVIOUS PHYSICAL DAMAGE

- Key in OFF position.
- Visually check the timing cover, CKP sensor and external trigger wheel (outside the timing cover) for obvious physical damage.
- **Do any parts appear physically damaged?**

Yes	No
REPAIR as necessary. RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.	GO to JD3.

JD3 CHECK FOR PROPER CKP BIAS VOLTAGES IN THE PCM

- CKP Sensor connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CKP Sensor Connector, Harness Side	(-) Vehicle Battery
CKP+	Negative terminal
CKP-	Negative terminal

- **Are the voltages between 1 - 3 V?**

Yes	No
GO to JD4.	GO to JD6.

JD4 CHECK THE CKP SENSOR RESISTANCE

- Key in OFF position.
- Measure the resistance between:

(+) CKP Sensor Connector, Component Side	(-) CKP Sensor Connector, Component Side
CKP+	CKP-

- **Is the resistance between 250 - 1K ohms?**

Yes	No
GO to JD5.	INSTALL a new CKP sensor. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

JD5 CHECK THE CKP HARNESS SHIELD GROUND

NOTE: **The harness shield protects the CKP signal from electrical noise and is grounded at one end, typically near the PCM.**

NOTE: **Carry out the following resistance measurement between the CKP shield and the ground.**

- Measure the resistance between:

(+) CKP_SHLD Assembly Connector, Harness Side	(-)
CKP_SHLD	Ground

- **Is the resistance less than 5 ohms?**

Yes	No
GO to JD6.	REPAIR the open circuit. CHECK for a poor ground connection. CLEAR the DTCs. REPEAT the self-test.

JD6 CHECK FOR SHORT BETWEEN CKP(+) AND CKP(-) IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) CKP Sensor Connector, Harness Side	(-) CKP Sensor Connector, Harness Side
CKP+	CKP-

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to JD7.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

JD7 CHECK THE CKP CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) CKP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
CKP-	CKP-
CKP+	CKP+

- **Are the resistances less than 5 ohms?**

Yes	No
GO to JD8.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

JD8 CHECK THE CKP CIRCUIT(S) FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) CKP Sensor Connector, Harness Side	(-) Vehicle Battery
CKP+	Negative terminal
CKP-	Negative terminal

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to JD9.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

JD9 CHECK THE CKP CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
CKP+	Negative terminal
CKP-	Negative terminal

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to JD10.

JD10 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST JE: INTEGRATED IGNITION COIL PACK A, B, OR C FAILURE

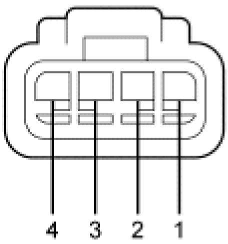
INTRODUCTION

This pinpoint test is intended to diagnose the following:

- ignition coil packs (12029)

- ignition coil harness
- IGN START/RUN circuit to coil packs
- powertrain control module (PCM) (12A650)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.



N0048012

	P0352	4	B	B	E12
	P0351	5	A	A	E17
	P0353	6	C	C	E16

TEST PROCEDURE

JE1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0350, P0351, P0352, or P0353 present?**

Yes	No
GO to JE2.	For all other DTCs, GO to **DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

JE2 DETERMINE WHICH COIL IS NOT FIRING PROPERLY

NOTE: **Electronic ignition engine timing is entirely controlled by the PCM. Electronic ignition timing is NOT adjustable. Do not attempt to check base timing. You will receive false readings.**

- Determine which coil is not firing properly using the information from Pinpoint Test JB or a DTC and the table at the beginning of this pinpoint test.
- Record the suspect cylinder, coil and PCM pin number from the table.
- **Is the suspect cylinder number, coil driver and PCM pin number recorded?**

Yes	No
GO to JE3.	To obtain the required information, REPEAT step JE2.

JE3 DTC P0351, P0352, P0353: CHECK IGN START/RUN VOLTAGE TO THE COIL PACK

- Suspect coil connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) Coil Pack Assembly Connector, Harness Side	(-)
IGN START/RUN	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to JE4.	The IGN START/RUN has a circuit concern. CHECK the condition of the related fuses/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the IGN START/RUN circuit for a short to ground. REPAIR as necessary. CARRY OUT the misfire monitor drive cycle. REFER to **ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . CLEAR the DTCs. REPEAT the self-test.

JE4 CHECK THE FUNCTIONALITY OF THE SUSPECT COIL DRIVER (CD) CIRCUIT

- Key in OFF position.
- Connect a test lamp between IGN START/RUN and the suspect CD circuit (determined from the table) at the coil pack harness connector.
- Crank the engine while the accelerator pedal is fully applied.
- Observe the test lamp while cranking the engine.
- **Does the test lamp blink consistently?**

Yes	No
GO to JE8.	GO to JE5.

JE5 CHECK THE SUSPECT CD CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) Coil Pack Assembly Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect coil driver	Suspect coil driver

- **Is the resistance less than 5 ohms?**

Yes	No
GO to JE6.	REPAIR the open circuit. CARRY out the misfire monitor drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . CLEAR the DTCs. REPEAT the self-test.

JE6 CHECK THE SUSPECT CD CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
Suspect coil driver	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CARRY out the misfire monitor drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . CLEAR the DTCs. REPEAT the self-test.	GO to JE7.

JE7 CHECK THE SUSPECT CD CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
Suspect coil driver	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to JE9.	REPAIR the short circuit. CARRY out the misfire monitor drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . CLEAR the DTCs. REPEAT the self-test.

JE8 CHECK THE SUSPECT COIL FOR DAMAGE

- Key in OFF position.
- Remove the spark plug wire from the suspect coil tower (as determined from the table).
- Connect the Air Gap Spark Tester 303-D037 (D81P-6666-A) or equivalent to the suspect spark plug wire.
- Crank the engine while the accelerator pedal is fully applied.
- Observe the spark tester while cranking the engine.
- **Is a bluish-white spark present?**

Yes	No
refer to **PINPOINT TEST Z**.	INSTALL a new coil pack as needed. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CARRY out the misfire monitor drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** . CLEAR the DTCs. REPEAT the self-test.

JE9 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No

INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST JF: INTEGRATED IGNITION COIL ON PLUG COIL A THROUGH J FAILURE

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- ignition coils (12029)
- ignition coil harness
- ignition coils relay
- powertrain control module (PCM) (12A650)

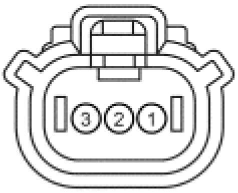

Fig. 164: Coil On Plug (COP) Connector - A

TEST PROCEDURE

JF1 DETERMINE WHICH COIL IS NOT FIRING PROPERLY

NOTE: Electronic ignition engine timing is entirely controlled by the PCM. Electronic ignition timing is NOT adjustable. Do not attempt to check base timing. You will receive false readings.

- Determine which coil is not firing properly using the information from Pinpoint Test JB or a DTC and the table at the beginning of this pinpoint test.
- Record the suspect cylinder, coil and PCM pin number from the table.
- **Is the suspect cylinder number, coil driver and PCM pin number recorded?**

Yes	No
GO to JF2.	REPEAT the test step to obtain the required information.

JF2 CHECK THE FUNCTIONALITY OF THE SUSPECT COIL DRIVER CIRCUIT

NOTE: This step may cause fuel pump related DTCs to set. Disregard any fuel pump related DTCs at this time.

NOTE: Test lamp bulb filament wattages vary widely. The intensity and duration of blinking depends on the test lamp being used.

- Key in OFF position.
- Suspect coil connector disconnected.
- Remove the fuel pump fuse to disable the fuel pump.
- Connect a non-powered test lamp between the IGN START/RUN and suspect coil driver, harness side.
- Observe the test lamp while cranking the engine.
- **Is the test lamp blinking consistently?**

Yes	No
GO to JF3.	GO to JF4.

JF3 CHECK THE FUNCTIONALITY OF THE SUSPECT COIL

- Key in OFF position.

- Carry out a visual inspection. Closely inspect the coil case and boot for carbon tracking, cracks and torn or improperly installed boots.
- Remove the suspect COP from the spark plug.
- Connect the Air Gap Spark Tester 303-DO37 (D81P-6666-A) or equivalent.
- Suspect coil connector connected.
- Crank the engine.
- Observe the spark tester while cranking the engine.
- **Is a bluish-white spark present?**

Yes	No
refer to **PINPOINT TEST Z**.	INSTALL a new suspect coil. If necessary, INSTALL a new spark plug. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

JF4 CHECK THE IGN START/RUN VOLTAGE TO THE SUSPECT COIL

- Key ON, engine OFF.
- Suspect coil connector disconnected.
- Measure the voltage between:

(+) COP Connector, Harness Side	(-) Vehicle Battery
IGN START/RUN	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to JF5.	For Crown Victoria, Grand Marquis, and Town Car, GO to JF9. For all others, REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

JF5 CHECK THE SUSPECT COIL DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Suspect coil connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) COP Connector, Harness Side
Suspect coil driver	COP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to JF6.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

JF6 CHECK THE SUSPECT COIL DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
Suspect coil driver	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to JF7.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

JF7 CHECK THE SUSPECT COIL DRIVER CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
Suspect coil driver	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to JF12.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test. If the concern or DTC is still present, GO to JF8.

JF8 CHECK THE SUSPECT COIL FOR DAMAGE

- PCM connector connected.
- Connect the Air Gap Spark Tester 303-D037 (D81P-6666-A) or equivalent to the suspect coil.
- Crank the engine while the accelerator pedal is fully applied.
- Observe the spark tester while cranking the engine.
- **Is a bluish-white spark present?**

Yes	No
If necessary, INSTALL a new spark plug. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	INSTALL a new suspect coil. REFER to the **ENGINE IGNITION - 4.6L (2V) AND 5.4L (2V) -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

JF9 CHECK VPWR CIRCUIT CONTINUITY BETWEEN THE SUSPECT COIL AND IGNITION COILS RELAY

- Key in OFF position.
- Ignition Coils Relay connector disconnected.
- Measure the resistance between:

(+) Ignition Coils Relay Connector, Harness Side	(-) Suspect coil Connector, Harness Side
VPWR - Pin 3	IGN START/RUN

- **Is the resistance less than 5 ohms?**

Yes	No
GO to JF10.	REPAIR the open circuit. The open is between the splice and the ignition coils relay. CLEAR the DTCs. REPEAT the self-test.

JF10 CHECK THE B+ AND IGN START/RUN VOLTAGE TO IGNITION COILS RELAY

- Key ON, engine OFF.
- Measure the voltage between:

(+) Ignition Coils Relay Connector, Harness Side	(-)
B+ - Pin 5	Ground
IGN START/RUN - Pin 2	Ground

- **Are the voltages greater than 10 V?**

Yes	No
GO to JF11.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

JF11 CHECK THE IGNITION COILS RELAY GND CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the voltage between:

(+) Ignition Coils Relay Connector, Harness	(-) Ignition Coils Relay Connector, Harness

Side	Side
B+ - Pin 5	GND - Pin 1

- **Is the voltage greater than 10 V?**

Yes	No
INSTALL a new Ignition Coils relay. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

JF12 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KA: FUEL PUMP (FP) RELAY

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- fuel pump relay (9345)
- inertia fuel shutoff (IFS) switch (9341)
- harness circuits: B+, VPWR, FP, GND, FPM, and FP PWR
- powertrain control module (PCM) (12A650)

The VPWR and FP circuits may be reversed in the harness connector. Refer to the Wiring Diagrams article for schematic and connector information.

Ranger	170 Pin	B21 B12	FPM FP
All other vehicles	190 Pin	B30 B62	FPM FP

TEST PROCEDURE

KA1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0230, P0231, P0232, or P1641 present?**

Yes	No
For KOEO and KOER DTCs P0230 or P1641, GO to KA2. For continuous memory DTCs P0230 or P1641, GO to KA32. For KOEO and KOER DTC P0231, GO to KA24. For continuous memory DTC P0231, GO to KA31. For KOEO and KOER DTC P0232, GO to KA12. For continuous memory DTC P0232, GO to KA29.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

KA2 KOEO AND KOER DTCS P0230 AND P1641: CHECK FOR THE PRESENCE OF DTC P0685 OR P0690

- Carry out the self-test.
- **Are DTCs P0685 or P0690 present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to KA3.

KA3 CHECK THE VPWR VOLTAGE TO FUEL PUMP RELAY

- FP Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FP Relay Connector, Harness Side	(-)

VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KA4.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KA4 CHECK THE FUEL PUMP RELAY

- Key in OFF position.
- Carry out the FP relay component test. Refer to the Wiring Diagrams Cell 149 Component Testing.
- **Does the FP relay pass the component test?**

Yes	No
GO to KA5.	INSTALL a new FP relay. CLEAR the DTCs. REPEAT the self-test.

KA5 CHECK THE FP CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FP Relay Connector, Harness Side	(-)
FP	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to KA6.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KA6 CHECK THE FUEL PUMP CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) FP Relay Connector, Harness Side	(-)
FP	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KA7.	REPAIR the short circuit. CLEAR the DTCs.

	REPEAT the self-test.

KA7 CHECK THE FUEL PUMP CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) FP Relay Connector, Harness Side	(-) PCM Connector, Harness Side
FP	FP

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KA8.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KA8 CHECK FOR KOEO DTCS

- Carry out the KOEO self-test.
- **Are DTCs P0231 or P0232 present?**

Yes	No
GO to KA9.	GO to KA34.

KA9 CHECK THE FP PRIMARY CIRCUIT INSIDE THE PCM

- PCM connector connected.
- FP Relay connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the FP_F PID.
- **Is the PID state YES?**

Yes	No
GO to KA34.	GO to KA10.

KA10 CHECK THE FUEL PUMP PRIMARY CIRCUIT INSIDE THE PCM WHILE CRANKING THE ENGINE

- Access the PCM and monitor the FP_F PID.
- While observing the PID, crank the engine.
- **Does the PID display indicate a concern during crank?**

Yes	No
GO to KA34.	The fuel pump primary circuit is OK in the harness and PCM. GO to KA11.

KA11 IS DTC P0231 PRESENT IN THE KOEO SELF-TEST?

- Carry out the KOEO self-test.
- **Is DTC P0231 present?**

Yes	No
GO to KA24.	GO to KA12.

KA12 KOEO AND KOER DTC P0232: DOES THE ENGINE START?

- **Does the engine start?**

Yes	No
GO to KA13.	GO to KA18.

KA13 VERIFY THE FUEL PUMP IS OFF

- Key ON, engine OFF.
- Wait for 5 seconds.
- The fuel pump is located above the fuel tank. Listen for the sound of the fuel pump operating which can be heard from outside the vehicle.
- **Is fuel pump off with the key ON?**

Yes	No
GO to KA15.	GO to KA14.

KA14 CHECK FOR FUEL PUMP RELAY CONTACTS ALWAYS CLOSED

- FP Relay connector disconnected.
- Key ON, engine OFF.
- **Is fuel pump off with the key ON?**

Yes	No
INSTALL a new FP relay. CLEAR the DTCs. REPEAT the self-test.	REPAIR the short circuit. The short circuit is between the FPPWR and FPM circuits or in the INJPWRM circuit. CLEAR the DTCs. REPEAT the self-test.

KA15 CHECK THE FPM CIRCUIT FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- FP Relay connector disconnected.
- Measure the resistance between:

(+) FP Relay Connector, Harness Side	(-) PCM Connector, Harness Side
FPPWR	FPM

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KA16.	REPAIR the open circuit. The concern is between the splice and the PCM. CLEAR the DTCs. REPEAT the self-test.

KA16 IS KOEO DTC P0231 PRESENT?

- Carry out the KOEO self-test.
- **Is DTC P0231 present?**

Yes	No
GO to KA34.	GO to KA17.

KA17 CHECK THE FPM PRIMARY CIRCUIT INSIDE THE PCM

- PCM connector connected.
- FP Relay connector connected.
- Key ON, engine OFF.
- Access the PCM and monitor the FPM PID.
- **Is the PID state OFF?**

Yes	No
The concern is not present at this time. The FPM circuit is OK in the harness and PCM. Disregard DTC P0232 at this time. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	GO to KA34.

KA18 CHECK IF THE INERTIA FUEL SHUTOFF (IFS) SWITCH IS TRIPPED

- **Is the IFS switch tripped?**

Yes	No
RESET the IFS switch. CLEAR the DTCs. REPEAT the self-test.	GO to KA19.

KA19 CHECK THE INERTIA FUEL SHUTOFF

- IFS Switch connector disconnected.
- Measure the resistance between:

(+) IFS Switch Connector, Component Side	(-) IFS Switch Connector, Component Side
FPPWR-A - Pin 2	FPPWR-B - Pin 1

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KA20.	INSTALL a new IFS switch. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KA20 CHECK THE FP PWR CIRCUIT FOR AN OPEN IN THE HARNESS

- FP Relay connector disconnected.
- Measure the resistance between:

(+) IFS Switch Connector, Harness Side	(-) FP Relay Connector, Harness Side
FPPWR-A - Pin 2	FPPWR

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KA21.	REPAIR the open circuit. CHECK for an open circuit between the IFS switch and the FPM splice. REFER to the Wiring Diagrams article for schematic and connector information. CLEAR the DTCs. REPEAT the self-test.

KA21 CHECK THE FUEL PUMP GROUND CIRCUIT FOR AN OPEN IN THE HARNESS

- FP connector disconnected.
- Measure the resistance between:

(+) FP Connector, Harness Side	(-)
FPGND	Ground

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KA22.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KA22 CHECK THE FP PWR CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) FP Connector, Harness Side	(-) IFS Switch Connector, Harness Side
FPPWR	FPPWR-B - Pin 1

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KA23.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KA23 CHECK THE INTERNAL RESISTANCE OF THE FUEL PUMP

- Measure the resistance between:

(+) FP Connector, Harness Side	(-) FP Connector, Harness Side
FPPWR	FPGND

- **Is the resistance less than 10 ohms?**

Yes	No
The fuel pump circuit is OK in the harness and PCM. Disregard DTC P0232 at this time. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts for further direction.	INSTALL a new FP. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KA24 KOEO AND KOER DTC P0231: IS KOEO DTC P0230 ALSO PRESENT?

- Carry out the KOEO self-test.
- **Is DTC P0230 present?**

Yes	No
GO to KA3.	GO to KA25.

KA25 DOES THE ENGINE START?

- **Does the engine start?**

Yes	No
GO to KA15.	GO to KA26.

KA26 CHECK IF THE IFS SWITCH IS TRIPPED

- **Is the IFS switch tripped?**

Yes	No
RESET the IFS switch. CLEAR the DTCs. REPEAT the self-test.	GO to KA27.

KA27 CHECK THE B+ CIRCUIT VOLTAGE TO THE FP RELAY

- FP Relay connector disconnected.

- Measure the voltage between:

(+) FP Relay Connector, Harness Side	(-)
B+	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KA28.	A B+ circuit concern is present. CHECK the condition of the related fuse/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the circuit for a short to ground before installing a new fuse/fuse link. CLEAR the DTCs. REPEAT the self-test.

KA28 CHECK THE FP PWR CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) FP Relay Connector, Harness Side	(-)
FPPWR	Ground

- **Is the resistance less than 10 ohms?**

Yes	No
INSTALL a new FP relay. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. The open is between the splice and the FP relay. CLEAR the DTCs. REPEAT the self-test.

KA29 CONTINUOUS MEMORY DTC P0232: IS A CONTINUOUS DTC P0230 PRESENT?

- Retrieve the continuous memory DTCs.
- **Is DTC P0230 present?**

Yes	No
GO to KA33.	GO to KA30.

KA30 CHECK THE FUEL PUMP SECONDARY CIRCUITS FOR A CONCERN

NOTE: **Be aware that DTC P0232 could be set if the IFS switch is tripped then reset, or if voltage is supplied to the FP PWR circuit when the PCM expects the fuel pump to be off. The fuel pump prime procedure produces this.**

NOTE: **The FPM PID turns ON when a concern is present.**

- Key ON, engine OFF.
- Access the PCM and monitor the FPM PID.
- Observe the FPM PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the FPPWR circuit between the FP RLY and the FP
  - Shake, wiggle, and bend the FP GND
  - Shake, wiggle, and bend the FPM circuit between the PCM and the splice to the FPPWR circuit
  - Shake, wiggle, and bend the INJPWRM circuit between the PCM and the splice to the FPPWR circuit
  - Lightly tap on the FP, IFS, and FP RLY to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KA31 CONTINUOUS MEMORY DTC P0231: CHECK THE HARNESS

- PCM connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A PCM Connector, Harness Side	Point B
FP	Ground

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
FPM	Ground

- The FP turns on and the voltage will be greater than 10 V.
- Check for an indication of a concern while carrying out the following. The voltage changes suddenly when a concern is present.
  - Shake, wiggle, and bend the B+ supply to the FP relay
  - Shake, wiggle, and bend the FP PWR circuit between the FP relay and the FPM splice
  - Lightly tap on the FP relay to simulate road shock
- Key in OFF position.
- Visually inspect the FP relay and its loom connector for damage and corrosion.
- **Is a concern present?**

Yes	No

ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KA32 CONTINUOUS MEMORY DTC P0230: CHECK FOR THE PRESENCE OF DTC P0685 OR P0690

- Carry out the self-test.
- **Are DTCs P0685 or P0690 present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to KA33.

KA33 CHECK THE FP PRIMARY CIRCUITS

NOTE: The PID indicates YES when a concern is present.

- Key ON, engine OFF.
- Wait for 5 seconds.
- Access the PCM and monitor the FP_F PID.
- Observe the FP_F PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the FP circuit between the PCM and the FP relay
  - Shake, wiggle, and bend the VPWR circuit between the electronic engine control power relay and the FP relay
  - Lightly tap on the FP relay to simulate road shock
- Key in OFF position.
- Visually inspect the PCM connector and wires as far back as the main loom for damage.
- Visually inspect the FPR connector and wires as far back as the main loom for damage.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KA34 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion

- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KB: FUEL PUMP DRIVER MODULE

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- fuel pump driver module (FPDM) (9D370) and (9D372)
- FPDM power supply relay
- inertia fuel shutoff (IFS) switch (9341)
- harness circuits: B+, GND, FPC, FPM, FPM2, FP PWR, FP2PWR, FP RTN, FP2RTN, VPWR Fuel, VPWR Fuel 2, and PWRGND
- powertrain control module (PCM) (12A650)

TEST PROCEDURE

KB1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P1233, P1234, P1235, P1236, P1237, P1238, or P1641 present?**

Yes	No
For DTC P1233, GO to KB2. For DTC P1234, GO to KB38. For DTCs P1235 or P1641, GO to KB20. For DTC P1236, GO to KB50. For DTC P1237, GO to KB26. For DTC P1238, GO to KB56.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

KB2 DTC P1233: IS DTC P1233 PRESENT IN THE KOEO SELF-TEST?

NOTE: The Mustang 5.4L is equipped with 2 FPDMs. The DTC P1233 applies to the FPDM mounted on the driver side of the luggage compartment.

- Carry out the KOEO self-test.
- **Is DTC P1233 present?**

Yes	No
GO to KB3.	The PCM is now receiving a signal from the FPDM. One possible cause of DTC P1233 is that the IFS switch was tripped, then reset. For a no start (engine cranks), DISREGARD the DTC at this time. RETURN to the **SYMPTOM CHARTS** article Symptom Charts and continue as directed. After repairing the no start, to diagnose the intermittent causes of P1233, GO to KB19. For all others, GO to KB19.

KB3 DOES THE ENGINE START?

NOTE: The Mustang 5.4L starts with 1 FPDM disabled.

- **Does the engine start?**

Yes	No
For Mustang 5.4L, GO to KB4. For all others, to check the FPM circuit, GO to KB15.	VERIFY the IFS switch is set (button pressed). If OK, GO to KB4.

KB4 CHECK THE VOLTAGE AND GROUND CIRCUITS TO THE FPDM

- FPDM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM Connector, Harness Side	(-) FPDM Connector, Harness Side
VPWR Fuel - Pin 5	PWRGND - Pin 3

- **Is the voltage greater than 10 V?**

Yes	No
For Mustang 5.4L, to check the FPM circuit, GO to KB15. For all others, INSTALL a new FPDM. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to KB5.

KB5 CHECK THE VOLTAGE TO THE FPDM

- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM Connector, Harness Side	(-)
VPWR Fuel - Pin 5	Ground

- **Is the voltage greater than 10 V?**

Yes	No
REPAIR the open circuit. The FPDM ground circuit is open. CLEAR the DTCs. REPEAT the self-test.	There is no voltage to the FPDM. For F-150, and Mark LT, GO to KB11. For all others, GO to KB6.

KB6 CHECK THE B+ VOLTAGE TO THE FPDM POWER SUPPLY RELAY

- Key in OFF position.
- FPDM PWR Relay connector disconnected.
- Measure the voltage between:

(+) FPDM PWR Relay Connector, Harness Side	(-)
B+	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KB7.	A B+ circuit concern is present. CHECK the condition of the related fuse/fuse links. If OK,

	REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the circuit for a short to ground before installing a new fuse/fuse link. CLEAR the DTCs. REPEAT the self-test.

KB7 CHECK THE VPWR VOLTAGE TO THE FPDM POWER SUPPLY RELAY

- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM PWR Relay Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KB8.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB8 CHECK FOR GROUND TO THE FPDM POWER SUPPLY RELAY

- Measure the resistance between:

(+) FPDM PWR Relay Connector, Harness Side	(-)
GND	Ground

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KB9.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB9 CHECK THE VPWR FUEL CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) FPDM Connector, Harness Side	(-) FPDM PWR Relay Connector, Harness Side
VPWR Fuel - Pin 5	VPWR Fuel

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new FPDM relay. CLEAR the DTCs.	GO to KB10.

REPEAT the self-test.	

KB10 ISOLATE THE OPEN IN THE FPDM CIRCUIT

- IFS Switch connector disconnected.
- Measure the resistance between:

(+) FPDM Connector, Harness Side	(-) IFS Switch Connector, Harness Side
VPWR Fuel - Pin 5	VPWR Fuel - B - Pin 1

- Measure the resistance between:

(+) FPDM PWR Relay Connector, Harness Side	(-) IFS Switch Connector, Harness Side
VPWR Fuel	VPWR Fuel - A - Pin 2

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new IFS switch. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . VERIFY the IFS switch is set (button pressed). CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB11 CHECK THE FUEL PUMP FUSE

NOTE: These steps are for applications with a FPDM PWR relay integral to the PDJB.

- Key in OFF position.
- Check the FPDM power supply relay fuse. Refer to the Wiring Diagrams article for schematic and connector information.
- **Is the fuse OK?**

Yes	No
GO to KB12.	INSTALL a new fuse. CHECK the associated circuits for a short to ground before installing the fuse. CLEAR the DTCs. REPEAT the self-test.

KB12 CHECK FOR VOLTAGE TO THE IFS SWITCH

- IFS Switch connector disconnected.
- Key ON, engine OFF.

- Measure the voltage between:

(+) IFS Switch Connector, Harness Side	(-)
VPWR Fuel - A - Pin 2	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KB14.	GO to KB13.

KB13 CHECK THE VPWR FUEL CIRCUIT FOR AN OPEN BETWEEN THE IFS AND PDJB

- Key in OFF position.
- PDJB connector disconnected. Refer to the Wiring Diagrams article for schematic and connector information.
- Measure the resistance between:

(+) IFS Switch Connector, Harness Side	(-) PDJB Connector, Harness Side
VPWR Fuel - A - Pin 2	VPWR Fuel - Pin 3

- **Is the resistance less than 5 ohms?**

Yes	No
CHECK the fuel pump fuse. REPAIR as necessary. If OK, INSTALL a new FP RLY/PDJB. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB14 CHECK THE IFS FOR AN OPEN

- Key in OFF position.
- Measure the resistance between:

(+) IFS Switch Connector, Component Side	(-) IFS Switch Connector, Component Side
VPWR Fuel - A - Pin 2	VPWR Fuel - B - Pin 1

- **Is the resistance less than 5 ohms?**

Yes	No
REPAIR the open circuit. The VPWR fuel circuit is open. CLEAR the DTCs. REPEAT the self-test.	INSTALL a new IFS switch. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB15 CHECK THE FPM CIRCUIT FOR AN OPEN IN THE HARNESS

- FPDM connector disconnected.

- PCM connector disconnected.
- Measure the resistance between:

(+) FPDM Connector, Harness Side	(-) PCM Connector, Harness Side
FPM - Pin 1	FPM

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KB16.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB16 CHECK THE FPM CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM Connector, Harness Side	(-)
FPM - Pin 1	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to KB17.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB17 CHECK THE FPM CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) FPDM Connector, Harness Side	(-)
FPM - Pin 1	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KB18.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB18 CHECK FOR FPM OUTPUT FROM THE FPDM

NOTE: **It is OK for the voltage to cycle below this range and then return within range.**

- FPDM connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
FPM	Ground

- **Is the voltage between 0.02 - 1 V?**

Yes	No
GO to KB64.	INSTALL a new FPDM. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB19 CHECK THE CIRCUITS THAT MAY CAUSE AN INTERMITTENT LOSS OF VOLTAGE TO THE FPDM

NOTE: **Be aware that P1233 could be set if the IFS switch is tripped then reset.**

NOTE: **With no concern present, the FPDM sends a 50% duty cycle (all OK) to the PCM on the FPM circuit. Depending on the scan tool type, the FPM PID may display 50%, or a random value that is fluctuating between 85% and 115%.**

- Key ON, engine OFF.
- Access the PCM and monitor the FPM PID.
- Observe the FPM PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the PWRGND circuit to the FPDM
  - Shake, wiggle, and bend the VPWR fuel circuit to the FPDM
  - Shake, wiggle, and bend the FPM circuit between the FPDM and the PCM
  - Shake, wiggle, and bend the B+ and ground circuits to the FPDM power supply relay
  - Lightly tap on the IFS switch to simulate road shock
  - Lightly tap on the FPDM to simulate road shock
  - Lightly tap on the FPDM power supply relay to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KB20 DTC P1235: IS DTC P1235 PRESENT IN THE KOEO SELF-TEST?

NOTE: The Mustang 5.4L is equipped with 2 FPDMs. The DTC P1235 applies to the FPDM mounted on the driver side of the luggage compartment.

NOTE: For ETC applications, check if ETC DTC P2105 is present. An ETC system concern could cause P1235, and should be diagnosed first.

- Carry out the KOEO self-test.
- **Is DTC P1235 present?**

Yes	No
GO to KB21.	GO to KB25.

KB21 CHECK THE FPC CIRCUIT FOR AN OPEN IN THE HARNESS

- FPDM connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) FPDM Connector, Harness Side
FPC	FPC - Pin 6

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KB22.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB22 CHECK THE FPC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- FPDM2 connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM Connector, Harness Side	(-)
FPC - Pin 6	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to KB23.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB23 CHECK THE FPC CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between:

(+) FPDM Connector, Harness Side	(-)
FPC - Pin 6	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KB24.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB24 CHECK THE FPC CIRCUIT IN THE FPDM

- FPDM connector connected.
- FPDM2 connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
FPC	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KB64.	INSTALL a new FPDM. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB25 CHECK THE FPC CIRCUIT FOR AN INTERMITTENT OPEN OR SHORTS

NOTE: With no concern present, the FPDM sends a 50% duty cycle (all OK) to the PCM on the FPM circuit. Depending on the scan tool type, the FPM PID may display 50%, or a random value that is fluctuating between 85% and 115%.

- Key ON, engine OFF.
- Access the PCM and monitor the FPM PID.
- Observe the FPM PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the FPC circuit between FPDM and the PCM
  - Lightly tap on the FPDM to simulate road shock

- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KB26 DTC P1237: IS DTC P1237 PRESENT IN THE KOEO SELF-TEST?

NOTE: The Mustang 5.4L is equipped with 2 FPDMs. The DTC P1237 applies to the FPDM mounted on the driver side of the luggage compartment.

- Carry out the KOEO self-test.
- **Is DTC P1237 present?**

Yes	No
GO to KB27.	DTC P1237 is possibly intermittent, GO to KB33.

KB27 DOES THE ENGINE START?

NOTE: The Mustang 5.4L starts with 1 FPDM disabled.

- FPDM2 connector disconnected.
- **Does the engine start?**

Yes	No
GO to KB36.	GO to KB28.

KB28 CHECK THE FPPWR, FPRTN AND INTERNAL FUEL PUMP CIRCUIT RESISTANCE

- Key in OFF position.
- FPDM connector disconnected.
- Measure the resistance between:

(+) FPDM Connector, Harness Side	(-) FPDM Connector, Harness Side
FPPWR - Pin 4	FPRTN - Pin 2

- **Is the resistance less than 10 ohms?**

Yes	No
GO to KB29.	ISOLATE the concern, GO to KB32.

KB29 CHECK THE FPRTN CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM Connector, Harness Side	(-)
FPRTN - Pin 2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to KB30.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB30 CHECK THE FPPWR CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- FP connector disconnected.
- Measure the resistance between:

(+) FPDM Connector, Harness Side	(-)
FPPWR - Pin 4	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KB31.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB31 CHECK FOR VOLTAGE TO FP

NOTE: **During output test mode, the fuel pump stays commanded on for only about 5 seconds.**

- FPDM connector connected.
- FP connector disconnected.
- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Measure the voltage between:

(+) FP Connector, Harness Side	(-) FP Connector, Harness Side
FPPWR	FPRTN

- **Is the voltage greater than 10 V?**

Yes	No
INSTALL a new FP. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	VERIFY the vehicle battery was at a proper charge during the test. VERIFY the pump ON command did not time out before the voltage check was made. REPEAT as necessary. If OK, INSTALL a new FPDM. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB32 ISOLATE THE OPEN CIRCUIT

- FP connector disconnected.
- Measure the resistance between:

(+) FP Connector, Harness Side	(-) FPDM Connector, Harness Side
FPPWR	FPPWR - Pin 4
FPRTN	FPRTN - Pin 2

- Measure the resistance between:

(+) FP Connector, Component Side	(-) FP Connector, Component Side
FPPWR	FPRTN

- **Is the resistance less than 10 ohms?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	REPAIR the open circuit. If the open is internal to the pump, INSTALL a new FP. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB33 VERIFY THE DTC P1237 IS INTERMITTENT

- Key ON, engine OFF.
- Access the PCM and monitor the FPM PID.
- **Is the FPM PID 75% (or varying between 250% and 400%)?**

Yes	No
A concern is present. GO to KB27.	CHECK for an intermittent concern, GO to KB34.

KB34 CHECK THE FPPWR AND FPRTN CIRCUIT FOR AN INTERMITTENT OPEN OR SHORTS

NOTE: **With no concern present, the FPDM sends a 50% duty cycle (all OK) to the PCM on the FPM circuit. Depending on the scan tool type, the FPM PID may display 50%, or a random value that is fluctuating between 85% and 115%.**

- Key ON, engine OFF.
- Access the PCM and monitor the FPM PID.
- Observe the FPM PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the FPPWR and FPRTN circuits between the FPDM and the FP
  - Lightly tap on the FP and FPDM to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to KB35.

KB35 CHECK THE FPPWR CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

NOTE: **The lamp turns on when a concern is present.**

- Key in OFF position.
- FPDM connector disconnected.
- Connect a non-powered test lamp between:

(+) FPDM Connector, Harness Side	(-) FPDM Connector, Harness Side
FPPWR - Pin 4	VPWR Fuel - Pin 5

- Key ON, engine OFF.
- Observe the test lamp for an indication of a concern. Shake, wiggle, and bend the FPPWR circuit between the FPDM and the FP.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KB36 CHECK THE FPPWR CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- FPDM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM Connector, Harness Side	(-)
FPPWR - Pin 4	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to KB37.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB37 CHECK THE FPRTN CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- FPDM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM Connector, Harness Side	(-) FPDM Connector, Harness Side
VPWR Fuel - Pin 5	FPRTN - Pin 2

- **Is the voltage less than 1 V?**

Yes	No
INSTALL a new FPDM. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB38 DTC P1234: IS DTC P1234 PRESENT IN THE KOEO SELF-TEST?

NOTE: **The Mustang 5.4L is equipped with 2 FPDMs. The DTC P1234 applies to the FPDM2 mounted on the passenger side of the luggage compartment.**

- Carry out the KOEO self-test.
- **Is DTC P1234 present?**

Yes	No
GO to KB39.	The PCM is now receiving a signal from FPDM2. One possible cause of DTC P1234 is that the IFS switch was tripped, then reset. GO to KB49.

KB39 CHECK THE VOLTAGE AND GROUND CIRCUITS TO THE FPDM2

- FPDM2 connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM2 Connector, Harness Side	(-) FPDM2 Connector, Harness Side
VPWR Fuel 2 - Pin 5	PWRGND - Pin 3

- **Is the voltage greater than 10 V?**

Yes	No
To check the FPM2 circuit, GO to KB45.	GO to KB40.

KB40 CHECK VOLTAGE TO FPDM2

- Measure the voltage between:

(+) FPDM2 Connector, Harness Side	(-)
VPWR Fuel 2 - Pin 5	Ground

- **Is the voltage greater than 10 V?**

Yes	No
REPAIR the open circuit. The FPDM2 ground circuit is open. CLEAR the DTCs. REPEAT the self-test.	There is no voltage to the FPDM2. GO to KB41.

KB41 CHECK THE B+ VOLTAGE TO THE FPDM2 POWER SUPPLY RELAY

- Key in OFF position.
- FPDM2 PWR Relay connector disconnected.
- Measure the voltage between:

(+) FPDM2 PWR Relay Connector, Harness Side	(-)
B+ - Pin 3	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KB42.	A B+ circuit concern is present. CHECK the condition of the related fuse/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the circuit for a short to ground before installing a new fuse/fuse link. CLEAR the DTCs. REPEAT the self-test.

KB42 CHECK THE VPWR VOLTAGE TO THE FPDM2 POWER SUPPLY RELAY

- Measure the voltage between:

(+) FPDM2 PWR Relay Connector, Harness Side	(-)
VPWR - Pin 1	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KB43.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB43 CHECK FOR GROUND TO THE FPDM2 POWER SUPPLY RELAY

- Key in OFF position.
- Measure the resistance between:

(+) FPDM2 PWR Relay Connector, Harness Side	(-)
GND - Pin 2	Ground

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KB44.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB44 CHECK THE VPWR FUEL 2 CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) FPDM2 Connector, Harness Side	(-) FPDM2 PWR Relay Connector, Harness Side
VPWR Fuel 2 - Pin 5	VPWR Fuel 2 - Pin 5

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new FPDM2 PWR relay. CLEAR the DTCs. REPEAT the self-test.	GO to KB49.

KB45 CHECK THE FPM2 CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- FPDM2 connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) FPDM2 Connector, Harness Side	(-) PCM Connector, Harness Side
FPM2 - Pin 1	FPM2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KB46.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB46 CHECK THE FPM2 CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM2 Connector, Harness Side	(-)
FPM2 - Pin 1	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to KB47.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB47 CHECK THE FPM2 CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) FPDM2 Connector, Harness Side	(-)
FPM2 - Pin 1	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KB48.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB48 CHECK FOR FPM2 OUTPUT FROM THE FPDM2

NOTE: **It is OK for the voltage to cycle below this range and then return within range.**

- FPDM2 connector connected.
- Key ON, engine OFF.

- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
FPM2	Ground

- **Is the voltage between 0.02 - 1 V?**

Yes	No
GO to KB64.	INSTALL a new FPDM2. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB49 CHECK CIRCUITS THAT MAY CAUSE AN INTERMITTENT LOSS OF VOLTAGE SUPPLY TO THE FPDM2

NOTE: Be aware that P1234 could be set if the IFS switch is tripped then reset.

NOTE: With no concern present, the FPDM2 sends a 50% duty cycle (all OK) to the PCM on the FPM2 circuit. Depending on the scan tool type, the FPM2 PID may display 50%, or a random value that is fluctuating between 85% and 115%.

- Key ON, engine OFF.
- Access the PCM and monitor the FPM2 PID.
- Observe the FPM2 PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the PWRGND circuit to the FPDM2
  - Shake, wiggle, and bend the VPWR fuel 2 circuit to the FPDM2
  - Shake, wiggle, and bend the FPM2 circuit between the FPDM2 and the PCM
  - Shake, wiggle, and bend the B+ and ground circuits to the FPDM2 power supply relay
  - Lightly tap on the IFS switch to simulate road shock
  - Lightly tap on the FPDM2 to simulate road shock
  - Lightly tap on the FPDM2 power supply relay to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KB50 DTC P1236: IS DTC P1236 PRESENT IN THE KOEO SELF-TEST?

- The Mustang 5.4L is equipped with 2 FPDMs. The DTC P1236 applies to the FPDM2 mounted on

the passenger side of the luggage compartment.

- Carry out the KOEO self-test.
- **Is DTC P1236 present?**

Yes	No
GO to KB51.	GO to KB55.

KB51 CHECK THE FPC CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- FPDM2 connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) FPDM2 Connector, Harness Side
FPC	FPC - Pin 6

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KB52.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KB52 CHECK THE FPC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- FPDM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM2 Connector, Harness Side	(-)
FPC - Pin 6	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to KB53.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB53 CHECK THE FPC CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between:

(+) FPDM2 Connector, Harness Side	(-)
FPC - Pin 6	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KB54.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB54 CHECK THE FPC CIRCUIT IN THE FPDM2

- FPDM2 connector connected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
FPC	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KB64.	INSTALL a new FPDM2. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB55 CHECK THE FPC CIRCUIT FOR AN INTERMITTENT OPEN OR SHORTS

NOTE: **With no concern present, the FPDM2 sends a 50% duty cycle (all OK) to the PCM on the FPM2 circuit. Depending on the scan tool type, the FPM2 PID may display 50%, or a random value that is fluctuating between 85% and 115%.**

- Key ON, engine OFF.
- Access the PCM and monitor the FPM2 PID.
- Observe the FPM2 PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the FPC circuit between FPDM2 and the PCM
  - Lightly tap on the FPDM2 to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KB56 DTC P1238: IS DTC P1238 PRESENT IN THE KOEO SELF-TEST?

NOTE: **The Mustang 5.4L is equipped with 2 FPDMs. The DTC P1238 applies to the FPDM2 mounted on the passenger side of the luggage compartment.**

- Carry out the KOEO self-test.
- **Is DTC P1238 present?**

Yes	No
GO to KB57.	CHECK for an intermittent concern, GO to KB63.

KB57 CHECK THE FP2PWR, FP2RTN AND INTERNAL FUEL PUMP CIRCUIT RESISTANCE

- Key in OFF position.
- FPDM2 connector disconnected.
- Measure the resistance between:

(+) FPDM2 Connector, Harness Side	(-) FPDM2 Connector, Harness Side
FP2PWR - Pin 4	FP2RTN - Pin 2

- **Is the resistance less than 10 ohms?**

Yes	No
GO to KB58.	ISOLATE the concern, GO to KB62.

KB58 CHECK THE FP2PWR AND FP2RTN CIRCUIT(S) FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key in OFF position.
- FP connector disconnected. Refer to the Wiring Diagrams article for schematic and connector information.
- Key ON, engine OFF.
- Measure the voltage between:

(+) FPDM2 Connector, Harness Side	(-)
FP2PWR - Pin 4	Ground
FP2RTN - Pin 2	Ground

- **Are the voltages less than 1 V?**

Yes	No
GO to KB59.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB59 CHECK THE FP2PWR AND FP2RTN CIRCUIT(S) FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) FPDM2 Connector, Harness Side	(-)
FP2PWR - Pin 4	Ground
FP2RTN - Pin 2	Ground

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to KB60.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB60 CHECK FOR A SHORT BETWEEN THE FP2PWR AND FP2RTN CIRCUITS

- Measure the resistance between:

(+) FPDM2 Connector, Harness Side	(-) FPDM2 Connector, Harness Side
FP2PWR - Pin 4	FP2RTN - Pin 2

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KB61.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KB61 CHECK FOR VOLTAGE TO THE FP

NOTE: **During output test mode, the fuel pump stays commanded on for only about 5 seconds.**

- FPDM2 connector connected.
- Key ON, engine OFF.
- Enter output test mode. Refer to **OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Measure the voltage between:

(+) FP Connector, Harness Side	(-) FP Connector, Harness Side
FP2PWR	FP2RTN

- **Is the voltage greater than 10 V?**

Yes	No
INSTALL a new FP. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	VERIFY the vehicle battery was at a proper charge during the test. VERIFY the pump ON command did not time out before the voltage check was made. REPEAT as necessary. If OK, INSTALL a new FPDM2. REFER to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB62 ISOLATE THE OPEN CIRCUIT

- FP connector disconnected. Refer to the Wiring Diagrams article for schematic and connector information.
- Measure the resistance between:

(+) FP Connector, Harness Side	(-) FPDM2 Connector, Harness Side
FP2PWR	FP2PWR - Pin 4
FP2RTN	FP2RTN - Pin 2

- Measure the resistance between:

(+) FP Connector, Component Side	(-) FP Connector, Component Side
FP2PWR	FP2RTN

- **Is the resistance less than 10 ohms?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	REPAIR the open circuit. If the open is internal to the pump, INSTALL a new FP. REFER to the **FUEL TANK AND LINES - GASOLINE AND DIESEL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KB63 CHECK THE FP2PWR AND FP2RTN CIRCUIT FOR AN INTERMITTENT OPEN OR SHORTS

NOTE: **With no concern present, the FPDM2 sends a 50% duty cycle (all OK) to the PCM on the FPM2 circuit. Depending on the scan tool type, the FPM2 PID may display 50%, or a random value that is fluctuating between 85% and 115%.**

- Key ON, engine OFF.
- Access the PCM and monitor the FPM2 PID.

- Observe the FPM2 PID for an indication of a concern while carrying out the following:
  - Shake, wiggle, and bend the FP2PWR and FP2RTN circuits between the FPDM2 and the FP
  - Lightly tap on the FP and FPDM2 to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

KB64 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KD: ELECTRIC EXHAUST GAS RECIRCULATION (EEGR) SYSTEM

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- EEGR system
- EEGR stepper motor (9D475)
- harness circuits: EGRMC1, EGRMC2, EGRMC3, EGRMC4 and VPWR
- powertrain control module (PCM) (12A650)

TEST PROCEDURE

KD1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0400, P0403, or P1408 present?**

Yes	No
For DTCs P0400 and P1408, GO to KD9. For DTC P0403, GO to KD2.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

KD2 DTC P0403: EGR CONTROL CIRCUIT - CHECK THE CONNECTION OF THE EEGR HARNESS CONNECTOR TO THE EEGR

NOTE: **If the DTC is intermittent, wiggle the harness and connectors when taking measurements.**

- Check the connection of the EEGR harness connector to the EEGR.
- **Are the connector contacts clean and correctly seated?**

Yes	No
GO to KD3.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

KD3 CHECK FOR VPWR AT THE EEGR HARNESS CONNECTOR

- Key ON, engine OFF.
- EEGR Assembly connector disconnected.
- Measure the voltage between:

(+) EEGR Assembly Connector, Harness Side	(-) Vehicle Battery
VPWR - Pin 2	Negative terminal
VPWR - Pin 5	Negative terminal

- **Are the voltages greater than 10 V?**

Yes	No
GO to KD4.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KD4 CHECK THE EEGR CIRCUIT(S) FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) EEGR Assembly Connector, Harness Side	(-) PCM Connector, Harness Side
EGRMC1 - Pin 1	EGRMC1
EGRMC2 - Pin 3	EGRMC2
EGRMC3 - Pin 4	EGRMC3
EGRMC4 - Pin 6	EGRMC4

- **Are the resistances less than 5 ohms?**

Yes	No
GO to KD5.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KD5 CHECK THE EEGR CIRCUIT(S) FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) EEGR Assembly Connector, Harness	

Side	(-) Vehicle Battery
EGRMC1 - Pin 1	Negative terminal
EGRMC2 - Pin 3	Negative terminal
EGRMC3 - Pin 4	Negative terminal
EGRMC4 - Pin 6	Negative terminal

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to KD6.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KD6 CHECK FOR SHORTS BETWEEN CIRCUITS IN THE EEGR HARNESS

NOTE: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
EGRMC3	EGRMC1
EGRMC3	EGRMC2
EGRMC3	EGRMC4
EGRMC1	EGRMC2
EGRMC1	EGRMC4
EGRMC2	EGRMC4

- **Are the resistances greater than 10K ohms?**

Yes	No
GO to KD7.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KD7 CHECK THE EEGR CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) EEGR Assembly Connector, Harness Side	(-) Vehicle Battery
EGRMC1 - Pin 1	Negative terminal
EGRMC2 - Pin 3	Negative terminal
EGRMC3 - Pin 4	Negative terminal

EGRMC4 - Pin 6	Negative terminal

- **Are the voltages greater than 0.1 V?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to KD8.

KD8 CHECK THE EEGR COILS FOR AN OPEN

- Key in OFF position.
- Measure the resistance between:

(+) EEGR Assembly Connector, Component Side	(-) EEGR Assembly Connector, Component Side
EGRMC1 - Pin 1	VPWR - Pin 2
EGRMC2 - Pin 3	VPWR - Pin 2
EGRMC3 - Pin 4	VPWR - Pin 5
EGRMC4 - Pin 6	VPWR - Pin 5

- **Are the resistances between 15 - 24 ohms?**

Yes	No
GO to KD12.	INSTALL a new EEGR assembly. REFER to the **ENGINE EMISSION CONTROL -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KD9 DTCS P0400 AND P1408: CHECK FOR STUCK OR STICKY EGR VALVE OPERATION BY COMPARING ACTUAL MAP VOLTAGE TO MAP PID VOLTAGE

NOTE: **Repair the following DTCs first, if present: P0102, P0103, P0107, P0108, P1100, P1101.**

- Key in OFF position.
- MAP Sensor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A MAP Sensor Connector, Harness Side	Point B MAP Sensor Connector, Component Side
VREF - Pin 2	VREF - Pin 2
SIGRTN - Pin 4	SIGRTN - Pin 4

- Key ON, engine running.

- Measure the voltage between:

(+) MAP Sensor Connector, Component Side	(-) Vehicle Battery
MAP - Pin 1	Negative terminal

- **Is the voltage between 1 - 2 V?**

Yes	No
GO to KD10.	CHECK the MAP harness for open and short circuits.

KD10 COMPARE ACTUAL MAP VOLTAGE TO MAP PID VOLTAGE EGR

- Key in OFF position.
- Remove the jumper wires.
- MAP Sensor connected.
- Record the actual MAP voltage values at KOEO, idle, 1,000 and 2,000 RPM.
- Key ON, engine OFF.
- Access the PCM and monitor the MAP PID.
- Note the MAP PID voltage.
- Key ON, engine running.
- Note the MAP PID voltage.
- Increase engine speed to 1,000 RPM.

  Note the MAP PID voltage.

- Increase engine speed to 2,000 RPM.

  Note the MAP PID voltage.

- **Does the MAP PID voltage stay within 0.5 V of the actual MAP voltage?**

Yes	No
The concern is not present at this time. Make sure the MAP sensor is correctly seated and the vacuum source is not blocked.	GO to KD11.

KD11 CARRY OUT THE KOER SELF-TEST

- **Is DTC P1408 retrieved again?**

Yes	No
INSTALL a new EEGR assembly. REFER to the **ENGINE EMISSION CONTROL**	REFER to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART**

-- E-SERIES . CLEAR the DTCs. REPEAT the self-test.	**INDEX** .

KD12 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

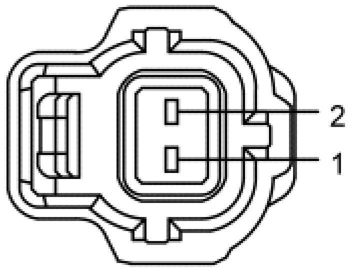
Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KE: IDLE AIR CONTROL (IAC) VALVE

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- idle air control (IAC) valve (9F715)
- harness circuits: IAC, PWR and B+ (IAC-RC)
- powertrain control module (PCM) (12A650)



A0077545

Fig. 180: Idle Air Control (IAC) Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
2	IAC (Idle Air Control)
1	PWR (POWER)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Escape/Mariner	150 (50-50-50) Pin	E39	IAC
Ranger	170 Pin	E33	IAC

TEST PROCEDURE

KE1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0505, P0506, P0507, P0511, P1504, P1506, or P1507 present?**

Yes	No
For DTCs P0505, P0506, P0511, P1504 or P1507, GO to KE2. For DTCs P0507 or P1506, GO to KE15.	For all other symptoms without DTCs, GO to KE2.

KE2 DTCS P0505, P0506, P0511, P1504 OR P1507: CHECK FOR INLET AIR LEAKS (OR STARTS ONLY AT PART THROTTLE)

- With the engine running at idle (if possible), listen for vacuum leaks.
- Inspect the entire intake air system from the mass air flow (MAF) sensor to the intake manifold for leaks such as:
  - damaged or loose IAC air tubes.
  - cracked or punctured intake air tube.
  - loose intake air tube at the air cleaner housing or throttle body.
  - IAC valve or gasket seal.
  - EGR valve gasket seal.
  - vacuum supply connector and hose.
  - PCV valve, connectors and hoses.
- **Are any leaks present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to KE3.

KE3 CHECK FOR VOLTAGE TO THE IAC SOLENOID

NOTE: If EGR DTC P0402 is output during the self-test, diagnose it first before continuing with this pinpoint test.

- IAC connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) IAC Connector, Harness Side	(-) Vehicle Battery
PWR - Pin 1	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to KE4.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KE4 CHECK THE RESISTANCE OF THE IAC VALVE

- Key in OFF position.
- IAC connector disconnected.
- Measure the resistance between:

(+) IAC Connector, Component Side	(-) IAC Connector, Component Side
PWR - Pin 1	IAC - Pin 2

- **Is the resistance between 6 ohms - 15 ohms?**

Yes	No
GO to KE5.	INSTALL a new IAC valve. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KE5 CHECK THE IAC VALVE FOR AN INTERNAL SHORT TO THE IAC CASE

- Measure the resistance between:

(+) IAC Connector, Component Side	(-) IAC Connector, Component Side
IAC - Pin 2	IAC Case

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KE6.	INSTALL a new IAC valve. REFER to the **ELECTRONIC ENGINE CONTROLS -**

	GASOLINE ENGINES -- E-SERIES . CLEAR the DTCs. REPEAT the self-test.

KE6 CHECK THE IAC CIRCUIT FOR AN OPEN IN THE HARNESS

- IAC connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) IAC Connector, Harness Side	(-) PCM Connector, Harness Side
IAC - Pin 2	IAC

- **Is the resistance less than 5 ohms?**

Yes	No
For IAC-RC applications, GO to KE7. For all others, GO to KE8.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KE7 CHECK IAC-RC FOR VOLTAGE

- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
IAC-RC	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KE8.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KE8 CHECK THE IAC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
IAC	Negative terminal

- **Is the voltage less than 1 V?**

Yes	No
GO to KE9.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KE9 CHECK THE IAC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
IAC	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KE10.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KE10 CHECK FOR A DROP IN IDLE RPM WITH THE IAC DISCONNECTED

- PCM connector connected.
- IAC connector connected.
- Key ON, engine running.
- Bring the engine to normal operating temperature.
- Transmission in PARK or NEUTRAL.
- Disconnect the IAC valve.
- **Does the RPM drop or the engine stall?**

Yes	No
GO to KE12.	GO to KE11.

KE11 CHECK FOR A STUCK IAC PINTLE

- Key in OFF position.
- Inspect the entire intake air system for debris, blockage or other damage.
- Remove and inspect the IAC valve and check the pintle movement.
- Check the air tubes (if equipped) for blockage or damage.
- Remove and inspect the air cleaner element for excessive dirt.
- **Is the IAC valve OK?**

Yes	No
GO to KE12.	INSTALL a new IAC valve. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KE12 VERIFY THE DTC

- **Is DTC P0511 or P1504 present in continuous memory or from the KOER self-test?**

Yes	No
GO to KE22.	GO to KE13.

KE13 CHECK THE IAC SIGNAL FROM THE PCM

NOTE: If stalling occurs, place a shim under the hard stop screw to maintain idle conditions.

NOTE: With the engine at normal operating temperature, closed throttle and all accessories off, the IAC duty cycle should be between approximately 22% and 65%.

- PCM connector connected.
- IAC connector connected.
- Key ON, engine running.
- Access the PCM and monitor the RPM PID.
- Access the PCM and monitor the IAC PID.
- Slowly increase the engine speed to 3,000 RPM and return to closed throttle. (Note: If closed throttle RPM is significantly higher than normal, ignore this step).
- **Is the percentage between 22 - 65%?**

Yes	No
GO to KE14.	INSTALL a new IAC valve. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KE14 VERIFY THE DTC

- **Is DTC P0506, P0511, P1504 or P1507 present in continuous memory?**

Yes	No
GO to KE20.	INSPECT the throttle body for damage. REPAIR as necessary. If OK, INSTALL a new IAC valve. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .

KE15 DTCS P0507 OR P1506: CHECK FOR INLET AIR LEAKS

- Key ON, engine running.
- With the engine running at idle, listen for vacuum leaks.
- Inspect the entire intake air system from the mass air flow (MAF) sensor to the intake manifold for

leaks such as:

  - damaged or loose IAC air tubes.
  - cracked or punctured intake air tube.
  - loose intake air tube at the air cleaner housing or throttle body.
  - IAC valve or gasket seal.
  - EGR valve gasket seal.
  - vacuum supply connector and hose.
  - PCV valve, connectors and hoses.
- **Are any leaks present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to KE16.

KE16 CHECK FOR EVAP DTCS

NOTE: EVAP system malfunctions can cause IAC DTCs or idle speed concerns.

- **Are any EVAP DTCs present?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to KE17.

KE17 CHECK THE IAC VALVE FOR CORRECT FUNCTION

- Key ON, engine running.
- Bring the engine to normal operating temperature.
- Transmission in PARK or NEUTRAL.
- Disconnect the IAC Valve.
- **Does the RPM drop or the engine stall?**

Yes	No
GO to KE18.	INSPECT the throttle body for damage. REPAIR as necessary. If OK, INSTALL a new IAC valve. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . CLEAR the DTCs. REPEAT the self-test.

KE18 CHECK THE IAC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

NOTE: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Key in OFF position.
- Scan tool connector disconnected.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
IAC	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KE19.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KE19 VERIFY THE SYMPTOM

- **Is a fast idle symptom currently present?**

Yes	No
GO to KE22.	GO to KE20.

KE20 CHECK THE IAC SYSTEM FOR AN INTERMITTENT OPEN OR SHORT

- PCM connector connected.
- Key ON, engine running.
- Access the PCM and monitor the IAC PID.
- Access the PCM and monitor the RPM PID.
- With the engine at normal operating temperature, closed throttle and all accessories off, the IAC duty cycle should be between approximately 22% and 65%.
- Observe the PIDs while carrying out the following at idle:
  - Lightly tap on the and wiggle the harness connector to simulate road shock.
  - Grasp the vehicle harness closest to the IAC valve. Shake and bend a small section of the harness from the IAC to the bulkhead and from the bulkhead to the PCM.
- **Do the IAC or RPM PIDs suddenly change in value, indicating a concern?**

Yes	No
ISOLATE the concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to KE21.

KE21 VERIFY THE SYMPTOM

- **Is an idle quality, starting or stalling symptom currently present?**

Yes	No
INSTALL a new IAC valve. REFER to the **ELECTRONIC ENGINE CONTROLS - GASOLINE ENGINES -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** to diagnose fast idle concerns.

KE22 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KF: FAN CONTROL (FC) RELAYS

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- LFC, MFC, HFC relays
- harness circuits: HFC, LFC, MFC, VPWR
- powertrain control module (PCM) (12A650)

Although the PCM output circuits are called low, medium and high fan control (FC), cooling fan operation is controlled by a combination of these outputs.

Refer to**ENGINE CONTROL COMPONENTS** .

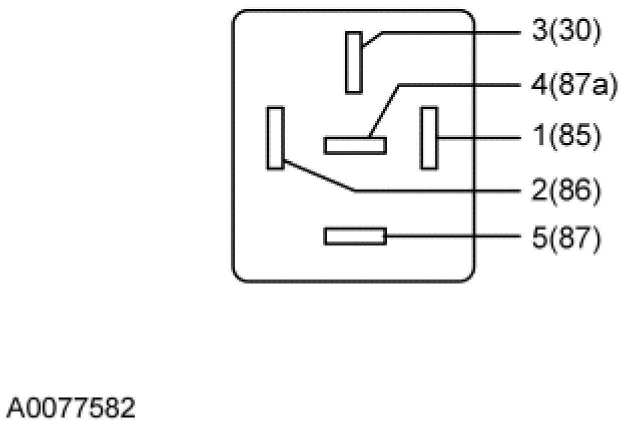


Fig. 181: Low Fan Control (LFC) Relay Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
2	LFC (Low Fan Control)
1	VPWR (Vehicle Power)

NOTE: The VPWR and LFC circuits may be reversed in the harness connector. Also, the LFC circuit may be wired to 2 separate relays. Refer to the Wiring Diagrams article for additional information.

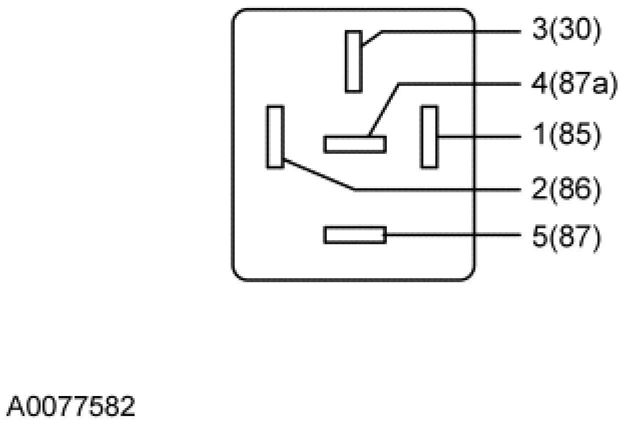

Fig. 182: Medium Fan Control (MFC) Relay Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
2	MFC (Medium Fan Control)
1	VPWR (Vehicle Power)

NOTE: The VPWR and MFC circuits may be reversed in the harness connector. Also, the MFC circuit may be wired to 2 separate relays. Refer to the Wiring Diagrams article for additional information.

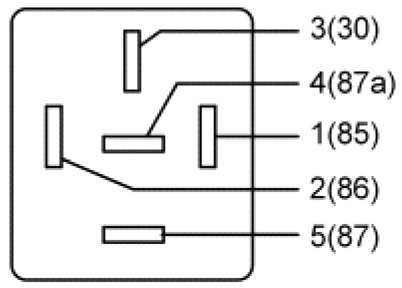

Fig. 183: High Fan Control (HFC) Relay Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
2	HFC (High Fan Control)
1	VPWR (Vehicle Power)

NOTE: The VPWR and HFC circuits may be reversed in the harness connector. Also, the HFC circuit may be wired to 2 separate relays. Refer to the Wiring Diagrams article for additional information.

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Pin	Circuit
Escape/Mariner 2.3L	B38 B17 B39	HFC MFC LFC
Focus	B18 B34	HFC LFC
Mustang	E4 E7	HFC LFC
Ranger	E7	LFC
All other vehicles	B38 B39	HFC LFC

TEST PROCEDURE

KF1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0480, P0481, P0482, P1474, P1477 or P1479 present?**

Yes	No
For KOEO and KOER DTCs P0480 or P1474, GO to KF3. For continuous memory DTCs P0480 or P1474, GO to KF36. For DTCs P0481, P0482, P1477 or P1479, GO to KF2.	For fans always on: components, GO to KF47. For fans always on: all others, GO to KF46. For cooling fan circuits, GO to KF47. For all others, GO to **DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

KF2 DTCS P0481, P0482, P1477 OR P1479: CHECK FOR THE PRESENCE OF THESE DTCS

- **Are DTCs P0481, P0482, P1477, or P1479 present? P0481 or P1479.**

Yes	No
For KOEO and KOER DTCs P0481 or P1479, Escape 3.0L, Mariner 3.0L. GO to KF27. For continuous memory DTCs P0481 or P1479, Escape 3.0L, Mariner 3.0L. GO to KF44. For KOEO and KOER DTCs P0481 or P1479, all others, GO to KF13. For continuous memory DTCs P0481 or P1479, all others, GO to KF38.	For KOEO and KOER DTCs P0482 or P1477, Focus, GO to KF18. For continuous memory DTCs P0482 or P1477, Focus, GO to KF42. For KOEO and KOER DTCs P0482 or P1477, all others, GO to KF8. For continuous memory DTCs P0482 or P1477, all others, GO to KF40.

KF3 KOEO AND KOER DTCS P0480 OR P1474: CHECK THE VPWR VOLTAGE TO THE LOW SPEED FC RELAY

- LFC Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) LFC Relay Connector, Harness Side	(-)
VPWR - Pin 1	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KF4.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF4 CHECK FOR LFC CIRCUIT CYCLING

- Key ON, engine OFF.

- Connect a non-powered test lamp between:

(+) LFC Relay Connector, Harness Side	(-) LFC Relay Connector, Harness Side
VPWR - Pin 1	LFC - Pin 2

- Enter output test mode. Refer to **OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Command the high speed fan ON.
- Command the outputs OFF.
- **Does the test lamp illuminate on and off when either the low or high speed cooling fan output is commanded on and off?**

Yes	No
INSTALL a new LFC relay. CLEAR the DTCs. REPEAT the self-test.	GO to KF5.

KF5 CHECK THE LFC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Remove the test lamp.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) LFC Relay Connector, Harness Side	(-)
LFC - Pin 2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to KF6.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF6 CHECK THE LFC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) LFC Relay Connector, Harness Side	(-)
LFC - Pin 2	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KF7.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF7 CHECK THE LFC CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) LFC Relay Connector, Harness Side	(-) PCM Connector, Harness Side
LFC - Pin 2	LFC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KF59.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF8 KOEO AND KOER DTCS P0482 OR P1477: CHECK THE VPWR VOLTAGE TO THE MEDIUM SPEED FC RELAY

- MFC Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MFC Relay Connector, Harness Side	(-)
VPWR - Pin 1	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KF9.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF9 CHECK FOR MFC CIRCUIT CYCLING

- Key ON, engine OFF.
- Connect a non-powered test lamp between:

(+) MFC Relay Connector, Harness Side	(-) MFC Relay Connector, Harness Side
VPWR - Pin 1	MFC - Pin 2

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Command the high speed fan ON.
- Command the outputs OFF.
- **Does the test lamp illuminate on and off when either the low or high speed cooling fan output is commanded on and off?**

Yes	No

INSTALL a new MFC relay. CLEAR the DTCs. REPEAT the self-test.	GO to KF10.

KF10 CHECK THE MFC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Remove the test lamp.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MFC Relay Connector, Harness Side	(-)
MFC - Pin 2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to KF11.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF11 CHECK THE MFC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) MFC Relay Connector, Harness Side	(-)
MFC - Pin 2	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KF12.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF12 CHECK THE MFC CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) MFC Relay Connector, Harness Side	(-) PCM Connector, Harness Side
MFC - Pin 2	MFC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KF59.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF13 KOEO AND KOER DTCS P0481 OR P1479: CHECK THE VPWR VOLTAGE TO THE HIGH SPEED FC RELAY

- HFC Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HFC Relay Connector, Harness Side	(-)
VPWR - Pin 1	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KF14.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF14 CHECK FOR HFC CIRCUIT CYCLING

- Key ON, engine OFF.
- Connect a non-powered test lamp between:

(+) HFC Relay Connector, Harness Side	(-) HFC Relay Connector, Harness Side
VPWR - Pin 1	HFC - Pin 2

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Command the high speed fan ON.
- Command the outputs OFF.
- **Does the test lamp illuminate on and off when either the low or high speed cooling fan output is commanded on and off?**

Yes	No
INSTALL a new HFC relay. CLEAR the DTCs. REPEAT the self-test.	GO to KF15.

KF15 CHECK THE HFC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Remove the test lamp.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HFC Relay Connector, Harness Side	(-)
HFC - Pin 2	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to KF16.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF16 CHECK THE HFC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) HFC Relay Connector, Harness Side	(-)
HFC - Pin 2	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KF17.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF17 CHECK THE HFC CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) HFC Relay Connector, Harness Side	(-) PCM Connector, Harness Side
HFC - Pin 2	HFC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KF59.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF18 KOEO AND KOER DTCS P0482 OR P1477: CHECK THE VPWR VOLTAGE TO THE MFC1 RELAY

NOTE: **This application has 2 relays wired to the MFC circuit. This procedure may call out MFC1 and MFC2 relays. Either of the relays may be used as the number 1, with the other relay being number 2.**

- MFC1 Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MFC1 Relay Connector, Harness Side	(-)

VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KF19.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF19 CHECK FOR MFC CIRCUIT CYCLING

- Connect a non-powered test lamp between:

(+) MFC1 Relay Connector, Harness Side	(-) MFC1 Relay Connector, Harness Side
VPWR	MFC

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Command the high speed fan ON.
- Command the outputs OFF.
- **Does the test lamp illuminate on and off when either the low or high speed cooling fan output is commanded on and off?**

Yes	No
INSTALL a new MFC1 relay at the end of diagnostics. Leave the relay disconnected. CLEAR the DTCs. REPEAT the self-test. GO to KF24.	Leave the test lamp connected. GO to KF20.

KF20 CHECK FOR MFC CIRCUIT CYCLING WITH THE MFC2 RLY DISCONNECTED

- Connect a non-powered test lamp between:

(+) MFC1 Relay Connector, Harness Side	(-) MFC1 Relay Connector, Harness Side
VPWR	MFC

- MFC2 Relay connector disconnected.
- Command the low speed fan ON.
- Command the high speed fan ON.
- Command the outputs OFF.
- **Does the test lamp illuminate on and off when either the low or high speed cooling fan output is commanded on and off?**

Yes	No
INSTALL a new MFC2 relay. CLEAR the DTCs.	GO to KF21.

REPEAT the self-test.	

KF21 CHECK THE MFC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MFC1 Relay Connector, Harness Side	(-)
MFC	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to KF22.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF22 CHECK THE MFC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) MFC1 Relay Connector, Harness Side	(-)
MFC	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KF23.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF23 CHECK THE MFC CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) MFC1 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
MFC	MFC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KF59.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF24 VERIFY THERE IS NOT AN OPEN IN THE CIRCUIT SPECIFIC TO THE MFC2 RELAY

- Access the PCM and monitor the MFC_F PID.
- Command the high speed fan ON.
- Command the outputs OFF.
- Command the low speed fan ON.
- Command the outputs OFF.
- **Does the PID indicate a concern (yes) when either the high or low speed cooling fan output is commanded on and off?**

Yes	No
GO to KF25.	INSTALL a new MFC relay. CLEAR the DTCs. REPEAT the self-test.

KF25 CHECK THE VPWR VOLTAGE TO THE MFC2 RELAY

- MFC2 Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) MFC2 Relay Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KF26.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF26 CHECK THE MFC CIRCUIT BETWEEN THE MEDIUM SPEED FC RELAY(S)

- Key in OFF position.
- Measure the resistance between:

(+) MFC1 Relay Connector, Harness Side	(-) MFC2 Relay Connector, Harness Side
MFC	MFC

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new MFC relay(s). CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF27 KOEO AND KOER DTCS P0481 OR P1479: CHECK THE VPWR VOLTAGE TO THE HFC1 RELAY

NOTE: **This application has 2 relays wired to the HFC circuit. This procedure may call out HFC1 and HFC2 relays. Either of the relays may be used as the number 1, with the other relay being number 2.**

- HFC1 Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HFC1 Relay Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KF28.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF28 CHECK FOR HFC CIRCUIT CYCLING

- Connect a non-powered test lamp between:

(+) HFC1 Relay Connector, Harness Side	(-) HFC1 Relay Connector, Harness Side
VPWR	HFC

- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Command the high speed fan ON.
- Command the outputs OFF.
- **Does the test lamp illuminate on and off when either the low or high speed cooling fan output is commanded on and off?**

Yes	No
INSTALL a new HFC1 relay at the end of diagnostics. Leave the relay disconnected. CLEAR the DTCs. REPEAT the self-test. GO to KF33.	Leave the test lamp connected. GO to KF29.

KF29 CHECK FOR HFC CIRCUIT CYCLING WITH THE HFC2 RLY DISCONNECTED

- Connect a non-powered test lamp between:

(+) HFC1 Relay Connector, Harness Side	(-) HFC1 Relay Connector, Harness Side
VPWR	HFC

- HFC2 Relay connector disconnected.

- Command the low speed fan ON.
- Command the high speed fan ON.
- Command the outputs OFF.
- **Does the test lamp illuminate on and off when either the low or high speed cooling fan output is commanded on and off?**

Yes	No
INSTALL a new HFC2 relay. CLEAR the DTCs. REPEAT the self-test.	GO to KF30.

KF30 CHECK THE HFC CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HFC1 Relay Connector, Harness Side	(-)
HFC	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to KF31.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF31 CHECK THE HFC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) HFC1 Relay Connector, Harness Side	(-)
HFC	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KF32.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KF32 CHECK THE HFC CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) HFC1 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
HFC	HFC

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KF59.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF33 VERIFY THERE IS NOT AN OPEN IN THE CIRCUIT SPECIFIC TO THE HFC2 RELAY

- Access the PCM and monitor the HFC_F PID.
- Command the high speed fan ON.
- Command the outputs OFF.
- Command the low speed fan ON.
- Command the outputs OFF.
- **Does the PID indicate a concern (yes) when either the high or low speed cooling fan output is commanded on and off?**

Yes	No
GO to KF34.	INSTALL a new HFC1 relay. CLEAR the DTCs. REPEAT the self-test.

KF34 CHECK THE VPWR VOLTAGE TO HFC2 RLY

- HFC2 Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) HFC2 Relay Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KF35.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF35 CHECK THE HFC CIRCUIT BETWEEN THE HIGH SPEED FC RELAY(S)

- Key in OFF position.
- Measure the resistance between:

(+) HFC1 Relay Connector, Harness Side	(-) HFC2 Relay Connector, Harness Side
HFC	HFC

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new HFC relay(s). CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF36 CONTINUOUS MEMORY DTCS P0480 OR P1474: CHECK THE LFC CIRCUIT FOR AN INTERMITTENT OPEN OR SHORT TO VOLTAGE

NOTE: If the test lamp does not turn on, command the high speed fan on.

- A/C and defrost off.
- Left Fan Motor connector disconnected.
- Right Fan Motor connector disconnected.
- LFC Relay connector disconnected.
- Connect a non-powered test lamp between:

(+) LFC Relay Connector, Harness Side	(-) LFC Relay Connector, Harness Side
VPWR - Pin 1	LFC - Pin 2

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Observe the test lamp for an indication of a concern while carrying out the following. Note that the lamp turns off when a concern is detected.
  - Shake, wiggle, and bend the LFC circuit(s).
  - Shake, wiggle, and bend the VPWR circuit to the LFC relay.
  - Inspect the LFC relay component for signs of damage.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to KF37.

KF37 CHECK THE LFC CIRCUIT FOR AN INTERMITTENT SHORT TO GROUND

- Key ON, engine OFF.
- Command the outputs OFF.
- Observe the test lamp for an indication of a concern while carrying out the following. Note that the lamp turns on when a concern is detected.
  - Shake, wiggle, and bend the LFC circuit
  - Lightly tap on the LFC RLY to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KF38 CONTINUOUS MEMORY DTCS P0481 OR P1479: CHECK THE HFC CIRCUIT FOR AN INTERMITTENT OPEN OR SHORT TO VOLTAGE

NOTE: If the test lamp does not turn on, command the low speed fan ON.

- A/C and defrost off.
- Left Fan Motor connector disconnected.
- Right Fan Motor connector disconnected.
- HFC Relay connector disconnected.
- Connect a non-powered test lamp between:

(+) HFC Relay Connector, Harness Side	(-) HFC Relay Connector, Harness Side
VPWR - Pin 1	HFC - Pin 2

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the high speed fan ON.
- Observe the test lamp for an indication of a concern while carrying out the following. Note that the lamp turns off when a concern is detected.
    - Shake, wiggle, and bend the HFC circuit(s)
    - Shake, wiggle, and bend the VPWR circuit to the HFC relay
    - Lightly tap on the HFC RLY to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to KF39.

KF39 CHECK THE HFC CIRCUIT FOR AN INTERMITTENT SHORT TO GROUND

- Key ON, engine OFF.
- Command the outputs OFF.
- Observe the test lamp for an indication of a concern. Note that the lamp illuminates when a concern is detected. Wiggle, shake, and bend the HFC circuit(s). Shake, wiggle, and bend the PCM on both high speed FC relays.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KF40 CONTINUOUS MEMORY DTCS P0482 OR P1477: CHECK THE MFC CIRCUIT FOR AN INTERMITTENT OPEN OR SHORT TO VOLTAGE

NOTE: If the test lamp does not turn on, command the high speed fan on.

- A/C and defrost off.
- Left Fan Motor connector disconnected.
- Right Fan Motor connector disconnected.
- MFC Relay connector disconnected.
- Connect a non-powered test lamp between:

(+) MFC Relay Connector, Harness Side	(-) MFC Relay Connector, Harness Side
VPWR - Pin 1	MFC - Pin 2

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Observe the test lamp for an indication of a concern while carrying out the following. Note that the lamp turns off when a concern is detected.
  - Shake, wiggle, and bend the MFC circuit(s).
  - Shake, wiggle, and bend the VPWR circuit to the MFC relay.
  - Inspect the MFC RLY component for signs of damage.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to KF41.

KF41 CHECK THE MFC CIRCUIT FOR AN INTERMITTENT SHORT TO GROUND

- Key ON, engine OFF.
- Command the outputs OFF.
- Observe the test lamp for an indication of a concern. Note that the lamp illuminates when a concern is detected. Wiggle, shake, and bend the HFC circuit(s). Shake, wiggle, and bend the PCM on both high speed FC relays.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KF42 CONTINUOUS MEMORY DTCS P0482 OR P1477: CHECK THE MFC CIRCUIT FOR AN INTERMITTENT OPEN OR SHORT TO VOLTAGE

NOTE: This application has 2 relays wired to the MFC circuit. This procedure may call out MFC1 and MFC2 relays. Either of the relays may be used as the number 1, with the other relay being number 2.

NOTE: If the test lamp does not turn on, command the high speed fan ON.

- AC and defroster OFF.
- Left Fan Motor connector disconnected.
- Right Fan Motor connector disconnected.
- MFC1 Relay connector disconnected.
- Connect a non-powered test lamp between:

(+) MFC1 Relay Connector, Harness Side	(-) MFC1 Relay Connector, Harness Side
VPWR	MFC

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Observe the test lamp for an indication of a concern while carrying out the following. Note that the lamp turns off when a concern is detected.
  - Shake, wiggle, and bend the MFC circuit between the PCM and both medium speed FC relays
  - Shake, wiggle, and bend the VPWR circuit to both medium speed FC relays
  - Lightly tap on the medium speed FC relay that is still connected to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to KF43.

KF43 CHECK THE MFC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key ON, engine OFF.
- Command the outputs OFF.
- Exit output test mode.

- Observe the test lamp for an indication of a concern. Note that the lamp illuminates when a concern is detected. Wiggle, shake, and bend the MFC circuit(s).
- Inspect the medium speed FC relay that is disconnected for intermittent concerns.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

KF44 CONTINUOUS MEMORY DTCS P0481 OR P1479: CHECK THE HFC CIRCUIT FOR AN INTERMITTENT OPEN OR SHORT TO VOLTAGE

NOTE: **This application has 2 relays wired to the HFC circuit. This procedure may call out HFC1 and HFC2 relays. Either of the relays may be used as the number 1, with the other relay being number 2.**

NOTE: **If the test lamp does not turn on, command the high speed fan ON.**

- A/C and defroster OFF.
- Left Fan Motor connector disconnected.
- Right Fan Motor connector disconnected.
- HFC1 Relay connector disconnected.
- Connect a non-powered test lamp between:

(+) HFC1 Relay Connector, Harness Side	(-) HFC1 Relay Connector, Harness Side
VPWR	HFC

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Observe the test lamp for an indication of a concern while carrying out the following. Note that the lamp turns off when a concern is detected.
  - Shake, wiggle, and bend the PCM and both high speed FC relays.
  - Shake, wiggle, and bend the VPWR circuit to both high speed FC relays
  - Lightly tap on the high speed FC relay that is still connected to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to KF45.

KF45 CHECK THE HFC CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key ON, engine OFF.
- Command the outputs OFF.
- Exit output test mode.
- Observe the test lamp for an indication of a concern. Note that the lamp illuminates when a concern is detected. Wiggle, shake, and bend the HFC circuit(s) between the PCM and on both high speed FC relays.
- Inspect the high speed FC relay that is disconnected for intermittent concerns.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

KF46 THE COOLING FAN ALWAYS RUNS (NO DTCS): VERIFY THE FAN IS NOT ON BECAUSE OF A/C HIGH PRESSURE SWITCH INPUT TO THE PCM

- Key ON, engine running.
- Access the PCM and monitor the ACP PID.
- **Is the PID state CLOSED?**

Yes	No
The PCM turns the fan on when the medium pressure, normally open contacts of the ACHP switch are closed. GO to KF57.	The input is OK. GO to KF47.

KF47 COOLING FAN CONCERN (NO DTCS): CHECK THE FAN CONTROL PRIMARY CIRCUITS

NOTE: Chose the PIDs below as appropriate, according to which circuits the vehicle has.

- Verify that the A/C is OFF.
- Verify engine temperature is below the temperature where the cooling fan comes on.
- Key ON, engine OFF.
- Access the PCM and monitor the LFC_F, MFC_F and HFC_F PIDs.
- **Does either PID indicate a concern?**

Yes	No
A concern is present in the primary circuit(s). GO to KF48.	For all except Ranger, the PCM primary circuit(s) is OK. To check for secondary wiring, REFER to the **ENGINE COOLING -- E-SERIES** ,

	for cooling system diagnosis. For Ranger: GO to KF50.

KF48 DOES THE LFCF PID INDICATE A CONCERN?

- **Does the LFCF PID indicate a concern?**

Yes	No
The low fan control (LFC) circuitry has a primary circuit concern. GO to KF3.	GO to KF49.

KF49 DOES THE MFCF PID INDICATE A CONCERN?

- **Does the MFCF PID indicate a concern?**

Yes	No
The medium fan control (MFC) primary circuitry has a circuit concern. For Focus, GO to KF18. For all others, GO to KF8.	The high fan control (HFC) primary circuitry has a circuit concern. For Escape 3.0L, and Mariner 3.0L, GO to KF27. For all others, GO to KF13.

KF50 IS THE SYMPTOM: COOLING FAN ALWAYS RUNS?

- **Is the symptom: cooling fan always runs?**

Yes	No
GO to KF56.	GO to KF51.

KF51 ELECTRIC COOLING FAN CONCERN (WITH NO DTCS): ELECTRIC COOLING FAN FUNCTIONAL CHECK

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- **Does the fan operate?**

Yes	No
All cooling fan circuit checks are OK. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts to continue diagnosis.	GO to KF52.

KF52 FAN INOPERATIVE: COMMAND THE LOW SPEED FAN ON AND CHECK FOR VOLTAGE TO THE CF

- Key in OFF position.

- CF Motor connector disconnected.
- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Measure the voltage between:

(+) CF Motor Connector, Harness Side	(-)
FAN PWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KF53.	GO to KF54.

KF53 CHECK THE GROUND CIRCUIT TO THE COOLING FAN

- Key in OFF position.
- Measure the resistance between:

(+) CF Motor Connector, Harness Side	(-)
GND	Ground

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new CF motor. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF54 CHECK THE B+ VOLTAGE TO THE FC RELAY

- FC Relay connector disconnected.
- Measure the voltage between:

(+) FC Relay Connector, Harness Side	(-)
B+	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KF55.	REPAIR the open circuit. There is a B+ circuit concern. CHECK the condition of the related fuse/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the circuit for a short to ground before replacing the fuse/fuse

	link. CLEAR the DTCs. REPEAT the self-test.

KF55 CHECK THE FAN PWR CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) FC Relay Connector, Harness Side	(-) CF Motor Connector, Harness Side
FAN PWR	FAN PWR

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new FC relay. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KF56 CHECK FOR FC RLY CONTACTS ALWAYS CLOSED

NOTE: Verify the A/C and defrost are off.

- FC Relay connector disconnected.
- Key ON, engine OFF.
- **Does the fan run with the key in the ON position?**

Yes	No
REPAIR the short circuit to PWR. CLEAR the DTCs. REPEAT the self-test.	INSTALL a new FC relay. CLEAR the DTCs. REPEAT the self-test.

KF57 CHECK THE A/CHPSW (MEDIUM PRESSURE, NORMALLY OPEN CONTACTS)

- A/CHPSW connector disconnected.
- Key ON, engine OFF.
- Access the PCM and monitor the ACP PID.
- **Is the PID state CLOSED?**

Yes	No
GO to KF58.	CONNECT the A/CHPSW. REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** , to diagnose the A/C system pressure. If OK, INSTALL a new A/CHPSW. CLEAR the DTCs. REPEAT the self-test.

KF58 CHECK THE A/CPSW CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.

- PCM connector disconnected.
- Measure the resistance between:

(+) A/CHPSW Connector, Harness Side	(-)
A/CPSW	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
VERIFY the results of the previous test steps. RETURN to the **SYMPTOM CHARTS** article, Symptom Charts to continue diagnosis.	REPAIR the short circuit to GND. CLEAR the DTCs. REPEAT the self-test.

KF59 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KG: FUEL INJECTOR

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- fuel injector(s) (9F593)
- harness circuits: VPWR and INJ 1 - 10
- powertrain control module (PCM) (12A650)

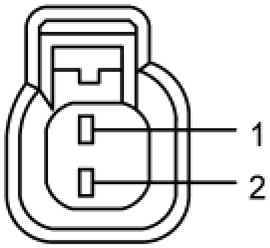

Fig. 184: Injector (INJ) Connector
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Fusion 3.0L, Milan 3.0L	A	2 1	INJ VPWR
All other vehicles	A	1 2	INJ VPWR

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
E-Series 6.8L, F-Super Duty 6.8L	170 Pin	E52 E35 E53 E36 E54 E37 E55 E38 E56 E39	INJ1 INJ2 INJ3 INJ4 INJ5 INJ6 INJ7 INJ8 INJ9 INJ10

TEST PROCEDURE

KG1 DTCS P0201 THROUGH P0210 OR SYMPTOMS WITHOUT DTCS: CHECK THE VPWR CIRCUIT FOR AN OPEN IN THE HARNESS

NOTE: **Disconnect the suspect fuel injector harness connector. Only the suspect injector needs to be diagnosed.**

NOTE: **On some vehicles, the injector voltage is only present when the fuel pump relay is energized. Measure the injector voltage within 2 seconds of the key ON.**

- Key in OFF position.
- INJ connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) INJ Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KG2.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KG2 CHECK THE INJ CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) INJ Connector, Harness Side
Suspect INJ	INJ

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KG3.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KG3 CHECK THE INJ CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Measure the resistance between:

(+) INJ Connector, Harness Side	(-)
INJ	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KG4.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KG4 CHECK THE INJ CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) INJ Connector, Harness Side	(-)
INJ	Ground

- **Is any voltage present?**

Yes	No
REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.	GO to KG5.

KG5 CHECK THE RESISTANCE OF THE FUEL INJECTOR

- Key in OFF position.
- Measure the resistance between:

(+) INJ Connector, Component Side	(-) INJ Connector, Component Side
VPWR	INJ

- **Is the resistance between 11 - 18 ohms?**

Yes	No
GO to KG6.	INSTALL a new fuel injector. REFER to the **FUEL**

	SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES . RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** . REPEAT the self-test.

KG6 CHECK THE FUNCTIONALITY OF THE INJ CIRCUIT

- PCM connector connected.
- Key ON, engine OFF.
- Connect a non-powered test lamp between:

(+) INJ Connector, Harness Side	(-) INJ Connector, Harness Side
VPWR	INJ

- Key ON, engine running.
- **Is the test lamp blinking?**

Yes	No
GO to KG7.	GO to KG8.

KG7 CARRY OUT A THOROUGH WIGGLE TEST ON THE FUEL INJECTOR HARNESS

- Key in OFF position.
- INJ connector connected.
- Key ON, engine running.
- Engine at normal operating temperature.
- Access the PCM and monitor the INJ_F PID.
- Wiggle, shake, and bend small sections of the wiring harness while working from the fuel injector to the PCM.
- **Are any injector values fluctuating in and out of range?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KG8 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
    - pushed out pins
    - corrosion
- Connect all the PCM connectors and make sure they seat correctly.

- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KJ: SUPERCHARGER BYPASS CONTROL

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- supercharger bypass actuator
- vacuum hoses

TEST PROCEDURE

KJ1 CHECK FOR DTCS

NOTE: **DTCs P1227 and P1228 are for informational purposes only and are usually accompanied by other DTCs. If concerns are present with the mass air flow (MAF) sensor, the exhaust gas recirculation (EGR) valve, or the manifold absolute pressure (MAP) sensor, DTCs P1227 or P1228 may be set. Diagnose all other DTCs before diagnosing DTCs P1227 or P1228.**

- **Are DTCs P1227, or P1228 present?**

Yes	No
GO to KJ2.	For lack/loss of power, GO to KJ3. For all other symptoms without DTCs, GO to KJ2.

KJ2 DTCS P1227 OR P1228: VERIFY THE DTC

- Record and clear the DTCs.
- Drive the vehicle at normal operating temperature with the engine exceeding 2,000 RPM.
- Check for DTCs.
- **Are any other DTCs present?**

Yes	No
DISREGARD the current diagnostic trouble code	GO to KJ4.

(DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	

KJ3 CHECK THE IAT2 PID

WARNING: **To avoid personal injury do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure. Steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

- Key ON, engine running.
- Access the PCM and monitor the IAT2 PID.
- **Is the temperature greater than 110°C (230°F)?**

Yes	No
CHECK for low fluid level in the charge air cooler (CAC) system. CHECK for damaged CAC lines. REFER to the **ENGINE COOLING -- E-SERIES** , Supercharger Cooling to diagnose a loss of coolant.	GO to KJ4.

KJ4 CHECK THE SUPERCHARGER BYPASS ACTUATOR VACUUM HOSES

NOTE: **For vehicle specific vacuum hose routing, refer to the VECI label located in the front of the engine compartment.**

- Check for holes, cracks, bends or kinks in the vacuum lines going to the supercharger bypass actuator.
- Check for any disconnected hoses at the supercharger bypass actuator.
- **Are any concerns present?**

Yes	No
REPAIR or INSTALL new vacuum lines as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to KJ5.

KJ5 CHECK THE BYPASS VALVE ACTUATOR

NOTE: **Additional DTCs may set as a result of disconnecting the vacuum line in this step.**

- Visually inspect the bypass valve actuator for damage.
- Key in OFF position.

- Note the position of the supercharger bypass actuator linkage.
- Key ON, engine running.
- Note the position of the supercharger bypass actuator linkage.
- Disconnect the supercharger bypass actuator upper vacuum hose.
- **Does the supercharger bypass actuator linkage move when the engine is started, and return to the original position when the supercharger bypass actuator vacuum line is disconnected?**

Yes	No
The concern is not present at this time. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** to diagnose lack/loss of power concerns.	INSTALL a new supercharger bypass actuator. CLEAR the DTCs. REPEAT the self-test.

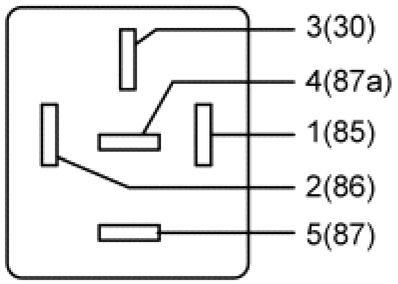
PINPOINT TEST KM: AIR CONDITIONING CLUTCH (A/CC) RELAY CIRCUIT

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- A/CC relay
- harness circuits: VPWR, A/CCR, A/CCS
- powertrain control module (PCM) (12A650)



A0077582

Fig. 185: Air Conditioning Clutch (A/CC) Relay Connector - A
Courtesy of FORD MOTOR CO.

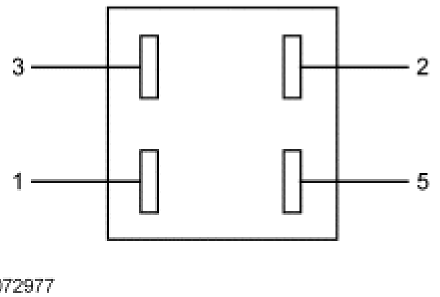


Fig. 186: Air Conditioning Clutch (A/CC) Relay Connector - B
Courtesy of FORD MOTOR CO.

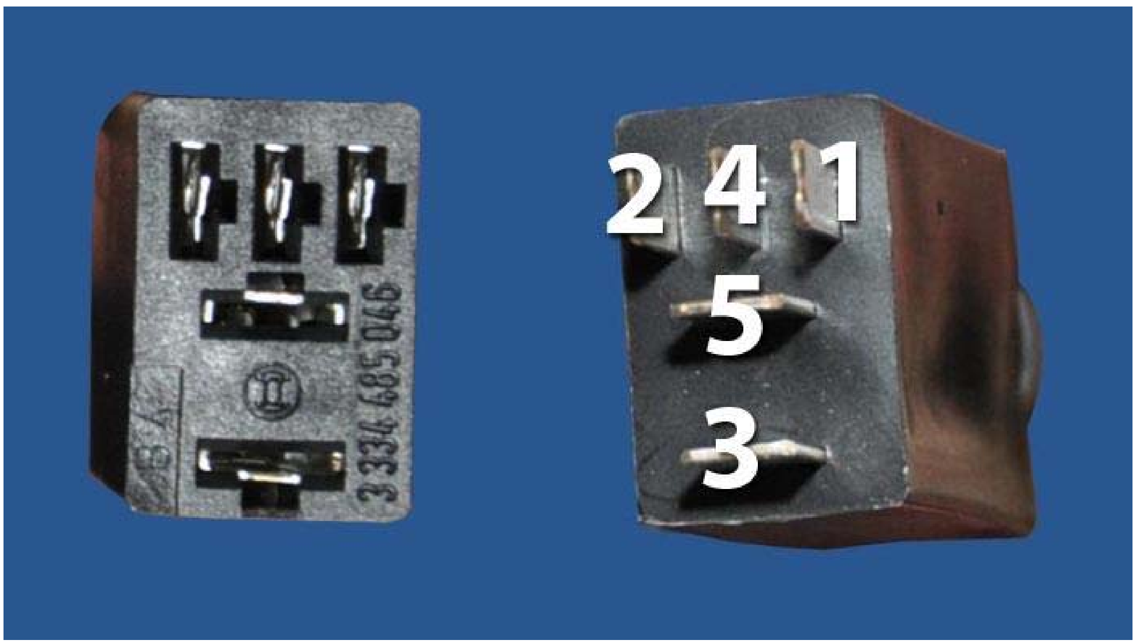

Fig. 187: Air Conditioning Clutch (A/CC) Relay Connector - C
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Expedition, F-150, Mark LT, Navigator	A	1 2	A/CCR VPWR
Focus	B	2 1	A/CCR VPWR
All other vehicles	C	1 2	A/CCR VPWR

The VPWR and A/CCR circuits may be reversed in the harness connector. Refer to the Wiring Diagrams article for additional information.

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
E-Series, F-Super Duty	170 Pin	E3	A/CCR
Edge, F-150, Mark LT, MKX, Sable, Taurus, Taurus X	190 Pin	B18	A/CCR
Escape/Mariner	150 (50-50-50) Pin	B25	A/CCR
Expedition, Navigator	140 Pin	B18	A/CCR
Focus	190 Pin	B2	A/CCR
Fusion, Milan, MKZ	140 Pin	B64	A/CCR
All other vehicles	170 Pin	B14	A/CCR

TEST PROCEDURE

KM1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Are DTCs P0534, P0645, P1460, P1464 or P1469 present?**

Yes	No
For KOEO and KOER DTCs P0645 or P1460, GO to KM2. For continuous memory DTCs P0645 or P1460, GO to KM10. For KOEO and KOER DTC P1464, GO to KM8. For continuous memory DTCs P0534 or P1469, GO to KM12.	For all others, GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

KM2 KOEO AND KOER DTCS P1460 OR P0645: VERIFY THAT THE ACCS PID IS OFF

NOTE: **Verify the A/C and the defrost are off during KOEO/KOER self-tests. If the vehicle is not equipped with A/C, the A/CCR circuit is not used and DTC P1460/P0645 can be ignored.**

- Key ON, engine running.
- A/C and defroster OFF.
- Access the PCM and monitor the ACCS PID.
- **Is the PID state OFF?**

Yes	No
GO to KM3.	REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is inoperative/does not operate correctly symptom.

KM3 CHECK THE VPWR VOLTAGE TO THE A/CC RELAY

- Key in OFF position.
- A/CC Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) A/CC Relay Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KM4.	REPAIR the open circuit. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. REPEAT the self-test.

KM4 CHECK THE A/CC RELAY

- Key in OFF position.
- Carry out the A/CC relay component test. Refer to the Wiring Diagrams Cell 149 Component Testing.
- **Does the A/CC relay pass the component test?**

Yes	No
GO to KM5.	INSTALL a new A/CC relay. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. CLEAR the DTCs. REPEAT the self-test.

KM5 CHECK THE A/CCR (WAC) CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) A/CC Relay Connector, Harness Side	(-)

A/CCR	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to KM6.	REPAIR the short circuit. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. REPEAT the self-test.

KM6 CHECK THE A/CCR (WAC) CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) A/CC Relay Connector, Harness Side	(-)
A/CCR	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KM7.	REPAIR the short circuit. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. REPEAT the self-test.

KM7 CHECK THE A/CCR (WAC) CIRCUIT FOR AN OPEN IN THE HARNESS

- Measure the resistance between:

(+) A/CC Relay Connector, Harness Side	(-) PCM Connector, Harness Side
A/CCR	A/CCR

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KM14.	REPAIR the open circuit. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. REPEAT the self-test.

KM8 KOEO AND KOER DTC P1464: VERIFY THE A/C AND DEFROST ARE OFF DURING THE SELF-TEST

- Verify the A/C and defrost are off during the self-test.
- **Are the A/C and defrost off during the self-test?**

Yes	No
GO to KM9.	Turn the A/C and defrost off. REPEAT the self-test where DTC P1464 was retrieved.

KM9 CHECK THE ACCS PID

- Key ON, engine OFF.
- A/C and defroster OFF.
- Access the PCM and monitor the ACCS PID.
- **Is the PID state ON?**

Yes	No
The ACCS PID indicates the PCM is being requested to turn the A/C on. REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is inoperative/does not operate correctly symptom.	The ACCS PID indicates that the ACCS input to the PCM is low. VERIFY the test step results. Turn off the A/C and defrost. REPEAT the self-test.

KM10 CONTINUOUS MEMORY DTCS P1460 OR P0645: CHECK THE A/CCR (WAC) CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

NOTE: If the vehicle is not equipped with A/C, the A/CCR circuit is not used and the P1460/P0645 can be ignored.

NOTE: The A/C clutch clicks on when a concern is present.

- Key ON, engine OFF.
- Check the A/CCR (WAC) circuit for short to ground while carrying out the following:
  - Wiggle, shake, and bend small sections of the wiring harness while working from the component to the module
  - Lightly tap on the A/CC relay to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. REPEAT the self-test.	GO to KM11.

KM11 CHECK THE A/CCR (WAC) FOR AN OPEN OR SHORT CIRCUIT TO VOLTAGE

NOTE: The A/C clutch clicks off if a concern is present.

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Check the A/CCR (WAC) circuit for an open or short to voltage while carrying out the following:
  - Wiggle, shake, and bend small sections of the wiring harness while working from the component to the module
  - Lightly tap on the A/CC relay to simulate road shock
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KM12 CONTINUOUS MEMORY DTCS P0534 OR P1469: CHECK FOR CAUSES OF FAST A/CCS CYCLING

- Check the following:
  - A/C system pressure
  - A/CCS cycle times

  REFER to the **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS -- E-SERIES** and diagnose the air conditioning (A/C) is inoperative/does not operate correctly symptom.

- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary.	GO to KM13.

KM13 CHECK FOR INTERMITTENT OPEN IN THE A/CCS CIRCUIT

NOTE: The ACCS PID turns off and on quickly when a concern is present, indicating an intermittent open.

- Key ON, engine OFF.
- Access the PCM and monitor the ACCS PID.
- Turn on the A/C switch.
- Check the A/CCR (WAC) circuit for an open or short to voltage while carrying out the following:
  - Wiggle, shake, and bend small sections of the wiring harness while working from the component to the module.
  - Lightly tap on the pressure switch (PS) (to simulate road shock).

- Inspect the A/CCS connector.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. START the engine. TURN on the A/C switch. WAIT for 15 seconds. TURN off the A/C switch. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

KM14 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KN: VARIABLE SPEED ELECTRIC COOLING FAN

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose the following:

- variable speed electric cooling fan (8T00)
- harness circuits: FCV, B+, GND
- powertrain control module (PCM) (12A650)

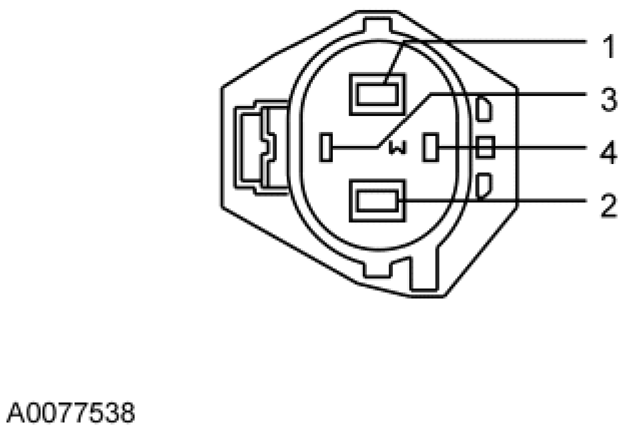

Fig. 188: Cooling Fan (CF) Motor Connector (1 Of 2)
Courtesy of FORD MOTOR CO.

Pin	Circuit
4	FCV (Fan Control Variable)
2	GND (Ground)
1	B+ (Battery Positive Voltage)

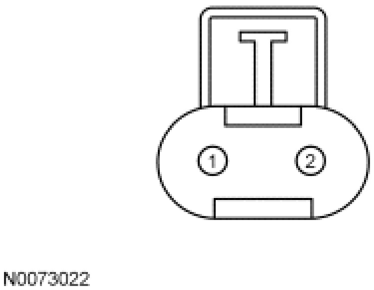

Fig. 189: Cooling Fan (CF) Motor Connector (2 Of 2)
Courtesy of FORD MOTOR CO.

Pin	Circuit
1	GND (Ground)
2	VPWR (Vehicle Power)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Crown Victoria, Grand Marquis, Town Car	170 Pin	E7	FCV

Fusion, Milan, MKZ	140 Pin	B8	FCV
All other vehicles	190 Pin	B48	FCV

TEST PROCEDURE

KN1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Is DTC P0480 or P0483 present?**

Yes	No
For KOEO and KOER DTC P0480, GO to KN2. For continuous memory DTC P0480, GO to KN9. For continuous memory DTC P0483, GO to KN15.	For electric cooling fan(s) does not operate (low, medium, high or variable speed), GO to KN11.

KN2 KOEO AND KOER DTC P0480: CHECK THE B+ AND GND CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- CF Module connector disconnected.
- Rotate the fan by hand. The fan should rotate freely, with no abnormal binding. If binding is present, remove any foreign materials or install a new fan assembly as required.
- Measure the voltage between:

(+) CF Module Connector, Harness Side	(-) CF Module Connector, Harness Side
B+ - Pin 1	GND - Pin 2

- **Is the voltage greater than 10 V?**

Yes	No
GO to KN4.	GO to KN3.

KN3 CHECK THE VOLTAGE TO THE COOLING FAN MODULE USING GROUND AS A REFERENCE

- Measure the voltage between:

(+) CF Module Connector, Harness Side	(-)
B+ - Pin 1	Ground

- **Is the voltage greater than 10 V?**

Yes	No
REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.	A B+ circuit concern is present. CHECK the condition of the related fuse/fuse links. If OK,

	REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the circuit for a short to ground before installing a new fuse/fuse link.

KN4 CHECK THE FCV CIRCUIT(S)

- Connect the 1.6K ohms resistor between the FCV and B+ circuits at the CF module harness connector (this simulates cooling fan circuitry).
- Key ON, engine OFF.
- Carry out the KOEO self-test.
- **Is DTC P0480 present?**

Yes	No
GO to KN6.	For Crown Victoria, Grand Marquis, and Town Car, GO to KN5. For all others, INSTALL a new CF module. REFER to the **ENGINE COOLING -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

KN5 CHECK THE COOLING FAN OPERATION

- CF Motor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A 12 Volt Vehicle Battery	Point B CF Motor Connector, Component Side
Positive terminal	VPWR - Pin 2

- Connect a 5 amp fused jumper wire between the following:

Point A Vehicle Battery	Point B CF Motor Connector, Component Side
Negative terminal	GND - Pin 1

- **Does the cooling fan motor operate correctly?**

Yes	No
INSTALL a new CF module. REFER to the **ENGINE COOLING -- E-SERIES** .	INSTALL a new Cooling Fan. REFER to the **ENGINE COOLING -- E-SERIES** .

KN6 CHECK THE FCV CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.

- Measure the voltage between:

(+) CF Module Connector, Harness Side	(-)
FCV - Pin 4	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to KN7.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KN7 CHECK THE FCV CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) CF Module Connector, Harness Side	(-)
FCV - Pin 4	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KN8.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KN8 CHECK FOR AN OPEN CIRCUIT BETWEEN THE PCM AND COOLING FAN MODULE

- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) CF Module Connector, Harness Side
FCV	FCV - Pin 4

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KN16.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KN9 CONTINUOUS MEMORY DTC P0480: CHECK THE B+ AND GND CIRCUIT FOR AN INTERMITTENT CONCERN

- Key in OFF position.
- CF Module connector disconnected.
- Rotate the fan by hand. The fan should rotate freely, with no abnormal binding. If binding is present, remove any foreign materials or install a new fan assembly as required.

- Connect a non-powered test lamp between:

(+) CF Module Connector, Harness Side	(-) CF Module Connector, Harness Side
B+ - Pin 1	GND - Pin 2

- Observe the test lamp for an indication of a concern while carrying out the following. Note that the lamp turns off when a concern is present.
  - Shake, wiggle, and bend the B+ and GND circuits to the CF
  - Shake, wiggle, and bend the associated fuse
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to KN10.

KN10 CHECK THE FCV CIRCUIT(S) FOR INTERMITTENT CONCERNS

- Connect the 1.6 K ohms resistor between the FCV and B+ circuits at the CF harness connector (this simulates cooling fan circuitry).
- Measure the voltage between:

(+) CF Module Connector, Harness Side	(-)
FCV - Pin 4	Ground

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the low speed fan ON.
- Observe the digital multimeter (DMM) for an indication of a concern while shaking, wiggling, and bending the FCV circuit between the CF module and the PCM. Note that voltage changes suddenly when a concern is detected.
- Command the outputs OFF.
- Exit output test mode.
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	refer to **PINPOINT TEST Z**.

KN11 COOLING FAN MOTOR DOES NOT OPERATE (WITH NO DTCS): COMMAND THE FAN ON TO CHECK OPERATION

- Carry out the KOEO self-test.
- Listen to the fan.
- **Does the fan operate sometime during the KOEO self-test?**

Yes	No
The concern is elsewhere. RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** for further direction.	GO to KN12.

KN12 CHECK THE B+ AND GND CIRCUITS TO THE COOLING FAN MODULE

- Key in OFF position.
- CF Module connector disconnected.
- Rotate the fan by hand. The fan should rotate freely, with no abnormal binding. If binding is present, remove any foreign materials or install a new fan assembly as required.
- Measure the voltage between:

(+) CF Module Connector, Harness Side	(-) CF Module Connector, Harness Side
B+ - Pin 1	GND - Pin 2

- **Is the voltage greater than 10 V?**

Yes	No
For Crown Victoria, Grand Marquis, and Town Car, GO to KN13. For all others, INSTALL a new CF module. REFER to the **ENGINE COOLING -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	GO to KN14.

KN13 CHECK THE COOLING FAN OPERATION

- CF Motor connector disconnected.
- Connect a 5 amp fused jumper wire between the following:

Point A 12 Volt Vehicle Battery	Point B CF Motor Connector, Component Side
Positive terminal	VPWR - Pin 2

- Connect a 5 amp fused jumper wire between the following:

Point A Vehicle Battery	Point B CF Motor Connector, Component Side
Negative terminal	GND - Pin 1

- **Does the cooling fan motor operate correctly?**

Yes	No

INSTALL a new CF module. REFER to the **ENGINE COOLING -- E-SERIES** .	INSTALL a new Cooling Fan. REFER to the **ENGINE COOLING -- E-SERIES** .

KN14 CHECK THE VOLTAGE TO THE COOLING FAN MODULE USING GROUND AS A REFERENCE

- Measure the voltage between:

(+) CF Module Connector, Harness Side	(-)
B+ - Pin 1	Ground

- **Is the voltage greater than 10 V?**

Yes	No
REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.	A B+ circuit concern is present. CHECK the condition of the related fuse/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the circuit for a short to ground before installing a new fuse/fuse link. CLEAR the DTCs. REPEAT the self-test.

KN15 CONTINUOUS MEMORY DTC P0483: CHECK FOR A COOLING FAN MOTOR OBSTRUCTION OR A COOLING FAN MOTOR MECHANICAL FAILURE

- **Is a cooling fan motor obstruction or a cooling fan motor mechanical failure present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	CLEAR the DTCs. REPEAT the self-test.

KN16 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KP: CHARGE AIR COOLER (CAC) PUMP

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- CAC pump relay (14B192)
- CAC pump (8501)
- harness circuits: CAC, VPWR and GND
- powertrain control module (PCM) (12A650)

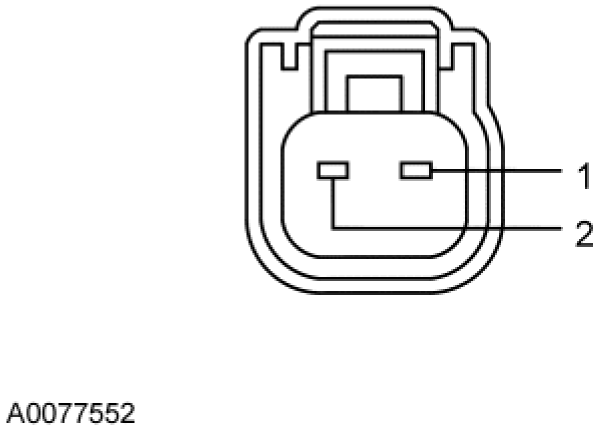

Fig. 190: Charge Air Cooler (CAC) Pump Connector
Courtesy of FORD MOTOR CO.

Pin	Circuit
2	GND (Ground)
1	PUMPPWR (Pump Power)

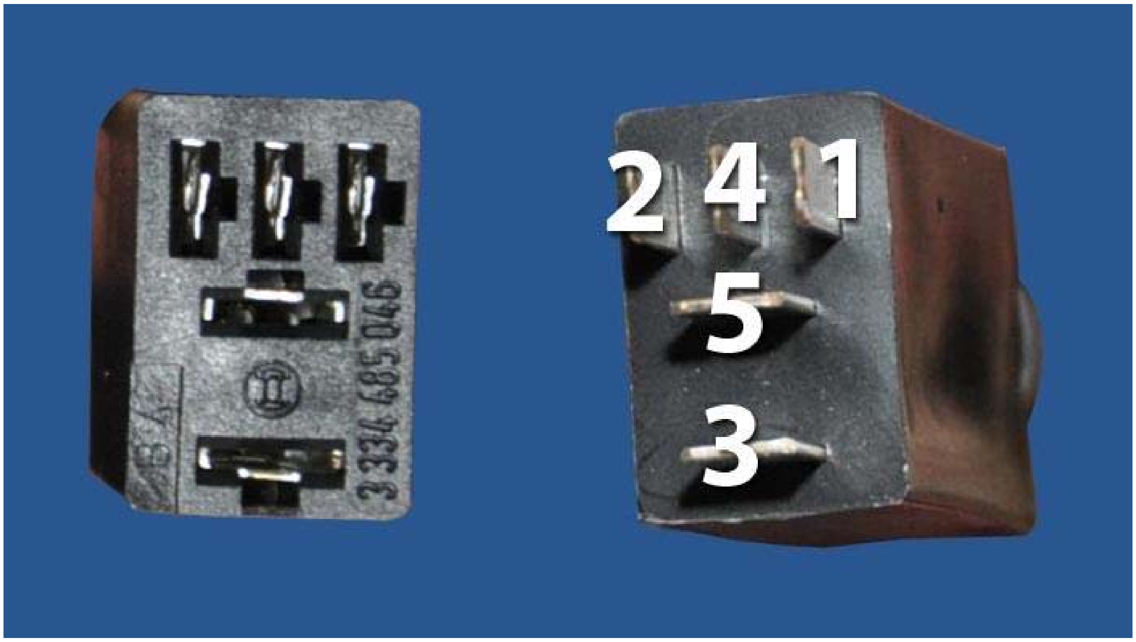

Fig. 191: Powertrain Control Module Power (PCM Power) Relay Connector - A
Courtesy of FORD MOTOR CO.

Pin	Circuit
5	PUMPPWR (Pump Power)
3	B+ (Battery Positive Voltage)
2	CAC (Charge Air Cooler)
1	VPWR (Vehicle Power)

Pin	Circuit
E64	CAC (Charge Air Cooler)

TEST PROCEDURE

KP1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

- **Is DTC P1229 present?**

Yes	No
For DTC P1229, GO to KP2.	For a boost gauge indicates higher than normal boost, GO to KP9.

KP2 DTC P1229: CHECK THE VOLTAGE TO THE CAC PUMP RELAY COIL

- Key in OFF position.
- CAC Relay connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) CAC Relay Connector, Harness Side	(-)
VPWR - Pin 1	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KP3.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KP3 CHECK THE CAC PUMP RELAY

- Key in OFF position.
- Remove the relay from the power distribution box.
- Measure the resistance between:

(+) CAC Relay Connector, Component Side	(-) CAC Relay Connector, Component Side
CAC - Pin 2	VPWR - Pin 1

- **Is the resistance between 65 - 100 ohms?**

Yes	No
GO to KP4.	INSTALL a new CAC relay. CLEAR the DTCs. REPEAT the self-test.

KP4 CHECK THE CAC PUMP RELAY

- Carry out the CAC pump relay component test. Refer to the Wiring Diagrams Cell 149 Component Testing.
- **Does the CAC pump relay pass the component test?**

Yes	No
GO to KP5.	INSTALL a new CAC relay. CLEAR the DTCs. REPEAT the self-test.

KP5 CHECK FOR AN OPEN CIRCUIT BETWEEN THE PCM AND THE CAC RELAY

- Key in OFF position.
- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) CAC Relay Connector, Harness Side
CAC - Pin E64	CAC - Pin 2

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KP6.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KP6 CHECK FOR A SHORT TO VOLTAGE BETWEEN THE PCM AND THE CAC RELAY

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
CAC - Pin E64	Negative terminal

- **Is the voltage less than 0.5 V?**

Yes	No
GO to KP7.	REPAIR the short circuit to PWR. CLEAR the DTCs. REPEAT the self-test.

KP7 CHECK BETWEEN THE PCM AND THE CAC RELAY FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) Vehicle Battery
CAC - Pin E64	Negative terminal

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to KP8.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

KP8 CHECK THE SCICP PID

- PCM connector connected.
- Access the PCM and monitor the SCICP PID.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- **Is the SCICP PID on?**

Yes	No
If the CAC reservoir is full, there is no air flow blockage at the CAC radiator, the IAT2 and connecting circuits are not high resistance or open, CAC hoses are not reversed and DTC P1229 is	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

present in KOEO and KOER, GO to KP15.	

KP9 CHECK THE CAC FOR MECHANICAL OPERATION

- Key ON, engine OFF.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Observe the CAC pump.
- Command the outputs OFF.
- **Does the CAC pump run?**

Yes	No
CHECK for low fluid level in the CAC system. CHECK for cracked or incorrectly routed CAC lines or airflow blockage at the CAC radiator. REPAIR the system as necessary. If the symptom still exists, RETURN to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** to diagnose boost gauge indicates higher than normal boost.	GO to KP10.

KP10 CHECK THE VOLTAGE AND GROUND CIRCUITS AT THE CAC PUMP

- Charge Air Cooler (CAC) Pump connector disconnected.
- Enter output test mode. Refer to**OUTPUT TEST MODE (OTM)** .
- Command the outputs ON.
- Measure the voltage between:

(+) Charge Air Cooler (CAC) Pump Connector, Harness Side	(-) Charge Air Cooler (CAC) Pump Connector, Harness Side
PUMPPWR - Pin 1	GND - Pin 2

- **Is the voltage greater than 10 V?**

Yes	No
INSTALL a new Charge Air Cooler (CAC) Pump. REFER to the **ENGINE COOLING -- E-SERIES** , Supercharger Cooling. CLEAR the DTCs. REPEAT the self-test.	GO to KP11.

KP11 CHECK THE CAC VOLTAGE CIRCUIT TO GND

- Measure the voltage between:

(+) Charge Air Cooler (CAC) Pump	

Connector, Harness Side	(-) Vehicle Battery
PUMPPWR - Pin 1	Negative terminal

- **Is the voltage greater than 10 V?**

Yes	No
GO to KP12.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KP12 CHECK THE INTEGRITY OF THE CAC PUMP GROUND CONNECTION

- Charge Air Cooler (CAC) Pump connector disconnected.
- Measure the resistance between:

(+) Charge Air Cooler (CAC) Pump Connector, Harness Side	(-) Vehicle Battery
GND - Pin 2	Negative terminal

- **Is the resistance less than 5 ohms?**

Yes	No
GO to KP13.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KP13 CHECK THE VOLTAGE TO THE CAC PUMP RELAY

- CAC Relay connector disconnected.
- Measure the voltage between:

(+) CAC Relay Connector, Harness Side	(-)
B+ - Pin 3	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to KP14.	REPAIR the open circuit. CHECK the fuses. CLEAR the DTCs. REPEAT the self-test.

KP14 CHECK FOR AN OPEN CAC PUMP CIRCUIT

- Measure the resistance between:

(+) CAC Relay Connector, Harness Side	(-) Charge Air Cooler (CAC) Pump Connector, Harness Side
PUMPPWR - Pin 5	PUMPPWR - Pin 1

- **Is the resistance less than 5 ohms?**

Yes	No
INSTALL a new CAC pump relay. CLEAR the DTCs. REPEAT the self-test.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

KP15 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. refer to **PINPOINT TEST Z**.

PINPOINT TEST NC: IGNITION ENGINE SPEED INPUT CIRCUIT

INTRODUCTION

This pinpoint test is intended to diagnose the powertrain control module (PCM) (12A650).

TEST PROCEDURE

NC1 CONTINUOUS MEMORY DTC P0320: ERRATIC IGNITION

- Verify all 2-way radio installations. Carefully follow the manufacturer's installation instructions regarding the routing of the antenna and voltage leads.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to NC2.

NC2 NO START CONCERN

- **Is the customer complaint no start?**

Yes	No
refer to **PINPOINT TEST A**.	GO to NC3.

NC3 INTERMITTENT CONDITION

- **Is this an intermittent condition?**

Yes	No
refer to **PINPOINT TEST Z**.	refer to **PINPOINT TEST JD**.

PINPOINT TEST ND: ENGINE RPM\VEHICLE SPEED LIMITER REACHED

INTRODUCTION

NOTE: Enter this pinpoint test only when directed here.

TEST PROCEDURE

ND1 DTCS P0219, P0297 OR P1270: EXCESSIVE ENGINE RPM OR VEHICLE SPEED

- P0219 (engine over speed), P0297 (vehicle over speed) or P1270 DTCs indicate the vehicle was operated in a manner which caused the engine or vehicle speed to exceed a calibrated limit.
  - Excessive engine RPM in NEUTRAL or operated in the wrong transmission gear.
  - Excessive wheel slippage (water, ice, mud or snow).
  - Vehicle driven at a high rate of speed.
- **Was the vehicle operating in any of the above conditions?**

Yes	No
The on-board diagnostics (OBD) system is OK. RETURN the vehicle to customer with information about the DTC.	REFER to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** . If there are no other symptoms, RETURN the vehicle to the customer with information about the DTC.

PINPOINT TEST QA: UNABLE TO ACTIVATE SELF-TEST/NETWORK COMMUNICATION ERROR

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- unable to communicate with PCM
- unable to activate the PCM self-test.
- incorrect self-test procedure

- harness circuits: ISP-R, PCMRC, PWRGND and VPWR

VREF INFORMATION TABLE

Application	Engine	Measure the PCM VREF at:
Edge/MKX	All	ETBTPS
Escape/Mariner	All	TP Sensor or FRPT
Expedition/Navigator	All	ETBTPS
Focus	All	ETBTPS
Fusion/Milan/MKZ	All	ETBTPS
Ranger	All	TP Sensor
Taurus/Taurus X/Sable	All	ETBTPS
All Others	All	FRPT

All other vehicles	B	3 1	SIGRTN VREF

Vehicle	Connector	Pin	Circuit
Edge, MKX, Sable, Taurus, Taurus X	190 Pin	B67, B68, B69, B70 B51, B52, B53 B8 B7	PWRGND VPWR PCMRC ISP-R
Escape/Mariner	150 (50-50-50) Pin	B47, B48, B49, B50 B35, B36	PWRGND VPWR
Expedition, Navigator	140 Pin	B67, B68, B69, B70 B51, B52, B53 B8 B7	PWRGND VPWR PCMRC ISP-R
Explorer, Explorer Sport Trac, Mountaineer, Mustang	170 Pin	B47, B48, B49, B50 B35, B36 B37 B46	PWRGND VPWR PCMRC ISP-R
F-150, Mark LT	190 Pin	B67, B68, B69, B70 B51, B52, B53 B40 B17	PWRGND VPWR PCMRC ISP-R
F-Super Duty	170 Pin	B47, B48, B49, B50 B35, B36	PWRGND VPWR

		B37 B31	PCMRC ISP-R
Focus	190 Pin	B69, B70 B67, B68 B38 B42	PWRGND VPWR PCMRC ISP-R
Fusion, Milan, MKZ	140 Pin	B67, B68, B69 B51, B52 B35 B37	PWRGND VPWR PCMRC ISP-R
All other vehicles	170 Pin	B47, B48, B49, B50 B35, B36	PWRGND VPWR

TEST PROCEDURE

QA1 CARRY OUT A VEHICLE INSPECTION AND VERIFY THE SELF-TEST PROCEDURE

NOTE: **If the self-test or communication concern occurred after a failed or an aborted reprogram, the module may be blank. Attempt to reprogram the module again before continuing with this pinpoint test.**

- Visually inspect the following for obvious signs of electrical damage:
  - harness wiring
  - electrical connections
- Verify the correct procedure was used to activate the self-test for the scan tool. Refer to**SCAN TOOL SETUP AND FUNCTIONALITY** .
- **Was the correct self-test procedure used?**

Yes	No
GO to QA2.	REFER to**SCAN TOOL SETUP AND FUNCTIONALITY** .

QA2 CARRY OUT THE NETWORK TEST

- Key ON, engine OFF.
- Carry out the network test.
- **Do all modules indicate pass?**

Yes	No
REFER to Symptom Charts, **PINPOINT TEST QT** .	If only PCM indicates fail, GO to QA3. For network test or all other modules indicates fail, REFER to the **MODULE COMMUNICATIONS NETWORK -- E-SERIES** to diagnose The Powertrain Control Module (PCM) Does Not Respond To The Scan Tool Or No High Speed

	Controller Area Network (HS-CAN) Communication Symptom.

QA3 CHECK FOR VREF VOLTAGE AT A SENSOR

NOTE: **PCM voltage and ground can be determined by measuring VREF voltage at a sensor. Refer to the VREF Information Table at the beginning of this pinpoint test for the vehicle application and the applicable sensor to test.**

- Key in OFF position.
- Disconnect the applicable sensor.
- Key ON, engine OFF.
- Measure the voltage between the applicable sensor VREF circuit, harness side and the applicable sensor SIGRTN circuit, harness side.
- **Is the voltage between 4.5 - 5.5 V?**

Yes	No
REFER to the **MODULE COMMUNICATIONS NETWORK -- E-SERIES** to diagnose The Powertrain Control Module (PCM) Does Not Respond To The Scan Tool Or No High Speed Controller Area Network (HS-CAN) Communication Symptom.	For Crown Victoria, Grand Marquis, E-Series, Escape/Mariner, Ranger, and Town Car, GO to QA6. For all others, GO to QA4.

QA4 CHECK THE ISP-R VOLTAGE AT THE PCM HARNESS CONNECTOR

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
ISP-R	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to QA5.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

QA5 CHECK THE PCM VPWR CIRCUITS FOR VOLTAGE

- Key in OFF position.
- Disconnect the PCM.

- Connect a 5 amp fused jumper wire between the following:

Point A PCM Connector, Harness Side	Point B
PCMRC	Ground

- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
VPWR	Ground

- **Are the voltages greater than 10 V?**

Yes	No
GO to QA7.	refer to **PINPOINT TEST B**.

QA6 CHECK THE PCM VPWR CIRCUITS FOR VOLTAGE

- Key in OFF position.
- Disconnect the PCM.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
VPWR	Ground

- **Are the voltages greater than 10 V?**

Yes	No
GO to QA7.	refer to **PINPOINT TEST B**.

QA7 CHECK THE PCM GROUND CIRCUITS FOR AN OPEN

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
PWRGND	Ground

- **Are the resistances less than 5 ohms?**

Yes	No
GO to QA8.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

QA8 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the network test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST QB: DTCS P0603 OR P1633: KEEP ALIVE POWER (KAPWR)

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- battery terminal condition
- KAPWR wire routing
- harness circuit: KAPWR
- powertrain control module (PCM) (12A650)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Edge, F-150, Mark LT, MKX, Sable, Taurus, Taurus X	190 Pin	B54	KAPWR
Escape/Mariner	150 (50-50-50) Pin	B45	KAPWR
Expedition, Fusion, Milan, MKZ,	140 Pin	B54	KAPWR

Navigator			
Focus	190 Pin	B62	KAPWR
All other vehicles	170 Pin	B45	KAPWR

TEST PROCEDURE

QB1 CHECK THE 12-VOLT BATTERY TERMINALS

NOTE: **If the KAPWR is interrupted to the PCM when a breakout box is installed or the battery is disconnected, DTC P0603/P1633 can be generated on the first power-up.**

NOTE: **If DTC P0603 occurred right after or during an unsuccessful reprogramming of the PCM, clear the DTCs and repeat the PCM self-test. If DTC P0603 is retrieved again, continue with this pinpoint test.**

- Inspect the 12-volt battery cables for loose connections and for corrosion.
- **Are the 12-volt battery terminal connections in good condition?**

Yes	No
GO to QB2.	REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

QB2 INSPECT THE ENGINE COMPARTMENT FOR CORRECT WIRE ROUTING

- Inspect the electronic engine control (EEC) system wiring for correct wire routing.
- Check the wiring routing to establish if any of the electrical connectors are being stressed due to poorly routed wiring. If necessary re-route and secure the wiring.
- Visually inspect the wiring and connectors.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to QB3.

QB3 CHECK KAPWR TO THE PCM

- Key in OFF position.
- PCM connector disconnected.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-) 12 Volt Vehicle Battery
KAPWR	Negative terminal

- While observing the multimeter, grasp the EEC harness and wiggle, shake or bend a small section while working from the battery to the PCM.
- **Is the voltage greater than 10 V?**

Yes	No
GO to QB4.	ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

QB4 CHECK FOR A REPEAT OF THE DTC

- PCM connector connected.
- Clear all DTCs that may have been caused by the PCM disconnect.
- Test drive the vehicle and allow the engine to reach normal operating temperature.
- Carry out the PCM self-test.
- **Is DTC P0603 or P1633 present?**

Yes	No
GO to QB5.	Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.

QB5 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST QC: DTC P1000: ON-BOARD DIAGNOSTIC (OBD) SYSTEMS READINESS TEST NOT COMPLETE

INTRODUCTION

NOTE: **Diagnostic trouble code (DTC) P1000 indicates that all the OBD monitors have not yet been successfully tested. In some areas, this DTC must be cleared to pass an inspection/maintenance test. The customer should be informed that the law specifies additional city and highway driving must be done to complete the check of the OBD system. This additional driving must occur before the vehicle is tested at the inspection/maintenance station. The amount of driving required varies with individual driving patterns. To complete this requirement in the shortest amount of time, refer to<u>ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE</u> .**

It is not necessary to clear DTC P1000 from the powertrain control module (PCM) by driving the vehicle unless it is requested by the customer to pass an inspection/maintenance test.

The only way DTC P1000 can be removed from memory is when all the OBD monitors are successfully completed.

DTC P1000 is set by the PCM under any of the following conditions.

- The vehicle is new from the factory and has not yet completed an OBD drive cycle.
- The battery or PCM is disconnected.
- An OBD monitor concern occurred before completion of an OBD drive cycle.
- The PCM DTCs have been cleared with a scan tool as part of a repair process.
- The PCM has been flashed and the vehicle has not yet completed an OBD drive cycle.
- DTC P1000 may not clear if the vehicle is equipped with a power take off (PTO) and the PTO is engaged or damaged.

TEST PROCEDURE

QC1 CONTINUOUS MEMORY DTC P1000: CHECK FOR ANY OTHER DTCS

NOTE: **Enter this pinpoint test only if DTC P1000 was retrieved from continuous memory. Ignore DTC P1000 in KOEO or KOER memory.**

- DTC P1000 indicates all of the OBD monitors have not yet been successfully tested.
- **Are any other DTCs received with P1000?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**<u>DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS</u>** .	GO to QC2.

QC2 CHECK FOR PTO

- **Is the vehicle equipped with PTO?**

Yes	No
GO to QC3.	GO to QC4.

QC3 CHECK THE PTO PID

- Key ON, engine running.
- Access the PCM and monitor the PTO PID.
- Cycle the PTO switch/actuator ON and OFF. (Follow the PTO aftermarket instructions).
- **Does the PTO PID cycle ON and OFF?**

Yes	No
GO to QC4.	GO to FB2.

QC4 REQUEST TO CLEAR DTC P1000

NOTE: An entire OBD drive cycle has not yet been completed to clear DTC P1000 from the PCM.

- **Has the customer requested DTC P1000 be cleared from the PCM memory?**

Yes	No
CARRY OUT an OBD drive cycle. REFER to**ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE** .	INFORM the customer that if the law in your area requires additional driving in order to clear DTC P1000 from the PCM memory, it must be completed before an inspection/maintenance test.

PINPOINT TEST QD: DTC P1260: PASSIVE ANTI-THEFT SYSTEM

INTRODUCTION

NOTE: The passive anti-theft system (PATS) uses radio frequency identification technology to deter a drive away theft. Passive means that it does not require any activity from the user. The PATS uses a specially encoded ignition key. Each encoded ignition key contains a permanently installed electronic device called a transponder. Each transponder contains a unique electronic identification code. Each encoded ignition key must be programmed into the vehicle before it can be used to start the engine. DTC P1260 is stored any time the PCM disables the vehicle because of the PATS.

TEST PROCEDURE

QD1 CHECK FOR PATS DTCS

- Repair all PATS DTCs before P1260. Refer to the **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS) -- E-SERIES** for System Description, Operation and Self-Test.

- **Are all PATS DTCs diagnosed?**

Yes	No
GO to QD2.	REFER to the **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS) -- E-SERIES** to diagnose any PATS related DTCs.

QD2 CHECK FOR ANY OTHER POWERTRAIN DTCS

- Repair all powertrain DTCs other than P1260.
- **Are all other powertrain DTCs diagnosed?**

Yes	No
GO to QD3.	DISREGARD DTC P1260. DIAGNOSE all other powertrain DTCs. REFER to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .

QD3 ATTEMPT TO START THE ENGINE

- Carry out a keep alive memory reset to clear DTC P1260. Refer to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .
- Attempt to start the engine.
- **Does the engine start?**

Yes	No
No system concerns exist at the present time. For intermittent no start or start stalls, CHECK for intermittent PATS concerns. (PATS cannot stall the engine after 1 second of operation). For intermittent stalls while driving, VERIFY scan tool-to-PCM communication during the concern. If a PCM communication error occurs, the possible causes are: loss of PWR or GND to the PCM, damaged PCM PWR relay, or a damaged EEC PWR diode. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	DTC P1260 is not the cause of the No Start. REFER to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** .

PINPOINT TEST QE: ELECTRONIC THROTTLE CONTROL (ETC) SYSTEM

INTRODUCTION

NOTE: **Diagnose and repair the following DTCs through DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS and the Workshop article respectively before entering this pinpoint test:**

- **P0715**
- **P0720**
- **P0731-P0735**
- **P0102-P0104**
- **P0321**
- **C1165**
- **U1027**

This pinpoint test is intended to diagnose the informational powertrain control module (PCM) diagnostic trouble codes (DTCs).

The informational DTCs are the result of limited operating strategy (LOS) or failure mode effects management (FMEM) operating strategy that maintains limited vehicle function in the event of a PCM, harness, or component concern.

Circuit DTCs can be accompanied by the informational DTCs, and should be diagnosed first. Informational DTCs without circuit DTCs may or may not indicate the actual concern and should be diagnosed as a symptom.

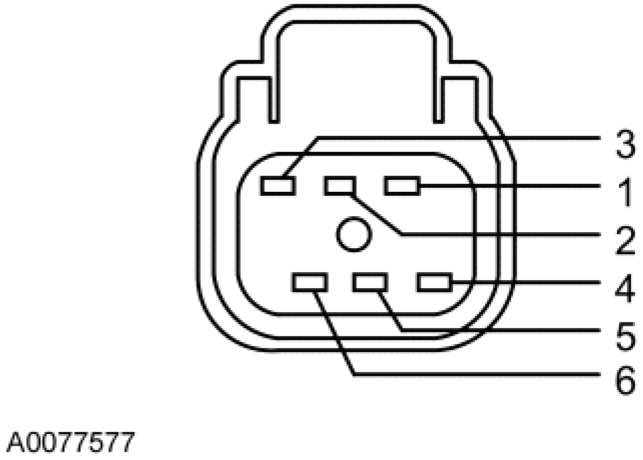

Fig. 198: EGR System Module (ESM) Connector

Pin	Circuit
6	SIGRTN (Signal Return)
2	VREF (Reference Voltage)

TEST PROCEDURE

QE1 CHECK FOR DTCS

NOTE: For DTC P061B, make sure the air cleaner and air inlet are correctly seated and properly installed before continuing diagnosis.

- **Are any DTCs present other than the following: P0600, P060A, P060B, P060C, P060D, P061B, P061C, P061D, P061F, P062C, P1674, P2104, P2105, P2110, or U0300?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	For Focus with DTC P0600, GO to QE2. For all others with DTC P0600, GO to QE18. For DTCs P060A, P060C, P060D, P061D, P1674 or U0300, GO to QE2. For DTC P060B, GO to QE3. For DTC P061B, GO to QE13. For DTC P061C, GO to QE5. For DTC P061F, GO to QE7. For DTCs P062C, P2104, P2105 or P2110, GO to QE8.

QE2 DTCS P060A, P060C, P060D, P061D, P1674 OR U0300: CHECK THE PCM FOR THE LATEST CALIBRATION

- Program the PCM to the latest calibration.
- Key in OFF position.
- Key ON, engine OFF.
- Key in OFF position.
- Key ON, engine running.
- Use the customer information to recreate the concern.
- Carry out the self-test.
- **Are DTCs P060A, P060C, P060D, P061D, P1674 or U0300 present?**

Yes	No
GO to QE18.	The concern is not present at this time.

QE3 DTC P060B: CHECK FOR REFERENCE VOLTAGE CONCERNS

- Inspect the PCM harness for damage.
- Verify the correct operation of the sensors using ETCREF, VREF and related circuits. refer to **PINPOINT TEST C** and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to QE4.

QE4 CHECK FOR AN INTERMITTENT CONCERN

- Clear the DTCs.
- Carry out the self-test.
- **Is DTC P060B present?**

Yes	No
GO to QE18.	The concern is not present at this time.

QE5 DTC P061C: CHECK THE CKP SENSOR FOR CORRECT OPERATION

- Verify correct operation of the CKP sensor and related circuits. refer to **PINPOINT TEST JD** and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to QE6.

QE6 CHECK THE CMP SENSOR FOR CORRECT OPERATION

- Verify correct operation of the CMP sensor and related circuits. refer to **PINPOINT TEST DR** and follow the pinpoint test direction.
- **Is a concern present?**

Yes	No
REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to QE7.

QE7 DTC P061F: VERIFY THE CUSTOMER CONCERN

- Clear the DTCs.
- Use the customer information to recreate the concern.
- Carry out the self-test.
- **Are DTCs P061C or P061F present?**

Yes	No
GO to QE18.	The concern is not present at this time.

QE8 DTCS P062C, P2104, P2105 OR P2110: CHECK FOR DTCS IN OTHER VEHICLE MODULES

- Check for self-test DTCs in all of the vehicle modules.
- **Are any DTCs present?**

Yes	No
REFER to the applicable Workshop article part to diagnose the DTC.	GO to QE9.

QE9 CHECK FOR THE PRESENCE OF ANY MODULE COMMUNICATION CONCERNS

- Check for self-test DTCs in all of the vehicle modules.
- **Are any communication concerns or communication DTCs present?**

Yes	No
For communication concerns in the PCM, DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** . For communication concerns in other modules, REFER to the applicable Workshop article part to diagnose the communication DTC.	For DTC P062C, GO to QE16. For DTC P2104, GO to QE10. For DTC P2105, GO to QE11. For DTC P2110, GO to QE15.

QE10 DTC P2104: CHECK FOR THE PRESENCE OF PCM DTCS

- Clear the PCM DTCs.
- Check for self-test DTCs.
- **Are any DTCs present other than P2104?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	refer to **PINPOINT TEST DK**.

QE11 DTC P2105: CHECK FOR THE PRESENCE OF PCM DTCS

NOTE: **P2105 may be set in combination with other DTCs. Diagnose other DTCs first.**

- Clear the PCM DTCs.
- Check for self-test DTCs.
- **Are any DTCs present other than P2105?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to QE12.

QE12 CARRY OUT A VISUAL INSPECTION

- Key in OFF position.
- Visually inspect the following for obvious signs of damage:

  - ETB
  - PCM
- Check the harness for routing, alterations, incorrect shielding, or electrical interference from other systems. Make sure aftermarket wiring is not routed near the PCM.
- Verify aftermarket equipment does not generate radio frequency interference/electromagnetic interference (RFI/EMI).
- **Is a concern present?**

Yes	No
ISOLATE the concern and REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	GO to QE18.

QE13 DTC P061B: CHECK FOR THE PRESENCE OF PCM DTCS

NOTE: **An intermittent CKP sensor or harness concern may cause DTC P061B to set. Check for intermittent CKP sensor and harness concerns.**

- Clear the PCM DTCs.
- Check for self-test DTCs.
- **Are any DTCs present other than P061B?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	For Crown Victoria, E-Series 4.6L, Explorer 4.0L, Explorer Sport Trac 4.0L, F-150 4.2L, F-150 4.6L, F-Super Duty 6.8L, Grand Marquis, Mountaineer 4.0L, Mustang 4.0L, Mustang 5.4L, and Town Car, GO to QE14. For all others, CHECK for an intermittent concern with an ETC related harness or sensor. refer to **PINPOINT TEST Z**.

QE14 CHECK THE MAP INPUT FOR AN OFFSET SIGNAL

- Key in OFF position.
- Allow the vehicle to cool down.
- ESM connector disconnected.
- Measure the resistance between:

(+) ESM Connector, Component Side	(-) ESM Connector, Component Side
VREF - Pin 2	SIGRTN - Pin 6

- **Is the resistance greater than 2K ohms?**

Yes	No
For Crown Victoria, Grand Marquis, Explorer 4.0L, Explorer Sport Trac 4.0L, Mountaineer 4.0L, and Town Car, GO to QE16. For all others, CHECK for an intermittent concern with an ETC related harness or sensor. refer to **PINPOINT TEST Z**.	INSTALL a new ESM. REFER to the **ENGINE EMISSION CONTROL - - E-SERIES** . CLEAR the DTCs. REPEAT the self-test.

QE15 DTC P2110: CHECK FOR THE PRESENCE OF PCM DTCS

NOTE: P2110 sets in combination with other DTCs.

- Clear the PCM DTCs.
- Check for self-test DTCs.
- **Are any DTCs present other than P2110?**

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** .	GO to QE18.

QE16 CHECK FOR ABS AND WHEEL SPEED SENSOR CONCERNS

NOTE: Refer to the REFERENCE VALUES article Reference Values for the typical diagnostic reference values.

- ESM connector connected.
- Key ON, engine running.
- Access the PCM and monitor the ISS_SRC, OSS_SRC and TSS PIDs.
- Access the PCM and monitor the VSS PID.
- Access the ABS and monitor the LF_WSPD, LR_WSPD, RF_WSPD and RR_WSPD PIDs.
- Road test the vehicle under various load conditions while comparing the PIDs. Check for signals that are intermittent or do not correspond.
- **Do the PID values correspond with the vehicle operating conditions?**

Yes	No
For Explorer 4.0L, Explorer Sport Trac 4.0L, F-150 5.4L, Mark LT, and Mountaineer 4.0L, GO to QE17. For all others, CHECK for an intermittent concern with an ETC related harness or sensor. refer to **PINPOINT TEST Z**.	REFER to the **VEHICLE DYNAMIC SYSTEMS -- E-SERIES** to diagnose any ABS concerns.

QE17 CHECK FOR A TRANSFER CASE MECHANICAL CONCERN

- Stop the vehicle.
- Select 4WD Low.
- **Does the vehicle shift into 4WD Low?**

Yes	No
CHECK for an intermittent concern with an ETC related harness or sensor. refer to **PINPOINT TEST Z**.	REFER to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** , Four Wheel Drive (4WD) Systems to diagnose any transfer case concerns.

QE18 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

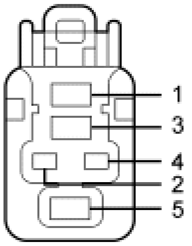
Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST TA: CLUTCH PEDAL POSITION (CPP) SWITCH

INTRODUCTION

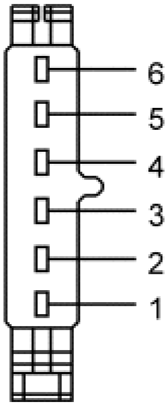
This pinpoint test is intended to diagnose the following:

- CPP (11A152/7C534)
- harness circuits: CPP / CPP BT and SIGRTN / GND
- powertrain control module (PCM) (12A650)



N0047960

Fig. 199: Clutch Pedal Position (CPP) Switch Connector - A
Courtesy of FORD MOTOR CO.



A0077530

Fig. 200: Clutch Pedal Position (CPP) Switch Connector - B
Courtesy of FORD MOTOR CO.

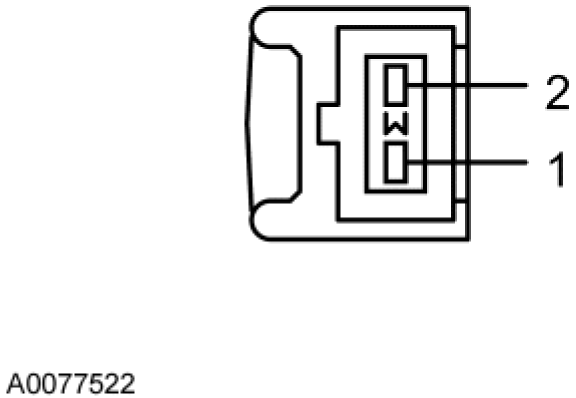


Fig. 201: Clutch Pedal Position (CPP) Switch Connector - C
Courtesy of FORD MOTOR CO.

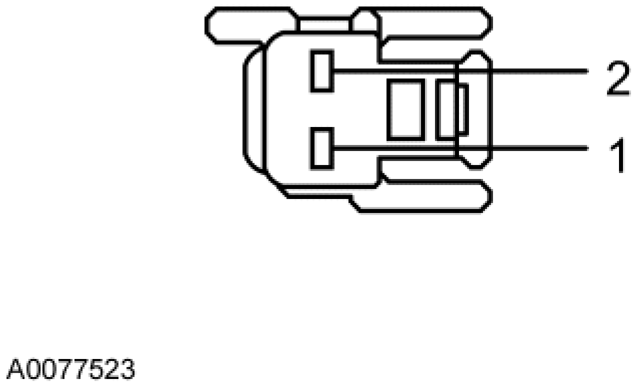

Fig. 202: Clutch Pedal Position (CPP) Switch Connector - D
Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Escape/Mariner	A	2 4	SIGRTN CPP
F-150	B	2 1	GND CPP
Mustang	C	2 1	GND CPP
Ranger	B	5 6	GND CPP
All other vehicles	D	2	GND

		1	CPP

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
Escape/Mariner	150 (50-50-50) Pin	B41, E41, T41 T27	SIGRTN CPP
F-150	190 Pin	B39 B58, E58, T43	CPP-BT SIGRTN
F-Super Duty	170 Pin	B34 B41, E58, T41	CPP-BT SIGRTN
Focus	190 Pin	T26 B58, E64, T40	CPP-BT SIGRTN
Fusion, Milan	140 Pin	B18 B58, E58	CPP-BT SIGRTN
All other vehicles	170 Pin	B41, E58, T41 B33	SIGRTN CPP

TEST PROCEDURE

TA1 DTC P0704, P0830: CHECK THE CPP SWITCH

WARNING: **Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.**

NOTE: During self-test, the clutch pedal must be down and gearshift lever in NEUTRAL.

- Key ON, engine OFF.
- Access the PCM and monitor the CPP PID.
- **Does the reading cycle when the CPP switch is activated?**

Yes	No
This may be an intermittent circuit concern. INSPECT connectors for signs of damage, water intrusion, corrosion. REPAIR as necessary.	GO to TA2.

TA2 CHECK THE SWITCH CIRCUIT RESISTANCE

NOTE: The CPP switch is located near the clutch pedal.

NOTE: Measure the CPP switch resistance with the clutch pedal pressed down.

- Inspect the switches and brackets for damage. Repair as necessary.
- CPP Switch connector disconnected.
- For Focus or Escape,
- Measure the resistance between:

(+) CPP Switch Connector, Component Side	(-) CPP Switch Connector, Component Side
CPP	SIGRTN

- For all others,
- Measure the resistance between:

(+) CPP Switch Connector, Component Side	(-) CPP Switch Connector, Component Side
CPP	GND

- **Is the resistance less than 5 ohms?**

Yes	No
GO to TA3.	INSTALL a new CPP switch. CLEAR the DTCs. REPEAT the self-test.

TA3 CHECK THE CPP FOR INTERNAL SHORTS

NOTE: Measure the CPP switch resistance with the clutch pedal released.

- For Focus or Escape,
- Measure the resistance between:

(+) CPP Switch Connector, Component Side	(-) CPP Switch Connector, Component Side
CPP	SIGRTN

- For all others,
- Measure the resistance between:

(+) CPP Switch Connector, Component Side	(-) CPP Switch Connector, Component Side
CPP	GND

- **Is the resistance greater than 10K ohms?**

Yes	No
For Focus or Escape, GO to TA5.	INSTALL a new CPP switch. CLEAR the DTCs.

For all others, GO to TA4.	REPEAT the self-test.

TA4 CHECK THE CPP AND GROUND CIRCUITS FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) CPP Switch Connector, Harness Side	(-) PCM Connector, Harness Side
CPP	CPP

- Measure the resistance between:

(+) CPP Switch Connector, Harness Side	(-)
GND	Ground

- **Is the resistance less than 5 ohms?**

Yes	No
GO to TA6.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

TA5 CHECK THE CPP AND SIGRTN CIRCUITS FOR AN OPEN IN THE HARNESS

- PCM connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) CPP Switch Connector, Harness Side
CPP	CPP
SIGRTN	SIGRTN

- **Are the resistances less than 5 ohms?**

Yes	No
GO to TA6.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

TA6 CHECK THE CPP CIRCUIT FOR A SHORT TO VOLTAGE

- Key ON, engine OFF.
- Measure the voltage between:

(+) CPP Switch Connector, Harness Side	(-)
CPP	Ground

- **Is the voltage less than 1 V?**

Yes	No
GO to TA7.	REPAIR the short circuit to PWR. CLEAR the DTCs. REPEAT the self-test.

TA7 CHECK THE CPP CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) CPP Switch Connector, Harness Side	(-)
CPP	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to TA8.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

TA8 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.
- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST TB: TRANSMISSION CONTROL SWITCH (TCS)/ TRANSMISSION CONTROL INDICATOR LAMP (TCIL)

INTRODUCTION

This pinpoint test is intended to diagnose the following:

- TCS
- TCIL

- harness circuits: TCS and TCIL
- powertrain control module (PCM) (12A650)

For PCM connector views or reference values, refer to the **REFERENCE VALUES** article.

Vehicle	Connector	Pin	Circuit
E-Series	170 Pin	B43 B27	TCIL TCS
Edge, MKX, Sable, Taurus, Taurus X	190 Pin	B16	TCS
Escape/Mariner	150 (50-50-50) Pin	B27	TCS
F-150, Mark LT	190 Pin	B45	TCS
F-Super Duty	170 Pin	B27	TCS
Focus	190 Pin	T30	TCS
Fusion	140 Pin	B16	TCS
All other vehicles	170 Pin	B29	TCS

TEST PROCEDURE

TB1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTC)

- **Is DTC P1780 present?**

Yes	No
GO to TB2.	For TCIL never on, GO to TB10. For TCIL always on, GO to TB8.

TB2 DTC P1780: CHECK THE TCS FUNCTION

NOTE: **Verify the TCS was cycled during self-test.**

- Key ON, engine OFF.
- Access the PCM and monitor the TCS PID.
- Apply and release the TCS and then hold it applied for 3 seconds. Release the switch.
- **Does the TCS PID change from ON to OFF and does the PID indicate ON when the switch is applied?**

Yes	No
REPEAT the KOER self-test and cycle the TCS during the test.	GO to TB3.

TB3 CHECK THE TCS VOLTAGE

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
TCS	Ground

- Monitor the voltage while applying and releasing the TCS several times.
- **Does the voltage change states?**

Yes	No
GO to TB12.	GO to TB4.

TB4 CHECK THE TCS CIRCUIT FOR A SHORT TO GROUND IN THE HARNESS

- Key in OFF position.
- TCS connector disconnected.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
TCS	Ground

- **Is the resistance greater than 10K ohms?**

Yes	No
GO to TB5.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

TB5 CHECK FOR VOLTAGE TO THE TCS

- Key ON, engine OFF.
- Measure the voltage between:

(+) TCS Connector, Harness Side	(-)
VPWR	Ground

- **Is the voltage greater than 10 V?**

Yes	No
GO to TB6.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

TB6 CHECK THE TCS CIRCUIT FOR AN OPEN IN THE HARNESS

- Key in OFF position.
- Measure the resistance between:

(+) PCM Connector, Harness Side	(-) TCS Connector, Harness Side
TCS	TCS

- **Is the resistance less than 5 ohms?**

Yes	No
GO to TB7.	REPAIR the open circuit. CLEAR the DTCs. REPEAT the self-test.

TB7 CHECK THE TCS CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS

- Key ON, engine OFF.
- Measure the voltage between:

(+) TCS Connector, Harness Side	(-)
TCS	Ground

- **Is the voltage less than 1 V?**

Yes	No
INSTALL a new TCS. REFER to the **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS -- E-SERIES** . CLEAR the DTCs. REPEAT the self-test.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

TB8 TCIL ALWAYS ON: CHECK THE TCIL FUNCTION

- Key ON, engine OFF.
- Apply and release the TCS.
- **Does the TCIL change state?**

Yes	No
Unable to duplicate or identify the concern at this time. refer to **PINPOINT TEST Z**.	GO to TB9.

TB9 CHECK THE TCIL CIRCUIT(S) FOR A SHORT TO GROUND IN THE HARNESS

NOTE: The TCIL turns off when the PCM is disconnected.

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- **Does the TCIL change state?**

Yes	No
GO to TB12.	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

TB10 TCIL NEVER ON: CHECK FOR KOER P1780

- Carry out the PCM KOER self-test.
- **Is DTC P1780 present?**

Yes	No
REPAIR the DTC. CLEAR the DTCs. REPEAT the self-test. GO to TB2.	GO to TB11.

TB11 CHECK FOR VOLTAGE TO THE TCIL

- Key in OFF position.
- PCM connector disconnected.
- Key ON, engine OFF.
- Connect a 5 amp fused jumper wire between the following:

Point A PCM Connector, Harness Side	Point B Vehicle Battery
TCIL	Negative terminal

- **Does the TCIL illuminate?**

Yes	No
GO to TB12.	CHECK the indicator bulb and the fuse. If OK, the open is in the wiring between the ignition switch and the TCIL pin at the harness connector. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

TB12 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Visually inspect for:
  - pushed out pins
  - corrosion
- Connect all the PCM connectors and make sure they seat correctly.

- Carry out the PCM self-test and verify the concern is still present.
- **Is the concern still present?**

Yes	No
INSTALL a new PCM. REFER to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST Z: INTERMITTENT

INTRODUCTION

WARNING: **Crown Victoria Police Interceptor vehicles equipped with fire suppression system, refer to part 419-03 for Important Safety Warnings. Failure to follow these instructions may result in personal injury.**

This pinpoint test is intended to diagnose and isolate intermittent concerns for the following:

- all electronic engine control (EEC) subsystems

This chart is used to determine which test to run for the suspect circuit. PIDs corresponding to each circuit are listed. Some circuits do not have an associated PID or the PID may not be available and has to be measured with a digital multimeter (DMM). More specific information on the PID can be found. If the vehicle has a coil pack system with a no start condition, carry out the ignition test.

PCM PIDS/SIGNALS

PCM/TCM PIDS/SIGNALS	Associated Circuit	Test Type
ACCS	A/CCS	input
ACET	ACET	input
ACP	ACPSW	input
AIR	AIR	output
AIRM	AIRM	input

WAC	WAC	output

TEST PROCEDURE

Z1 DIRECTION FOR INTERMITTENT DIAGNOSTIC PATH

NOTE: **Proceed with this step only if the powertrain control module (PCM) was not previously cleared. Record freeze frame data prior to clearing the PCM DTCs. Clearing the DTCs clears any freeze frame data and eliminates FMEM. This helps to recreate the original conditions that set the DTCs or caused the symptom.**

- Key ON, engine OFF.
- Clear the PCM DTCs.
- **Are the PCM DTCs cleared?**

Yes	No
GO to Z2.	RESET the keep alive memory (KAM). REFER to**RESETTING THE KEEP ALIVE MEMORY (KAM)** .

Z2 SELECT THE PIDS AND/OR SIGNALS RELATED TO THE SYSTEM

- A list of related PIDs and/or signals are needed for use with the scan tool to monitor the suspect areas. Obtain the customer symptom description. Use the Reference Value Symptom chart and proceed to the Reference Value PID/Signal Measurement chart located at the beginning of Reference Values.

- Highlight each available PID/signal recommended by the charts under the PID/signal selection menu on the scan tool.
- **Are all available PIDs/signals related to the symptom selected?**

Yes	No
GO to Z3.	REPEAT the test step. GO to Z2.

Z3 DECISION TO VERIFY THE SYMPTOM

NOTE: The path to symptom verification is optional, but is recommended for several reasons. For example: the vehicle is back for a repeat repair, or there is no DTC present.

- **Is a concern symptom detected?**

Yes	No
GO to Z10.	GO to Z4.

Z4 COLLECT ANY SYMPTOM RELATED DATA TO AID IN VERIFICATION

NOTE: Only MIL codes trigger freeze frame data. Refer to the scan tool instruction article to retrieve the freeze frame information.

- Prepare the freeze frame data for use with information from the Symptom Charts.
- Check for continuous memory DTCs that should have been recorded from an earlier pinpoint test.
- Access the information from the customer information worksheet and the customer if available. Access any other symptom related data available, such as TSBs and OASIS reports.
- **Is all available data recorded?**

Yes	No
GO to Z5.	GATHER as much data as possible to aid in isolating the intermittent concern area. REPEAT the test step. GO to Z4.

Z5 RECREATE THE SYMPTOM USING ALL AVAILABLE DATA

NOTE: To recreate the original conditions that set the DTC or caused the symptom, the vehicle may require driving.

- With the scan tool, select and monitor the same PIDs as displayed in freeze frame along with any previously selected PIDs/signals from step Z2. Using the freeze frame data recorded earlier, recreate the conditions described by each freeze frame PID. Pay special attention to ECT, LOAD, RPM and VSS. Also, use any available data from the customer, TSBs, and other sources to aid in producing the correct conditions for recreating the symptom.

- When the symptom occurs, press the trigger to begin recording. Refer to the scan tool instruction article for information on the recorder function.
- **Can the symptom be recreated?**

Yes	No
GO to Z10.	GO to Z6.

Z6 RECREATE THE SYMPTOM

NOTE: **PIDs for output in the Reference Value Charts represent command values only. Circuit measurements with a digital multimeter indicate the actual output status. Therefore, in the case of a concern, the PID and circuit reading on the vehicle may not correspond with each other. PIDs for PCM circuits with a mismatch in the digital multimeter measurement indicate a possible PCM concern.**

- The road test is the last attempt to locate the area of concern before physically disturbing vehicle circuits.
- The Intermittent Road Test Procedure is a set of instructions for monitoring PIDs/signals with a scan tool and circuit measurements with a digital multimeter. This is done under 4 different conditions - key on/engine off, hot idle, 48 km/h (30 mph) and 88 km/h (55 mph). Use the typical diagnostic reference values to compare with the actual vehicle.
- Locate the correct Reference Value Chart.
- Setup the vehicle to measure the circuits with a digital multimeter and a scan tool.
- Connect a scan tool to the DLC.
- Key ON, engine OFF.
- With the scan tool, select and monitor PIDs and measure the circuits shown in the Reference Value Chart.
- Compare the scan tool PIDs and digital multimeter values to the Reference Value Charts.
- **Are any values out of range?**

Yes	No
GO to Z10.	GO to Z7.

Z7 RECREATE THE SYMPTOM USING THE HOT IDLE ROAD TEST

NOTE: **The engine temperature should be at least 87°C (189°F).**

- Key ON, engine running.
- Continue to monitor the PIDs and circuits as in the previous step.
- **Are any values out of range?**

Yes	No
GO to Z10.	GO to Z8.

Z8 RECREATE THE SYMPTOM DURING AN 48 KM/H (30 MPH) ROAD TEST

- Drive the vehicle on a preplanned route.
- Continue to monitor the PIDs and circuits as in the previous step.
- **Are any values out of range?**

Yes	No
GO to Z10.	GO to Z9.

Z9 RECREATE THE SYMPTOM DURING AN 88 KM/H (55 MPH) ROAD TEST

- Continue to drive the vehicle on the preplanned route.
- Continue to monitor the PIDs and circuits as in the previous step.
- **Are any values out of range?**

Yes	No
GO to Z10.	It is now necessary to physically disturb the selected vehicle circuits in an attempt to recreate the intermittent concern. GO to Z10.

Z10 SELECT THE CIRCUITS FROM THE PCM PIDS/SIGNALS CHART

NOTE: **From the same chart, be sure to select and proceed with the appropriate test type.**

NOTE: **The Input Test step should be used on sensing inputs such as temperature, position or oxygen.**

NOTE: **The Output Test step should be used on output devices such as relays, coils or solenoids.**

- Remain in the PID/Signal selection menu with the scan tool.
- Highlight only the PIDs/signals from step Z2.
- Proceed to the PCM PIDS/SIGNALS chart located at the beginning of this test.
- Match the selected PIDs/signals to the corresponding circuit in the chart. There may be more than one circuit to test. If a PID/signal recording was made with the scan tool, it may be helpful to replay it at this time. Refer to the scan tool instruction article for additional information.
- **Has a test been chosen?**

Yes	No

For the input test step, GO to Z11. For the output test step, GO to Z15.	To diagnose other driveability symptoms, REFER to**NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** .

Z11 KOEO INPUT TEST PROCEDURE FOR THE PCM SENSORS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

- Using the circuits chosen from the PCM PIDS/SIGNALS Chart, select only the recommended PIDs/signals to monitor with the scan tool. If a PID is not available for the circuit, use a digital multimeter to check the value.
- Proceed to the area of the suspect wiring or component concern.
- Key ON, engine OFF.
- If the input is a switch type-component, turn it on manually.
- Monitor the PID or DMM while tapping on the component.
- Monitor while wiggling the sensor harness wire from the component to the PCM.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Are there abrupt changes in the PID values that do not compare with the values?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to Z12.

Z12 KOER INPUT TEST PROCEDURE FOR THE PCM SENSORS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

- Key ON, engine running.
- Continue to monitor the PIDs and circuits as in the previous step.
- Proceed to the area of the suspect wiring or component concern.
- If the input is a switch type-component, turn it on manually.
- Monitor the PID or DMM while tapping on the component.
- Monitor while wiggling the sensor harness wire from the component to the PCM.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.

- **Are any values fluctuating in and out of range?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to Z13.

Z13 KOEO WATER SOAK TEST PROCEDURE FOR THE PCM SENSORS, EXCLUDING HIGH VOLTAGE CIRCUITS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

- Key ON, engine OFF.
- Continue to monitor the PIDs and circuits as in the previous step.
- Proceed to the area of the suspect wiring or component concern.
- If the input is a switch type-component, turn it on manually.
- Monitor the PID or DMM values while lightly spraying a water mist on the component.
- Monitor while spraying the sensor harness wire from the component to the PCM.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Are any values fluctuating in and out of range?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to Z14.

Z14 KOER WATER SOAK TEST PROCEDURE FOR THE PCM SENSORS, EXCLUDING HIGH VOLTAGE CIRCUITS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

- Key ON, engine running.
- Continue to monitor the PIDs and circuits as in the previous step.
- Proceed to the area of the suspect wiring or component concern.
- If the input is a switch type-component, turn it on manually.
- Monitor the PID or DMM values while lightly spraying a water mist on the component.
- Monitor while spraying the sensor harness wire from the component to the PCM.

- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Are any values fluctuating in and out of range?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to Z15.

Z15 KOER WIGGLE TEST PROCEDURE FOR THE PCM SENSORS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

NOTE: **Remember that PIDs selected from the PCM PIDS/SIGNALS Chart display commanded values only. A digital multimeter measurement is needed to display the actual values. Be sure to compare them. Look for fluctuations to occur during any part of the following test. The output state test may not control some outputs, such as injectors and ignition coils and may not be available for all actuators.**

- Using the circuits chosen from the PCM PIDS/SIGNALS Chart, select only the recommended PIDs/signals to monitor with the scan tool. If a PID is not available for the circuit, use a DMM to check the value.
- Key ON, engine OFF.
- With the scan tool, turn on selected outputs using output state control. Refer to the scan tool instruction article.
- Proceed to the area of the suspect wiring or component concern.
- Monitor the PID or DMM while tapping on the component.
- Monitor while wiggling the sensor harness wire from the component to the PCM.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Is there a mismatch between command and actual or are any values fluctuating in and out of range when compared to the Reference Value Charts?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to Z16.

Z16 KOER OUTPUT TEST PROCEDURE FOR THE PCM ACTUATORS

WARNING: **When carrying out any test steps, always be aware of hands,**

clothing or tools near cooling fans, belts or hot surfaces.

Failure to follow these instructions may result in personal injury.

NOTE: **Remember that PIDs selected from the PCM PIDS/SIGNALS Chart display commanded values only. A digital multimeter measurement is needed to display the actual values. Be sure to compare them. Look for fluctuations to occur during any part of the following test. The output state test may not control some outputs, such as injectors and ignition coils and may not be available for all actuators.**

- Key ON, engine running.
- Proceed to the area of the suspect wiring or component concern.
- Monitor the PIDs with the scan tool and note the values. Compare the scan tool values with values from a digital multimeter with the engine at idle. Look for fluctuations in the values while tapping on the suspect component.
- If a coil for a coil on plug application is suspect, turn off the key. Gain access to the coil and measure continuity from the spark plug terminal to the signal terminal while tapping the coil. A large fluctuation in resistance indicates an intermittent open or short.
- Monitor while wiggling the sensor harness wire from the component to the PCM.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Is there a scan tool to DMM value mismatch or an idle fluctuation?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to Z17.

Z17 KOEO WATER SOAK TEST PROCEDURE FOR THE PCM ACTUATORS, EXCLUDING HIGH VOLTAGE CIRCUITS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

NOTE: **Remember that PIDs selected from the PCM PIDS/SIGNALS Chart display commanded values only. A digital multimeter measurement is needed to display the actual values. Be sure to compare them. Look for fluctuations to occur during any part of the following test. The output state test may not control some outputs, such as injectors and ignition coils and may not be available for all actuators.**

- Key ON, engine OFF.

- With the scan tool, turn on selected outputs using output state control. Refer to the scan tool instruction article.
- Proceed to the area of the suspect wiring or component concern.
- Monitor the PID or DMM values while lightly spraying a water mist on the component.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Is there a mismatch between command and actual or are any values fluctuating in and out of range when compared to the Reference Value Charts?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to Z18.

Z18 KOER WATER SOAK TEST PROCEDURE FOR THE PCM ACTUATORS

WARNING: **When carrying out any test steps, always be aware of hands, clothing or tools near cooling fans, belts or hot surfaces.**

Failure to follow these instructions may result in personal injury.

- Key ON, engine running.
- Using the circuits chosen from the PCM PIDS/SIGNALS Chart, select only the recommended PIDs/signals to monitor with the scan tool. If a PID is not available for the circuit, use a DMM to check the value.
- Proceed to the area of the suspect wiring or component concern.
- Monitor the PID or DMM values while lightly spraying a water mist on the component.
- Monitor while spraying the sensor harness wire from the component to the PCM.
- Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values.
- **Is there a mismatch between command and actual or are any values fluctuating in and out of range when compared to the Reference Value Charts?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	GO to Z19.

Z19 INSPECT FOR INTERMITTENT MECHANICAL CONCERNS

NOTE: **It is possible for an intermittent mechanical concern to cause a good PCM system to react abnormally.**

- An inspection of DTC related mechanical systems should have been carried out in an earlier part. If not, visually inspect at this time.

- Look for possible vacuum lines, wires, cables, linkage or hoses that may become kinked, shorted or restricted during normal engine operation.
- This may include engine/transmission gear changes, acceleration and deceleration, rough roads and various engine RPM and torque related conditions.
- **Is a mechanical concern detected?**

Yes	No
REPAIR as necessary. VERIFY the repair. CLEAR the DTCs. REPEAT the self-test.	It is necessary to seek additional help. REFER to the Professional Technician Society (PTS) web site, the OASIS system or the Technical Hotline. A vehicle data recorder (VDR) or similar recorder may also be useful.

2008 ENGINE PERFORMANCE

Powertrain DTC Charts & Descriptions - Gasoline Engines

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS

NOTE: Refer to the applicable Workshop Manual part to diagnose the body and chassis DTCs.

DTC LIST

DIAGNOSTIC TROUBLE CODES (DTC) LIST

DTC	Description
DTC P0010	INTAKE CAMSHAFT POSITION ACTUATOR CIRCUIT/OPEN (BANK 1)
DTC P0011	INTAKE CAMSHAFT POSITION TIMING - OVER-ADVANCED (BANK 1)
DTC P0012	INTAKE CAMSHAFT POSITION TIMING - OVER-RETARDED (BANK 1)
DTC P0016	CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION - BANK 1 SENSOR A
DTC P0018	CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION - BANK 2 SENSOR A
DTC P0020	INTAKE CAMSHAFT POSITION ACTUATOR CIRCUIT/OPEN (BANK 2)
DTC P0021	INTAKE CAMSHAFT POSITION TIMING - OVER-ADVANCED (BANK 2)
DTC P0022	INTAKE CAMSHAFT POSITION TIMING - OVER-RETARDED (BANK 2)
DTC P0030	HO2S HEATER CONTROL CIRCUIT (BANK 1, SENSOR 1)
DTC P0040	OXYGEN SENSOR SIGNALS SWAPPED BANK 1 SENSOR 1/BANK 2 SENSOR 1
DTC P0041	OXYGEN SENSOR SIGNALS SWAPPED BANK 1 SENSOR 2/BANK 2 SENSOR 2
DTC P0050	HO2S HEATER CONTROL CIRCUIT (BANK 2, SENSOR 1)
DTC P0053	HO2S HEATER RESISTANCE (BANK 1, SENSOR 1)
DTC P0054	HO2S HEATER RESISTANCE (BANK 1, SENSOR 2)
DTC P0055	HO2S HEATER RESISTANCE (BANK 1, SENSOR 3)
DTC P0059	HO2S HEATER RESISTANCE (BANK 2, SENSOR 1)
DTC P0060	HO2S HEATER RESISTANCE (BANK 2, SENSOR 2)
DTC P0068	MANIFOLD ABSOLUTE PRESSURE (MAP)/MASS AIR FLOW (MAF) - THROTTLE POSITION CORRELATION
DTC P0097	INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT LOW
DTC P0098	INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT HIGH
DTC P0102	MASS OR VOLUME AIR FLOW A CIRCUIT LOW
DTC P0103	MASS OR VOLUME AIR FLOW A CIRCUIT HIGH
DTC P0104	MASS OR VOLUME AIR FLOW A CIRCUIT INTERMITTENT/ERRATIC
DTC P0106	MANIFOLD ABSOLUTE PRESSURE (MAP/BARO) SENSOR RANGE/PERFORMANCE
DTC P0107	MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR LOW

DTC P0108	MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR HIGH
DTC P0109	MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR INTERMITTENT
DTC P0111	INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE
DTC P0112	INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT LOW
DTC P0113	INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT HIGH
DTC P0114	INTAKE AIR TEMPERATURE (IAT) SENSOR 1 INTERMITTENT/ERRATIC
DTC P0116	ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE
DTC P0117	ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT LOW
DTC P0118	ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT HIGH
DTC P0119	ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT INTERMITTENT/ERRATIC
DTC P0121	THROTTLE/PEDAL POSITION SENSOR A CIRCUIT RANGE/PERFORMANCE
DTC P0122	THROTTLE/PEDAL POSITION SENSOR A CIRCUIT LOW
DTC P0123	THROTTLE/PEDAL POSITION SENSOR A CIRCUIT HIGH
DTC P0125	INSUFFICIENT COOLANT TEMPERATURE FOR CLOSED LOOP FUEL CONTROL
DTC P0127	INTAKE AIR TEMPERATURE (IAT) TOO HIGH
DTC P0128	COOLANT THERMOSTAT (COOLANT TEMPERATURE BELOW THERMOSTAT REGULATING TEMPERATURE)
DTC P012B	TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT RANGE/PERFORMANCE
DTC P012C	TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT LOW
DTC P012D	TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT HIGH
DTC P012E	TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT INTERMITTENT/ERRATIC
DTC P0130	O2 CIRCUIT (BANK 1, SENSOR 1)
DTC P0132	O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 1)
DTC P0133	O2 CIRCUIT SLOW RESPONSE (BANK 1, SENSOR 1)
DTC P0134	O2 CIRCUIT NO ACTIVITY DETECTED (BANK 1, SENSOR 1)
DTC P0135	O2 HEATER CIRCUIT (BANK 1, SENSOR 1)
DTC P0138	O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 2)
DTC P0139	O2 CIRCUIT SLOW RESPONSE (BANK 1, SENSOR 2)
DTC P0141	O2 HEATER CIRCUIT (BANK 1, SENSOR 2)
DTC P0144	O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 3)
DTC P0147	O2 HEATER CIRCUIT (BANK 1, SENSOR 3)
DTC P0148	FUEL DELIVERY ERROR
DTC P0150	O2 CIRCUIT (BANK 2, SENSOR 1)
DTC P0152	O2 CIRCUIT HIGH VOLTAGE (BANK 2, SENSOR 1)

DTC P0153	O2 CIRCUIT SLOW RESPONSE (BANK 2, SENSOR 1)
DTC P0154	O2 CIRCUIT NO ACTIVITY DETECTED (BANK 2, SENSOR 1)
DTC P0155	O2 HEATER CIRCUIT (BANK 2, SENSOR 1)
DTC P0158	O2 CIRCUIT HIGH VOLTAGE (BANK 2, SENSOR 2)
DTC P0159	O2 CIRCUIT SLOW RESPONSE (BANK 2, SENSOR 2)
DTC P0161	O2 HEATER CIRCUIT (BANK 2, SENSOR 2)
DTC P0171	SYSTEM TOO LEAN (BANK 1)
DTC P0172	SYSTEM TOO RICH (BANK 1)
DTC P0174	SYSTEM TOO LEAN (BANK 2)
DTC P0175	SYSTEM TOO RICH (BANK 2)
DTC P0180	FUEL TEMPERATURE SENSOR A CIRCUIT
DTC P0181	FUEL TEMPERATURE SENSOR A CIRCUIT RANGE/PERFORMANCE
DTC P0182	FUEL TEMPERATURE SENSOR A CIRCUIT LOW
DTC P0183	FUEL TEMPERATURE SENSOR A CIRCUIT HIGH
DTC P0190	FUEL RAIL PRESSURE SENSOR A CIRCUIT
DTC P0191	FUEL RAIL PRESSURE SENSOR A CIRCUIT RANGE/PERFORMANCE
DTC P0192	FUEL RAIL PRESSURE SENSOR A CIRCUIT LOW
DTC P0193	FUEL RAIL PRESSURE SENSOR A CIRCUIT HIGH
DTC P0196	ENGINE OIL TEMPERATURE (EOT) SENSOR CIRCUIT RANGE/PERFORMANCE
DTC P0197	ENGINE OIL TEMPERATURE (EOT) SENSOR CIRCUIT LOW
DTC P0198	ENGINE OIL TEMPERATURE (EOT) SENSOR CIRCUIT HIGH
DTC P020X	INJECTOR CIRCUIT/OPEN - CYLINDER X
DTC P0210	INJECTOR CIRCUIT/OPEN - CYLINDER 10
DTC P0217	ENGINE COOLANT OVER-TEMPERATURE CONDITION
DTC P0218	TRANSMISSION FLUID TEMPERATURE OVER-TEMPERATURE CONDITION
DTC P0219	ENGINE OVER SPEED CONDITION
DTC P0221	THROTTLE/PEDAL POSITION SENSOR/SWITCH B CIRCUIT RANGE/PERFORMANCE
DTC P0222	THROTTLE/PEDAL POSITION SENSOR/SWITCH B CIRCUIT LOW
DTC P0223	THROTTLE/PEDAL POSITION SENSOR/SWITCH B CIRCUIT HIGH
DTC P0230	FUEL PUMP PRIMARY CIRCUIT
DTC P0231	FUEL PUMP SECONDARY CIRCUIT LOW
DTC P0232	FUEL PUMP SECONDARY CIRCUIT HIGH
DTC P0297	VEHICLE OVER SPEED CONDITION
DTC P0298	ENGINE OIL OVER TEMPERATURE CONDITION
DTC P0300	RANDOM MISFIRE DETECTED
DTC P0301 - P0309	CYLINDER X MISFIRE DETECTED
DTC P0310	CYLINDER 10 MISFIRE DETECTED
DTC P0315	CRANKSHAFT POSITION SYSTEM VARIATION NOT LEARNED.
DTC P0316	MISFIRE DETECTED ON STARTUP (FIRST 1000 REVOLUTIONS)

DTC P0320	IGNITION/DISTRIBUTOR ENGINE SPEED INPUT CIRCUIT
DTC P0325	KNOCK SENSOR 1 CIRCUIT (BANK 1)
DTC P0326	KNOCK SENSOR 1 CIRCUIT RANGE/PERFORMANCE (BANK 1)
DTC P0330	KNOCK SENSOR 2 CIRCUIT (BANK 2)
DTC P0331	KNOCK SENSOR 2 CIRCUIT RANGE/PERFORMANCE (BANK 2)
DTC P0340	CAMSHAFT POSITION SENSOR A CIRCUIT (BANK 1 OR SINGLE SENSOR)
DTC P0344	CAMSHAFT POSITION SENSOR A CIRCUIT INTERMITTENT (BANK 1 OR SINGLE SENSOR)
DTC P0345	CAMSHAFT POSITION SENSOR A CIRCUIT (BANK 2)
DTC P0349	CAMSHAFT POSITION SENSOR A CIRCUIT INTERMITTENT (BANK 2)
DTC P0350	IGNITION COIL PRIMARY/SECONDARY CIRCUIT
DTC P0351	IGNITION COIL A PRIMARY/SECONDARY CIRCUIT
DTC P0352	IGNITION COIL B PRIMARY/SECONDARY CIRCUIT
DTC P0353	IGNITION COIL C PRIMARY/SECONDARY CIRCUIT
DTC P0354	IGNITION COIL D PRIMARY/SECONDARY CIRCUIT
DTC P0355	IGNITION COIL E PRIMARY/SECONDARY CIRCUIT
DTC P0356	IGNITION COIL F PRIMARY/SECONDARY CIRCUIT
DTC P0357	IGNITION COIL G PRIMARY/SECONDARY CIRCUIT
DTC P0358	IGNITION COIL H PRIMARY/SECONDARY CIRCUIT
DTC P0359	IGNITION COIL I PRIMARY/SECONDARY CIRCUIT
DTC P0360	IGNITION COIL J PRIMARY/SECONDARY CIRCUIT
DTC P0400	EXHAUST GAS RECIRCULATION (EGR) FLOW
DTC P0401	EXHAUST GAS RECIRCULATION (EGR) FLOW INSUFFICIENT DETECTED
DTC P0402	EXHAUST GAS RECIRCULATION (EGR) FLOW EXCESSIVE DETECTED
DTC P0403	EXHAUST GAS RECIRCULATION (EGR) CONTROL CIRCUIT
DTC P0405	EXHAUST GAS RECIRCULATION (EGR) SENSOR A CIRCUIT LOW
DTC P0406	EXHAUST GAS RECIRCULATION (EGR) SENSOR A CIRCUIT HIGH
DTC P0410	SECONDARY AIR INJECTION (AIR) SYSTEM
DTC P0412	SECONDARY AIR INJECTION (AIR) SYSTEM - SWITCHING VALVE A CIRCUIT
DTC P0420	CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 1)
DTC P0430	CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 2)
DTC P0442	EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (SMALL LEAK)
DTC P0443	EVAPORATIVE EMISSION SYSTEM PURGE CONTROL VALVE CIRCUIT
DTC P0446	EVAPORATIVE EMISSION SYSTEM VENT CONTROL CIRCUIT
DTC P0451	EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH RANGE/PERFORMANCE
DTC P0452	EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH LOW
DTC P0453	EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH HIGH
DTC P0454	EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH INTERMITTENT
DTC P0455	EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (GROSS LEAK/NO FLOW)

DTC P0456	EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (VERY SMALL LEAK)
DTC P0457	EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (FUEL CAP LOOSE/OFF)
DTC P0460	FUEL LEVEL SENSOR A CIRCUIT
DTC P0461	FUEL LEVEL SENSOR A CIRCUIT RANGE/PERFORMANCE
DTC P0462	FUEL LEVEL SENSOR A CIRCUIT LOW
DTC P0463	FUEL LEVEL SENSOR A CIRCUIT HIGH
DTC P0480	FAN 1 CONTROL CIRCUIT
DTC P0481	FAN 2 CONTROL CIRCUIT
DTC P0482	FAN 3 CONTROL CIRCUIT
DTC P0483	FAN PERFORMANCE
DTC P0491	SECONDARY AIR INJECTION (AIR) SYSTEM INSUFFICIENT FLOW (BANK 1)
DTC P0500	VEHICLE SPEED SENSOR (VSS) A
DTC P0503	VEHICLE SPEED SENSOR (VSS) A INTERMITTENT/ERRATIC/HIGH
DTC P0504	BRAKE SWITCH CORRELATION
DTC P0505	IDLE AIR CONTROL (IAC) SYSTEM
DTC P0506	IDLE AIR CONTROL (IAC) SYSTEM RPM LOWER THAN EXPECTED
DTC P0507	IDLE AIR CONTROL (IAC) SYSTEM RPM HIGHER THAN EXPECTED
DTC P050A	COLD START IDLE AIR CONTROL PERFORMANCE
DTC P050B	COLD START IGNITION TIMING PERFORMANCE
DTC P050E	COLD START ENGINE EXHAUST TEMPERATURE OUT OF RANGE
DTC P0511	IDLE AIR CONTROL (IAC) CIRCUIT
DTC P0512	STARTER REQUEST CIRCUIT
DTC P0528	FAN SPEED SENSOR CIRCUIT NO SIGNAL
DTC P052A	COLD START CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 1)
DTC P052B	COLD START CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 1)
DTC P052C	COLD START CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 2)
DTC P052D	COLD START CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 2)
DTC P0532	A/C PRESSURE REFRIGERANT SENSOR A CIRCUIT LOW
DTC P0533	A/C REFRIGERANT PRESSURE SENSOR A CIRCUIT HIGH
DTC P0534	A/C REFRIGERANT CHARGE LOSS
DTC P0537	A/C EVAPORATOR TEMPERATURE SENSOR CIRCUIT LOW
DTC P0538	A/C EVAPORATOR TEMPERATURE SENSOR CIRCUIT HIGH
DTC P053A	POSITIVE CRANKCASE VENTILATION (PCV) HEATER CONTROL CIRCUIT / OPEN
DTC P0552	POWER STEERING PRESSURE (PSP) SENSOR/SWITCH CIRCUIT LOW
DTC P0553	POWER STEERING PRESSURE (PSP) SENSOR CIRCUIT HIGH INPUT
DTC P0563	SYSTEM VOLTAGE HIGH
DTC P0571	BRAKE SWITCH A CIRCUIT
DTC P0572	BRAKE SWITCH A CIRCUIT LOW
DTC P0573	BRAKE SWITCH A CIRCUIT HIGH

DTC P0579	CRUISE CONTROL MULTIFUNCTION INPUT A CIRCUIT RANGE / PERFORMANCE
DTC P0581	CRUISE CONTROL MULTIFUNCTION INPUT A CIRCUIT HIGH
DTC P0600	SERIAL COMMUNICATION LINK
DTC P0602	POWERTRAIN CONTROL MODULE (PCM) PROGRAMMING ERROR
DTC P0603	INTERNAL CONTROL MODULE KEEP ALIVE MEMORY (KAM) ERROR
DTC P0604	INTERNAL CONTROL MODULE RANDOM ACCESS MEMORY (RAM) ERROR
DTC P0605	INTERNAL CONTROL MODULE READ ONLY MEMORY (ROM) ERROR
DTC P0606	CONTROL MODULE PROCESSOR
DTC P0607	CONTROL MODULE PERFORMANCE
DTC P060A	INTERNAL CONTROL MODULE MONITORING PROCESSOR PERFORMANCE
DTC P060B	INTERNAL CONTROL MODULE A/D PROCESSING PERFORMANCE
DTC P060C	INTERNAL CONTROL MODULE MAIN PROCESSOR PERFORMANCE
DTC P060D	INTERNAL CONTROL MODULE ACCELERATOR PEDAL POSITION PERFORMANCE
DTC P0610	CONTROL MODULE VEHICLE OPTIONS ERROR
DTC P061B	INTERNAL CONTROL MODULE TORQUE CALCULATION PERFORMANCE
DTC P061C	INTERNAL CONTROL MODULE ENGINE RPM PERFORMANCE
DTC P061D	INTERNAL CONTROL MODULE ENGINE AIR MASS PERFORMANCE
DTC P061F	INTERNAL CONTROL MODULE THROTTLE ACTUATOR CONTROLLER PERFORMANCE
DTC P0620	GENERATOR CONTROL CIRCUIT
DTC P0622	GENERATOR FIELD TERMINAL CIRCUIT
DTC P0625	GENERATOR FIELD TERMINAL CIRCUIT LOW
DTC P0626	GENERATOR FIELD TERMINAL CIRCUIT HIGH
DTC P062C	INTERNAL CONTROL MODULE VEHICLE SPEED PERFORMANCE
DTC P0642	SENSOR REFERENCE VOLTAGE A CIRCUIT LOW
DTC P0643	SENSOR REFERENCE VOLTAGE A CIRCUIT HIGH
DTC P0645	AIR CONDITIONING CLUTCH RELAY (A/CCR) CONTROL CIRCUIT
DTC P064D	INTERNAL CONTROL MODULE O2 SENSOR PROCESSOR PERFORMANCE - BANK 1
DTC P064E	INTERNAL CONTROL MODULE O2 SENSOR PROCESSOR PERFORMANCE - BANK 2
DTC P0657	ACTUATOR SUPPLY VOLTAGE A CIRCUIT/OPEN
DTC P065B	GENERATOR CONTROL CIRCUIT RANGE/PERFORMANCE
DTC P0660	INTAKE MANIFOLD TUNING VALVE (IMTV) CONTROL CIRCUIT OPEN - BANK 1
DTC P0663	INTAKE MANIFOLD TUNING VALVE (IMTV) CONTROL CIRCUIT OPEN - BANK 2
DTC P0685	ELECTRONIC CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER RELAY CONTROL CIRCUIT/OPEN
DTC P0689	ELECTRONIC CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE

	(PCM) POWER RELAY SENSE CIRCUIT LOW
DTC P0690	ELECTRONIC CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER RELAY SENSE CIRCUIT HIGH
DTC P0703	BRAKE SWITCH B INPUT CIRCUIT
DTC P0704	CLUTCH SWITCH INPUT CIRCUIT
DTC P0705	TRANSMISSION RANGE SENSOR A CIRCUIT (PRNDL) INPUT
DTC P0707	TRANSMISSION RANGE SENSOR A CIRCUIT LOW
DTC P0708	TRANSMISSION RANGE SENSOR A CIRCUIT HIGH
DTC P071X	TRANSMISSION CODE
DTC P0720	OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT
DTC P0721	OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT RANGE/PERFORMANCE
DTC P0722	OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT NO SIGNAL
DTC P0723	OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT INTERMITTENT
DTC P073X	TRANSMISSION CODE
DTC P074X	TRANSMISSION CODE
DTC P075X	TRANSMISSION CODE
DTC P076X	TRANSMISSION CODE
DTC P077X	TRANSMISSION CODE
DTC P078X	TRANSMISSION CODE
DTC P079X	TRANSMISSION CODE
DTC P0815	UPSHIFT SWITCH CIRCUIT
DTC P0830	CLUTCH PEDAL SWITCH A CIRCUIT
DTC P0833	CLUTCH PEDAL SWITCH B CIRCUIT
DTC P0840	TRANSMISSION FLUID PRESSURE SENSOR/SWITCH A CIRCUIT
DTC P09XX	TRANSMISSION CODE
DTC P1000	ON-BOARD DIAGNOSTIC (OBD) SYSTEMS READINESS TEST NOT COMPLETE
DTC P1001	KEY ON ENGINE RUNNING (KOER) NOT ABLE TO COMPLETE, KOER ABORTED
DTC P1100	MASS AIR FLOW (MAF) SENSOR CIRCUIT INTERMITTENT
DTC P1101	MASS AIR FLOW (MAF) SENSOR OUT OF SELF-TEST RANGE
DTC P1112	INTAKE AIR TEMPERATURE (IAT) CIRCUIT INTERMITTENT
DTC P1114	INTAKE AIR TEMPERATURE 2 (IAT2) CIRCUIT LOW (SUPERCHARGED/TURBOCHARGED ENGINES)
DTC P1115	INTAKE AIR TEMPERATURE 2 (IAT2) CIRCUIT HIGH (SUPERCHARGED/TURBOCHARGED ENGINES)
DTC P1116	ENGINE COOLANT TEMPERATURE (ECT) SENSOR OUT OF SELF-TEST RANGE
DTC P1117	ENGINE COOLANT TEMPERATURE (ECT) SENSOR CIRCUIT INTERMITTENT
DTC P1120	THROTTLE POSITION SENSOR A OUT OF RANGE LOW (RATCH TOO LOW)
DTC P1124	THROTTLE POSITION SENSOR A OUT OF SELF-TEST RANGE
DTC P1127	EXHAUST TEMPERATURE OUT OF RANGE, O2 SENSOR TESTS NOT COMPLETED

DTC P115E	THROTTLE ACTUATOR CONTROL (TAC) THROTTLE BODY AIR FLOW TRIM AT MAX LIMIT
DTC P117A	ENGINE OIL OVER TEMPERATURE - FORCED LIMITED POWER
DTC P1184	ENGINE OIL TEMPERATURE (EOT) SENSOR OUT OF SELF-TEST RANGE
DTC P1227	WASTEGATE FAILED CLOSED (OVER PRESSURE)
DTC P1228	WASTEGATE FAILED OPEN (UNDER PRESSURE)
DTC P1229	CHARGE AIR COOLER (CAC) PUMP DRIVER
DTC P1233	FUEL PUMP DRIVER MODULE DISABLED OR OFF LINE
DTC P1234	FUEL PUMP DRIVER MODULE DISABLED OR OFF LINE
DTC P1235	FUEL PUMP CONTROL OUT OF RANGE
DTC P1236	FUEL PUMP CONTROL OUT OF RANGE
DTC P1237	FUEL PUMP SECONDARY CIRCUIT
DTC P1238	FUEL PUMP SECONDARY CIRCUIT
DTC P1244	ALTERNATOR LOAD HIGH INPUT
DTC P1245	ALTERNATOR LOAD LOW INPUT
DTC P1246	ALTERNATOR LOAD INPUT
DTC P1260	THEFT DETECTED, VEHICLE IMMOBILIZED
DTC P1270	ENGINE RPM OR VEHICLE SPEED LIMITER REACHED
DTC P1285	CYLINDER HEAD OVER TEMPERATURE CONDITION
DTC P1288	CYLINDER HEAD TEMPERATURE (CHT) SENSOR OUT OF SELF-TEST RANGE
DTC P1289	CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT HIGH
DTC P128A	CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT INTERMITTENT/ERRATIC
DTC P1290	CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT LOW
DTC P1299	CYLINDER HEAD OVER TEMPERATURE PROTECTION ACTIVE
DTC P1336	CRANKSHAFT/CAMSHAFT SENSOR RANGE/PERFORMANCE
DTC P1397	SYSTEM VOLTAGE OUT OF SELF -TEST RANGE
DTC P1405	DIFFERENTIAL PRESSURE FEEDBACK SENSOR UPSTREAM HOSE OFF OR PLUGGED
DTC P1406	DIFFERENTIAL PRESSURE FEEDBACK SENSOR DOWNSTREAM HOSE OFF OR PLUGGED
DTC P1408	EXHAUST GAS RECIRCULATION (EGR) FLOW OUT OF SELF-TEST RANGE (NON-MIL)
DTC P1409	EXHAUST GAS RECIRCULATION (EGR) VACUUM REGULATOR SOLENOID CIRCUIT
DTC P1436	A/C EVAPORATOR AIR TEMPERATURE CIRCUIT LOW
DTC P1437	A/C EVAPORATOR AIR TEMPERATURE CIRCUIT HIGH
DTC P144A	EVAPORATIVE EMISSION SYSTEM PURGE VAPOR LINE RESTRICTED/BLOCKED
DTC P1450	UNABLE TO BLEED UP FUEL TANK VACUUM
DTC P1451	EVAPORATIVE EMISSION SYSTEM VENT CONTROL CIRCUIT
DTC P145E	PCV HEATER CONTROL B CIRCUIT

DTC P1460	WIDE OPEN THROTTLE A/C CUTOUT CIRCUIT
DTC P1461	A/C PRESSURE SENSOR CIRCUIT HIGH
DTC P1462	AIR CONDITIONING PRESSURE (A/CP) SENSOR LOW VOLTAGE DETECTED
DTC P1463	AIR CONDITIONING PRESSURE SENSOR (A/CP) INSUFFICIENT PRESSURE CHANGE
DTC P1464	A/C DEMAND OUT OF SELF-TEST RANGE
DTC P1469	RAPID A/C CYCLING
DTC P1474	FAN CONTROL PRIMARY CIRCUIT
DTC P1477	ADDITIONAL FAN RELAY CIRCUIT
DTC P1479	HIGH FAN CONTROL PRIMARY CIRCUIT
DTC P1489	PCV HEATER CONTROL CIRCUIT
DTC P1500	VEHICLE SPEED SENSOR (VSS)
DTC P1501	VEHICLE SPEED SENSOR (VSS) OUT OF SELF-TEST RANGE
DTC P1502	VEHICLE SPEED SENSOR (VSS) INTERMITTENT
DTC P1504	IDLE AIR CONTROL (IAC) CIRCUIT
DTC P1506	IDLE AIR CONTROL (IAC) OVERSPEED ERROR
DTC P1507	IDLE AIR CONTROL (IAC) UNDER SPEED ERROR
DTC P1512	INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED (BANK 1)
DTC P1513	INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED (BANK 2)
DTC P1516	INTAKE MANIFOLD RUNNER CONTROL (IMRC) INPUT ERROR (BANK 1)
DTC P1517	INTAKE MANIFOLD RUNNER CONTROL (IMRC) INPUT ERROR (BANK 2)
DTC P1518	INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN BANK 1
DTC P1519	INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED BANK 1
DTC P151A	INTAKE MANIFOLD RUNNER CONTROLLER PERFORMANCE
DTC P1520	INTAKE MANIFOLD RUNNER CONTROL (IMRC) CIRCUIT
DTC P1537	INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN (BANK 1)
DTC P1538	INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN (BANK 2)
DTC P1548	ENGINE AIR FILTER RESTRICTION
DTC P1549	INTAKE MANIFOLD COMMUNICATION CONTROL (IMCC) CIRCUIT (BANK 1)
DTC P1550	POWER STEERING PRESSURE (PSP) SENSOR OUT OF SELF-TEST RANGE
DTC P1572	BRAKE PEDAL SWITCH CIRCUIT
DTC P1575	PEDAL POSITION OUT OF SELF TEST RANGE
DTC P1633	KEEP ALIVE POWER (KAPWR) VOLTAGE TOO LOW
DTC P1635	TIRE/AXLE RATIO OUT OF ACCEPTABLE RANGE
DTC P1636	INDUCTIVE SIGNATURE CHIP COMMUNICATION ERROR
DTC P1639	VEHICLE ID (VID) BLOCK CORRUPTED, NOT PROGRAMMED
DTC P1640	POWERTRAIN DTCS AVAILABLE IN ANOTHER MODULE
DTC P1641	FUEL PUMP PRIMARY CIRCUIT
DTC P1646	LINEAR O2 SENSOR CONTROL CHIP (BANK 1)
DTC P1647	LINEAR O2 SENSOR CONTROL CHIP (BANK 2)
DTC P1650	POWER STEERING PRESSURE (PSP) SWITCH OUT OF SELF-TEST RANGE

DTC P1651	POWER STEERING PRESSURE (PSP) SWITCH INPUT
DTC P1674	CONTROL MODULE SOFTWARE CORRUPTED
DTC P1703	BRAKE SWITCH OUT OF SELF-TEST RANGE
DTC P1705	TRANSMISSION RANGE SENSOR OUT OF SELF-TEST RANGE
DTC P1709	PARK/NEUTRAL POSITION (PNP) SWITCH OUT OF SELF-TEST RANGE
DTC P1729	4X4L SWITCH
DTC P1780	TRANSMISSION CONTROL SWITCH (TCS) OUT OF SELF-TEST RANGE
DTC P1781	4X4L SWITCH OUT OF SELF-TEST RANGE
DTC P17XX	
DTC P18XX	
DTC P1900	OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT INTERMITTENT
DTC P1901	TURBINE SHAFT SPEED (TSS) SENSOR CIRCUIT INTERMITTENT

DTC DIAGNOSIS

P0010 - INTAKE CAMSHAFT POSITION ACTUATOR CIRCUIT/OPEN (BANK 1)

P0010 - INTAKE CAMSHAFT POSITION ACTUATOR CIRCUIT/OPEN (BANK 1)

Description:	The powertrain control module (PCM) monitors the variable camshaft timing (VCT) circuit to the PCM for high and low voltage. The test fails if the voltage exceeds or falls below a calibrated limit for a calibrated amount of time.		
Possible Causes:	• Open or short in the VCT circuit • Open VPWR circuit • Open or short in the VCT solenoid valve		
Diagnostic Aids:	This DTC is a circuit check. Testing should include the harness and solenoid coil.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HK** .		

P0011 - INTAKE CAMSHAFT POSITION TIMING - OVER-ADVANCED (BANK 1)

P0011 - INTAKE CAMSHAFT POSITION TIMING - OVER-ADVANCED (BANK 1)

Description:	The powertrain control module (PCM) monitors the variable camshaft timing (VCT) position for an over-advanced camshaft timing. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in an advanced position.		
Possible Causes:	• Camshaft timing incorrectly set • Continuous oil flow to the VCT piston chamber • VCT solenoid valve stuck open • Camshaft advance mechanism binding (VCT unit)		
Diagnostic Aids:	This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the **ENGINE SYSTEM - GENERAL INFORMATION -- E-SERIES** , Oil Pressure Test, to check the engine oil pressure. Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** , Timing Drive Components, to check the engine timing.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST HK** .	refer to **PINPOINT TEST HK** .

P0012 - INTAKE CAMSHAFT POSITION TIMING - OVER-RETARDED (BANK 1)

P0012 - INTAKE CAMSHAFT POSITION TIMING - OVER-RETARDED (BANK 1)

Description:	The powertrain control module (PCM) monitors the variable camshaft timing (VCT) position for over-retarded camshaft timing. The test fails when the camshaft timing exceeds a maximum calibrated value or remains

	in a retarded position.		
Possible Causes:	• Camshaft timing incorrectly set • Continuous oil flow to the VCT piston chamber • VCT solenoid valve stuck open • Camshaft advance mechanism binding (VCT unit)		
Diagnostic Aids:	This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the **ENGINE SYSTEM - GENERAL INFORMATION -- E-SERIES** , Oil Pressure Test, to check the engine oil pressure. Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** , Timing Drive Components, to check the engine timing.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST HK** .	refer to **PINPOINT TEST HK** .

P0016 - CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION - BANK 1 SENSOR A

P0016 - CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION - BANK 1 SENSOR A

Description:	The powertrain control module (PCM) monitors the variable camshaft timing (VCT) position for a misalignment between the camshaft and crankshaft. The test fails when the misalignment is 1 tooth or greater. This DTC can also be set due to VCT system concerns (oil contamination or VCT solenoid stuck).		
Possible Causes:	• Camshaft timing incorrectly set • VCT solenoid stuck in position • Camshaft advance mechanism binding (VCT unit)		
Diagnostic Aids:	This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the **ENGINE SYSTEM - GENERAL INFORMATION -- E-SERIES** , Oil Pressure Test, to check the engine oil pressure. Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** , Timing Drive Components, to check the engine timing.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HK** .

P0018 - CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION - BANK 2 SENSOR A

P0030 - HO2S HEATER CONTROL CIRCUIT (BANK 1, SENSOR 1)

P0030 - HO2S HEATER CONTROL CIRCUIT (BANK 1, SENSOR 1)

Description:	The powertrain control module (PCM) monitors the heater in the heated oxygen sensor (HO2S) for correct operation. The PCM controls the heater on/off duty cycle to maintain a temperature of 780°C (1,436°F). The test fails when the sensor does not warm up to the required temperature in a

	calibrated amount of time. The test also fails when the PCM is not able to maintain the required temperature after the sensor is warm.		
Possible Causes:	• Open UO2S circuit • Open UO2SGREF circuit • Open UO2SHTR circuit • UO2SHTR circuit short to voltage • Loose connection, and damaged or corroded terminals • Exhaust temperature significantly higher than expected • Damaged universal HO2S		
Diagnostic Aids:	Inspect the connectors for signs of damage, water ingress, or corrosion.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST DZ** .	refer to **PINPOINT TEST DZ** .

P0040 - OXYGEN SENSOR SIGNALS SWAPPED BANK 1 SENSOR 1/BANK 2 SENSOR 1

P0040 - OXYGEN SENSOR SIGNALS SWAPPED BANK 1 SENSOR 1/BANK 2 SENSOR 1

Description:	The heated oxygen sensor (HO2S) monitor determines if the HO2S signal response for a fuel shift corresponds to the correct engine bank. The test fails when there is no response from the HO2S being tested.		
Possible Causes:	• Crossed HO2S harness connectors • Crossed HO2S wiring at the harness connectors • Crossed HO2S wiring at the PCM connectors		
Diagnostic Aids:	Connect the HO2S connector to the correct bank.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Sable PZEV, Taurus PZEV, Taurus X PZEV	-	refer to **PINPOINT TEST DZ** .	-
All others	-	refer to **PINPOINT TEST DW** .	-

P0041 - OXYGEN SENSOR SIGNALS SWAPPED BANK 1 SENSOR 2/BANK 2 SENSOR 2

P0041 - OXYGEN SENSOR SIGNALS SWAPPED BANK 1 SENSOR 2/BANK 2 SENSOR 2

Description:	The heated oxygen sensor (HO2S) monitor determines if the HO2S signal response for a fuel shift corresponds to the correct engine bank. The test fails when there is no response from the HO2S being tested.
Possible Causes:	• Crossed HO2S harness connectors • Crossed HO2S wiring at the harness connectors • Crossed HO2S wiring at the PCM connectors

Diagnostic Aids:	Connect the HO2S connector to the correct bank.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST DW** .	-

P0050 - HO2S HEATER CONTROL CIRCUIT (BANK 2, SENSOR 1)

P0050 - HO2S HEATER CONTROL CIRCUIT (BANK 2, SENSOR 1)

Description:	See the description for DTC P0030.		
Possible Causes:	See the possible causes for DTC P0030.		
Diagnostic Aids:	See the diagnostic aids for DTC P0030.

P0053 - HO2S HEATER RESISTANCE (BANK 1, SENSOR 1)

P0053 - HO2S HEATER RESISTANCE (BANK 1, SENSOR 1)

Description:	Heater current requirements too low or high in the heated oxygen sensor (HO2S) heater control circuit.		
Possible Causes:	• VPWR circuit open • HO2S heater circuit open • HO2S heater circuit short in the harness • Damaged HO2S heater		
Diagnostic Aids:	Inspect the connectors for signs of damage, water ingress, or corrosion.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Sable PZEV, Taurus PZEV, Taurus X PZEV	refer to **PINPOINT TEST DZ** .

P0068 - MANIFOLD ABSOLUTE PRESSURE (MAP)/MASS AIR FLOW (MAF) - THROTTLE POSITION CORRELATION

P0068 - MANIFOLD ABSOLUTE PRESSURE (MAP)/MASS AIR FLOW (MAF) - THROTTLE POSITION CORRELATION

Description:	The powertrain control module (PCM) monitors a vehicle operation rationality check by comparing sensed throttle position to mass air flow readings. If during a key on engine running (KOER) self-test, the comparison of the throttle position (TP) sensor and MAF sensor readings are not consistent with the calibrated load values, the test fails and a DTC is stored in continuous memory.

Possible Causes:	• Air leak between MAF sensor and throttle body • Damaged MAF sensor • TP sensor not seated correctly • Damaged TP sensor		
Diagnostic Aids:	Diagnose any MAF or TP circuit DTCs first. Drive the vehicle and exercise the throttle and the TP sensor in all gears. A TP PID less than 4.82% (0.24 volt) with a LOAD PID greater than 55%, or a TP PID greater than 49.05% (2.44 volts) with a LOAD PID less than 30% indicates a concern is present.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles With Electronic Throttle Control (ETC)	-	refer to **PINPOINT TEST DV** .	refer to **PINPOINT TEST DV** .
All others	-	refer to **PINPOINT TEST DH** .	refer to **PINPOINT TEST DH** .

P0097 - INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT LOW

P0097 - INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT LOW

Description:	Indicates the sensor signal is less than the self-test minimum. The intake air temperature 2 (IAT2) sensor minimum is 0.2 volt.		
Possible Causes:	• Grounded circuit in the harness • Incorrect harness connection • Damaged sensor		
Diagnostic Aids:	Monitor the IAT2 PID value. A typical IAT2 temperature should be greater than the IAT1 temperature.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DU** .		

P0098 - INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT HIGH

P0098 - INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT HIGH

Description:	Indicates the sensor signal is greater than the self-test maximum. The intake air temperature 2 (IAT2) sensor maximum is 4.6 volts.		
Possible Causes:	• Open circuit in the harness • Sensor signal short to voltage • Incorrect harness connection • Damaged sensor		
Diagnostic Aids:	Monitor the IAT2 PID value. A typical IAT2 temperature should be greater than the IAT1 temperature.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**

All		refer to **PINPOINT TEST DU** .

P0102 - MASS OR VOLUME AIR FLOW A CIRCUIT LOW

P0102 - MASS OR VOLUME AIR FLOW A CIRCUIT LOW

Description:	The mass air flow (MAF) sensor circuit is monitored by the powertrain control module (PCM) for low air flow (or voltage) input through the comprehensive component monitor (CCM). If during key on, engine running (KOER) the air flow (or voltage) changes below a minimum calibrated limit, the test fails.		
Possible Causes:	• MAF sensor disconnected • MAF circuit open to PCM • VPWR open to MAF sensor • PWR GND open to the MAF sensor • MAF RTN circuit open to PCM • MAF circuit shorted to GND • Intake air leak (near the MAF sensor) • A closed throttle indication (throttle position [TP] sensor system) • Damaged MAF sensor		
Diagnostic Aids:	A MAF PID reading less than 0.23 volt in continuous memory or KOER indicates a hard fault.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST DC** .	refer to **PINPOINT TEST DC** .

P0103 - MASS OR VOLUME AIR FLOW A CIRCUIT HIGH

P0103 - MASS OR VOLUME AIR FLOW A CIRCUIT HIGH

Description:	The mass air flow (MAF) sensor circuit is monitored by the powertrain control module (PCM) for high air flow (or voltage) input through the comprehensive component monitor (CCM). If during key on, engine off (KOEO), or key on, engine running (KOER), the air flow (or voltage) changes above a maximum calibrated limit, the test fails.		
Possible Causes:	• MAF sensor screen is blocked • MAF circuit shorted to voltage • Damaged MAF sensor		
Diagnostic Aids:	A MAF PID (MAF PID) reading greater than 4.6 volts during KOER indicates a hard fault.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DC** .		

P0104 - MASS OR VOLUME AIR FLOW A CIRCUIT INTERMITTENT/ERRATIC

P0104 - MASS OR VOLUME AIR FLOW A CIRCUIT INTERMITTENT/ERRATIC

Description:	A concern exists in the mass air flow (MAF) sensor A circuit, or the air tube containing the sensor, causing an incorrect air flow reading.		
Possible Causes:	• Intermittent circuit A open or short • Air leaks in the tube from the MAF to the throttle body		
Diagnostic Aids:	Verify the integrity of the MAF sensor circuit A for an intermittent concern. Check the MAF sensor tube for air leaks.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST DC** .	refer to **PINPOINT TEST DC** .

P0106 - MANIFOLD ABSOLUTE PRESSURE (MAP/BARO) SENSOR RANGE/PERFORMANCE

P0106 - MANIFOLD ABSOLUTE PRESSURE (MAP/BARO) SENSOR RANGE/PERFORMANCE

Description:	MAP sensor input to the powertrain control module (PCM) is monitored and is not within the calibrated value.		
Possible Causes:	• Slow responding MAP sensor • Electrical circuit failure • Damaged MAP sensor		
Diagnostic Aids:	The VREF voltage should be between 4.0 and 6.0 volts.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DM** .		

P0107 - MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR LOW

P0107 - MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR LOW

Description:	MAP sensor operating voltage is below the minimum calibrated parameter of 0.25 volts.		
Possible Causes:	• Open in the circuit, or short to ground • VREF circuit open, or short to ground • Damaged MAP sensor		
Diagnostic Aids:	The VREF voltage should be between 4.0 and 6.0 volts.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DM** .		

P0108 - MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR

HIGH

P0108 - MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR HIGH

Description:	Sensor operating voltage is greater than 5 volts (VREF). As a result it failed above the maximum allowable calibrated parameter.
Possible Causes:	• VREF shorted to VPWR • MAP signal shorted to VPWR • VREF should be less than 6.0 volts • Open circuit
Diagnostic Aids:	The VREF voltage should be between 4.0 and 6.0 volts.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DM** .		

P0109 - MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR INTERMITTENT

P0109 - MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR INTERMITTENT

Description:	The sensor signal to the powertrain control module (PCM) is failing intermittently.
Possible Causes:	• Loose electrical connection • Damaged MAP sensor
Diagnostic Aids:	Check the harness and connection.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DM** .	-	-

P0111 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE

P0111 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE

Description:	Indicates the IAT rationality test has failed. This DTC indicates that the IAT value is higher than a calibrated value and could prevent 1 or more on-board diagnostic (OBD) monitors from completing. The PCM runs this logic after an engine off and a calibrated soak period (typically 6 hours). This soak period allows IAT and engine coolant temperature (CHT or ECT) to stabilize and not differ by more than a calibrated value. DTC P0111 is set when: the IAT at engine start exceeds the ECT or CHT by more than a calibrated value, typically 17°C (30°F).
Possible Causes:	• IAT Sensor
	Make sure the IAT and the CHT or ECT are similar when the engine is

Diagnostic Aids:	cold.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DA** .		

P0112 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT LOW

P0112 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT LOW

Description:	Indicates the sensor signal is less than the self-test minimum. The IAT sensor minimum is 0.2 volt or 121°C (250°F).		
Possible Causes:	• Grounded circuit in the harness • Damaged sensor • Incorrect harness connection		
Diagnostic Aids:	An IAT V PID reading less than 0.2 volt with key ON engine OFF or during any engine operating mode indicates a concern is present.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DA** .		

P0113 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT HIGH

P0113 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT HIGH

Description:	Indicates the sensor signal is greater than the self-test maximum. The IAT sensor maximum is 4.6 volts or -50°C (-58°F).		
Possible Causes:	• Open circuit in the harness • Sensor signal short to voltage • Damaged sensor • Incorrect harness connection		
Diagnostic Aids:	An IAT PID reading greater than 4.6 volts with the key ON engine OFF or during any engine operating mode indicates a concern is present.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DA** .		

P0114 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 INTERMITTENT/ERRATIC

P0114 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 INTERMITTENT/ERRATIC

Description:	Indicates the sensor signal was intermittent during the comprehensive component monitor (CCM).
Possible Causes:	• Damaged harness • Damaged sensor • Damaged harness connector

Diagnostic Aids:	Monitor the IAT on a scan tool. Look for sudden changes in the reading when the harness is wiggled or the sensor is tapped.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DA** .		

P0116 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE

P0116 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE

Description:	Indicates the engine coolant temperature rationality test has failed. This DTC indicates that the ECT or cylinder head temperature (CHT) value is higher than the calibrated value and could prevent 1 or more on-board diagnostic (OBD) monitors from completing. The PCM runs this logic after an engine off and a calibrated soak period (typically 6 hours). This soak period allows the intake air temperature (IAT) and the CHT or ECT to stabilize and not differ by more than a calibrated value. DTC P0116 is set when all of the following conditions are met: The ECT at engine start exceeds the IAT at engine start by more than a calibrated value, typically 17°C (30°F). The ECT exceeds a calibrated value, typically 107°C (225°F). The fuel system, heated oxygen and misfire monitors have not completed. The calibrated time to set DTC P0116 has expired.		
Possible Causes:	• ECT or CHT sensor • Coolant system concern		
Diagnostic Aids:	Make sure the IAT and the ECT are similar when the engine is cold. Also make sure the ECT or CHT sensor and the actual engine operating temperatures are the same.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles with only a CHT sensor	-	-	refer to **PINPOINT TEST DL** .
All others	-	-	refer to **PINPOINT TEST DX** .

P0117 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT LOW

P0117 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT LOW

Description:	Indicates the sensor signal is less than the self-test minimum. The ECT sensor minimum is 0.2 volt or 121°C (250°F).
Possible Causes:	• Grounded circuit in the harness • Damaged sensor

	• Incorrect harness connection			
Diagnostic Aids:	A concern is present if an ECT PID reading less than 0.2 volt with the key ON engine OFF or during any engine operating mode.			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All		refer to **PINPOINT TEST DX** .		

P0118 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT HIGH

P0118 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT HIGH

Description:	Indicates the sensor signal is greater than the self-test maximum. The ECT sensor maximum is 4.6 volts or -50°C (-58°F).			
Possible Causes:	• Open circuit in the harness • Sensor signal short to voltage • Incorrect harness connection • Damaged sensor			
Diagnostic Aids:	An ECT PID reading greater than 4.6 volts with the key ON engine OFF or during any engine operating mode indicates a concern is present.			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All		refer to **PINPOINT TEST DX** .		

P0119 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT INTERMITTENT/ERRATIC

P0119 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT INTERMITTENT/ERRATIC

Description:	Indicates the ECT circuit became intermittently open or shorted while the engine was running. On vehicles that are not equipped with an ECT sensor, the cylinder head temperature (CHT) sensor can be used and can set this DTC.			
Possible Causes:	• Damaged harness • Damaged sensor • Damaged harness connector • Low engine coolant			
Diagnostic Aids:	Monitor the ECT or the CHT on a scan tool, look for sudden changes in the reading when the harness is wiggled or the sensor is tapped.			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles with only a CHT sensor		-	-	refer to **PINPOINT TEST DL** .
All others		-	-	refer to **PINPOINT TEST DX** .

P0121 - THROTTLE/PEDAL POSITION SENSOR A CIRCUIT RANGE/PERFORMANCE

P0121 - THROTTLE/PEDAL POSITION SENSOR A CIRCUIT RANGE/PERFORMANCE

<table>
<tr><th colspan="4">For Vehicles With Electronic Throttle Control (ETC)</th></tr>
<tr><td>Description:</td><td colspan="3">The electronic throttle control (ETC) throttle position (TP) sensor 1 circuit was flagged as a concern by the powertrain control module (PCM) indicating an out of range in either the closed or wide open throttle (WOT) modes.</td></tr>
<tr><td>Possible Causes:</td><td colspan="3">Obstruction in the throttle plate movement
Damaged throttle body
TP circuit open to PCM
Damaged TP sensor
SIG RTN circuit open to the TP sensor
Self-test operator error (foot resting on the accelerator pedal during test)</td></tr>
<tr><td>Diagnostic Aids:</td><td colspan="3">This concern exhibits a symptom of limited power.</td></tr>
<tr><th colspan="4">For All Others</th></tr>
<tr><td>Description:</td><td colspan="3">The throttle position (TP) sensor circuit is monitored by the powertrain control module (PCM) for a non-closed throttle position at idle. The test fails if the key on engine running (KOER) self-test terminates upon placing the transmission gear selector in DRIVE or REVERSE or the TP closed throttle position is not achieved when closing the throttle (idle) after opening it (in PARK or NEUTRAL).</td></tr>
<tr><td>Possible Causes:</td><td colspan="3">Binding throttle linkage

</table>

P0122 - THROTTLE/PEDAL POSITION SENSOR A CIRCUIT LOW

P0122 - THROTTLE/PEDAL POSITION SENSOR A CIRCUIT LOW

<table>
<tr><th colspan="2">For Vehicles With Electronic Throttle Control (ETC)</th></tr>
<tr><td>Description:</td><td>The ETC throttle position (TP) sensor 1 circuit was flagged as a concern by the powertrain control module (PCM) indicating a low voltage or open circuit.</td></tr>
</table>

Possible Causes:	• Open ETC TP sensor harness • Short to ground in the ETC TP sensor harness • Damaged TP sensor • SIG RTN circuit open to the TP sensor
Diagnostic Aids:	This concern exhibits a symptom of limited power. A TP1 PID reading less than 0.25 volt in key ON, engine OFF or key ON, engine running indicates a concern is present.
For All Others	
Description:	The TP sensor circuit is monitored by the PCM for a high TP rotation angle (or voltage) input through the comprehensive component monitor (CCM). The test fails if the TP rotation angle (or voltage) changes above the maximum calibrated limit.
Possible Causes:	• TP sensor not seated properly • TP circuit open to PCM • VREF open to TP sensor • TP circuit short to GND • Damaged TP sensor
Diagnostic Aids:	This concern exhibits a symptom of limited power. A TP PID reading less than 3.42% (0.17 volt) in key ON, engine OFF or key ON, engine running indicates a concern is present.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles With Electronic Throttle Control (ETC)	refer to **PINPOINT TEST DV** .		
All others	refer to **PINPOINT TEST DH** .		

P0123 - THROTTLE/PEDAL POSITION SENSOR A CIRCUIT HIGH

P0123 - THROTTLE/PEDAL POSITION SENSOR A CIRCUIT HIGH

For Vehicles With Electronic Throttle Control (ETC)	
Description:	The ETC throttle position (TP) sensor 1 circuit was flagged as a concern by the powertrain control module (PCM) indicating a high voltage.
Possible Causes:	• TP sensor harness short to VREF • TP sensor harness is short to voltage • Damaged TP sensor • VREF circuit short to TP sensor
Diagnostic Aids:	Drive the vehicle, bring it to a stop, and turn the key to the OFF position. Start the vehicle and carry out the key on engine running (KOER) self-test at idle. Access the KOER DTCs on the scan tool. The TP1 signal is normally at a high voltage at closed throttle, and a lower voltage at wide open throttle (WOT) (opposite of TP2). A TP1 PID reading greater than 4.75 volts in key ON, engine OFF or key ON, engine running indicates a

	concern is present.
For All Others	
Description:	The TP sensor circuit is monitored by the PCM for a high TP rotation angle (or voltage) input through the comprehensive component monitor (CCM). The test fails if the TP rotation angle (or voltage) changes above the maximum calibrated limit.
Possible Causes:	• TP sensor not seated properly • TP sensor harness is short to voltage • TP sensor harness short to VREF • SIG RTN circuit open to the TP sensor • Damaged TP sensor
Diagnostic Aids:	A TP PID reading greater than 93% (4.65 volts) in key ON, engine OFF or key ON, engine running indicates a concern is present.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Vehicles With Electronic Throttle Control (ETC)	refer to **PINPOINT TEST DV** .		
All others	refer to **PINPOINT TEST DH** .		

P0125 - INSUFFICIENT COOLANT TEMPERATURE FOR CLOSED LOOP FUEL CONTROL

P0125 - INSUFFICIENT COOLANT TEMPERATURE FOR CLOSED LOOP FUEL CONTROL

Description:	Indicates the engine coolant temperature (ECT) or the cylinder heat temperature (CHT) sensor has not achieved the required temperature level to enter closed loop operating conditions within a specified amount of time after starting the engine.
Possible Causes:	• Insufficient warm up time • Low engine coolant level • Leaking or stuck open thermostat • Malfunctioning ECT sensor • Malfunctioning CHT sensor
Diagnostic Aids:	Compare the thermostat specification to the actual ECT using the engine temperature PID (ECT or CHT). The temperature reading should be similar when the engine is at a normal operating temperature.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Vehicles with only a CHT sensor	-	-	refer to **PINPOINT TEST DL** .
All others	-	-	refer to **PINPOINT TEST DX** .

P0127 - INTAKE AIR TEMPERATURE (IAT) TOO HIGH

P0127 - INTAKE AIR TEMPERATURE (IAT) TOO HIGH

Description:	Indicates that the IAT2 sensor has detected a concern in the charge air cooler CAC system.		
Possible Causes:	• Blockage of heat exchangers • Low fluid level • Fluid leakage • CAC pump or relay failure • Crossed CAC coolant lines		
Diagnostic Aids:	Monitor the IAT2 PID. A typical IAT2 temperature should be greater than the IAT1 temperature.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DU** .		

P0128 - COOLANT THERMOSTAT (COOLANT TEMPERATURE BELOW THERMOSTAT REGULATING TEMPERATURE)

P0128 - COOLANT THERMOSTAT (COOLANT TEMPERATURE BELOW THERMOSTAT REGULATING TEMPERATURE)

Description:	Indicates that the thermostat monitor has not achieved the required engine operating temperature within a specified amount of time after starting the engine.		
Possible Causes:	• Insufficient warm up time • Low engine coolant level • Leaking or stuck open thermostat • Inoperative engine coolant temperature (ECT) sensor • Inoperative cylinder head temperature (CHT) sensor		
Diagnostic Aids:	Refer to**THERMOSTAT MONITOR** for system information.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles with only a CHT sensor	-	-	refer to **PINPOINT TEST DL** .
All others	-	-	refer to **PINPOINT TEST DX** .

P012B - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT RANGE/PERFORMANCE

P012B - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT RANGE/PERFORMANCE

Description:	Manifold absolute pressure (MAP) sensor input to the powertrain control module (PCM) is monitored and is not within the calibrated value.
	• Slow responding MAP sensor

Possible Causes:	• Electrical circuit failure • Damaged MAP sensor		
Diagnostic Aids:	The VREF voltage should be between 4.0 and 6.0 volts.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DM** .		

P012C - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT LOW

P012C - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT LOW

Description:	MAP sensor operating voltage is below the minimum calibrated parameter of 0.25 volts.		
Possible Causes:	• Open in the circuit, or short to ground • VREF circuit open, or short to ground • Damaged MAP sensor		
Diagnostic Aids:	VREF voltage should be between 4.0 and 6.0 volts.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DM** .		

P012D - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT HIGH

P012D - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT HIGH

Description:	Manifold absolute pressure (MAP) sensor operating voltage is above the maximum calibrated parameter of 5 volts.		
Possible Causes:	• VREF shorted to VPWR • MAP signal shorted to VPWR • VREF circuit short to voltage • Open circuit		
Diagnostic Aids:	VREF should be greater than 4.0 volts.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DM** .		

P012E - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT INTERMITTENT/ERRATIC

P012E - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT INTERMITTENT/ERRATIC

Description:	The sensor signal to the powertrain control module (PCM) is intermittent.
Possible Causes:	• Loose electrical connection • Damaged manifold absolute pressure (MAP) sensor

Diagnostic Aids:	Check the harness and connection.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DM** .	-	-

P0130 - O2 CIRCUIT (BANK 1, SENSOR 1)

P0130 - O2 CIRCUIT (BANK 1, SENSOR 1)

Description:	The powertrain control module (PCM) monitors the heated oxygen sensor (HO2S) for a circuit concern. The test fails when the PCM detects a concern with one of the circuits used to determine the oxygen content in the exhaust gas.		
Possible Causes:	• Open UO2S circuit • Open UO2SGREF circuit • UO2S circuit short to voltage or ground • UO2SGREF circuit short to voltage or ground • UO2SPC circuit short to voltage or ground • UO2SPCT circuit short to voltage or ground • Damaged universal HO2S		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST DZ** .	refer to **PINPOINT TEST DZ** .

P0132 - O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 1)

P0132 - O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 1)

Description:	The heated oxygen sensor (HO2S) signals are monitored for an over voltage condition. The code is set when the HO2S signal voltage is 1.5 volts or greater.		
Possible Causes:	• Short to VPWR in the harness or HO2S		
Diagnostic Aids:	An HO2S PID switching across 0.45 volt from 0.2 to 0.9 volt indicates a normal switching HO2S. An HO2S PID voltage of 1.5 volts or greater indicates a short to voltage.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DW** .		

P0133 - O2 CIRCUIT SLOW RESPONSE (BANK 1, SENSOR 1)

P0133 - O2 CIRCUIT SLOW RESPONSE (BANK 1, SENSOR 1)

Description:	For the Taurus, Taurus X, Sable PZEVs, the powertrain control module (PCM) commands an air/fuel ratio that changes in the shape of a square wave. The PCM calculates the length of the resulting signal from the HO2S. The test fails when the length of the signal is less than a calibrated limit. For all others, the PCM checks the HO2S signal frequency and amplitude. The test fails when the frequency and amplitude less than a calibrated limit.			
Possible Causes:	• Contaminated HO2S • Exhaust leaks • Short/open wiring • Incorrect fueling • MAF sensor • Deteriorating HO2S • Inlet air leaks			
Diagnostic Aids:	Access the HO2S test results from the generic OBD menu to verify the DTC.			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Sable PZEV, Taurus PZEV, Taurus X PZEV		-	-	refer to **PINPOINT TEST DZ** .
All others		-	-	refer to **PINPOINT TEST DW** .

P0134 - O2 CIRCUIT NO ACTIVITY DETECTED (BANK 1, SENSOR 1)

P0134 - O2 CIRCUIT NO ACTIVITY DETECTED (BANK 1, SENSOR 1)

Description:	The powertrain control module (PCM) monitors the heated oxygen sensor (HO2S) for a lack of movement concern. If the sensor signal value is not changing from the default value, the PCM commands an oscillating air/fuel ratio attempting to detect some movement in the signal value. The test fails when the PCM is unable to detect movement in the sensor signal while the air/fuel ratio is oscillating.			
Possible Causes:	• Open UO2SPC circuit • Damaged universal HO2S			
Diagnostic Aids:				
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All		-	refer to **PINPOINT TEST DZ** .	refer to **PINPOINT TEST DZ** .

P0135 - O2 HEATER CIRCUIT (BANK 1, SENSOR 1)

P0135 - O2 HEATER CIRCUIT (BANK 1, SENSOR 1)

Description:	During testing the heated oxygen sensor (HO2S) heaters are checked for open and short circuits and excessive current draw. The test fails when the current draw exceeds a calibrated limit or an open or short circuit is detected.		
Possible Causes:	• Vacuum hose disconnected on exhaust gas recirculation (EGR) system module (ESM) applications • Short to VPWR in the harness or HO2S • Water in the harness connector • Open VPWR circuit • Open UO2SHTR circuit • Open GND circuit • Low battery voltage • Corrosion or incorrect harness connections • Damaged HO2S heater		
Diagnostic Aids:	Inspect the connectors for signs of damage, water ingress, or corrosion.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Sable PZEV, Taurus PZEV, Taurus X PZEV	refer to **PINPOINT TEST DZ** .		
All others	refer to **PINPOINT TEST DW** .		

P0138 - O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 2)

P0138 - O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 2)

Description:	See the description for DTC P0132.		
Possible Causes:	See the possible causes for DTC P0132.		
Diagnostic Aids:	See the diagnostic aids for DTC P0132.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DW** .		

P0139 - O2 CIRCUIT SLOW RESPONSE (BANK 1, SENSOR 2)

P0139 - O2 CIRCUIT SLOW RESPONSE (BANK 1, SENSOR 2)

Description:	The heated oxygen sensor (HO2S) monitor tracks the rate of voltage change during the rise and fall of the HO2S signal. When the rate of voltage change is less than a calibrated value, the powertrain control module (PCM) begins to modify the fuel trim attempting to increase the HO2S voltage switch rate. The DTC is set when the PCM is at the allowable limit or has exceeded an allowable length of time for fuel trim modification, without detecting an acceptable rate of voltage change.

Possible Causes:	• Contaminated or damaged HO2S • Deteriorating HO2S • Exhaust leaks • Aftermarket accessories • Performance modifications		
Diagnostic Aids:	Access the HO2S test results from the generic OBD menu to verify the DTC.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST DW** .

P0141 - O2 HEATER CIRCUIT (BANK 1, SENSOR 2)

P0141 - O2 HEATER CIRCUIT (BANK 1, SENSOR 2)

Description: **Possible Causes:** **Diagnostic Aids:**	See the description for DTC P0135. See the possible causes for DTC P0135. See the diagnostic aids for DTC P0135.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DW** .		

P0144 - O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 3)

P0144 - O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 3)

Description: **Possible Causes:** **Diagnostic Aids:**	See the description for DTC P0132. See the possible causes for DTC P0132. See the diagnostic aids for DTC P0132.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DW** .		

P0147 - O2 HEATER CIRCUIT (BANK 1, SENSOR 3)

P0147 - O2 HEATER CIRCUIT (BANK 1, SENSOR 3)

Description: **Possible Causes:** **Diagnostic Aids:**	See the description for DTC P0135. See the possible causes for DTC P0135. See the diagnostic aids for DTC P0135.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DW** .		

P0148 - FUEL DELIVERY ERROR

P0148 - FUEL DELIVERY ERROR

Description:	At least 1 bank is lean at wide open throttle (WOT).		
Possible Causes:	• Severely restricted fuel filter • Severely restricted fuel supply line • Damaged or worn fuel pump • Damaged or contaminated mass air flow (MAF) sensor		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HC** .

P0150 - O2 CIRCUIT (BANK 2, SENSOR 1)

P0150 - O2 CIRCUIT (BANK 2, SENSOR 1)

Description:	See the description for DTC P0130.		
Possible Causes:	See the possible causes for DTC P0130.		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST DZ** .	refer to **PINPOINT TEST DZ** .

All		refer to **PINPOINT TEST DW** .		

P0171 - SYSTEM TOO LEAN (BANK 1)

P0171 - SYSTEM TOO LEAN (BANK 1)

Description:	The adaptive fuel strategy continuously monitors the fuel delivery hardware. The test fails when the adaptive fuel tables reach a rich calibrated limit. Refer to**POWERTRAIN CONTROL SOFTWARE** Fuel Trim for more information.
Possible Causes:	Fuel System: • Damaged or leaking fuel pulse damper • Fuel filter plugged or dirty • Damaged or worn fuel pump • Leaking fuel pump check valve • Leaking/contaminated fuel injectors • Low fuel pressure or running out of fuel • Evaporative emission (EVAP) canister purge valve is leaking when the canister is clean • Fuel supply line restricted • Fuel rail pressure sensor bias • Ethanol content in the fuel Exhaust System: • Exhaust leaks in the exhaust manifold gasket or mating gaskets before or near the heated oxygen sensor (HO2S)

	EGR System: • Vacuum hose disconnected on exhaust gas recirculation (EGR) system module (ESM) applications • EGR valve tube/gasket leak • EGR vacuum regulator solenoid leak Intake Air System: • Air leaks after the mass air flow (MAF) sensor • Vacuum leaks • Positive crankcase ventilation (PCV) system is leaking or the valve is stuck open • Incorrectly seated engine oil dipstick • Intake air turbulence due to incorrect air filter • Damaged or contaminated MAF sensor
Diagnostic Aids:	View the Freeze Frame Data to determine the operating conditions when the DTC was set. Observe the LONGFT1 and LONGFT2 PIDs. Refer to**ADAPTIVE FUEL DTC DIAGNOSTIC TECHNIQUES** for more information and the appropriate pinpoint test for specific concern identification.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST H** .

P0172 - SYSTEM TOO RICH (BANK 1)

P0172 - SYSTEM TOO RICH (BANK 1)

Description:	The adaptive fuel strategy continuously monitors the fuel delivery hardware. The test fails when the adaptive fuel tables reach a lean calibrated limit. Refer to**POWERTRAIN CONTROL SOFTWARE** Fuel Trim for more information.
Possible Causes:	Fuel System: • Damaged or leaking fuel pulse damper • Leaking fuel injectors • Fuel return line restricted • Fuel rail pressure sensor bias • EVAP canister purge valve is leaking when the canister is full

	Base engine: • Engine oil contamination Intake Air System: • Damaged or contaminated mass air flow (MAF) sensor		
Diagnostic Aids:	View the Freeze Frame Data to determine the operating conditions when the DTC was set. Observe the LONGFT1 and LONGFT2 PIDs. Refer to **ADAPTIVE FUEL DTC DIAGNOSTIC TECHNIQUES** for more information and the appropriate pinpoint test for specific concern identification.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST H** .

P0174 - SYSTEM TOO LEAN (BANK 2)

P0174 - SYSTEM TOO LEAN (BANK 2)

Description: **Possible Causes:** **Diagnostic Aids:**	See the description for DTC P0171. See the possible causes for DTC P0171. See the diagnostic aids for DTC P0171.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST H** .

P0175 - SYSTEM TOO RICH (BANK 2)

P0175 - SYSTEM TOO RICH (BANK 2)

Description: **Possible Causes:** **Diagnostic Aids:**	See the description for DTC P0172. See the possible causes for DTC P0172. See the diagnostic aids for DTC P0172.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST H** .

P0180 - FUEL TEMPERATURE SENSOR A CIRCUIT

P0180 - FUEL TEMPERATURE SENSOR A CIRCUIT

	The comprehensive component monitor (CCM) monitors the fuel

Description:	temperature sensor circuit to the powertrain control module (PCM) for low and high voltage. The test fails if the voltage falls below or exceeds a calibrated limit and amount of time during testing.		
Possible Causes:	• Open or short in the harness • Low ambient temperature operation • Incorrect harness connection • Damaged fuel temperature sensor		
Diagnostic Aids:	Verify the FRT PID value to determine an open or short.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DD** .		

P0181 - FUEL TEMPERATURE SENSOR A CIRCUIT RANGE/PERFORMANCE

P0181 - FUEL TEMPERATURE SENSOR A CIRCUIT RANGE/PERFORMANCE

Description:	The comprehensive component monitor (CCM) monitors the fuel temperature sensor for acceptable operating temperature. The test fails if the voltage falls below or exceeds a calibrated limit, for a calibrated amount of time during testing.		
Possible Causes:	• Open or short in the harness • Low ambient temperature operation • Incorrect harness connection • Damaged fuel temperature sensor • Damaged powertrain control module (PCM)		
Diagnostic Aids:	Verify the FRT PID value to determine an open or short.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DD** .	refer to **PINPOINT TEST DD** .	-

P0182 - FUEL TEMPERATURE SENSOR A CIRCUIT LOW

P0182 - FUEL TEMPERATURE SENSOR A CIRCUIT LOW

Description:	The comprehensive component monitor (CCM) monitors the fuel temperature sensor circuit to the powertrain control module (PCM) for low voltage. The test fails if the voltage falls below a calibrated limit for a calibrated amount of time during testing.
Possible Causes:	• Short in the harness • VREF open or short • Low ambient temperature operation • Incorrect harness connection • Damaged fuel temperature sensor

Diagnostic Aids:	Verify the FRT PID and VREF values to determine an open or short.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DD** .		

P0183 - FUEL TEMPERATURE SENSOR A CIRCUIT HIGH

P0183 - FUEL TEMPERATURE SENSOR A CIRCUIT HIGH

Description:	The comprehensive component monitor (CCM) monitors the fuel temperature sensor circuit to the powertrain control module (PCM) for high voltage. The test fails if the voltage exceeds a calibrated limit for a calibrated amount of time during testing.		
Possible Causes:	• Open circuit • Open or short to voltage in the harness • Incorrect harness connection • Damaged fuel temperature sensor		
Diagnostic Aids:	Verify the FRT PID value to determine an open or short.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DD** .		

P0190 - FUEL RAIL PRESSURE SENSOR A CIRCUIT

P0190 - FUEL RAIL PRESSURE SENSOR A CIRCUIT

Description:	The comprehensive component monitor (CCM) monitors the fuel rail pressure (FRP) sensor to the powertrain control module (PCM) for VREF voltage. The test fails when the VREF voltage from the PCM drops to a voltage less than a minimum calibrated value.		
Possible Causes:	• VREF open in harness • VREF open in sensor • Vacuum leaks		
Diagnostic Aids:	Verify a VREF voltage between 4 and 6 volts.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST DD** .

P0191 - FUEL RAIL PRESSURE SENSOR A CIRCUIT RANGE/PERFORMANCE

P0191 - FUEL RAIL PRESSURE SENSOR A CIRCUIT RANGE/PERFORMANCE

Description:	The comprehensive component monitor (CCM) checks the fuel rail pressure (FRP) sensor for an acceptable fuel pressure. The test fails when the fuel pressure falls below or exceeds a minimum/maximum calibrated

Possible Causes:	value for a calibrated period of time. • High fuel pressure • Low fuel pressure • Damaged FRP sensor • Excessive resistance in the circuit • Vacuum leaks • Low or no fuel		
Diagnostic Aids:	A FRP PID value during key ON, engine running of 138 kPa (20 psi) to 413 kPa (60 psi) is acceptable.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DD** .		

P0192 - FUEL RAIL PRESSURE SENSOR A CIRCUIT LOW

P0192 - FUEL RAIL PRESSURE SENSOR A CIRCUIT LOW

Description:	The comprehensive component monitor (CCM) monitors the fuel rail pressure (FRP) sensor circuit to the powertrain control module (PCM) for low voltage. The test fails if the voltage falls below a calibrated limit for a calibrated amount of time during testing.		
Possible Causes:	• FRP signal short to SIG RTN or PWR GND • Damaged FRP sensor		
Diagnostic Aids:	A FRP PID value during key ON, engine OFF or key ON, engine running less than 0.3 volt indicates a concern is present.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DD** .		

P0193 - FUEL RAIL PRESSURE SENSOR A CIRCUIT HIGH

P0193 - FUEL RAIL PRESSURE SENSOR A CIRCUIT HIGH

Description:	The comprehensive component monitor (CCM) monitors the fuel rail pressure (FRP) sensor circuit to the powertrain control module (PCM) for high voltage. The test fails if the voltage exceeds a calibrated limit for a calibrated amount of time during testing.
Possible Causes:	• FRP signal short to VREF or VPWR • FRP signal open • Damaged FRP sensor
Diagnostic Aids:	An FRP signal high condition can be caused by any number of conditions, including a short on FRP signal to VREF, a more positive voltage level, an open FRP signal or signal return. The FRP signal line is pulled up by the PCM and VREF at the sensor, and down by the sensor through SIGRTN.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	refer to **PINPOINT TEST DD** .		

P0196 - ENGINE OIL TEMPERATURE (EOT) SENSOR CIRCUIT RANGE/PERFORMANCE

P0196 - ENGINE OIL TEMPERATURE (EOT) SENSOR CIRCUIT RANGE/PERFORMANCE

Description:	Indicates the value from the EOT sensor is not within the powertrain control module (PCM) predicted engine oil temperature range, based on other PCM inputs.		
Possible Causes:	• Engine not at operating temperature • Cooling system problem or stuck thermostat • EOT circuit failure		
Diagnostic Aids:	The EOT rationality test looks for the EOT sensor value to be within a calibrated delta of the PCM predicted engine oil temperature. Make sure the EOT sensor reading is similar to the engine temperature. If the EOT reading greatly differs from engine temperature, check the EOT circuitry for correct operation.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DY** .		

P0197 - ENGINE OIL TEMPERATURE (EOT) SENSOR CIRCUIT LOW

P0197 - ENGINE OIL TEMPERATURE (EOT) SENSOR CIRCUIT LOW

Description:	Indicates EOT signal voltage is low (high temperature).		
Possible Causes:	• Damaged harness • Damaged harness connector • Damaged sensor		
Diagnostic Aids:	An EOT PID reading less than 0.2 volt with the key on engine off (KOEO) or during any engine operating mode indicates a concern is present.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DY** .		

P0198 - ENGINE OIL TEMPERATURE (EOT) SENSOR CIRCUIT HIGH

P0198 - ENGINE OIL TEMPERATURE (EOT) SENSOR CIRCUIT HIGH

Description:	Indicates EOT signal voltage is high (low temperature).
Possible Causes:	• Damaged harness • Damaged harness connector • Damaged sensor

Diagnostic Aids:	An EOT PID reading greater than 4.5 volts with the key ON engine OFF or during any engine operating mode indicates a concern is present.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DY** .		

P020X - INJECTOR CIRCUIT/OPEN - CYLINDER X

P020X - INJECTOR CIRCUIT/OPEN - CYLINDER X

Description:	Note: x represents injector numbers 1 through 9. The comprehensive component monitor (CCM) monitors the operation of the fuel injector drivers in the powertrain control module (PCM). The test fails when the fuel injector circuitry is inoperative.		
Possible Causes:	• Open circuit • Damaged fuel injector • Damaged PCM		
Diagnostic Aids:	PID Data Monitor INJx_F fault flags equals YES. This DTC is set when a concern is detected between the PCM and the fuel injector.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KG** .		

P0210 - INJECTOR CIRCUIT/OPEN - CYLINDER 10

P0210 - INJECTOR CIRCUIT/OPEN - CYLINDER 10

Description:	See the description for DTC P020x.		
Possible Causes:	See the possible causes for DTC P020x.		
Diagnostic Aids:	See the diagnostic aids for DTC P020x.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KG** .		

P0217 - ENGINE COOLANT OVER-TEMPERATURE CONDITION

P0217 - ENGINE COOLANT OVER-TEMPERATURE CONDITION

Description:	Indicates an engine overheat condition was detected by the engine temperature sensor (CHT or ECT depending how the vehicle is equipped).
Possible Causes:	• Engine cooling system concerns • Low engine coolant level • Base engine concerns
	Monitor the engine temperature PID (CHT or ECT) for an overheat

Diagnostic Aids:	condition. Typical engine temperature should be close to cooling system thermostat specification.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DX** .		

P0218 - TRANSMISSION FLUID TEMPERATURE OVER-TEMPERATURE CONDITION

P0218 - TRANSMISSION FLUID TEMPERATURE OVER-TEMPERATURE CONDITION

Description:	Indicates a transmission overheat condition was sensed by the transmission fluid temperature (TFT) sensor.		
Possible Causes:	• Low transmission fluid level • Transmission cooling system concerns		
Diagnostic Aids:	Monitor the transmission temperature PID TFT for an overheat condition.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P0219 - ENGINE OVER SPEED CONDITION

P0219 - ENGINE OVER SPEED CONDITION

Description:	Indicates the vehicle has been operated in a manner which caused the engine speed to exceed a calibrated limit. The engine RPM is continuously monitored and evaluated by the powertrain control module (PCM). The DTC is set when the RPM exceeds the calibrated limit set within the PCM. For additional information on the engine RPM limiter, refer to**POWERTRAIN CONTROL SOFTWARE** .		
Possible Causes:	• Wheel slippage (water, ice, mud, and snow) • Excessive engine RPM in NEUTRAL or operated in the wrong transmission gear		
Diagnostic Aids:	The DTC indicates the vehicle has been operated in a manner which caused the engine speed to exceed a calibrated limit.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST ND** .

P0221 - THROTTLE/PEDAL POSITION SENSOR/SWITCH B CIRCUIT RANGE/PERFORMANCE

P0221 - THROTTLE/PEDAL POSITION SENSOR/SWITCH B CIRCUIT RANGE/PERFORMANCE

Description:	The electronic throttle control (ETC) throttle position (TP) sensor 2 circuit was flagged as a concern by the powertrain control module (PCM) indicating an out of range in either the closed or wide open throttle

Possible Causes:	(WOT) modes. • Binding throttle linkage • Damaged throttle body • TP circuit open to PCM • Damaged TP sensor • SIG RTN circuit open to the TP sensor • Self-test operator error (foot resting on the accelerator pedal during test)		
Diagnostic Aids:	This concern exhibits a symptom of limited power.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DV** .		

P0222 - THROTTLE/PEDAL POSITION SENSOR/SWITCH B CIRCUIT LOW

P0222 - THROTTLE/PEDAL POSITION SENSOR/SWITCH B CIRCUIT LOW

Description:	The electronic throttle control (ETC) throttle position (TP) sensor 2 circuit was flagged as a concern by the powertrain control module (PCM) indicating a low voltage, or open circuit.		
Possible Causes:	• Open ETC TP sensor harness • Short to ground in the ETC TP sensor harness • Damaged TP sensor • SIG RTN circuit open to the TP sensor		
Diagnostic Aids:	This concern exhibits a symptom of limited power. A TP2 PID reading less than 0.25 volt in key ON, engine OFF or key ON, engine running indicates a concern is present.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DV** .		

P0223 - THROTTLE/PEDAL POSITION SENSOR/SWITCH B CIRCUIT HIGH

P0223 - THROTTLE/PEDAL POSITION SENSOR/SWITCH B CIRCUIT HIGH

Description:	The electronic throttle control (ETC) throttle position (TP) sensor 2 circuit was flagged as a concern by the powertrain control module (PCM) indicating a high voltage.
Possible Causes:	• ETC TP sensor harness shorted to VREF • Damaged TP sensor • ETC TP2 circuit open • VREF circuit short to TP sensor
Diagnostic Aids:	This concern exhibits a symptom of limited power. A TP2 PID reading greater than 4.75 volts in key ON, engine OFF or key ON, engine

	running indicates a concern is present.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DV** .		

P0230 - FUEL PUMP PRIMARY CIRCUIT

P0230 - FUEL PUMP PRIMARY CIRCUIT

Description:	The powertrain control module (PCM) monitors the fuel pump (FP) circuit output from the PCM. The test fails when the FP output is commanded ON (grounded) and excessive current draw is detected on the FP circuit. The test also fails when the FP output is commanded OFF and voltage is not detected on the FP circuit. The PCM expects to detect VPWR voltage coming through the fuel pump relay coil to the FP circuit.		
Possible Causes:	• Open or shorted (FP) circuit • Open VPWR circuit to the fuel pump relay • Damaged fuel pump relay • Damaged PCM		
Diagnostic Aids:	A concern is present when the FP_F PID reads YES. An open circuit or short to ground can only be detected with the fuel pump commanded OFF. A short to voltage can only be detected with the fuel pump commanded ON. During the key on engine off (KOEO) and key on engine running (KOER) self-test, the fuel pump output command is cycled on and off.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KA** .		

P0231 - FUEL PUMP SECONDARY CIRCUIT LOW

P0231 - FUEL PUMP SECONDARY CIRCUIT LOW

Description:	The powertrain control module (PCM) monitors the fuel pump monitor (FPM) circuit. The test fails if the PCM commands the fuel pump ON and B+ voltage is not detected on the FPM circuit.		
Possible Causes:	• Open B+ circuit to the fuel pump relay • Open FP PWR circuit between the fuel pump relay and its connection to the FPM circuit • Damaged fuel pump relay		
Diagnostic Aids:	During the key on engine off (KOEO) self-test, the PCM commands the fuel pump ON so this test can be carried out.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KA** .		

P0232 - FUEL PUMP SECONDARY CIRCUIT HIGH

P0232 - FUEL PUMP SECONDARY CIRCUIT HIGH

Description:	The powertrain control module (PCM) monitors the fuel pump monitor (FPM) circuit. This test fails when the PCM detects voltage on the FPM circuit while the fuel pump is commanded OFF. The FPM circuit is wired to a pull-up voltage inside the PCM. The FPM circuit goes high if, with the key ON, engine OFF and the fuel pump commanded OFF, the FPM/FP PWR circuit loses its path to ground through the fuel pump. The FPM circuit also goes high if the FPM/FP PWR circuit is short to voltage.		
Possible Causes:	• Inertia fuel shutoff (IFS) switch not reset or electrically open • Open circuit between the fuel pump and the FPM connection to the FP PWR circuit • Poor fuel pump ground • Fuel pump electrically open • Fuel pump secondary circuits short to voltage • Fuel pump relay contacts always closed • Open FPM circuit between the PCM and the connection to the FP PWR circuit		
Diagnostic Aids:	Continuous memory P0232 can be set if the IFS switch is tripped then reset, or if the fuel pump circuit is activated when the PCM expected the circuit to be off. This DTC may set during a fuel system test or prime procedure.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KA** .		

P0297 - VEHICLE OVER SPEED CONDITION

P0297 - VEHICLE OVER SPEED CONDITION

Description:	Indicates the vehicle has been operated in a manner which caused the vehicle speed to exceed a calibration limit. The vehicle speed is continuously monitored and evaluated by the powertrain control module (PCM). The DTC is set when the vehicle speed exceeds the calibrated limit set within the PCM. For additional information on the vehicle speed limiter, refer to**POWERTRAIN CONTROL SOFTWARE** .		
Possible Causes:	• Vehicle driven at a high rate of speed		
Diagnostic Aids:	The DTC indicates the vehicle has been operated in a manner which caused the engine speed to exceed a calibrated limit.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST ND** .

P0298 - ENGINE OIL OVER TEMPERATURE CONDITION

P0298 - ENGINE OIL OVER TEMPERATURE CONDITION

Description:	Indicates the engine oil temperature protection strategy in the powertrain control module (PCM) has been activated. This temporarily prohibits high engine speed operation by disabling injectors, to reduce the risk of engine damage from high engine oil temperature. On engines equipped with an oil temperature sensor, the PCM reads oil temperature to determine if it is excessive. When an oil temperature sensor is not present, the PCM uses an oil algorithm to determine actual temperature. Engine shutdown strategy function is the same on vehicles with and without oil temperature sensors.		
Possible Causes:	• Very high engine RPM for an extended period of time • Overheating condition • Damaged engine oil temperature (EOT) sensor or circuit (vehicles with an EOT sensor) • Base engine concerns		
Diagnostic Aids:	The engine is operating in high RPM range due to incorrect gear selection. This may cause a lack/loss of power or surge.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST DY** .

P0300 - RANDOM MISFIRE DETECTED

P0300 - RANDOM MISFIRE DETECTED

Description:	The random misfire DTC indicates multiple cylinders are misfiring or the powertrain control module (PCM) cannot identify which cylinder is misfiring.		
Possible Causes:	• Camshaft position sensor (CMP) • Low fuel (less than 1/8 tank) • Stuck open EGR valve • Blocked EGR passages		
Diagnostic Aids:	One or more EGR passages may be blocked or partially blocked. If this is the case the misfire detection monitor indicates the EGR port to check for possible blockage.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HD** .

P0301 - P0309 - CYLINDER X MISFIRE DETECTED

P030X - CYLINDER X MISFIRE DETECTED

Description:	NOTE: x represents cylinder numbers 1 through 9. The misfire detection monitor is designed to monitor engine misfire and identify the specific cylinder in which the misfire has occurred. Misfire is defined as lack of combustion in a cylinder due to absence of spark, poor fuel metering, poor compression, or any other cause.
Possible Causes:	• Ignition system • Fuel injectors • Running out of fuel • EVAP canister purge valve • Fuel pressure • Evaporative emission system • EGR system • Base engine
Diagnostic Aids:	The malfunction indicator lamp (MIL) blinks once per second when a misfire severe enough to cause catalyst damage is detected. If the MIL is on steady state due to a misfire, this indicates the threshold for emissions was exceeded and caused the vehicle to fail an inspection and maintenance tailpipe test.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HD** .

P0310 - CYLINDER 10 MISFIRE DETECTED

P0310 - CYLINDER 10 MISFIRE DETECTED

Description:	See the description for DTC P030x.
Possible Causes:	See the possible causes for DTC P030x.
Diagnostic Aids:	See the diagnostic aids for DTC P030x.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HD** .

P0315 - CRANKSHAFT POSITION SYSTEM VARIATION NOT LEARNED.

P0315 - CRANKSHAFT POSITION SYSTEM VARIATION NOT LEARNED.

Description:	The powertrain control module (PCM) is unable to learn and correct for mechanical inaccuracies in crankshaft pulse wheel tooth spacing. This DTC disables the misfire monitor.
Possible Causes:	• Damaged crankshaft pulse wheel teeth • Damaged crankshaft position (CKP) sensor

Diagnostic Aids:	Requires visual inspection of the CKP sensor and the crankshaft pulse wheel teeth for damage.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HD** .

P0316 - MISFIRE DETECTED ON STARTUP (FIRST 1000 REVOLUTIONS)

P0316 - MISFIRE DETECTED ON STARTUP (FIRST 1000 REVOLUTIONS)

Description:	DTC P0316 is set in addition to any type B misfire DTC which occurs in the first 1,000 revolution test interval following engine start.		
Possible Causes:	• Damaged crankshaft position (CKP) sensor • Ignition system • Fuel injectors • Running out of fuel • Fuel quality • Base engine • Damaged powertrain control module (PCM)		
Diagnostic Aids:	Freeze frame data and the DTC P03xx are also stored, indicating which cylinder the misfire occurred.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HD** .

P0320 - IGNITION/DISTRIBUTOR ENGINE SPEED INPUT CIRCUIT

P0320 - IGNITION/DISTRIBUTOR ENGINE SPEED INPUT CIRCUIT

Description:	The ignition engine speed sensor input signal to powertrain control module (PCM) is continuously monitored. The test fails when the signal indicates that 2 successive erratic profile ignition pickup (PIP) pulses occurred.		
Possible Causes:	• Loose wires/connectors • Arcing secondary ignition components (coil, wires and plugs) • On-board transmitter (2-way radio)		
Diagnostic Aids:	The DTC indicates that 2 successive erratic PIP pulses occurred.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST NC** .

P0325 - KNOCK SENSOR 1 CIRCUIT (BANK 1)

P0325 - KNOCK SENSOR 1 CIRCUIT (BANK 1)

Description:	The KS detects vibrations upon increase and decrease in engine RPM. The knock sensor generates a voltage based on this vibration. A DTC is set if the voltage goes outside a calibrated level.		
Possible Causes:	• KS circuit short to GND • KS sensor circuit short to voltage • KS circuit open • Damaged KS		
Diagnostic Aids:	A knock sensor voltage greater than 0.5 volt with the key ON engine OFF indicates a concern is present.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST DG** .	refer to **PINPOINT TEST DG** .

P0326 - KNOCK SENSOR 1 CIRCUIT RANGE/PERFORMANCE (BANK 1)

P0326 - KNOCK SENSOR 1 CIRCUIT RANGE/PERFORMANCE (BANK 1)

Description:	See the description for DTC P0325.		
Possible Causes:	See the possible causes for DTC P0325.		
Diagnostic Aids:	See the diagnostic aids for DTC P0325.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST DG** .	refer to **PINPOINT TEST DG** .

P0330 - KNOCK SENSOR 2 CIRCUIT (BANK 2)

P0330 - KNOCK SENSOR 2 CIRCUIT (BANK 2)

Description:	See the description for DTC P0325.		
Possible Causes:	See the possible causes for DTC P0325.		
Diagnostic Aids:	See the diagnostic aids for DTC P0325.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST DG** .	refer to **PINPOINT TEST DG** .

P0331 - KNOCK SENSOR 2 CIRCUIT RANGE/PERFORMANCE (BANK 2)

P0331 - KNOCK SENSOR 2 CIRCUIT RANGE/PERFORMANCE (BANK 2)

Description:	See the description for DTC P0325.		
Possible Causes:	See the possible causes for DTC P0325.		
Diagnostic Aids:	See the diagnostic aids for DTC P0325.		

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	-	refer to **PINPOINT TEST DG** .	refer to **PINPOINT TEST DG** .

P0340 - CAMSHAFT POSITION SENSOR A CIRCUIT (BANK 1 OR SINGLE SENSOR)

P0340 - CAMSHAFT POSITION SENSOR A CIRCUIT (BANK 1 OR SINGLE SENSOR)

Description:	The test fails when the powertrain control module (PCM) can no longer detect the signal from the camshaft position (CMP) sensor on bank 1.
Possible Causes:	• CMP circuit open • CMP circuit short to GND • CMP circuit short to voltage • SIG RTN open (VR sensor) • CMP GND open (Hall-effect sensor) • CMP circuit short to CMP2 circuit (if equipped) • CMP incorrectly installed (Hall-effect sensor) • Damaged CMP sensor shielding • Damaged CMP sensor • Damaged PCM
Diagnostic Aids:	Harness routing, harness alterations, incorrect shielding, or electrical interference from other systems may have an intermittent impact on the CMP signal.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	refer to **PINPOINT TEST DR** .		

P0344 - CAMSHAFT POSITION SENSOR A CIRCUIT INTERMITTENT (BANK 1 OR SINGLE SENSOR)

P0344 - CAMSHAFT POSITION SENSOR A CIRCUIT INTERMITTENT (BANK 1 OR SINGLE SENSOR)

Description:	The test fails when the powertrain control module (PCM) detects an intermittent signal from the camshaft position (CMP) sensor.
Possible Causes:	• Intermittent open circuit • Intermittent short circuit • Damaged sensor shielding • Damaged sensor
Diagnostic Aids:	Harness routing, harness alterations, incorrect shielding, or electrical interference from other systems may have an intermittent impact on the CMP signal.

	Key On Engine	Key On Engine	

Application		Off	Running	Continuous Memory
All		-	-	refer to **PINPOINT TEST DR** .

P0345 - CAMSHAFT POSITION SENSOR A CIRCUIT (BANK 2)

P0345 - CAMSHAFT POSITION SENSOR A CIRCUIT (BANK 2)

Description:	The test fails when the powertrain control module (PCM) can no longer detect the signal from the camshaft position (CMP) sensor on bank 2.			
Possible Causes:	See the possible causes for DTC P0340.			
Diagnostic Aids:	See the diagnostic aids for DTC P0340.			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All		refer to **PINPOINT TEST DR** .		

P0349 - CAMSHAFT POSITION SENSOR A CIRCUIT INTERMITTENT (BANK 2)

P0349 - CAMSHAFT POSITION SENSOR A CIRCUIT INTERMITTENT (BANK 2)

Description:	See the description for DTC P0344.			
Possible Causes:	See the possible causes for DTC P0344.			
Diagnostic Aids:	See the diagnostic aids for DTC P0344.			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All		-	-	refer to **PINPOINT TEST DR** .

P0350 - IGNITION COIL PRIMARY/SECONDARY CIRCUIT

P0350 - IGNITION COIL PRIMARY/SECONDARY CIRCUIT

Description:	Each ignition primary circuit is continuously monitored. The test fails when the powertrain control module (PCM) does not receive a valid ignition diagnostic monitor (IDM) pulse signal from the ignition module (integrated in the PCM).
Possible Causes:	• Open or short in the ignition START/RUN circuit • Open coil driver circuit • Coil driver circuit short to ground • Damaged coil • Coil driver circuit short to VPWR
Diagnostic Aids:	The PCM may disable the fuel injector for a cylinder that is misfiring to protect the exhaust system catalyst. Use the 12-volt non-powered test lamp to verify START/RUN voltage at the ignition coil harness connector. Check the coil driver circuit for open, short to VPWR, or short to ground.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	refer to **PINPOINT TEST JE** .		

P0351 - IGNITION COIL A PRIMARY/SECONDARY CIRCUIT

P0351 - IGNITION COIL A PRIMARY/SECONDARY CIRCUIT

Description: **Possible Causes:** **Diagnostic Aids:**	See the description for DTC P0350. See the possible causes for DTC P0350. See the diagnostic aids for DTC P0350.

P0400 - EXHAUST GAS RECIRCULATION (EGR) FLOW

P0400 - EXHAUST GAS RECIRCULATION (EGR) FLOW

Description:	The electric EGR (EEGR) system is monitored once per drive cycle at high and low load conditions. The test fails when a concern is detected by powertrain control module (PCM) calculations indicating the EGR flow is less or greater than expected.
	• EEGR valve stuck open or closed • Connector to EEGR not seated • EEGR motor winding circuits short or open • No voltage to the EEGR

Possible Causes:	• Harness open or short to voltage or ground • Vacuum signal to manifold absolute pressure (MAP) restricted or leaking • Mass air flow (MAF) sensor signal erroneous • Carbon build up in the EEGR valve seat area • One or more sensors is not responding or is out of range		
Diagnostic Aids:	All of the following sensors input data to the PCM for correct operation of the EEGR system: engine coolant temperature (ECT), crankshaft position (CKP), intake air temperature (IAT), MAF, throttle position (TP), MAP. Any DTC relating to these sensors must be resolved prior to addressing DTC P0400.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KD** .		

P0401 - EXHAUST GAS RECIRCULATION (EGR) FLOW INSUFFICIENT DETECTED

P0401 - EXHAUST GAS RECIRCULATION (EGR) FLOW INSUFFICIENT DETECTED

Description:	The EGR system is monitored during steady state driving conditions while the EGR is commanded on. The test fails when the signal from the differential pressure feedback EGR sensor indicates that EGR flow is less than the desired minimum.		
Possible Causes:	• Vacuum supply • EGR valve stuck closed • EGR valve leaks vacuum • EGR flow path restricted • EVR circuit short to voltage • VREF open to differential pressure feedback EGR sensor • Differential pressure feedback EGR sensor downstream hose is off or plugged • EVR circuit open • VPWR open to EGR vacuum regulator solenoid • Differential pressure feedback EGR sensor hoses are both off • Differential pressure feedback EGR sensor hoses are reversed • Damaged EGR orifice tube • Damaged EGR vacuum regulator solenoid		
Diagnostic Aids:	Carry out the key on engine running (KOER) self-test and look for DTC P1408 as an indication of a hard fault. If DTC P1408 is not present, look for contamination, restrictions, leaks, and intermittent concerns.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**

Vehicles with an EGR system module (ESM)		-	-	refer to **PINPOINT TEST HH** .
All others		-	-	refer to **PINPOINT TEST HE** .

P0402 - EXHAUST GAS RECIRCULATION (EGR) FLOW EXCESSIVE DETECTED

P0402 - EXHAUST GAS RECIRCULATION (EGR) FLOW EXCESSIVE DETECTED

Description:	The EGR system is monitored for undesired EGR flow during idle. The EGR monitor looks at the differential pressure feedback EGR (DPFE) signal at idle and compares it to the stored signal measured during key on engine off (KOEO). The test fails when the signal at idle is greater than at KOEO by a calibrated amount.		
Possible Causes:	• EGR valve stuck open • Plugged EGR vacuum regulator solenoid vent • Plugged EGR tube • Slow responding differential pressure feedback EGR sensor • Damaged differential pressure feedback EGR sensor • Incorrect vacuum hose connection • Plugged vacuum hoses • EVR circuit short to ground • Damaged EGR vacuum regulator solenoid		
Diagnostic Aids:	A DPFEGR PID reading that is greater at idle than during KOEO by 0.5 volt or a rough engine idle may indicate a hard fault.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles with an EGR system module (ESM)	-	refer to **PINPOINT TEST HH** .	refer to **PINPOINT TEST HH** .
All others	-	refer to **PINPOINT TEST HE** .	refer to **PINPOINT TEST HE** .

P0403 - EXHAUST GAS RECIRCULATION (EGR) CONTROL CIRCUIT

P0403 - EXHAUST GAS RECIRCULATION (EGR) CONTROL CIRCUIT

For Vehicles With an Electric EGR (EEGR)	
Description:	The EEGR system is continuously monitored to check the 4 EEGR motor coils, circuits, and the powertrain control module (PCM) for opens, shorts to voltage and ground. If a concern is detected, the EEGR system is disabled and additional monitoring is suspended for the remainder of the drive until the next drive cycle.
	• EEGR motor windings open • Connector to EEGR not seated • Open circuit in the harness from the PCM to the EEGR

Possible Causes:	• Short circuit in the EEGR motor • Short circuit in the harness from the PCM to the EEGR • PCM
Diagnostic Aids:	
For All Others	
Description:	This test checks the electrical function of the EGR vacuum regulator solenoid. The test fails when the EVR circuit voltage is either too high or too low when compared to the expected voltage range. The EGR system must be enabled for the test to be completed.
Possible Causes:	• EVR circuit open • EVR circuit short to voltage or ground • VPWR open to EGR vacuum regulator solenoid • EGR vacuum regulator solenoid • PCM
Diagnostic Aids:	The EGR vacuum regulator solenoid resistance is between 26 and 40 ohms.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles with an EGR system module (ESM)	refer to **PINPOINT TEST HH** .		
Vehicles With an Electric EGR (EEGR)	refer to **PINPOINT TEST KD** .		
All others	refer to **PINPOINT TEST HE** .		

P0405 - EXHAUST GAS RECIRCULATION (EGR) SENSOR A CIRCUIT LOW

P0405 - EXHAUST GAS RECIRCULATION (EGR) SENSOR A CIRCUIT LOW

Description:	The EGR monitor checks the differential pressure feedback EGR sensor signal to the powertrain control module (PCM) for low voltage. The test fails when the average voltage to the PCM drops to a voltage less than the minimum calibrated value.
Possible Causes:	• Differential pressure feedback EGR circuit short to ground • Damaged differential pressure feedback EGR sensor • VREF circuit short to ground
Diagnostic Aids:	A DPFEGR PID reading less than 0.05 volt with the key ON, engine OFF or running indicates a hard fault.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles with an EGR system module (ESM)	refer to **PINPOINT TEST HH** .		
All others	refer to **PINPOINT TEST HE** .		

P0406 - EXHAUST GAS RECIRCULATION (EGR) SENSOR A CIRCUIT HIGH

P0406 - EXHAUST GAS RECIRCULATION (EGR) SENSOR A CIRCUIT HIGH

Description:	The EGR monitor checks the EGR sensor signal to the powertrain control module (PCM) for high voltage. The test fails when the average voltage to the PCM exceeds the maximum calibrated value.
Possible Causes:	• Differential pressure feedback EGR circuit open • VREF circuit short to voltage • Damaged differential pressure feedback EGR sensor • Differential pressure feedback EGR circuit short to voltage • SIG RTN circuit open
Diagnostic Aids:	A DPFEGR PID reading greater than 4.5 volts with the key ON, engine OFF or running indicates a hard fault.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Vehicles with an EGR system module (ESM)	refer to **PINPOINT TEST HH** .		
All others	refer to **PINPOINT TEST HE** .		

P0410 - SECONDARY AIR INJECTION (AIR) SYSTEM

P0410 - SECONDARY AIR INJECTION (AIR) SYSTEM

Description:	The AIR system detected a lack of air flow with the secondary AIR pump ON.
Possible Causes:	• AIR inlet hose leak. • AIR inlet hose disconnected.
Diagnostic Aids:	Measured air flow is less than expected. Visually inspect the secondary AIR inlet hose.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	refer to **PINPOINT TEST HM** .		

P0412 - SECONDARY AIR INJECTION (AIR) SYSTEM - SWITCHING VALVE A CIRCUIT

P0412 - SECONDARY AIR INJECTION (AIR) SYSTEM - SWITCHING VALVE A CIRCUIT

Description:	On the primary side of the AIR relay, open and short faults on the AIR command circuit are detected during normal operation by the powertrain control module (PCM) output driver.
Possible Causes:	• Short to voltage or ground in the AIR command circuit • Open in the AIR command circuit • AIR bypass solenoid fault • AIR relay fault

Diagnostic Aids:	For intermittent faults use the AIR PCM output driver fault PID (AIRF) during a harness wiggle test with the AIR PCM output driver in OFF and ON states. The AIR PCM output driver fault PID AIRF instantly detects open circuits and shorts to ground with the PCM output driver off. The AIR PCM output driver fault PID AIRF instantly detects open circuits and shorts to ground with the PCM output driver off. The AIR PCM output driver fault PID AIRF instantly detects a short to voltage or low resistance load with the PCM output driver on. Use the OTM to toggle the PCM output driver from OFF to ON. Refer to**OUTPUT TEST MODE (OTM)** .		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HM** .		

P0420 - CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 1)

P0420 - CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 1)

Description:	Indicates the bank 1 catalyst system efficiency is below the acceptable threshold.
Possible Causes:	• Use of leaded fuel • Damaged heated oxygen sensor (HO2S) • Out of range engine coolant temperature (ECT) sensor • High fuel pressure • Damaged exhaust manifold • Damaged catalytic converter • Oil contamination • Cylinder misfiring • Downstream HO2S wires incorrectly connected • Damaged exhaust system pipe • Damaged muffler/tailpipe assembly • Retarded spark timing • Leaking fuel injector
Diagnostic Aids:	The signal line lengths of the downstream HO2Ss are compared against the signal line lengths of the upstream HO2Ss. Under normal closed loop fuel conditions, high efficiency catalysts have oxygen storage which reduces the frequency and amplitude of the downstream HO2S as compared with an upstream HO2S signal. As catalyst efficiency deteriorates, its ability to store oxygen declines and the downstream HO2S signal has an increased amplitude and frequency, approaching the amplitude and frequency of the upstream HO2S. Once beyond an acceptable limit the DTC is set. Vehicles with universal HO2Ss compare the signal line length of the downstream HO2Ss to an expected signal line length of the downstream

	HO2Ss with a deteriorated catalytic converter.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HF** .

P0430 - CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 2)

P0430 - CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 2)

Description:	Indicates the bank 2 catalyst system efficiency is below the acceptable threshold.		
Possible Causes:	See the possible causes for DTC P0420.		
Diagnostic Aids:	See the diagnostic aids for DTC P0420.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HF** .

P0442 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (SMALL LEAK)

P0442 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (SMALL LEAK)

Description:	The powertrain control module (PCM) monitors the complete evaporative emission (EVAP) control system for the presence of a small fuel vapor leak. System failure occurs when a fuel vapor leak from an opening as small as 1.016 mm (0.040 in) is detected by the EVAP running loss monitor test.
Possible Causes:	• Aftermarket EVAP hardware that does not conform to the required specifications • Small holes or cuts in the fuel vapor hoses/tubes • Canister vent solenoid stays partially open on closed command • Damaged, missing or loosely installed fuel filler cap • Capless fuel tank filler pipe damaged or not sealed properly (if equipped) • Loose fuel vapor hose/tube connections to the EVAP system components • EVAP system component seals leaking at or near the EVAP canister purge valve, fuel tank pressure sensor, canister vent (CV) solenoid, fuel vapor control valve tube assembly or fuel vapor vent valve assembly
Diagnostic Aids:	Check for a missing fuel filler cap or the integrity of the cap. Verify the capless fuel tank filler pipe is sealed properly (if equipped). Check for loose or damaged vapor hoses. Visually inspect the EVAP canister inlet port, CV solenoid filter, and canister vent hose assembly for contamination or debris.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	-	-	refer to **PINPOINT TEST HX** .

P0443 - EVAPORATIVE EMISSION SYSTEM PURGE CONTROL VALVE CIRCUIT

P0443 - EVAPORATIVE EMISSION SYSTEM PURGE CONTROL VALVE CIRCUIT

Description:	The powertrain control module (PCM) monitors the state of the evaporative emission (EVAP) canister purge valve circuit output driver. The test fails when the signal moves outside the minimum or maximum limit for the commanded state.		
Possible Causes:	• VPWR circuit open • EVAP canister purge valve circuit short to GND • Damaged EVAP canister purge valve • EVAP canister purge valve circuit open • EVAP canister purge valve circuit short to VPWR • Damaged PCM		
Diagnostic Aids:	To verify normal function, monitor the EVAP canister purge valve signal PID EVAPPDC (or EVMV for electronic valve) and the signal voltage (PCM control side). With the valve closed, the EVAPPDC indicates a 0% duty cycle (0 mA for EVMV) and voltage approximately equal to battery voltage. When the valve is commanded fully open, EVAPPDC indicates 100% duty cycle (1000 mA for EVMV) and a voltage drop of 3 volts minimum is normal. Output test mode may be used to switch output on/off to verify function.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HX** .		

P0446 - EVAPORATIVE EMISSION SYSTEM VENT CONTROL CIRCUIT

P0446 - EVAPORATIVE EMISSION SYSTEM VENT CONTROL CIRCUIT

Description:	Monitors the canister vent (CV) solenoid circuit for an electrical failure. The test fails when the signal moves outside the minimum or maximum allowable calibrated parameters for a specified canister vent duty cycle by powertrain control module (PCM) command.
Possible Causes:	• VPWR circuit open • KAPWR circuit open (vehicles equipped with engine off natural vacuum (EONV) EVAP leak check monitor) • CV solenoid circuit short to PWR GND or CHASSIS GND • Damaged CV solenoid • CV solenoid circuit open

	• CV solenoid circuit short to VPWR • CV solenoid circuit short to KAPWR (vehicles equipped with engine off natural vacuum (EONV) EVAP leak check monitor) • Damaged PCM		
Diagnostic Aids:	To verify normal functioning, monitor the EVAP canister vent solenoid signal PID EVAPCV and the signal voltage (PCM control side). With the valve open, EVAPCV indicates 0% duty cycle and a voltage approximately equal to battery voltage. When the valve is commanded fully closed, EVAPCV indicates 100% duty cycle, and a minimum voltage drop of 4 volts is normal. Output test mode may be used to switch output on/off to verify function.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HX** .		

P0451 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH RANGE/PERFORMANCE

P0451 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH RANGE/PERFORMANCE

Description:	Note: For some vehicle applications, DTC P0451 is set for a fuel tank pressure (FTP) sensor range (offset) concern. The DTC P0454 replaces the original P0451 for intermittent (noisy) sensor concerns. Until the phase in process is complete, noisy or offset FTP sensor concerns may set DTC P0451. The fuel tank pressure changes greater than 14 inches of water in 0.10 seconds. FTP sensor output is offset by + /- 1.7 inches of water.		
Possible Causes:	• Intermittent open or short in the FTP sensor or the FTP sensor signal • Contaminated or damaged sensor • Damaged powertrain control module (PCM)		
Diagnostic Aids:	Monitor the FTP PID and note if it changes from above 15 inches of water to below minus (-) 15 inches of water often in 1 minute. With the FTP sensor at atmospheric pressure, the FTP PID normally indicates 0 inches of water. Look for a minimum reading of +/- 1.7 inches of water as an indication of an offset condition.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HX** .		

P0452 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH LOW

P0452 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH LOW

Description:	The powertrain control module (PCM) monitors the evaporative emission (EVAP) control system fuel tank pressure (FTP) sensor input signal to the PCM. The test fails when the signal average drops below a minimum allowable calibrated parameter.		
Possible Causes:	• Contamination internal to the FTP sensor connector • FTP circuit short to GND or SIG RTN • Damaged FTP sensor		
Diagnostic Aids:	An FTP voltage PID reading less than 0.22 volt in key ON, engine OFF or key ON, engine running indicates a concern is present.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HX** .		

P0453 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH HIGH

P0453 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH HIGH

Description:	The powertrain control module (PCM) monitors the evaporative emission (EVAP) control system fuel tank pressure (FTP) sensor input signal to the PCM. The test fails when the signal average jumps above a minimum allowable calibrated parameter.		
Possible Causes:	• FTP circuit open • VREF short to VPWR • FTP circuit short to VREF or VPWR • SIG RTN circuit open • Damaged FTP sensor		
Diagnostic Aids:	An FTP voltage PID reading greater than 4.50 volts in key ON, engine OFF or key ON, engine running indicates a concern is present.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HX** .		

P0454 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH INTERMITTENT

P0454 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH INTERMITTENT

Description:	The fuel tank pressure changes greater than 14 inches of water in 0.10 seconds.		
Possible Causes:	• Intermittent open or short in the fuel tank pressure (FTP) sensor or the FTP sensor signal • Contaminated or damaged sensor		
Diagnostic Aids:	Monitor the FTP PID and note if it changes from above 15 inches of water to below minus (-) 15 inches of water often in 1 minute.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**

All	-	-	refer to **PINPOINT TEST Z** .

P0455 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (GROSS LEAK/NO FLOW)

P0455 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (GROSS LEAK/NO FLOW)

Description:	The powertrain control module (PCM) monitors the complete evaporative emission (EVAP) control system for no purge flow, the presence of a large fuel vapor leak, or multiple small fuel vapor leaks. System failure occurs when no purge flow, which is attributed to fuel vapor blockages or restrictions, a large fuel vapor leak, or multiple fuel vapor leaks are detected by the EVAP running loss monitor test with the engine running, but not at idle.		
Possible Causes:	• Aftermarket EVAP hardware that does not conform to the required specifications • Disconnected or cracked fuel EVAP canister tube, EVAP canister purge outlet tube, or EVAP return tube • EVAP canister purge valve stuck closed • Damaged EVAP canister • Damaged, missing or loosely installed fuel filler cap • Capless fuel tank filler pipe damaged or not sealed properly (if equipped) • Loose fuel vapor hose/tube connections to the EVAP system components • Blockages or restrictions in the fuel vapor hoses/tubes • Fuel vapor control valve tube assembly or fuel vapor vent valve assembly blocked • Canister vent (CV) solenoid stuck open • Mechanically inoperative fuel tank pressure (FTP) sensor		
Diagnostic Aids:	Check for audible vacuum noise or significant fuel odor in the engine compartment or near the EVAP canister and fuel tank.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HX** .

P0456 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (VERY SMALL LEAK)

P0456 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (VERY SMALL LEAK)

Description:	The powertrain control module (PCM) monitors the complete evaporative emission (EVAP) control system for the presence of a very small fuel vapor leak. The system failure occurs when a fuel vapor leak from an opening as small as 0.508 mm (0.020 inch) is detected by the

Possible Causes:	EVAP running loss monitor test. • Very small holes or cuts in the fuel vapor hoses/tubes • Loose fuel vapor hose/tube connections to the EVAP system components • EVAP system component seals leaking. See the Possible Causes for DTC P0442		
Diagnostic Aids:	Check for a missing fuel filler cap or the integrity of the cap. Verify the capless fuel tank filler pipe is sealed properly (if equipped). Check for loose or damaged vapor hoses. Visually inspect the EVAP canister inlet port, CV solenoid filter, and canister vent hose assembly for contamination or debris.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HX** .

P0457 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (FUEL CAP LOOSE/OFF)

P0457 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (FUEL CAP LOOSE/OFF)

Description:	The powertrain control module (PCM) continuously monitors the fuel level and retains the last updated value prior to the ignition switch being placed in the OFF position. After the ignition switch is placed in the ON position a new fuel level is taken and compared to the level recorded at key off. If the fuel level has increased, a flag is set in the PCM indicating the vehicle was refueled. If the evaporative emission (EVAP) monitor detects a gross leak while the refueling flag is set, a loose fuel filler cap or an improperly sealed fuel tank filler pipe (if equipped) is suspected and the DTC is set. On most vehicles when the DTC sets, either the check fuel cap indicator illuminates or a message on the instrument cluster displays to instruct the driver to check the fuel cap or capless fuel tank filler pipe (if equipped).		
Possible Causes:	• Damaged, missing, or loosely installed fuel filler cap • Capless fuel tank filler pipe damaged or not sealed properly (if equipped)		
Diagnostic Aids:	Check for a missing fuel filler cap or the integrity of the cap. Verify the capless fuel tank filler pipe is sealed properly (if equipped). If OK, clear the continuous memory DTCs and test the system for correct operation.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HX** .

P0460 - FUEL LEVEL SENSOR A CIRCUIT

P0460 - FUEL LEVEL SENSOR A CIRCUIT

Description:	The powertrain control module (PCM) monitors the fuel level input (FLI) communications network message for a concern. The test fails when the PCM determines that the value of the FLI signal is stuck. The PCM calculates the amount of fuel used during operation. If the FLI signal does not change or does not correspond with the calculated fuel usage, the DTC is set.		
Possible Causes:	• Stuck float arm • Fuel level is always greater than 95% due to refueling patterns • Fuel level is always less than 5% due to refueling patterns • Fuel level is always at the same level between 3% and 97% full due to refueling patterns • Fuel pump (FP) module concern • Damaged instrument cluster (IC)		
Diagnostic Aids:	Check with the customer for driving and fueling habits that would keep the fuel level at approximately the same value. Monitor the FLI PIDs while attempting to move the fuel level float by adding or removing fuel as necessary.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HX** .		

P0461 - FUEL LEVEL SENSOR A CIRCUIT RANGE/PERFORMANCE

P0461 - FUEL LEVEL SENSOR A CIRCUIT RANGE/PERFORMANCE

Description:	The powertrain control module (PCM) monitors the fuel level input (FLI) communications network message for a concern. The test fails when the FLI signal repeatedly moves in and out of range, exceeding the minimum or maximum allowable calibrated parameters for a specified fuel fill percentage in the fuel tank.		
Possible Causes:	• Excessive electrical noise • Intermittent open circuit		
Diagnostic Aids:	Verify aftermarket equipment does not generate the radio frequency interference / electromagnetic interference (RFI/EMI) which may cause noisy FLI input signal.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HX** .		

P0462 - FUEL LEVEL SENSOR A CIRCUIT LOW

P0462 - FUEL LEVEL SENSOR A CIRCUIT LOW

Description:	The powertrain control module (PCM) monitors the fuel level input (FLI) communications network message for a concern. The test fails when the FLI signal is less than the minimum allowable calibrated parameter for a

	specified fuel fill percentage in the fuel tank.		
Possible Causes:	• Empty fuel tank • Fuel pump (FP) module concern • Incorrectly installed fuel gauge • Damaged instrument cluster (IC) • Damaged fuel gauge • FLI circuit short to ground		
Diagnostic Aids:	Monitor the FLI PIDs in key ON, engine running. A concern is present if the FLI percentage PID is at 25% fill and the FLI voltage PID is less than 0.90 volt with a non-matching fuel gauge or the FLI percentage PID is at 75% fill and the FLI voltage PID is greater than 2.45 volts with a non-matching fuel gauge.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HX** .		

P0463 - FUEL LEVEL SENSOR A CIRCUIT HIGH

P0463 - FUEL LEVEL SENSOR A CIRCUIT HIGH

Description:	The powertrain control module (PCM) monitors the fuel level input (FLI) communications network message for a concern. The test fails when the FLI signal is greater than the maximum allowable calibrated parameter for a specified fuel fill percentage in the fuel tank.		
Possible Causes:	• Fuel pump (FP) module concern • Incorrectly installed fuel gauge • Damaged instrument cluster (IC) • FLI circuit open • FLI short to VPWR • Overfilled fuel tank • Damaged fuel gauge		
Diagnostic Aids:	See the diagnostic aids for DTC P0462.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HX** .		

P0480 - FAN 1 CONTROL CIRCUIT

P0480 - FAN 1 CONTROL CIRCUIT

For Relay Controlled Electric Cooling Fan	
Description:	Monitors the low fan control (LFC) primary circuit output from the powertrain control (PCM). The test fails when the PCM grounds the LFC circuit and excessive current draw is detected on the LFC circuit; or with

	the LFC circuit not grounded by the PCM the voltage is not detected on the LFC circuit (the PCM expects to detect VPWR voltage coming through the low speed fan control relay coil to the LFC circuit).
Possible Causes:	• Open or short LFC circuit • Open VPWR circuit to the low speed FC relay • Damaged low speed FC relay
Diagnostic Aids:	When the LFC PID reads YES, a concern is currently present. During the key on engine off (KOEO) self-test, the cooling fan is cycled on and off. A short to voltage can only be detected when the PCM is grounding the LFC circuit. During the KOEO and key on engine running (KOER) self-test, the LFC circuit is cycled on and off.
For Variable Speed Electric Cooling Fan	
Description:	This test checks the fan control-variable (FCV) output circuit. The DTC sets if the powertrain control module (PCM) detects the voltage on the FCV circuit is not within the expected range.
Possible Causes:	• FCV circuit open or short • B+ or ground circuit concern to cooling fan • VPWR open to cooling fan (if applicable) • Damaged cooling fan module
Diagnostic Aids:	During the key on engine off (KOEO) self-test, the cooling fan is cycled on and off.
For Cooling Fan Clutch	
Description:	This test checks the fan control-variable (FCV) output circuit for the cooling fan clutch. The DTC sets if the powertrain control module (PCM) detects the voltage on the FCV circuit is not within the expected range.
Possible Causes:	• FCV circuit open in the harness • FCV circuit short to voltage or ground in the harness • Damaged cooling fan clutch solenoid.
Diagnostic Aids:	During the key on engine off (KOEO) self-test, the cooling fan is cycled on and off.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Relay Controlled Electric Cooling Fan	refer to **PINPOINT TEST KF** .		
Variable Speed Electric Cooling Fan	refer to **PINPOINT TEST KN** .		
Cooling Fan Clutch	refer to **PINPOINT TEST HV** .		

P0481 - FAN 2 CONTROL CIRCUIT

P0481 - FAN 2 CONTROL CIRCUIT

	Monitors the HFC primary circuit output from the powertrain control module (PCM). The test fails, when the HFC output is commanded on

Description:	(grounded) and excessive current draw is detected on the HFC circuit; or when the HFC circuit is commanded off and voltage is not detected on the HFC circuit (the PCM expects to detect VPWR voltage through the high speed FC relay coil to the HFC circuit).		
Possible Causes:	• Open or short HFC circuit • Open VPWR circuit to the high speed FC relay • Damaged high speed FC relay		
Diagnostic Aids:	When the HFCF PID reads YES, a concern is currently present. An open circuit or short to ground can only be detected when the PCM is not grounding the HFC circuit. A short to voltage can only be detected when the PCM is grounding the HFC circuit. During the key on engine off (KOEO) and key on engine running (KOER) self-test, the HFC circuit is cycled on and off.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KF** .		

P0482 - FAN 3 CONTROL CIRCUIT

P0482 - FAN 3 CONTROL CIRCUIT

Description:	Monitors the MFC primary circuit output from the powertrain control module (PCM). The test fails, when the MFC output is commanded on (grounded) and excessive current draw is detected on the MFC circuit; or when the MFC circuit is commanded off and voltage is not detected on the MFC circuit (the PCM expects to detect IGN START/RUN voltage through the medium speed FC relay coil to the MFC circuit).		
Possible Causes:	• Open or short MFC circuit • Open IGN START/RUN circuit to the medium speed FC relay • Damaged medium speed FC relay		
Diagnostic Aids:	When the MFCF PID reads YES, a concern is currently present. An open circuit or short to ground can only be detected when the PCM is not grounding the MFC circuit. A short to voltage can only be detected when the PCM is grounding the MFC circuit. During the key on engine off (KOEO) and key on engine running (KOER) self-test, the MFC circuit is cycled on and off. Use output test mode to command the low speed/high speed fan on. The PCM also activates the medium speed fan output.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KF** .		

P0483 - FAN PERFORMANCE

P0483 - FAN PERFORMANCE

For Vehicles Equipped With Electronic Fan Clutch	

Description:	If the cooling fan clutch fan is binding, or the PCM detects the fan speed is at or near 0 RPM, the DTC is set.
Possible Causes:	• Cooling fan motor mechanical concerns • Obstruction or binding conditions
Diagnostic Aids:	Check for a mechanical concern with the cooling fan motor or for obstructions limiting the cooling fan motor operation.
For All others	
Description:	The PCM controls the fan speed and operation using a duty cycle output on the fan control variable (FCV) circuit.
Possible Causes:	• Cooling fan motor mechanical concerns • Obstruction or binding conditions • Overheated controller
Diagnostic Aids:	Check for a mechanical concern with the cooling fan motor or for obstructions limiting the cooling fan motor operation.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All others	-	-	refer to **PINPOINT TEST KN** .
Vehicles Equipped With Electronic Fan Clutch	-	-	refer to **PINPOINT TEST HV** .

P0491 - SECONDARY AIR INJECTION (AIR) SYSTEM INSUFFICIENT FLOW (BANK 1)

P0491 - SECONDARY AIR INJECTION (AIR) SYSTEM INSUFFICIENT FLOW (BANK 1)

Description:	The AIR system detected that there was insufficient mass air flow change during pump switching (ON/OFF).
Possible Causes:	• Secondary AIR pump with no or low air flow. • Secondary AIR bypass solenoid leaking/blocked or stuck open/closed. • Secondary AIR diverter valve leaking/blocked or stuck open/closed. • Secondary AIR air hose restricted. • Secondary AIR vacuum hoes restricted or leaking.
Diagnostic Aids:	Measured air flow is less than expected. Visually inspect the secondary AIR inlet hose.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST HM** .	refer to **PINPOINT TEST HM** .

P0500 - VEHICLE SPEED SENSOR (VSS) A

P0500 - VEHICLE SPEED SENSOR (VSS) A

Description:	Indicates the powertrain control module (PCM) detected an error in the vehicle speed information. Vehicle speed data is received from either the VSS, the transfer case speed sensor (TCSS) or the anti-lock brake system (ABS) control module. If the engine RPM is above the torque converter stall speed (automatic transmission) and the engine load is high, it can be inferred that the vehicle must be moving. If there is insufficient vehicle speed data input, a concern is indicated and a DTC is set. On most vehicle applications the malfunction indicator lamp (MIL) is illuminated when this DTC is set.
Possible Causes:	• Open in the VSS+/VSS- harness circuit • Open in the TCSS signal or the TCSS signal return harness circuit • Short to GND in the VSS harness circuit • Short to GND in the TCSS harness circuit • Short to PWR in the VSS harness circuit • Short to PWR in the TCSS harness circuit • Damaged drive mechanism for VSS or TCSS • Damaged VSS or TCSS • Damaged wheel speed sensors • Damaged wheel speed sensor harness circuits • Damage in the module(s) connected to the VSC/VSS circuit • Open or short in the vehicle speed circuit VSS signal between the ABS VSS signal output and the VSS signal inputs to the PCM and other modules (F-Super Duty)
Diagnostic Aids:	Monitor the VSS PID while driving the vehicle. This DTC is set when the PCM detects a sudden loss of vehicle speed signal over a period of time. If vehicle speed data is lost, check the source of the vehicle speed input: VSS, TCSS or ABS. Note: On some manual shift-on-the-fly (MSOF) applications, VSS and TCSS PID can be monitored. However if no TCSS PID is available and VSS PID is zero, TCSS circuitry frequency must be checked for loss of sensor signal. If another vehicle electronic module has generated the P0500 and the vehicle does not receive its vehicle speed input from the VSS, TCSS or ABS, check the PCM for output shaft speed (OSS) sensor DTCs. On OSS applications the PCM uses the OSS to calculate the vehicle speed. If no OSS DTCs are found check for correct PCM configuration, tire size and axle ratio.

Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
F-Super Duty		refer to **PINPOINT TEST DF** .		
Expedition, Navigator, Sable, Taurus, Taurus X		The powertrain control module (PCM) uses information from the anti-lock brake system (ABS) module and the transmission control module (TCM) to calculate vehicle speed. Check these modules for DTCs.		
All others		refer to **PINPOINT TEST DP** .		

P0503 - VEHICLE SPEED SENSOR (VSS) A INTERMITTENT/ERRATIC/HIGH

P0503 - VEHICLE SPEED SENSOR (VSS) A INTERMITTENT/ERRATIC/HIGH

Description:	Indicates poor or noisy VSS performance. Vehicle speed data is received from either the VSS, the transfer case speed sensor (TCSS), or the anti-lock brake system (ABS) control module.		
Possible Causes:	• Noisy VSS/TCSS input signal from the radio frequency interference / electromagnetic interference (RFI/EMI) external sources, such as ignition components or the charging circuit • Damaged VSS or driven gears • Damaged TCSS • Damaged wiring harness or connectors • Malfunction in the module(s) or circuit connected to the VSS/TCSS circuit • Aftermarket add-on		
Diagnostic Aids:	Monitor the VSS PID while driving the vehicle, and check for intermittent vehicle speed indication. Verify the ignition and charging systems are functioning correctly.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
F-Super Duty	refer to **PINPOINT TEST DF** .		
Expedition, Navigator, Sable, Taurus, Taurus X	The powertrain control module (PCM) uses information from the anti-lock brake system (ABS) module and the transmission control module (TCM) to calculate vehicle speed. Check these modules for DTCs.		
All others	refer to **PINPOINT TEST DP** .		

P0504 - BRAKE SWITCH CORRELATION

P0504 - BRAKE SWITCH CORRELATION

Description:	The PCM does a comparison test between the brake pedal switch and the brake pedal position switch.		
Possible Causes:	• Damaged brake switch • Open or short in the BPS circuit • Open or short in the BPP circuit		
Diagnostic Aids:	Check the state of PID BPS and PID BPP. BPS is normally closed and BPP is normally open.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST FD** .		

P0505 - IDLE AIR CONTROL (IAC) SYSTEM

P0505 - IDLE AIR CONTROL (IAC) SYSTEM

For Vehicles With Electronic Throttle Control (ETC)			
Description:	The powertrain control module (PCM) attempts to control engine speed during the key on, engine running (KOER) self-test. The test fails when the desired RPM could not be reached or controlled during the self-test.		
Possible Causes:	• Failure mode effects management (FMEM) condition is present • Intake air restriction • Exhaust restriction • Sludged throttle body • Vacuum leaks • Damaged electronic throttle body (ETB) • Damaged PCM		
Diagnostic Aids:	This DTC may be accompanied by other DTCs. Diagnose other DTCs first. If other DTCs are not present inspect the intake air system for air restrictions, vacuum leaks, and damage. If no concerns are present, clear the DTC and carry out the KOER self-test.		
For All Others			
Description:	The powertrain control module (PCM) attempts to control engine speed during the key on, engine running (KOER) self-test. The test fails when the desired RPM could not be reached or controlled during the self-test.		
Possible Causes:	• IAC circuit open • VPWR to IAC solenoid open • B+ or VPWR to IAC solenoid open • Air inlet is plugged • IAC circuit shorted to PWR • Damaged IAC valve		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles With Electronic Throttle Control (ETC)	refer to **PINPOINT TEST HU** .		
All others	refer to **PINPOINT TEST KE** .		

P0506 - IDLE AIR CONTROL (IAC) SYSTEM RPM LOWER THAN EXPECTED

P0506 - IDLE AIR CONTROL (IAC) SYSTEM RPM LOWER THAN EXPECTED

For Vehicles With Electronic Throttle Control (ETC)	
Description:	This DTC is set when the powertrain control module (PCM) detects an engine idle speed that is less than the desired RPM.
	• Intake air restriction • Vacuum leaks

Possible Causes:	• Exhaust restriction • Engine mechanical concern • Sludged throttle body • Damaged electronic throttle body (ETB) • Damaged PCM
Diagnostic Aids:	This DTC may be accompanied by other DTCs. Diagnose other DTCs first. If other DTCs are not present inspect the intake air system for air restrictions and damage. If no concerns are present, clear the DTC and carry out the KOER self-test.
For All Others	
Description:	This DTC is set when the powertrain control module (PCM) detects an engine idle speed that is less than the desired RPM.
Possible Causes:	• IAC circuit open • Air inlet is plugged • B+ or VPWR to IAC solenoid open • Damaged or incorrect IAC valve • IAC valve stuck closed • VPWR to IAC solenoid open • IAC circuit shorted to PWR
Diagnostic Aids:	Disconnect the IAC valve and look for little or no change in engine RPM as an indication of a stuck or damaged valve.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles With Electronic Throttle Control (ETC)	refer to **PINPOINT TEST HU** .		
All others	refer to **PINPOINT TEST KE** .		

P0507 - IDLE AIR CONTROL (IAC) SYSTEM RPM HIGHER THAN EXPECTED

P0507 - IDLE AIR CONTROL (IAC) SYSTEM RPM HIGHER THAN EXPECTED

For Vehicles With Electronic Throttle Control (ETC)	
Description:	This DTC is set when the powertrain control module (PCM) detects an engine idle speed that is greater than the desired RPM.
Possible Causes:	• Intake air leak after throttle body • Vacuum leaks • Damaged EVAP system • EGR valve leaks vacuum • Damaged electronic throttle body (ETB) • Damaged PCM
	This DTC is informational only and it may be accompanied by other DTCs. Diagnose other DTCs first. If other DTCs are not present inspect

Diagnostic Aids:	the intake air system for air or vacuum leaks and damage. If no concerns are present, clear the DTC and repeat the self-test.
For All Others	
Description:	This DTC is set when the powertrain control module (PCM) detects an engine idle speed that is greater than the desired RPM.
Possible Causes:	• IAC circuit shorted to ground • Damaged or incorrect IAC valve • IAC valve stuck open • Intake air leak after throttle body • Vacuum leaks • Damaged EVAP system • EGR valve leaks vacuum
Diagnostic Aids:	Disconnect the IAC valve and look for little or no change in engine RPM as an indication of a stuck or damaged valve.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles With Electronic Throttle Control (ETC)	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		
All others	refer to **PINPOINT TEST KE** .		

P050A - COLD START IDLE AIR CONTROL PERFORMANCE

P050A - COLD START IDLE AIR CONTROL PERFORMANCE

Description:	The cold start emission reduction monitor has detected an airflow performance deficiency. The cold start emission reduction monitor validates the operation of the components of the system required to achieve the cold start emission reduction strategy, retarded spark timing (P050B) and elevated idle airflow (P050A). When the idle airflow test portion of the cold start emission reduction strategy is enabled, the idle air control system requests a higher idle RPM to increase the engine airflow. The cold start emission reduction monitor compares the actual airflow measured by the MAF sensor to the requested PCM airflow. The DTC is set when the airflow is less than the calibrated limit.
Possible Causes:	• Damaged intake air system tubes • Restricted air filter • Restricted or blocked idle air control or intake passages • Air or vacuum leaks • Base engine problem
Diagnostic Aids:	This DTC is an informational DTC and may be accompanied by other DTCs. Diagnose other DTCs first. If other DTCs are not present inspect the intake air system for air restrictions and damage. If no concerns are present, clear the DTCs and repeat the self-test. The cold start emission reduction monitor runs during a cold start. Before

	repeating the self-test, a 2 to 3 hour soak period is required for the cold start emission reduction monitor to run at start up.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

P050B - COLD START IGNITION TIMING PERFORMANCE

P050B - COLD START IGNITION TIMING PERFORMANCE

Description:	The cold start ignition timing performance has a functional response test of actual spark timing angle actual versus commanded spark timing in the powertrain control module (PCM).		
Possible Causes:	• Spark timing • Spark capture circuit • Spark timing monitor • Spark capture circuit monitor		
Diagnostic Aids:	Diagnose all other powertrain related DTCs first.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles with coil pack ignition system	refer to **PINPOINT TEST JC** .		
All others	refer to **PINPOINT TEST JB** .		

P050E - COLD START ENGINE EXHAUST TEMPERATURE OUT OF RANGE

P050E - COLD START ENGINE EXHAUST TEMPERATURE OUT OF RANGE

For Vehicles With Electronic Throttle Control (ETC)	
Description:	The powertrain control module (PCM) calculates the actual catalyst warm up temperature during a cold start. The PCM then compares the actual temperature to the expected catalyst temperature model. The difference between the actual and expected temperatures is a ratio. When this ratio exceeds the calibrated value this DTC is set and the malfunction indicator lamp (MIL) illuminates.
Possible Causes:	• Intake air restriction • Exhaust restriction • Engine mechanical concern • Damaged or sludged electronic throttle body (ETB) • Vacuum leaks • Damaged PCM
Diagnostic Aids:	This DTC is informational only and it may be accompanied by other DTCs. Diagnose other DTCs first. If other DTCs are not present inspect the intake air system for air restrictions, vacuum leaks, and damage. If no

	concerns are present, clear the DTC and carry out the key ON, engine running (KOER) self-test.		
For All Others			
Description:	The powertrain control module (PCM) attempts to control engine speed during the key on, engine running (KOER) self-test. The test fails when the desired RPM could not be reached or controlled during the self-test.		
Possible Causes:	• IAC circuit open • VPWR to IAC solenoid open • B+ or VPWR to IAC solenoid open • Air inlet is plugged • IAC circuit shorted to PWR • Damaged IAC valve		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles With Electronic Throttle Control (ETC)	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		
All others	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

P0511 - IDLE AIR CONTROL (IAC) CIRCUIT

P0511 - IDLE AIR CONTROL (IAC) CIRCUIT

Description:	This DTC is set when the powertrain control module (PCM) detects an electrical load failure on the IAC output circuit.		
Possible Causes:	• IAC circuit open • VPWR to IAC solenoid open • B+ or VPWR to IAC solenoid open • IAC circuit shorted to PWR • Damaged IAC valve • IAC circuit short to GND		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KE** .		

P0512 - STARTER REQUEST CIRCUIT

P0512 - STARTER REQUEST CIRCUIT

Description:	Indicates the one touch integrated starting system voltage circuit to the starter relay has a short to voltage.
Possible Causes:	• Short to voltage

Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **STARTING SYSTEM - GASOLINE ENGINES -- E-SERIES** .		

P0528 - FAN SPEED SENSOR CIRCUIT NO SIGNAL

P0528 - FAN SPEED SENSOR CIRCUIT NO SIGNAL

Description:	The powertrain control module (PCM) uses the fan speed sensor (FSS) input to monitor the cooling fan clutch speed. If the indicated fan speed is lower than the calibrated value during the key on engine running (KOER) self-test, the DTC is set.		
Possible Causes:	• FSS VPWR circuit open in the harness • FSS PWRGND circuit open in the harness • FSS circuit open in the harness • FSS circuit short to voltage or ground in the harness • Damaged FSS sensor • Damaged PCM		
Diagnostic Aids:	Visually inspect the cooling fan clutch for damage or obstruction.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HV** .		

P052A - COLD START CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 1)

P052A - COLD START CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 1)

Description:	The powertrain control module (PCM) monitors the variable camshaft timing (VCT) position for an over-advanced camshaft timing during cold start up. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in an advanced position.		
Possible Causes:	• Camshaft timing incorrectly set • Continuous oil flow to the VCT piston chamber • VCT solenoid valve stuck open • Camshaft advance mechanism binding (VCT unit)		
Diagnostic Aids:	This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the **ENGINE SYSTEM - GENERAL INFORMATION -- E-SERIES** , Oil Pressure Test, to check the engine oil pressure. Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** , Timing Drive Components, to check the engine timing.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**

All	-	refer to **PINPOINT TEST HK** .	refer to **PINPOINT TEST HK** .

P052B - COLD START CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 1)

P052B - COLD START CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 1)

Description:	The powertrain control module (PCM) monitors the variable camshaft timing (VCT) position for over-retarded camshaft timing during cold start up. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in a retarded position.		
Possible Causes:	• Camshaft timing incorrectly set • Continuous oil flow to the VCT piston chamber • VCT solenoid valve stuck open • Camshaft advance mechanism binding (VCT unit)		
Diagnostic Aids:	This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the **ENGINE SYSTEM - GENERAL INFORMATION -- E-SERIES** , Oil Pressure Test, to check the engine oil pressure. Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** , Timing Drive Components, to check the engine timing.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST HK** .	refer to **PINPOINT TEST HK** .

P052C - COLD START CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 2)

P052C - COLD START CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 2)

Description:	The powertrain control module (PCM) monitors the variable camshaft timing (VCT) position for an over-advanced camshaft timing during cold start up. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in an advanced position.		
Possible Causes:	• Camshaft timing improperly set • Continuous oil flow to the VCT piston chamber • VCT solenoid valve stuck open • Camshaft advance mechanism binding (VCT unit)		
Diagnostic Aids:	This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the **ENGINE SYSTEM - GENERAL INFORMATION -- E-SERIES** , Oil Pressure Test, to check the engine oil pressure. Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** , Timing Drive Components, to check the engine timing.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**

All	-	refer to **PINPOINT TEST HK** .	refer to **PINPOINT TEST HK** .

P052D - COLD START CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 2)

P052D - COLD START CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 2)

Description:	The powertrain control module (PCM) monitors the variable camshaft timing (VCT) position for over-retarded camshaft timing during cold start up. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in a retarded position.		
Possible Causes:	• Camshaft timing improperly set • Continuous oil flow to the VCT piston chamber • VCT solenoid valve stuck open • Camshaft advance mechanism binding (VCT unit)		
Diagnostic Aids:	This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the **ENGINE SYSTEM - GENERAL INFORMATION -- E-SERIES** , Oil Pressure Test, to check the engine oil pressure. Refer to the **ENGINE - 4.6L AND 5.4L -- E-SERIES** , Timing Drive Components, to check the engine timing.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST HK** .	refer to **PINPOINT TEST HK** .

P0532 - A/C PRESSURE REFRIGERANT SENSOR A CIRCUIT LOW

P0532 - A/C PRESSURE REFRIGERANT SENSOR A CIRCUIT LOW

Description:	The ACP transducer sensor inputs a voltage to the powertrain control module (PCM). If the voltage is below the calibrated level the DTC sets.		
Possible Causes:	• ACP transducer sensor circuit short to GND or SIGRTN • VREF circuit open • Open ACP transducer sensor circuit • Damaged ACP transducer sensor		
Diagnostic Aids:	Verify the VREF voltage is between 4 and 6 volts.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DS** .		

P0533 - A/C REFRIGERANT PRESSURE SENSOR A CIRCUIT HIGH

P0533 - A/C REFRIGERANT PRESSURE SENSOR A CIRCUIT HIGH

Description:	The ACP transducer sensor inputs a voltage to the powertrain control

	module (PCM). If the voltage is above a calibrated level the DTC sets.		
Possible Causes:	• ACP transducer sensor circuit short to PWR • Open ACP transducer sensor circuit • ACP transducer sensor circuit short to VREF • Damaged ACP transducer sensor		
Diagnostic Aids:	Verify the VREF voltage is between 4 and 6 volts.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DS** .		

P0534 - A/C REFRIGERANT CHARGE LOSS

P0534 - A/C REFRIGERANT CHARGE LOSS

Description:	Indicates frequent A/C compressor clutch cycling.		
Possible Causes:	• Mechanical A/C system concern (such as low refrigerant charge, damaged A/C cycling switch) • Intermittent open between the cycling pressure switch and the powertrain control module (PCM) • Intermittent open in the IGN RUN circuit to cycling pressure switch (if applicable)		
Diagnostic Aids:	This test is designed to protect the transmission. In some strategies, the PCM unlocks the torque converter during A/C clutch engagement. If a concern is present that results in frequent A/C clutch cycling, damage could occur if the torque converter is cycled at these intervals. This test detects this condition, sets the DTC and prevents the torque converter from excessive cycling.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST KM** .

P0537 - A/C EVAPORATOR TEMPERATURE SENSOR CIRCUIT LOW

P0537 - A/C EVAPORATOR TEMPERATURE SENSOR CIRCUIT LOW

Description:	Indicates the ACET signal input was less than the self-test minimum. The self-test minimum is 0.13 volts.
Possible Causes:	• ACET circuit short to ground or SIG RTN • Damaged ACET sensor
Diagnostic Aids:	The powertrain control module (PCM) sources a low current 5 volts on the ACET circuit (this voltage can be measured with the sensor disconnected). As the A/C evaporator air temperature changes, the ACET circuit resistance to SIG RTN (ground) changes (which changes the voltage the PCM detects). When the ACET signal is detected below the

	self-test minimum, check for shorts to the SIG RTN or ground, which would pull the voltage low.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DJ** .		

P0538 - A/C EVAPORATOR TEMPERATURE SENSOR CIRCUIT HIGH

P0538 - A/C EVAPORATOR TEMPERATURE SENSOR CIRCUIT HIGH

Description:	Indicates the ACET signal input was greater than the self-test maximum. The self-test maximum is 4.5 volts.
Possible Causes:	• ACET circuit open • SIG RTN circuit open to the ACET sensor • ACET circuit short to voltage (VREF) • Damaged ACET sensor
Diagnostic Aids:	The powertrain control module (PCM) sources a low current 5 volts on the ACET circuit (this voltage can be measured with the sensor disconnected). As the A/C evaporator air temperature changes, the ACET circuit resistance to SIG RTN (ground) changes (which changes the voltage the PCM detects). When the ACET signal is detected above the self-test maximum, check for open circuits (ACET or SIG RTN), which would cause the voltage to remain high. Although not as probable, also check for a short to voltage (VREF).

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DJ** .		

P053A - POSITIVE CRANKCASE VENTILATION (PCV) HEATER CONTROL CIRCUIT / OPEN

P053A - POSITIVE CRANKCASE VENTILATION (PCV) HEATER CONTROL CIRCUIT / OPEN

Description:	This DTC sets when the powertrain control module (PCM) detects a positive crankcase ventilation (PCV) heater circuit failure.
Possible Causes:	• Open or shorted PCV circuit • Damaged PCV heater assembly
Diagnostic Aids:	Make sure the PCV valve is correct for the engine application and the PCV heater connector is properly connected.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HG** .

P0552 - POWER STEERING PRESSURE (PSP) SENSOR/SWITCH CIRCUIT LOW

P0552 - POWER STEERING PRESSURE (PSP) SENSOR/SWITCH CIRCUIT LOW

Description:	Indicates the PSP sensor input signal was less than the self-test minimum.		
Possible Causes:	• PSP sensor damaged • SIG RTN circuit open • VREF circuit open or shorted • PSP sensor signal circuit open or shorted		
Diagnostic Aids:	View the PSP PID to monitor the PSP input.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DT** .		

P0553 - POWER STEERING PRESSURE (PSP) SENSOR CIRCUIT HIGH INPUT

P0553 - POWER STEERING PRESSURE (PSP) SENSOR CIRCUIT HIGH INPUT

Description:	Indicates the PSP sensor input signal was greater than the self-test maximum.		
Possible Causes:	• PSP sensor damaged • VREF circuit shorted to voltage • PSP sensor signal circuit open • PSP sensor signal circuit shorted to voltage		
Diagnostic Aids:	View the PSP PID to monitor the PSP input.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DT** .		

P0563 - SYSTEM VOLTAGE HIGH

P0563 - SYSTEM VOLTAGE HIGH

Description:	This DTC is set when the powertrain control module (PCM) detects high system voltage.		
Possible Causes:	• Charging system concern		
Diagnostic Aids:	System voltage is monitored by the PCM. When the voltage is above or below a calibrated value, an internal counter increments until a DTC is set.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST B** .		

P0571 - BRAKE SWITCH A CIRCUIT

P0571 - BRAKE SWITCH A CIRCUIT

Description:	The purpose of this DTC is to check whether the brake switch has toggled or not during the KOER test.

Possible Causes:	• Open or short in the BPP circuit • Open or short in the stoplamp circuits • Concern in module(s) connected to the BPP circuit • Damaged brake switch • Misadjusted brake switch		
Diagnostic Aids:	Using the scan tool, check the BOO PID. The BOO PID should toggle on and off with brake pedal activation.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST FD** .		

P0572 - BRAKE SWITCH A CIRCUIT LOW

P0572 - BRAKE SWITCH A CIRCUIT LOW

Description:	This DTC indicates the brake switch is stuck in the ON position.		
Possible Causes:	• Open or short in the BPP circuit • Open or short in the stoplamp circuits • Damaged brake switch • Misadjusted brake switch		
Diagnostic Aids:	Using the scan tool, check the BOO PID. The BOO PID should toggle on and off with brake pedal activation.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST FD** .		

P0573 - BRAKE SWITCH A CIRCUIT HIGH

P0573 - BRAKE SWITCH A CIRCUIT HIGH

Description:	This DTC indicates the brake switch is stuck in the OFF position.		
Possible Causes:	• Open or short in the BPP circuit • Open or short in the stoplamp circuits • Damaged brake switch • Misadjusted brake switch		
Diagnostic Aids:	Using the scan tool, check the BOO PID. The BOO PID should toggle on and off with brake pedal activation.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST FD** .		

P0579 - CRUISE CONTROL MULTIFUNCTION INPUT A CIRCUIT RANGE / PERFORMANCE

P0579 - CRUISE CONTROL MULTIFUNCTION INPUT A CIRCUIT RANGE / PERFORMANCE

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **SPEED CONTROL -- E-SERIES** .		

P0581 - CRUISE CONTROL MULTIFUNCTION INPUT A CIRCUIT HIGH

P0581 - CRUISE CONTROL MULTIFUNCTION INPUT A CIRCUIT HIGH

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **SPEED CONTROL -- E-SERIES** .		

P0600 - SERIAL COMMUNICATION LINK

P0600 - SERIAL COMMUNICATION LINK

Description:	Indicates an error occurred in the powertrain control module (PCM). This DTC may be set alone or in combination with P2105.		
Possible Causes:	• Software incompatibility issue • Damaged PCM		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST QE** .

P0602 - POWERTRAIN CONTROL MODULE (PCM) PROGRAMMING ERROR

P0602 - POWERTRAIN CONTROL MODULE (PCM) PROGRAMMING ERROR

Description:	This DTC indicates a programming error within the vehicle ID (VID) block.		
Possible Causes:	• VID data corrupted by the scan tool during VID reprogramming		
Diagnostic Aids:	Using the scan tool, reprogram the VID block. If the PCM does not allow reprogramming of the VID block, reflashing of the PCM is required.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	The VID block must be programmed. Refer to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Making Changes to the VID Block.		

P0603 - INTERNAL CONTROL MODULE KEEP ALIVE MEMORY (KAM) ERROR

P0603 - INTERNAL CONTROL MODULE KEEP ALIVE MEMORY (KAM) ERROR

Description:	Indicates the powertrain control module (PCM) has experienced an internal memory concern. However, there are external items that can cause this DTC.		
Possible Causes:	• Reprogramming • Battery terminal corrosion • KAPWR to PCM interrupt/open • Loose battery connection		
Diagnostic Aids:	If KAPWR is interrupted to the PCM because of a battery or PCM disconnect, this DTC can be generated on the first power-up.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST QB** .	-	refer to **PINPOINT TEST QB** .

P0604 - INTERNAL CONTROL MODULE RANDOM ACCESS MEMORY (RAM) ERROR

P0604 - INTERNAL CONTROL MODULE RANDOM ACCESS MEMORY (RAM) ERROR

Description:	Indicates the powertrain control module (PCM) RAM has been corrupted.		
Possible Causes:	• Module reprogramming • Aftermarket performance products. • Damaged PCM		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Reprogram or update the calibration. Check for other DTCs or drive symptoms for further action. Make sure to check for aftermarket performance products before installing a new PCM. If it is necessary to install a new PCM, refer to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.		

P0605 - INTERNAL CONTROL MODULE READ ONLY MEMORY (ROM) ERROR

P0605 - INTERNAL CONTROL MODULE READ ONLY MEMORY (ROM) ERROR

Description:	The powertrain control module (PCM) ROM has been corrupted.
Possible Causes:	• An attempt was made to change the calibration • Module programming error • Aftermarket performance products • Damaged PCM

Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Reprogram the vehicle identification VID block (use as built data). Check for other DTCs or drive symptoms for further action. Make sure to check for aftermarket performance products before installing a new powertrain control module (PCM). If it is necessary to install a new PCM, refer to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.		

P0606 - CONTROL MODULE PROCESSOR

P0606 - CONTROL MODULE PROCESSOR

Description:	This DTC indicates an internal powertrain control module (PCM) communication error.		
Possible Causes:	• Damaged PCM		
Diagnostic Aids:	Reprogram or update the calibration. Check for other DTCs and diagnose those first. Make sure to check for aftermarket performance products before installing a new PCM. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Reprogram or update the calibration. Check for other DTCs and diagnose those first. Make sure to check for aftermarket performance products before installing a new PCM. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.		

P0607 - CONTROL MODULE PERFORMANCE

P0607 - CONTROL MODULE PERFORMANCE

Description:	Indicates that the powertrain control module (PCM) internal central processing unit (CPU) has encountered an error. The PCM monitors itself and carries out internal checks of its own CPU. If any of these checks returns an incorrect value, the DTC is set.
Possible Causes:	• Module programming error • Aftermarket performance products • Damaged PCM
	Reprogram or update the calibration. Check for other DTCs and diagnose

Diagnostic Aids:	those first. Make sure to check for aftermarket performance products before installing a new PCM. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Reprogram or update the calibration. Check for other DTCs and diagnose those first. Make sure to check for aftermarket performance products before installing a new PCM. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.		

P060A - INTERNAL CONTROL MODULE MONITORING PROCESSOR PERFORMANCE

P060A - INTERNAL CONTROL MODULE MONITORING PROCESSOR PERFORMANCE

Description:	Indicates an error occurred in the powertrain control module (PCM). This DTC may set in combination with P2105.		
Possible Causes:	• Software incompatibility issue • Damaged PCM		
Diagnostic Aids:	Verify the PCM is at the latest calibration level.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST QE** .

P060B - INTERNAL CONTROL MODULE A/D PROCESSING PERFORMANCE

P060B - INTERNAL CONTROL MODULE A/D PROCESSING PERFORMANCE

Description:	Indicates an error occurred in the powertrain control module (PCM). This DTC may set in combination with P2104 or P2110.		
Possible Causes:	• Damaged PCM		
Diagnostic Aids:	Inspect the harness for damage. Verify correct operation of the sensors using VREF and related circuits.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST QE** .

P060C - INTERNAL CONTROL MODULE MAIN PROCESSOR PERFORMANCE

P060C - INTERNAL CONTROL MODULE MAIN PROCESSOR PERFORMANCE

Description:	Indicates an error occurred in the powertrain control module (PCM).		
Possible Causes:	• Software incompatibility issue • Damaged PCM		
Diagnostic Aids:	Verify the PCM is at the latest calibration level.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST QE** .

P060D - INTERNAL CONTROL MODULE ACCELERATOR PEDAL POSITION PERFORMANCE

P060D - INTERNAL CONTROL MODULE ACCELERATOR PEDAL POSITION PERFORMANCE

Description:	Indicates an error occurred in the powertrain control module (PCM). If the PCM detects a concern identifying an issue with an accelerator pedal position (APP) sensor signal or with processing the brake pedal sensor input, the DTC is set.		
Possible Causes:	• Damaged PCM		
Diagnostic Aids:	Verify the PCM is at the latest calibration level.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST QE** .

P0610 - CONTROL MODULE VEHICLE OPTIONS ERROR

P0610 - CONTROL MODULE VEHICLE OPTIONS ERROR

Description:	Indicates a powertrain control module (PCM) vehicle options error.		
Possible Causes:	• Module reprogramming • Aftermarket performance products. • PCM		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	See Note 1

P061B - INTERNAL CONTROL MODULE TORQUE CALCULATION PERFORMANCE

P061B - INTERNAL CONTROL MODULE TORQUE CALCULATION PERFORMANCE

Description:	Indicates a calculation error occurred in the powertrain control module (PCM).		
Possible Causes:			
Diagnostic Aids:	Check for sensor and circuit related DTCs. Do not install a new electronic throttle body (ETB) for this DTC.		

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	-	-	refer to **PINPOINT TEST QE** .

P061C - INTERNAL CONTROL MODULE ENGINE RPM PERFORMANCE

P061C - INTERNAL CONTROL MODULE ENGINE RPM PERFORMANCE

Description:	Indicates a calculation error occurred in the powertrain control module (PCM).		
Possible Causes:	• Crankshaft position (CKP) sensor circuit is open or short • CKP sensor circuit intermittent • Damaged CKP sensor • Camshaft position (CMP) sensor circuit is open or short • CMP sensor circuit intermittent • Damaged CMP sensor • Damaged PCM		
Diagnostic Aids:	Verify correct operation of the CKP and CMP sensors and related circuits.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST QE** .

P061D - INTERNAL CONTROL MODULE ENGINE AIR MASS PERFORMANCE

P061D - INTERNAL CONTROL MODULE ENGINE AIR MASS PERFORMANCE

Description:	Indicates an error occurred in the powertrain control module (PCM).		
Possible Causes:	• Software incompatibility issue • Damaged PCM		
Diagnostic Aids:	Verify the PCM is at the latest calibration level.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST QE** .

P061F - INTERNAL CONTROL MODULE THROTTLE ACTUATOR CONTROLLER PERFORMANCE

P061F - INTERNAL CONTROL MODULE THROTTLE ACTUATOR CONTROLLER PERFORMANCE

Description:	Indicates an error occurred in the powertrain control module (PCM).
Possible Causes:	

Diagnostic Aids:	Verify correct operation of the electronic throttle control (ETC) components and related circuits.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST QE** .

P0620 - GENERATOR CONTROL CIRCUIT

P0620 - GENERATOR CONTROL CIRCUIT

Description:	The powertrain control module (PCM) reads the GENLI and sends a DTC through the network when the signal frequency of GENLI indicates a concern.		
Possible Causes:	• I-line control (ILC) circuit short to ground • ILC circuit short to voltage • ILC circuit open • GENLI circuit short to voltage or ground • GENLI circuit open • B+ circuit open • Generator drive mechanism • Damaged generator/regulator assembly • Damaged PCM		
Diagnostic Aids:	Verify the battery voltage is 14.5 volts. Verify the generator/regulator has the correct part number.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HY** .		

P0622 - GENERATOR FIELD TERMINAL CIRCUIT

P0622 - GENERATOR FIELD TERMINAL CIRCUIT

Description:	The powertrain control module (PCM) monitors the generator load from the generator/regulator in the form of frequency. The frequency range is determined by the temperature of the voltage regulator, where 97% indicates a full load, and less than 6% indicates no load.
Possible Causes:	• GENLI circuit short to voltage or ground • GENLI circuit open • GENRC circuit short to voltage or ground • GENRC circuit open • ILC circuit short to voltage or ground • ILC circuit open • Battery-sense circuit open

	• Generator drive mechanism • Damaged generator/regulator assembly • Damaged PCM		
Diagnostic Aids:	Verify the battery voltage is 14.5 volts. Verify the generator/regulator has the correct part number.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HY** .		

P0625 - GENERATOR FIELD TERMINAL CIRCUIT LOW

P0625 - GENERATOR FIELD TERMINAL CIRCUIT LOW

Description:	The powertrain control module (PCM) monitors generator load from the generator/regulator in the form of frequency. The concern indicates the input is lower than the load should be in normal operation. The load input could be low when no generator output exists.		
Possible Causes:	• GENRC circuit short to ground • GENLI circuit short to ground • Open B+ wire during operation • Low system voltage • Broken generator belt • Damaged generator/regulator assembly		
Diagnostic Aids:	Verify the battery voltage is 14.5 volts. Verify the generator/regulator has the correct part number.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HY** .		

P0626 - GENERATOR FIELD TERMINAL CIRCUIT HIGH

P0626 - GENERATOR FIELD TERMINAL CIRCUIT HIGH

Description:	The powertrain control module (PCM) monitors generator load from the generator/regulator in the form of frequency. The concern indicates the input is higher than the load should be in normal operation. The load input could be high when a battery short to ground exists.		
Possible Causes:	• GENLI circuit short to voltage • GENRC circuit short to voltage • B+ open prior to start-up • Open GENRC prior to start-up • Open ILC prior to start-up		
Diagnostic Aids:	Verify the battery voltage is 14.5 volts. Verify the generator/regulator has the correct part number.		

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	refer to **PINPOINT TEST HY** .		

P062C - INTERNAL CONTROL MODULE VEHICLE SPEED PERFORMANCE

P062C - INTERNAL CONTROL MODULE VEHICLE SPEED PERFORMANCE

Description:	Indicates an error occurred in the powertrain control module (PCM).		
Possible Causes:	• Module communications network concerns • Output shaft speed (OSS) sensor concern • Turbine shaft speed (TSS) sensor concern • Antilock braking system (ABS) concern		
Diagnostic Aids:	Repair any ABS DTCs, ABS-related DTCs in other modules, or vehicle communication concerns.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST QE** .

P0642 - SENSOR REFERENCE VOLTAGE A CIRCUIT LOW

P0642 - SENSOR REFERENCE VOLTAGE A CIRCUIT LOW

Description:	Indicates the reference voltage (VREF) circuit is less than VREF minimum.		
Possible Causes:	• VREF circuit short to ground • Damaged sensor • Incorrect harness connection		
Diagnostic Aids:	This DTC is set due to an under voltage condition on the VREF circuit.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST C** .		

P0643 - SENSOR REFERENCE VOLTAGE A CIRCUIT HIGH

P0643 - SENSOR REFERENCE VOLTAGE A CIRCUIT HIGH

Description:	Indicates the reference voltage (VREF) circuit is greater than VREF maximum.		
Possible Causes:	• VREF circuit short to voltage • Damaged sensor • Incorrect harness connection		
Diagnostic Aids:	This DTC is set due to an over voltage condition on the VREF circuit.		
Application	**Key On Engine**	**Key On Engine**	**Continuous Memory**

	Off	Running	
All	refer to **PINPOINT TEST C** .		

P0645 - AIR CONDITIONING CLUTCH RELAY (A/CCR) CONTROL CIRCUIT

P0645 - AIR CONDITIONING CLUTCH RELAY (A/CCR) CONTROL CIRCUIT

Description:	Monitors the A/CCR circuit output from the powertrain control module (PCM). The test fails when the PCM grounds the A/CCR circuit, excessive current draw is detected on the A/CCR circuit; or, with the A/CCR circuit not grounded by the PCM, voltage is not detected on the A/CCR circuit (the PCM expects to detect VPWR voltage coming through the A/CCR relay coil to the A/CCR circuit).		
Possible Causes:	• Open or short A/CCR circuit • Damaged A/CCR relay • Open VPWR circuit to the A/CCR relay		
Diagnostic Aids:	The A/CCR control circuit can be monitored using the WACF and WAC PID. When the WACF PID reads YES, a concern is present. An open circuit or short to ground can only be detected when the PCM is not grounding the circuit. A short to voltage can only be detected when the PCM is grounding the circuit. During the key on engine off (KOEO) and key on engine running (KOER) self-test, the WAC circuit is cycled on and off. Verify the A/C and the defrost were OFF during the KOEO and KOER self-tests. Check ACCS the PID to verify. If the vehicle is not equipped with A/C, ignore DTC P0645.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KM** .		

P064D - INTERNAL CONTROL MODULE O2 SENSOR PROCESSOR PERFORMANCE - BANK 1

P064D - INTERNAL CONTROL MODULE O2 SENSOR PROCESSOR PERFORMANCE - BANK 1

Description:	The powertrain control module (PCM) monitors the application-specific integrated circuit that controls and monitors the heated oxygen sensor (HO2S). The test fails when the PCM detects an internal circuit or communication concern.		
Possible Causes:	• Damaged PCM		
Diagnostic Aids:	Internal PCM concern.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
	Reprogram or update the calibration. Check for other DTCs and diagnose those first. Make sure to check for aftermarket performance products before installing a new PCM. Clear the DTCs, repeat the self-		

All		test. If the DTC is retrieved again, install a new PCM. Refer to **FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** .

P064E - INTERNAL CONTROL MODULE O2 SENSOR PROCESSOR PERFORMANCE - BANK 2

P064E - INTERNAL CONTROL MODULE O2 SENSOR PROCESSOR PERFORMANCE - BANK 2

Description: **Possible Causes:** **Diagnostic Aids:**	See the description for DTC P064D. See the possible causes for DTC P064D. See the diagnostic aids for DTC P064D.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Reprogram or update the calibration. Check for other DTCs and diagnose those first. Make sure to check for aftermarket performance products before installing a new PCM. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to **FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** .		

P0657 - ACTUATOR SUPPLY VOLTAGE A CIRCUIT/OPEN

P0657 - ACTUATOR SUPPLY VOLTAGE A CIRCUIT/OPEN

Description:	Voltage to all transmission solenoids has been interrupted.		
Possible Causes:			
Diagnostic Aids:	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P065B - GENERATOR CONTROL CIRCUIT RANGE/PERFORMANCE

P065B - GENERATOR CONTROL CIRCUIT RANGE/PERFORMANCE

Description:	The powertrain control module (PCM) reads the GENLI and sends a DTC through the network when the signal frequency of GENLI indicates a concern.		
Possible Causes:	• GENLI circuit short to voltage or ground • GENLI circuit open • Damaged generator/regulator assembly • Damaged PCM		
Diagnostic Aids:	Verify the battery voltage is 14.5 volts. Verify the generator/regulator has the correct part number.		
	Key On Engine	**Key On Engine**	

Application	Off	Running	Continuous Memory
All	refer to **PINPOINT TEST HY** .		

P0660 - INTAKE MANIFOLD TUNING VALVE (IMTV) CONTROL CIRCUIT OPEN - BANK 1

P0660 - INTAKE MANIFOLD TUNING VALVE (IMTV) CONTROL CIRCUIT OPEN - BANK 1

Description:	The IMTV system is monitored for failure during continuous, key on engine off (KOEO), or key on engine running (KOER) self-tests. The test fails when the signal is more or less than an expected calibrated range.		
Possible Causes:	• IMTV signal circuit open, shorted to PWR GND or SIG RTN • Damaged IMTV actuator		
Diagnostic Aids:	An IMTVM PID reading may indicate a fault.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P0663 - INTAKE MANIFOLD TUNING VALVE (IMTV) CONTROL CIRCUIT OPEN - BANK 2

P0663 - INTAKE MANIFOLD TUNING VALVE (IMTV) CONTROL CIRCUIT OPEN - BANK 2

Description:	The IMTV system is monitored for failure during continuous, key on engine off (KOEO), or key on engine running (KOER) self-tests. The test fails when the signal is more or less than an expected calibrated range.		
Possible Causes:	• IMTV signal circuit open, shorted to PWR GND or SIG RTN • Damaged IMTV actuator		
Diagnostic Aids:	An IMTVM PID reading may indicate a fault.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P0685 - ELECTRONIC CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER RELAY CONTROL CIRCUIT/OPEN

P0685 - ELECTRONIC CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER RELAY CONTROL CIRCUIT/OPEN

Description:	This DTC sets when the ignition switch position run (ISP-R) circuit indicates the key is in the OFF, ACC, or LOCK position, and the amount of time the PCM remains powered through the PCM power relay exceeds a predetermined amount of time.		
Possible Causes:	• PCM relay control (PCMRC) circuit short to ground in the harness • Damaged PCM power relay		
Diagnostic Aids:	Ability to communicate with the PCM when the key is in the OFF, ACC, or LOCK position indicates a hard fault.		
Application	**Key On Engine**	**Key On Engine**	**Continuous Memory**

	Off	Running	
All	refer to **PINPOINT TEST B** .		

P0689 - ELECTRONIC CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER RELAY SENSE CIRCUIT LOW

P0689 - ELECTRONIC CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER RELAY SENSE CIRCUIT LOW

Description:	This DTC sets when the passive anti theft system (PATS) system indicates the key is in ON or START position and the ignition switch position run (ISP-R) circuit indicates OFF, ACC, or LOCK position.		
Possible Causes:	• Ignition circuit fuse • ISP-R circuit open in the harness • ISP-R circuit short to ground in the harness • Damaged ignition switch • Damaged PATS system		
Diagnostic Aids:	Diagnose and repair all PATS DTCs first.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST B** .		

P0690 - ELECTRONIC CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER RELAY SENSE CIRCUIT HIGH

P0690 - ELECTRONIC CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER RELAY SENSE CIRCUIT HIGH

Description:	This DTC sets when the passive anti theft system (PATS) system indicates the key is in the OFF, ACC, or LOCK position and the ignition switch position run (ISP-R) circuit indicates ON or START position.		
Possible Causes:	• ISP-R circuit short to voltage in the harness • Damaged PATS system • Damaged ignition switch		
Diagnostic Aids:	Diagnose and repair all PATS DTCs first.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST B** .		

P0703 - BRAKE SWITCH B INPUT CIRCUIT

P0703 - BRAKE SWITCH B INPUT CIRCUIT

Description:	Indicates the powertrain control module (PCM) did not receive a brake pedal position (BPP) input.
	• Open or short in the BPP circuit

Possible Causes:	• Open or short in the stoplamp circuits • Damage in module(s) connected to the BPP circuit. • Damaged brake switch • Misadjusted brake switch		
Diagnostic Aids:	Check for proper function of the stoplamp. Using a scan tool, check the BPP PID. The stoplamp and PID should toggle on and off with brake pedal activation.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Town Car	Verify the brake pedal was applied and released during the key on engine running (KOER) self-test. For additional concerns, refer to the **EXTERIOR LIGHTING -- E-SERIES** .		
Expedition, Navigator	Verify the brake pedal was applied and released during the key on engine running (KOER) self-test. For additional concerns, refer to the **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS) -- E-SERIES** .		
All others	refer to **PINPOINT TEST FD** .		

P0704 - CLUTCH SWITCH INPUT CIRCUIT

P0704 - CLUTCH SWITCH INPUT CIRCUIT

Description:	When the clutch pedal is applied the voltage goes to low. If the powertrain control module (PCM) does not see this change from high to low the DTC is set.		
Possible Causes:	• Clutch pedal position (CPP) circuit short to voltage • Damaged CPP switch • CPP circuit open in the SIGRTN		
Diagnostic Aids:	When the clutch pedal is applied and then released, the CPP switch voltage should cycle.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST TA** .	-	refer to **PINPOINT TEST TA** .

P0705 - TRANSMISSION RANGE SENSOR A CIRCUIT (PRNDL) INPUT

P0705 - TRANSMISSION RANGE SENSOR A CIRCUIT (PRNDL) INPUT

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION -**		

	4R70E/4R75E -- E-SERIES .

P0707 - TRANSMISSION RANGE SENSOR A CIRCUIT LOW

P0707 - TRANSMISSION RANGE SENSOR A CIRCUIT LOW

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P0708 - TRANSMISSION RANGE SENSOR A CIRCUIT HIGH

P0708 - TRANSMISSION RANGE SENSOR A CIRCUIT HIGH

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P071X - TRANSMISSION CODE

P071X - TRANSMISSION CODE

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P0720 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT

P0720 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT

Description:	The OSS sensor inputs a signal to the powertrain control module (PCM) based on the speed of the output shaft of the transmission.
Possible Causes:	• OSS sensor circuit short to GND • OSS sensor circuit short to PWR • OSS sensor circuit open

	• Damaged OSS sensor		
Diagnostic Aids:	Verify the sensor signal output varies with the vehicle speed.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Manual Transmission	-	-	refer to **PINPOINT TEST DP** .
Automatic Transmission	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P0721 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT RANGE/PERFORMANCE

P0721 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT RANGE/PERFORMANCE

Description:	The OSS sensor signal is very sensitive to noise. This noise distorts the input to the powertrain control module (PCM).		
Possible Causes:	• Wiring misrouted • Aftermarket add-on • Wiring damaged • Wiring insulation wear		
Diagnostic Aids:	Check the routing of the harness. Check the wiring and the connector for damage.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Manual Transmission	-	-	refer to **PINPOINT TEST DP** .
Automatic Transmission	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P0722 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT NO SIGNAL

P0722 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT NO SIGNAL

Description:	The OSS sensor failed to provide a signal to the PCM upon initial movement of vehicle.		
Possible Causes:	• Damaged OSS connector • Damaged OSS sensor, or not installed properly • Harness intermittently shorted or open		
Diagnostic Aids:	Check the wiring, connector, and sensor for damage.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Manual Transmission	-	-	refer to **PINPOINT TEST DP** .
Automatic Transmission	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P0723 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT INTERMITTENT

P0723 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT INTERMITTENT

Description:	The OSS sensor signal to the PCM is irregular or interrupted.		
Possible Causes:	• Harness connector not properly seated • Harness intermittently shorted or open • Harness connector damaged • OSS sensor damaged, or not installed properly		
Diagnostic Aids:	Verify harness and connector integrity. Verify proper installation of the OSS sensor.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Manual Transmission	-	-	refer to **PINPOINT TEST DP** .
Automatic Transmission	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P073X - TRANSMISSION CODE

P073X - TRANSMISSION CODE

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P074X - TRANSMISSION CODE

P074X - TRANSMISSION CODE

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P075X - TRANSMISSION CODE

P075X - TRANSMISSION CODE

Description:	

Possible Causes: **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P076X - TRANSMISSION CODE

P076X - TRANSMISSION CODE

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P077X - TRANSMISSION CODE

P077X - TRANSMISSION CODE

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P078X - TRANSMISSION CODE

P078X - TRANSMISSION CODE

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P079X - TRANSMISSION CODE

P079X - TRANSMISSION CODE

Description:	

Possible Causes: **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P0815 - UPSHIFT SWITCH CIRCUIT

P0815 - UPSHIFT SWITCH CIRCUIT

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P0830 - CLUTCH PEDAL SWITCH A CIRCUIT

P0830 - CLUTCH PEDAL SWITCH A CIRCUIT

Description:	The powertrain control module (PCM) monitors the clutch pedal position bottom of travel (CPP-BT) switch only during the calibrated engine speed range (cranking speed range). This DTC is set when the CPP-BT switch does not indicate that the clutch is disengaged (clutch pedal pressed) when the engine is cranked.		
Possible Causes:	• Damaged CPP-BT switch • Damaged CPP-BT harness • Open PWRGND circuit to the CPP-BT switch • Vehicle push-started with the clutch engaged (clutch pedal released) • Aftermarket remote starting device		
Diagnostic Aids:	Verify that the vehicle was not push-started with the clutch engaged. Check for aftermarket equipment such as remote starting devices which may bypass the clutch pedal position switch when cranking the engine.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
F-150 4.2L	-	-	refer to **PINPOINT TEST TA** .
All others	Refer to the **STARTING SYSTEM - GASOLINE ENGINES -- E-SERIES** to diagnose the symptom no start, no crank.		

P0833 - CLUTCH PEDAL SWITCH B CIRCUIT

P0833 - CLUTCH PEDAL SWITCH B CIRCUIT

Description:	The powertrain control module (PCM) monitors the clutch pedal position top of travel (CPP-TT) switch only during the calibrated engine speed range (cranking speed range). This DTC is set when the CPP-TT does not indicate that the clutch is disengaged (clutch pedal pressed) when the engine is cranked.		
Possible Causes:	• Damaged CPP-TT switch • Damaged CPP-TT harness • Open PWRGND circuit to the CPP-TT switch • Vehicle push-started with the clutch engaged (clutch pedal released) • Aftermarket remote starting device		
Diagnostic Aids:	Verify that the vehicle was not push-started with the clutch engaged. Check for aftermarket equipment such as remote starting devices which may bypass the clutch pedal position switch when cranking the engine.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **SPEED CONTROL -- E-SERIES** .		

P0840 - TRANSMISSION FLUID PRESSURE SENSOR/SWITCH A CIRCUIT

P0840 - TRANSMISSION FLUID PRESSURE SENSOR/SWITCH A CIRCUIT

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P09XX - TRANSMISSION CODE

P09XX - TRANSMISSION CODE

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P1000 - ON-BOARD DIAGNOSTIC (OBD) SYSTEMS READINESS TEST NOT COMPLETE

P1000 - ON-BOARD DIAGNOSTIC (OBD) SYSTEMS READINESS TEST NOT COMPLETE

Description:	The OBD monitors are carried out during the OBD drive cycle. This DTC is stored in continuous memory if any of the OBD monitors do not carry out their full diagnostic check.		
Possible Causes:	• The vehicle is new from the factory • Battery or powertrain control module (PCM) had recently been disconnected • An OBD monitor concern occurred before completion of an OBD drive cycle • PCM DTCs have recently been cleared with a scan tool • Power take off (PTO) circuit concern or PTO is on during testing.		
Diagnostic Aids:	This DTC, inspection/maintenance (I/M) readiness function is part of the PCM strategy. A battery disconnection or clearing codes using a scan tool results in the various I/M readiness bits being set to a not-ready condition. As each non-continuous OBD monitor completes a full diagnostic check, the I/M readiness bit associated with that monitor is set to a ready condition. This may take 1 or 2 drive cycles based on whether concerns are detected or not. The readiness bits for comprehensive component monitoring (CCM), misfire and fuel system monitoring are considered complete once all the non-continuous monitors have been evaluated. Because the EVAP system monitor requires certain ambient conditions to run, special logic can bypass the monitor for the purpose of clearing the EVAP and I/M readiness bit, due to continued presence of these extreme conditions. DTC P1000 does not need to be cleared from the PCM except to pass an I/M test. The malfunction indicator lamp (MIL) flashes after a period of time with the key in the RUN position (engine not running) if DTC P1000 is set.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	See Note 2	See Note 2	refer to **PINPOINT TEST QC** .

P1001 - KEY ON ENGINE RUNNING (KOER) NOT ABLE TO COMPLETE, KOER ABORTED

P1001 - KEY ON ENGINE RUNNING (KOER) NOT ABLE TO COMPLETE, KOER ABORTED

Description:	This non-malfunction indicator lamp (MIL) DTC is set when the KOER self-test does not complete in the time allowed.		
Possible Causes:	• Incorrect self-test procedure • Unexpected response from the self-test monitors • RPM out of specification		
Diagnostic Aids:	Carry out the KOEO self-test. Refer to the **SYMPTOM CHARTS** article, Powertrain Control Module (PCM) Quick Test.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the		

	DTC.

P1100 - MASS AIR FLOW (MAF) SENSOR CIRCUIT INTERMITTENT

P1100 - MASS AIR FLOW (MAF) SENSOR CIRCUIT INTERMITTENT

Description:	The MAF sensor circuit is monitored by the powertrain control module (PCM) for sudden voltage (or air flow) input change through the comprehensive component monitor (CCM). If during the last 40 warm-up cycles in key on, engine running (KOER) the PCM detects a voltage (or air flow) change beyond the minimum or maximum calibrated limit, a continuous memory DTC is stored.		
Possible Causes:	• Poor continuity through the MAF sensor connectors • Poor continuity through the MAF sensor harness • Intermittent open or short inside the MAF sensor		
Diagnostic Aids:	While accessing the MAF PID on the scan tool, lightly tap on the MAF sensor or wiggle the MAF sensor connector and harness. If the MAF PID suddenly changes below 0.23 volt or above 4.60 volts, an intermittent fault is indicated.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DC** .		

P1101 - MASS AIR FLOW (MAF) SENSOR OUT OF SELF-TEST RANGE

P1101 - MASS AIR FLOW (MAF) SENSOR OUT OF SELF-TEST RANGE

Description:	The MAF sensor circuit is monitored by the powertrain control module (PCM) for an out of range air flow (or voltage) input. If, during key on engine off (KOEO), the air flow voltage signal is greater than 0.27 volt the test fails. Likewise, if, during key on engine running (KOER), the air flow voltage signal is not within 0.46 volt to 2.44 volts, the test fails.		
Possible Causes:	• Low battery charge • MAF sensor partially connected • MAF sensor contamination • PWR GND open to the MAF sensor • MAF RTN circuit open to PCM • Damaged MAF sensor		
Diagnostic Aids:	A MAF PID reading greater than 0.27 volt (KOEO) or a MAF PID reading outside the 0.46 volt to 2.44 volts range (KOER) indicates a hard fault.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DC** .	refer to **PINPOINT TEST DC** .	-

P1112 - INTAKE AIR TEMPERATURE (IAT) CIRCUIT INTERMITTENT

P1112 - INTAKE AIR TEMPERATURE (IAT) CIRCUIT INTERMITTENT

Description:	Indicates the IAT sensor signal was intermittent.		
Possible Causes:	• Damaged harness • Damaged sensor • Damaged harness connector		
Diagnostic Aids:	Monitor the IAT on a scan tool. Look for sudden changes in the reading when the harness is wiggled or the sensor is tapped.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST DA** .

P1114 - INTAKE AIR TEMPERATURE 2 (IAT2) CIRCUIT LOW (SUPERCHARGED/TURBOCHARGED ENGINES)

P1114 - INTAKE AIR TEMPERATURE 2 (IAT2) CIRCUIT LOW (SUPERCHARGED/TURBOCHARGED ENGINES)

Description:	Indicates the sensor signal is less than the self-test minimum. The IAT2 sensor minimum is 0.2 volt.		
Possible Causes:	• Grounded circuit in the harness • Incorrect harness connection • Damaged sensor		
Diagnostic Aids:	Monitor the IAT2 PID value. A typical IAT2 temperature should be greater than the IAT1 temperature.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DU** .		

P1115 - INTAKE AIR TEMPERATURE 2 (IAT2) CIRCUIT HIGH (SUPERCHARGED/TURBOCHARGED ENGINES)

P1115 - INTAKE AIR TEMPERATURE 2 (IAT2) CIRCUIT HIGH (SUPERCHARGED/TURBOCHARGED ENGINES)

Description:	Indicates the sensor signal is greater than the self-test maximum. The IAT2 sensor maximum is 4.6 volts.
Possible Causes:	• Open circuit in the harness • Sensor signal short to voltage • Incorrect harness connection • Damaged sensor
Diagnostic Aids:	Monitor the IAT2 PID value. A typical IAT2 temperature should be greater than the IAT1 temperature.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	refer to **PINPOINT TEST DU** .		

P1116 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR OUT OF SELF-TEST RANGE

P1116 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR OUT OF SELF-TEST RANGE

Description:	Indicates the ECT sensor is out of self-test range. The correct range is 0.3 to 3.7 volts.		
Possible Causes:	• Overheating condition • Malfunctioning thermostat • Damaged ECT sensor • Low engine coolant • Damaged harness connector		
Diagnostic Aids:	The ECT must be greater than 10°C (50°F) to pass the key on engine off (KOEO) self-test and greater than 82°C (180°F) to pass the key on engine running (KOER) self-test.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles with only a (CHT) sensor	refer to **PINPOINT TEST DL** .	refer to **PINPOINT TEST DL** .	-
All others	refer to **PINPOINT TEST DX** .	refer to **PINPOINT TEST DX** .	-

P1117 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR CIRCUIT INTERMITTENT

P1117 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR CIRCUIT INTERMITTENT

Description:	Indicates the ECT circuit became intermittently open or shorted while the engine was running.		
Possible Causes:	• Damaged harness • Damaged sensor • Damaged harness connector • Low engine coolant		
Diagnostic Aids:	Monitor the ECT on a scan tool. Look for sudden changes in the reading when the harness is wiggled or the sensor is tapped.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST DX** .

P1120 - THROTTLE POSITION SENSOR A OUT OF RANGE LOW (RATCH TOO LOW)

P1120 - THROTTLE POSITION SENSOR A OUT OF RANGE LOW (RATCH TOO LOW)

Description:	The throttle position (TP) sensor circuit is monitored by the powertrain control module (PCM) for a low TP rotation angle or voltage input below the closed throttle position through the comprehensive component monitor (CCM). The test fails if the TP rotation angle or voltage remains within the calibrated self-test range, but falls between 3.42-9.85% (0.17-0.49 volt).		
Possible Causes:	• TP circuit with frayed wires • Corrosion or loose connection on the TP circuit connectors and pins • VREF open to TP sensor • VREF short to SIG RTN		
Diagnostic Aids:	A TP PID between 3.42-9.85% (0.17-0.49 volt) in key ON, engine OFF or key ON, engine running indicates a concern is present.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DH** .		

P1124 - THROTTLE POSITION SENSOR A OUT OF SELF-TEST RANGE

P1124 - THROTTLE POSITION SENSOR A OUT OF SELF-TEST RANGE

For Vehicles With Electronic Throttle Control (ETC)			
Description:	During key on engine off (KOEO) and key on engine running (KOER) self-tests, the powertrain control module (PCM) monitors the electronic throttle control (ETC) throttle position (TP) sensor inputs to determine if the TP1 and TP2 signals are less than an expected value. If either TP1 or TP2 is greater than the expected value, the DTC is set.		
Possible Causes:	• Accelerator pedal applied during KOEO or KOER self-test		
Diagnostic Aids:	Repeat the self-test without applying the accelerator pedal. Make sure the floor mat is not interfering with the accelerator pedal. Diagnose any TP circuit DTCs first.		
For All Others			
Description:	The throttle position (TP) sensor circuit is monitored by the powertrain control module (PCM) for an out of range TP rotation angle or voltage input. The test fails if the TP rotation angle or voltage reading is less than 13.27% (0.66 volt) or greater than 23.52% (1.17 volts).		
Possible Causes:	• Binding or bent throttle linkage • TP sensor not seated properly • Throttle plate below closed throttle position • Throttle plate/screw misadjusted • Damaged TP sensor		
Diagnostic Aids:	The TP PID reading not between 13.27-23.52% (0.66-1.17 volts) in key ON, engine OFF or key ON, engine running indicates a concern is present.		
Application	**Key On Engine Off**	**Key On Engine**	**Continuous Memory**

			Running	
Vehicles With Electronic Throttle Control (ETC)		refer to **PINPOINT TEST DV** .	refer to **PINPOINT TEST DV** .	-
All others		refer to **PINPOINT TEST DH** .	refer to **PINPOINT TEST DH** .	-

P1127 - EXHAUST TEMPERATURE OUT OF RANGE, O2 SENSOR TESTS NOT COMPLETED

P1127 - EXHAUST TEMPERATURE OUT OF RANGE, O2 SENSOR TESTS NOT COMPLETED

Description:	The heated oxygen sensor (HO2S) monitor uses an exhaust temperature model to determine when the HO2S heaters are cycled ON. The test fails when the inferred exhaust temperature is below a minimum calibrated value.		
Possible Causes:	• Engine not operating long enough prior to carrying out the key on engine running (KOER) self-test • Exhaust system too cool		
Diagnostic Aids:	Monitor the HO2S heater PIDs to determine their ON/OFF state. DTC P1127 is present if the exhaust is not hot.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Sable PZEV, Taurus PZEV, Taurus X PZEV	-	refer to **PINPOINT TEST DZ** .	-
All others	-	refer to **PINPOINT TEST DW** .	-

P115E - THROTTLE ACTUATOR CONTROL (TAC) THROTTLE BODY AIR FLOW TRIM AT MAX LIMIT

P115E - THROTTLE ACTUATOR CONTROL (TAC) THROTTLE BODY AIR FLOW TRIM AT MAX LIMIT

Description:	During idle, the powertrain control module (PCM) monitors the throttle angle and air flow. If the air flow is determined to be less than expected, the PCM adjusts the throttle angle to compensate. The air flow reduction is typically the result of engine deposit buildup around the throttle plate. This DTC indicates the PCM has reached the maximum allowed compensation and is no longer able to compensate for the buildup.		
Possible Causes:	• Engine deposits around the throttle plate		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Install a new throttle body. Refer to the **FUEL SYSTEM - GENERAL INFORMATION - GASOLINE AND DIESEL -- E-SERIES** .		

P117A - ENGINE OIL OVER TEMPERATURE - FORCED LIMITED POWER

P117A - ENGINE OIL OVER TEMPERATURE - FORCED LIMITED POWER

Description:	Indicates the engine oil protection strategy is enabled when the engine oil temperature (EOT) reaches a predetermined level in the powertrain control module (PCM). The PCM then limits the engine RPMs until the EOT returns to normal.		
Possible Causes:	• Engine overheating • Low engine coolant • Loaded weight is greater than the maximum vehicle weight rating. Refer to Owner's Literature for vehicle weight ratings.		
Diagnostic Aids:	This DTC is an informational DTC and may be set by an engine overheating concern. If the engine overheats, check the cooling system. Refer to the **ENGINE COOLING -- E-SERIES** for cooling system diagnosis.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

P1184 - ENGINE OIL TEMPERATURE (EOT) SENSOR OUT OF SELF-TEST RANGE

P1184 - ENGINE OIL TEMPERATURE (EOT) SENSOR OUT OF SELF-TEST RANGE

Description:	Indicates the EOT signal was out of self-test range.		
Possible Causes:	• Damaged harness • Damaged sensor • Damaged harness connector		
Diagnostic Aids:	The engine should be at operating temperature before carrying out the self-test.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DY** .		

P1227 - WASTEGATE FAILED CLOSED (OVER PRESSURE)

P1227 - WASTEGATE FAILED CLOSED (OVER PRESSURE)

Description:	Indicates that boost pressure is continuously higher than desired.
Possible Causes:	• EGR valve • MAF sensor • SIP sensor • Supercharger bypass actuator stuck closed • Supercharger
	This DTC is informational only and it may be accompanied by other

Diagnostic Aids:	DTCs. Diagnose other DTCs first.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST KJ** .

P1228 - WASTEGATE FAILED OPEN (UNDER PRESSURE)

P1228 - WASTEGATE FAILED OPEN (UNDER PRESSURE)

Description:	Indicates that boost pressure is continuously lower than desired.		
Possible Causes:	• EGR valve • MAF sensor • SIP sensor • Supercharger bypass actuator stuck open • Supercharger		
Diagnostic Aids:	This DTC is informational only and it may be accompanied by other DTCs. Diagnose other DTCs first.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST KJ** .

P1229 - CHARGE AIR COOLER (CAC) PUMP DRIVER

P1229 - CHARGE AIR COOLER (CAC) PUMP DRIVER

Description:	This DTC sets when the powertrain control module (PCM) commands the supercharger CAC pump to operate but no current is detected.		
Possible Causes:	• CAC pump motor open circuit • CAC pump relay coil open • Open circuit between the relay and pump • CAC pump motor shorted • Open circuit between the PCM and the relay • Poor CAC pump ground connection		
Diagnostic Aids:	Check for voltage at the relay. Check the fuse in the voltage circuit. Check the ground connection of the CAC pump motor.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KP** .		

P1233 - FUEL PUMP DRIVER MODULE DISABLED OR OFF LINE

P1233 - FUEL PUMP DRIVER MODULE DISABLED OR OFF LINE

Description:	The powertrain control module (PCM) monitors the fuel pump monitor (FPM) circuit from the fuel pump driver module (FPDM). With the key ON, engine OFF or key ON, engine running the FPDM continuously sends a duty cycle signal to the PCM through the FPM circuit. The test fails if the PCM stops receiving the duty cycle signal.		
Possible Causes:	• Inertia fuel shutoff (IFS) switch needs to be reset • Open FPDM ground circuit • Open circuit to FPDM PWR RLY • Open FPDM PWR circuit • Open or short FPM circuit (engine should start) • Damaged IFS switch • Damaged FPDM PWR RLY • Damaged FPDM		
Diagnostic Aids:	The PCM expects to see one of the following duty cycle signals from the FPDM on the FPM circuit: 1) 50% (500 ms on, 500 ms off), all OK. 2) 25% (250 ms on, 750 ms off), FPDM did not receive a fuel pump (FP) duty cycle command from the PCM, or the duty cycle that was received was invalid. 3) 75% (750 ms on, 250 off), the FPDM detected a concern in the circuits between the FPDM and the fuel pump.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KB** .		

P1234 - FUEL PUMP DRIVER MODULE DISABLED OR OFF LINE

P1234 - FUEL PUMP DRIVER MODULE DISABLED OR OFF LINE

Description:	The powertrain control module (PCM) monitors the fuel pump monitor 2 (FPM2) circuit from the fuel pump driver module 2 (FPDM2). With the key ON, engine OFF or key ON, engine running the FPDM2 continuously sends a duty cycle signal to the PCM through the FPM2 circuit. The test fails if the PCM stops receiving the duty cycle signal.
Possible Causes:	• Inertia fuel shutoff (IFS) switch needs to be reset • Open FPDM2 ground circuit • Open circuit to FPDM2 PWR RLY • Open FPDM2 PWR circuit • Open or short FPM2 circuit (engine should start) • Damaged IFS switch • Damaged FPDM2 PWR RLY • Damaged FPDM2
Diagnostic Aids:	The PCM expects to see one of the following duty cycle signals from the FPDM2 on the FPM2 circuit: 1) 50% (500 ms on, 500 ms off), all OK. 2) 25% (250 ms on, 750 ms off), the FPDM2 did not receive a fuel pump

	(FP) duty cycle command from the PCM, or the duty cycle that was received was invalid. 3) 75% (750 ms on, 250 off), the FPDM2 detected a concern in the circuits between the FPDM2 and the fuel pump.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KB** .		

P1235 - FUEL PUMP CONTROL OUT OF RANGE

P1235 - FUEL PUMP CONTROL OUT OF RANGE

Description:	This DTC indicates the fuel pump driver module (FPDM) detected an invalid or missing fuel pump (FP) duty cycle signal on the fuel pump control (FPC) circuit from the powertrain control module (PCM). The FPDM sends a message to the PCM through the fuel pump monitor (FPM) circuit, indicating this concern was detected. The PCM sets the DTC when the message is received.		
Possible Causes:	• FPC circuit open or short • Electronic throttle control (ETC) system concern. Check for ETC DTCs • Damaged FPDM • Damaged PCM		
Diagnostic Aids:	The FPDM sends a 25% duty cycle (250 ms on, 750 ms off) through the FPM circuit to the PCM while the concern is being detected by the FPDM. If the concern is no longer detected, the FPDM returns to sending an all OK (50% duty cycle) message to the PCM. For ETC applications, check if ETC DTC P2105 is present. An ETC system concern could cause DTC P1235, and should be diagnosed first.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KB** .		

P1236 - FUEL PUMP CONTROL OUT OF RANGE

P1236 - FUEL PUMP CONTROL OUT OF RANGE

Description:	This DTC indicates the fuel pump driver module 2 (FPDM2) detected an invalid or missing fuel pump (FP) duty cycle signal on the fuel pump control (FPC) circuit from the powertrain control module (PCM). The FPDM2 sends a message to the PCM through the fuel pump monitor 2 (FPM2) circuit, indicating this concern was detected. The PCM sets the DTC when the message is received.
Possible Causes:	• FPC circuit open or short • Damaged FPDM2 • Damaged PCM
	The FPDM2 sends a 25% duty cycle (250 ms on, 750 ms off) through the

Diagnostic Aids:	FPM2 circuit to the PCM while the concern is being detected by the FPDM2. If the concern is no longer detected, the FPDM2 returns to sending an all OK (50% duty cycle) message to the PCM.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KB** .		

P1237 - FUEL PUMP SECONDARY CIRCUIT

P1237 - FUEL PUMP SECONDARY CIRCUIT

Description:	This DTC indicates that the fuel pump driver module (FPDM) detected a fuel pump secondary circuit concern. The FPDM sends a message to the powertrain control module (PCM) through the fuel pump monitor (FPM) circuit indicating this concern was detected. The PCM sets the DTC when the message is received.		
Possible Causes:	• Open or short FP PWR circuit • Open FP RTN circuit to FPDM • Open or short circuit in the fuel pump • Locked fuel pump rotor • Damaged FPDM		
Diagnostic Aids:	The FPDM sends a 75% duty cycle (750 ms on, 250 ms off) through the FPM circuit to the PCM while the concern is being detected by the FPDM. If the concern is no longer detected, the PCM returns to sending an all OK (50% duty cycle) message to the PCM. The FPDM controls pump speed by supplying a variable ground on the FP RTN circuit.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KB** .		

P1238 - FUEL PUMP SECONDARY CIRCUIT

P1238 - FUEL PUMP SECONDARY CIRCUIT

Description:	This DTC indicates the fuel pump driver module (FPDM2) detected a fuel pump secondary circuit concern. The FPDM2 sends a message to the powertrain control module (PCM) through the fuel pump monitor (FPM2) circuit, indicating this concern was detected. The PCM sets the DTC when the message is received.
Possible Causes:	• Open or short FP2PWR circuit • Open FP2RTN circuit to FPDM2 • Open or short circuit in the fuel pump • Locked fuel pump rotor • Damaged FPDM2
	The FPDM2 sends a 75% duty cycle (750 ms on, 250 ms off) through the

Diagnostic Aids:	FPM2 circuit to the PCM while the concern is being detected by the FPDM2. If the concern is no longer detected, the PCM returns to sending an all OK (50% duty cycle) message to the PCM. The FPDM2 controls pump speed by supplying a variable ground on the FP2RTN circuit.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KB** .		

P1244 - ALTERNATOR LOAD HIGH INPUT

P1244 - ALTERNATOR LOAD HIGH INPUT

Description:	The powertrain control module (PCM) monitors generator load from the generator/regulator in the form of frequency. The concern indicates the input is higher than the load should be in normal operation. The load input could be high when a battery short to ground exists.		
Possible Causes:	• GENLI circuit short to voltage • GENRC circuit short to voltage • B+ open prior to start-up • Open GENRC prior to start-up • Open ILC prior to start-up • Damaged PCM		
Diagnostic Aids:	Verify the battery voltage is 14.5 volts. Verify the generator/regulator has the correct part number.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HY** .		

P1245 - ALTERNATOR LOAD LOW INPUT

P1245 - ALTERNATOR LOAD LOW INPUT

Description:	The powertrain control module (PCM) monitors generator load from the generator/regulator in the form of frequency. The concern indicates the input is lower than the load should be in normal operation. The load input could be low when no generator output exists.
Possible Causes:	• GENRC circuit short to ground • GENLI circuit short to ground • Open B+ wire during operation • Low system voltage • Broken generator belt • Damaged generator/regulator assembly • Damaged PCM
Diagnostic Aids:	Verify the battery voltage is 14.5 volts.

	Verify the generator/regulator has the correct part number.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HY** .		

P1246 - ALTERNATOR LOAD INPUT

P1246 - ALTERNATOR LOAD INPUT

Description:	The powertrain control module (PCM) monitors the generator load from the generator/regulator in the form of frequency. The frequency range is determined by the temperature of the voltage regulator, where 97% indicates a full load, and less than 6% indicates no load.		
Possible Causes:	• GENLI circuit shorted to voltage or ground • GENLI circuit open • GENRC circuit shorted to power or ground • GENRC circuit open • ILC circuit shorted to voltage or ground • ILC circuit open • Battery-sense circuit open • Generator drive mechanism • Damaged generator/regulator assembly • Damaged PCM		
Diagnostic Aids:	Verify the battery voltage is 14.5 volts. Verify the generator/regulator has the correct part number.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HY** .		

P1260 - THEFT DETECTED, VEHICLE IMMOBILIZED

P1260 - THEFT DETECTED, VEHICLE IMMOBILIZED

Description:	Indicates the passive anti-theft system (PATS) determined a theft condition existed and the engine is disabled. This DTC is a good indicator to check the PATS for DTCs.		
Possible Causes:	• Previous theft condition • Anti-theft system failure		
Diagnostic Aids:	Theft indicator flashing rapidly or on solid when ignition switch is in the ON position. Check anti-theft system for DTCs.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST QD** .

P1270 - ENGINE RPM OR VEHICLE SPEED LIMITER REACHED

P1270 - ENGINE RPM OR VEHICLE SPEED LIMITER REACHED

Description:	Indicates the vehicle has been operated in a manner which caused the engine or vehicle to exceed a calibration limit. The engine RPM and vehicle speed are continuously monitored and evaluated by the powertrain control module (PCM). The DTC is set when the RPM or vehicle speed falls out of a calibrated range. For additional information on the engine RPM/vehicle speed limiter, refer to**POWERTRAIN CONTROL SOFTWARE** .
Possible Causes:	• Wheel slippage (water, ice, mud, and snow) • Excessive engine RPM in NEUTRAL or operated in the wrong transmission gear • Vehicle driven at a high rate of speed
Diagnostic Aids:	The DTC indicates the vehicle was operated in a manner which caused the engine RPM or vehicle speed to exceed a calibrated limit.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST ND** .

P1285 - CYLINDER HEAD OVER TEMPERATURE CONDITION

P1285 - CYLINDER HEAD OVER TEMPERATURE CONDITION

Description:	Indicates an engine overheat condition was sensed by the cylinder head temperature (CHT) sensor.
Possible Causes:	• Low engine coolant level • Base engine concerns • Engine cooling system concerns • CHT sensor concern
Diagnostic Aids:	On some applications when this fault occurs the engine temperature warning indicator illuminates or forces the temperature gauge to the full H (hot) zone. The warning indicator can be triggered by either grounding the engine temperature warning circuit when wired to the powertrain control module (PCM), or by sending a PCM network message to the instrument cluster (IC).

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DL** .		

P1288 - CYLINDER HEAD TEMPERATURE (CHT) SENSOR OUT OF SELF-TEST RANGE

P1288 - CYLINDER HEAD TEMPERATURE (CHT) SENSOR OUT OF SELF-TEST RANGE

	Indicates the CHT sensor is out of self-test range. The engine is not at a

Description:	normal operating temperature.		
Possible Causes:	• Cold engine • Engine overheating • Damaged harness connector • Low engine coolant level • Damaged CHT sensor		
Diagnostic Aids:	Bring the engine to operating temperature. If cold, repeat the self-test. If the engine overheats, check the cooling system. Refer to the **ENGINE COOLING -- E-SERIES** for cooling system diagnosis.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DL** .		

P1289 - CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT HIGH

P1289 - CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT HIGH

Description:	Indicates a CHT sensor circuit open.		
Possible Causes:	• Open CHT sensor circuit • CHT sensor circuit short to voltage • Damaged CHT sensor • Incorrect harness connection		
Diagnostic Aids:	A CHT V PID reading of greater than 4.6 volts with key ON engine OFF, or during any engine operating mode, indicates a concern is present. Note: DTC P0118 may also be reported when this DTC is set. Either of these DTCs activate the MIL.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DL** .		

P128A - CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT INTERMITTENT/ERRATIC

P128A - CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT INTERMITTENT/ERRATIC

Description:	Indicates the CHT circuit became intermittently open or shorted while the engine was running.		
Possible Causes:	• Damaged harness or connector • Damaged sensor		
Diagnostic Aids:	Monitor the CHT on a scan tool. Look for sudden changes in the reading when the harness is wiggled or the sensor is tapped.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**

All	-	-	refer to **PINPOINT TEST DL** .

P1290 - CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT LOW

P1290 - CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT LOW

Description:	Indicates a CHT sensor circuit short to ground.		
Possible Causes:	• Grounded circuit in CHT harness • Damaged CHT sensor • Incorrect harness connection		
Diagnostic Aids:	A CHT V PID value reading of less than 0.2 volt with key ON engine OFF, or during any engine operating mode, indicates a concern is present. DTC P0117 may also be reported when this DTC is set. Either of these DTCs activates the malfunction indicator lamp (MIL).		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DL** .		

P1299 - CYLINDER HEAD OVER TEMPERATURE PROTECTION ACTIVE

P1299 - CYLINDER HEAD OVER TEMPERATURE PROTECTION ACTIVE

Description:	Indicates an engine overheat condition was detected by the cylinder head temperature (CHT) sensor. A failure mode effects management (FMEM) strategy called fail-safe cooling was activated to cool the engine.		
Possible Causes:	• Engine cooling system concerns • Low engine coolant level • Base engine concerns		
Diagnostic Aids:	Refer to**POWERTRAIN CONTROL SOFTWARE** , for more information on the fail-safe cooling strategy and cylinder head temperature sensor.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DL** .		

P1336 - CRANKSHAFT/CAMSHAFT SENSOR RANGE/PERFORMANCE

P1336 - CRANKSHAFT/CAMSHAFT SENSOR RANGE/PERFORMANCE

Description:	The input signal to the powertrain control module (PCM) from the crankshaft position (CKP) sensor or the camshaft position (CMP) sensor is erratic.
Possible Causes:	• Damaged CKP sensor • Damaged CMP sensor • Base engine concerns

Diagnostic Aids:	• Harness concerns Check the harness for routing, alterations, incorrect shielding, or electrical interference from other systems.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST JD** .

P1397 - SYSTEM VOLTAGE OUT OF SELF -TEST RANGE

P1397 - SYSTEM VOLTAGE OUT OF SELF -TEST RANGE

Description:	This DTC indicates that the 12-volt system voltage is too high or too low during the key on engine off (KOEO) or key on engine running (KOER) self-test. It sets if the system voltage falls below or exceeds the calibrated threshold at any time during the KOEO or KOER self-test.		
Possible Causes:	• Battery or charging system concern.		
Diagnostic Aids:	Make sure the battery voltage is between 11 and 18 volts before running a KOEO or KOER self-test.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **GENERATOR AND REGULATOR -- E-SERIES** to diagnose the battery is discharged or battery voltage is low symptom or the charging system overcharges (battery voltage is greater than 15.5 volts) symptom.		

P1405 - DIFFERENTIAL PRESSURE FEEDBACK SENSOR UPSTREAM HOSE OFF OR PLUGGED

P1405 - DIFFERENTIAL PRESSURE FEEDBACK SENSOR UPSTREAM HOSE OFF OR PLUGGED

Description:	While driving, the exhaust gas recirculation (EGR) monitor commands the EGR valve closed and checks the differential pressure across the EGR orifice. The test fails when the signal from the differential pressure feedback EGR sensor indicates EGR flow is in the negative direction.		
Possible Causes:	• The upstream hose is disconnected • The upstream hose is plugged (ice) • Plugged or damaged EGR tube		
Diagnostic Aids:	Look for signs of water or icing in the hose. Verify the hose connection and routing (no excessive dips). Check the differential pressure feedback EGR sensor for correct mounting and function. View the DPFEGR PID while applying and releasing vacuum directly to the sensor with a hand pump.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST HE** .	refer to **PINPOINT TEST HE** .

P1406 - DIFFERENTIAL PRESSURE FEEDBACK SENSOR DOWNSTREAM HOSE OFF OR PLUGGED

P1406 - DIFFERENTIAL PRESSURE FEEDBACK SENSOR DOWNSTREAM HOSE OFF OR PLUGGED

Description:	While driving, the exhaust gas recirculation (EGR) monitor commands the EGR valve closed and checks the differential pressure across the EGR orifice. The test fails when the signal from the differential pressure feedback EGR sensor continues to indicate EGR flow even after the EGR valve is commanded closed.		
Possible Causes:	• Downstream hose is disconnected • Downstream hose is plugged (ice) • Plugged or damaged EGR tube		
Diagnostic Aids:	Look for signs of water or icing in the hose. Verify the hose connection and routing (no excessive dips). Check the differential pressure feedback EGR sensor for correct mounting and function. View the DPFEGR PID while applying and releasing vacuum directly to the sensor with a hand pump.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HE** .		

P1408 - EXHAUST GAS RECIRCULATION (EGR) FLOW OUT OF SELF-TEST RANGE (NON-MIL)

P1408 - EXHAUST GAS RECIRCULATION (EGR) FLOW OUT OF SELF-TEST RANGE (NON-MIL)

Description:	This test is carried out during the key on engine running (KOER) on-demand self-test only. The EGR system is commanded on at a fixed engine speed. The test does not pass and the DTC is set when the measured EGR flow falls above or below the required calibration.		
Possible Causes:	• For electric EGR (EEGR) system, see possible causes for DTC P0400. • For vacuum activated systems, see the possible causes for DTC P0401.		
Diagnostic Aids:	For EEGR, use the output state control function of the scan tool and monitor the manifold absolute pressure (MAP) PID and the EEGR PID (EGRMDSD) while commanding the EEGR on. If EGR is introduced into the engine at idle, the RPM drops or stalls out. For vacuum systems see diagnostic aids for DTC P0401.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles With an Electric EGR (EEGR)	-	refer to **PINPOINT TEST KD** .	-
Vehicles with an EGR system module (ESM)	-	refer to **PINPOINT TEST HH** .	-
		refer to **PINPOINT TEST**	

All others		-	**HE** .	-

P1409 - EXHAUST GAS RECIRCULATION (EGR) VACUUM REGULATOR SOLENOID CIRCUIT

P1409 - EXHAUST GAS RECIRCULATION (EGR) VACUUM REGULATOR SOLENOID CIRCUIT

Description:	This test checks the electrical function of the EGR vacuum regulator solenoid. The test fails when the EVR circuit voltage is either too high or too low when compared to the expected voltage range. The EGR system must be enabled for the test to be completed.			
Possible Causes:	• EVR circuit open • EVR circuit short to voltage or ground • VPWR open to EGR vacuum regulator solenoid • Damaged EGR vacuum regulator solenoid			
Diagnostic Aids:	The EGR vacuum regulator solenoid resistance is between 26 and 40 ohms.			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles with an EGR system module (ESM)		refer to **PINPOINT TEST HH** .		
All others		refer to **PINPOINT TEST HE** .		

P1436 - A/C EVAPORATOR AIR TEMPERATURE CIRCUIT LOW

P1436 - A/C EVAPORATOR AIR TEMPERATURE CIRCUIT LOW

Description:	Indicates the A/CET signal input was less than the self-test minimum. The self-test minimum is 0.13 volts.			
Possible Causes:	• A/CET circuit short to ground or SIG RTN • Damaged A/CET sensor			
Diagnostic Aids:	The powertrain control module (PCM) sources a low current 5 volt reference on the A/CET circuit (this voltage can be measured with the sensor disconnected). As the A/C evaporator air temperature changes, the A/CET circuit resistance to SIG RTN (ground) changes (which changes the voltage the PCM detects). When the A/CET signal is detected below the self-test minimum, check for shorts to SIG RTN or ground which would pull the voltage low.			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All		refer to **PINPOINT TEST DJ** .		

P1437 - A/C EVAPORATOR AIR TEMPERATURE CIRCUIT HIGH

P1437 - A/C EVAPORATOR AIR TEMPERATURE CIRCUIT HIGH

Description:	Indicates the A/CET signal input was greater than the self-test minimum. The self-test maximum is 4.5 volts.

Possible Causes:	• A/CET circuit open • SIG RTN circuit open to A/CET sensor • A/CET circuit short to voltage (VREF) • Damaged A/CET sensor		
Diagnostic Aids:	The powertrain control module (PCM) sources a low current 5 volt reference on the A/CET circuit (this voltage can be measured with the sensor disconnected). As the A/C evaporator air temperature changes, the A/CET circuit resistance to SIG RTN (ground) changes (which changes the voltage the PCM detects). When the A/CET signal is detected above the self-test maximum, check for open circuits (A/CET or SIG RTN), which would cause the voltage to remain high. Although not as probable, also check for a short to voltage (VREF).		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DJ** .		

P144A - EVAPORATIVE EMISSION SYSTEM PURGE VAPOR LINE RESTRICTED/BLOCKED

P144A - EVAPORATIVE EMISSION SYSTEM PURGE VAPOR LINE RESTRICTED/BLOCKED

Description:	The powertrain control module (PCM) monitors the evaporative emission (EVAP) system for a blocked fuel vapor tube between the fuel tank pressure (FTP) sensor and the fuel tank. During the initial phase of the EVAP monitor, the PCM closes the canister vent and a vacuum develops in the fuel vapor tubes and lines and in the fuel tank. The PCM monitors the FTP sensor to determine the amount of vacuum and how quickly the vacuum increases. The rate at which the vacuum increases is compared to an expected value. If the vacuum increases quicker than expected, a blocked fuel vapor tube is suspected and an intrusive test is carried out in the final phase of the EVAP monitor. If the intrusive test confirms a blockage a counter is increments and once the counter reaches a calibrated number of completions, the DTC is set.		
Possible Causes:	• Blocked fuel vapor tube between the FTP sensor and the fuel tank		
Diagnostic Aids:	Check the fuel vapor tube for blockage between the fuel tank pressure FTP sensor and the fuel tank.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HX** .

P1450 - UNABLE TO BLEED UP FUEL TANK VACUUM

P1450 - UNABLE TO BLEED UP FUEL TANK VACUUM

Description:	Monitors the fuel vapor vacuum and pressure in the fuel tank. System failure occurs when the evaporative emission (EVAP) running loss monitor detects excessive fuel tank vacuum with the engine running, but

Possible Causes:	not at idle. • Blockages or kinks in the EVAP canister tube or EVAP canister purge outlet tube between the fuel tank, the EVAP canister purge valve and the EVAP canister • Fuel filler cap stuck closed, preventing vacuum relief • Capless fuel tank filler pipe damaged, preventing vacuum relief (if equipped) • Contaminated fuel vapor elbow on the EVAP canister • Restricted EVAP canister • CV solenoid stuck partially or fully open • Plugged CV solenoid filter • EVAP canister purge valve stuck open • VREF circuit open in the harness near the fuel tank pressure (FTP) sensor, the FTP sensor or the powertrain control module (PCM) • Damaged FTP sensor		
Diagnostic Aids:	Visually inspect the EVAP canister inlet port, CV solenoid filter, and canister vent hose assembly for contamination or debris. Check EVAP canister purge valve for vacuum leak.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HX** .

P1451 - EVAPORATIVE EMISSION SYSTEM VENT CONTROL CIRCUIT

P1451 - EVAPORATIVE EMISSION SYSTEM VENT CONTROL CIRCUIT

Description:	Monitors the canister vent (CV) solenoid circuit for an electrical failure. The test fails when the signal moves outside the minimum or maximum allowable calibrated parameters for a specified canister vent duty cycle by powertrain control module (PCM) command.		
Possible Causes:	• VPWR circuit open • CV solenoid circuit short to PWR GND or CHASSIS GND • Damaged CV solenoid • CV solenoid circuit open • CV solenoid circuit short to VPWR		
Diagnostic Aids:	To verify normal functioning, monitor the evaporative emission (EVAP) CV solenoid signal PID EVAPCV and the signal voltage on the PCM control side. With the valve open, the EVAPCV PID indicates 0% duty cycle and a voltage approximately equal to battery voltage. When the valve is commanded fully closed, the EVAPCV PID indicates 100% duty cycle, and a minimum voltage drop of 4 volts is normal. Output test mode may be used to switch the output on and off to verify function.		

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	refer to **PINPOINT TEST HX** .		

P145E - PCV HEATER CONTROL B CIRCUIT

P145E - PCV HEATER CONTROL B CIRCUIT

Description:	This DTC sets when the powertrain control module (PCM) detects a positive crankcase ventilation (PCV) heater circuit failure.		
Possible Causes:	• Open or shorted PCV circuit • Damaged PCV heater assembly		
Diagnostic Aids:	Make sure the PCV valve is correct for the engine application and the PCV heater connector is properly connected.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HG** .	-	-

P1460 - WIDE OPEN THROTTLE A/C CUTOUT CIRCUIT

P1460 - WIDE OPEN THROTTLE A/C CUTOUT CIRCUIT

Description:	Monitors the A/CCR circuit output from the powertrain control module (PCM). The test fails when the PCM grounds the A/CCR circuit, excessive current draw is detected on the A/CCR circuit; or, with the A/CCR circuit not grounded by the PCM, voltage is not detected on the A/CCR circuit (the PCM expects to detect VPWR voltage coming through the A/CCR relay coil to the A/CCR circuit).		
Possible Causes:	• Open or short A/CCR circuit • Damaged A/CCR relay • Open VPWR circuit to the A/CCR relay		
Diagnostic Aids:	The A/CCR control circuit can be monitored using the WACF and WAC PID. When the WACF PID reads YES, a concern is present. An open circuit or short to ground can only be detected when the PCM is not grounding the circuit. A short to voltage can only be detected when the PCM is grounding the circuit. During the key ON engine OFF (KOEO) and the key OFF engine running (KOER) self-test, the WAC circuit is cycled on and off. Verify the A/C and the defrost were off during KOEO and KOER self-test (Check the A/CCS PID to verify). If the vehicle is not equipped with A/C, ignore DTC P1460.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**

All		refer to **PINPOINT TEST KM** .

P1461 - A/C PRESSURE SENSOR CIRCUIT HIGH

P1461 - A/C PRESSURE SENSOR CIRCUIT HIGH

Description:	The A/CP sensor inputs a voltage to the PCM. If the voltage is above a calibrated level the DTC sets.		
Possible Causes:	• A/CP sensor circuit short to PWR • A/CP circuit open • A/CP circuit short to VREF • Damaged A/CP sensor		
Diagnostic Aids:	Verify a VREF voltage between 4 and 6 volts.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DS** .		

P1462 - AIR CONDITIONING PRESSURE (A/CP) SENSOR LOW VOLTAGE DETECTED

P1462 - AIR CONDITIONING PRESSURE (A/CP) SENSOR LOW VOLTAGE DETECTED

Description:	The A/CP sensor inputs a voltage to the powertrain control module (PCM). If the voltage is below the calibrated level the DTC sets. The A/CP sensor inputs a voltage to the PCM. If the voltage is below the calibrated level the DTC sets.		
Possible Causes:	• A/CP circuit short to GND or SIGRTN • VREF circuit open • Open A/CP circuit • Damaged A/CP sensor		
Diagnostic Aids:	Verify a VREF voltage between 4 and 6 volts.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DS** .		

P1463 - AIR CONDITIONING PRESSURE SENSOR (A/CP) INSUFFICIENT PRESSURE CHANGE

P1463 - AIR CONDITIONING PRESSURE SENSOR (A/CP) INSUFFICIENT PRESSURE CHANGE

Description:	Each time the A/C clutch engages, the powertrain control module (PCM) is looking for a pressure change in the refrigerant. If the change in pressure is outside of the calibration the DTC sets.
Possible Causes:	• A/C system mechanical failure • Open ACP or VREF circuit • A/C sensor damaged • A/C system electrical failure

	• A/C clutch always engaged			
Diagnostic Aids:	Verify the A/C system function, including refrigerant charge. Refer to the **CLIMATE CONTROL -- E-SERIES** .			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All		-	-	refer to **PINPOINT TEST DS** .

P1464 - A/C DEMAND OUT OF SELF-TEST RANGE

P1464 - A/C DEMAND OUT OF SELF-TEST RANGE

Description:	The diagnostic trouble code (DTC) sets when the powertrain control module (PCM) receives a request for A/C during the self-test.			
Possible Causes:	• A/C or defrost on during self-test • A/CCS circuit short to voltage • Damaged A/C demand switch • Damaged WAC relay			
Diagnostic Aids:	If the A/C or defrost was on during self-test, turn the A/C or defrost off and repeat the self-test. An A/C request to the PCM may come through the communication link or on a dedicated hardwire circuit from the A/C switch.			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All		refer to **PINPOINT TEST KM** .	refer to **PINPOINT TEST KM** .	-

P1469 - RAPID A/C CYCLING

P1469 - RAPID A/C CYCLING

Description:	Indicates frequent A/C compressor clutch cycling.			
Possible Causes:	• Mechanical A/C system concern (such as low refrigerant charge, damaged A/C cycling switch) • Intermittent open between the cycling pressure switch and the powertrain control module (PCM) • Intermittent open in the IGN RUN circuit to cycling pressure switch (if applicable)			
Diagnostic Aids:	This test is designed to protect the transmission. In some strategies, the PCM unlocks the torque converter during A/C clutch engagement. If a concern is present that results in frequent A/C clutch cycling, damage could occur if the torque converter is cycled at these intervals. This test detects this condition, sets the DTC and prevents the torque converter from excessive cycling.			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**

All		-	-	refer to **PINPOINT TEST KM** .

P1474 - FAN CONTROL PRIMARY CIRCUIT

P1474 - FAN CONTROL PRIMARY CIRCUIT

Description:	Monitors the LFC primary circuit output from the powertrain control module (PCM). The test fails if the PCM grounds the LFC circuit, excessive current draw is detected on the LFC circuit, or with the LFC circuit not grounded by the PCM, voltage is not detected on the LFC circuit (the PCM expects to detect VPWR voltage coming through the low speed FC relay coil to the LFC circuit).			
Possible Causes:	• Open or short LFC circuit • Open VPWR circuit to the low speed FC relay • Damaged low speed FC relay			
Diagnostic Aids:	When the LFCF PID reads YES, a concern is currently present. An open circuit or short to ground can only be detected when the PCM is not grounding the LFC circuit. A short to voltage can only be detected when the PCM is grounding the LFC circuit. During the key on engine off (KOEO) and key on engine running (KOER) self-test, the LFC circuit is cycled on and off.			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All		refer to **PINPOINT TEST KF** .		

P1477 - ADDITIONAL FAN RELAY CIRCUIT

P1477 - ADDITIONAL FAN RELAY CIRCUIT

Description:	Monitors the MFC primary circuit output from the powertrain control module (PCM). The test fails if the MFC output commanded on (grounded), excessive current draw is detected on the MFC circuit or, with the MFC circuit commanded off, voltage is not detected on the MFC circuit (the PCM expects to detect IGN START/RUN voltage through the medium speed FC relay coil to the MFC circuit).
Possible Causes:	• Open or short MFC circuit • Open IGN START/RUN circuit to the medium speed FC relay • Damaged medium speed FC relay
Diagnostic Aids:	When the MFCF PID reads YES, a concern is currently present. An open circuit or short to ground can only be detected when the PCM is not grounding the MFC circuit. A short to voltage can only be detected when the PCM is grounding the MFC circuit. During the key on engine off (KOEO) and key on engine running (KOER) self-test, the MFC circuit is cycled on and off.

	When using output test mode on a scan tool, and commanding the low speed fan on, the PCM also activates the medium speed fan output.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KF** .		

P1479 - HIGH FAN CONTROL PRIMARY CIRCUIT

P1479 - HIGH FAN CONTROL PRIMARY CIRCUIT

Description:	Monitors the HFC primary circuit output from the powertrain control module (PCM). The test fails if the HFC output commanded on (grounded), excessive current draw is detected on the HFC circuit or, with the HFC circuit commanded off, voltage is not detected on the HFC circuit (the PCM expects to detect VPWR voltage through the high speed FC relay coil to the HFC circuit).		
Possible Causes:	• Open or short HFC circuit • Open VPWR circuit to the high speed FC relay • Damaged high speed FC relay		
Diagnostic Aids:	When the HFCF PID reads YES, a concern is currently present. An open circuit or short to ground can only be detected when the PCM is not grounding the HFC circuit. A short to voltage can only be detected when the PCM is grounding the HFC circuit. During the key on engine off (KOEO) and key on engine running (KOER) self-test, the HFC circuit is cycled on and off.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KF** .		

P1489 - PCV HEATER CONTROL CIRCUIT

P1489 - PCV HEATER CONTROL CIRCUIT

Description:	This DTC sets when the powertrain control module (PCM) detects a positive crankcase ventilation (PCV) heater circuit failure.		
Possible Causes:	• Open or shorted PCV circuit • Damaged PCV heater assembly		
Diagnostic Aids:	Make sure the PCV valve is correct for the engine application and the PCV heater connector is properly connected.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HG** .		

P1500 - VEHICLE SPEED SENSOR (VSS)

P1500 - VEHICLE SPEED SENSOR (VSS)

Description:	Indicates the VSS input signal was intermittent. This DTC is set when a VSS concern interferes with other on-board diagnostics (OBD) tests, such as the catalyst efficiency monitor, the EVAP monitor or the HO2S monitor.		
Possible Causes:	• Intermittent VSS connections • Intermittent open in the VSS harness circuit(s) • Intermittent short in VSS harness circuit(s) • Damaged VSS		
Diagnostic Aids:	Check the wiring, connector, and sensor for damage.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
F-Super Duty	refer to **PINPOINT TEST DF** .		
Expedition, Navigator, Sable, Taurus, Taurus X	The powertrain control module (PCM) uses information from the anti-lock brake system (ABS) module and the transmission control module (TCM) to calculate vehicle speed. Check these modules for DTCs.		
All others	refer to **PINPOINT TEST DP** .		

P1501 - VEHICLE SPEED SENSOR (VSS) OUT OF SELF-TEST RANGE

P1501 - VEHICLE SPEED SENSOR (VSS) OUT OF SELF-TEST RANGE

Description:	Indicates the VSS input signal is out of self-test range. If the powertrain control module (PCM) detects a VSS input signal any time during the self-test, DTC P1501 is set and the test aborts.		
Possible Causes:	• Noise on the VSS input signal from the radio frequency interference/electro magnetic interference (RFI/EMI) • External sources, such as ignition wires, the charging circuit or aftermarket equipment		
Diagnostic Aids:	Verify the VSS input is 0 km/h (0 mph) when the vehicle transmission is in PARK.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
F-Super Duty	refer to **PINPOINT TEST DF** .	refer to **PINPOINT TEST DF** .	-
Expedition, Navigator, Sable, Taurus, Taurus X	The powertrain control module (PCM) uses information from the anti-lock brake system (ABS) module and the transmission control module (TCM) to calculate vehicle speed. Check these modules for DTCs.		
All others	refer to **PINPOINT TEST DP** .	refer to **PINPOINT TEST DP** .	-

P1502 - VEHICLE SPEED SENSOR (VSS) INTERMITTENT

P1502 - VEHICLE SPEED SENSOR (VSS) INTERMITTENT

Description:	Indicates the powertrain control module (PCM) detected an error in the vehicle speed information. Vehicle speed data is received from either the VSS, transfer case speed sensor (TCSS) or anti-lock brake system (ABS) control module. This DTC is set the same way as P0500. However, it is intended to flash the transmission control indicator lamp (TCIL) for first time VSS circuit error/malfunctions.		
Possible Causes:	See the possible causes for DTC P0500.		
Diagnostic Aids:	See the diagnostic aids for DTC P0500.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
F-Super Duty	refer to **PINPOINT TEST DF** .		
Expedition, Navigator, Sable, Taurus, Taurus X	The powertrain control module (PCM) uses information from the anti-lock brake system (ABS) module and the transmission control module (TCM) to calculate vehicle speed. Check these modules for DTCs.		
All others	refer to **PINPOINT TEST DP** .		

P1504 - IDLE AIR CONTROL (IAC) CIRCUIT

P1504 - IDLE AIR CONTROL (IAC) CIRCUIT

Description:	This DTC is set when the powertrain control module (PCM) detects an electrical load failure on the IAC output circuit.		
Possible Causes:	• IAC circuit open • VPWR to IAC solenoid open • IAC circuit short to voltage • IAC circuit short to GND • Damaged IAC valve		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KE** .		

P1506 - IDLE AIR CONTROL (IAC) OVERSPEED ERROR

P1506 - IDLE AIR CONTROL (IAC) OVERSPEED ERROR

Description:	This DTC is set when the powertrain control module (PCM) detects an engine idle speed that is greater than the desired RPM.
	• IAC circuit short to GND • Damaged IAC valve

Possible Causes:	• IAC valve stuck open • Intake air leak after throttle body • Vacuum leaks • Damaged EVAP system
Diagnostic Aids:	Disconnect the IAC valve and look for little or no change in engine RPM as an indication of a stuck or damaged valve.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KE** .		

P1507 - IDLE AIR CONTROL (IAC) UNDER SPEED ERROR

P1507 - IDLE AIR CONTROL (IAC) UNDER SPEED ERROR

Description:	This DTC is set when the powertrain control module (PCM) detects an engine idle speed that is less than the desired RPM.
Possible Causes:	• IAC circuit open • Air inlet is plugged • Damaged or incorrect IAC valve • IAC valve stuck closed • VPWR to IAC solenoid open • IAC circuit short to voltage
Diagnostic Aids:	Disconnect the IAC valve and look for little or no change in engine RPM as an indication of a stuck or damaged valve.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST KE** .		

P1512 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED (BANK 1)

P1512 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED (BANK 1)

Description:	This DTC is set when the vacuum actuated IMRC is commanded open, but the IMRC monitor indicates closed.
Possible Causes:	• IMRC monitor circuit open • Suspect IMRC solenoid • Mechanical concern - bind, seize, damage, or obstruction of IMRC hardware
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HU** .

P1513 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED (BANK 2)

P1513 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED (BANK 2)

Description:	This DTC is set when the vacuum actuated IMRC is commanded open, but the IMRC monitor indicates closed.		
Possible Causes:	• IMRC monitor circuit open • Suspect IMRC solenoid • Mechanical concern - bind, seize, damage, or obstruction of IMRC hardware		
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST HU** .

P1516 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) INPUT ERROR (BANK 1)

P1516 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) INPUT ERROR (BANK 1)

Description:	The IMRC system is monitored for failure during continuous or key on engine off (KOEO) self-test. Each DTC distinguishes the corresponding bank for IMRC actuator assemblies with dual monitor switches. The test fails when the signal is outside an expected calibrated range.		
Possible Causes:	• Mechanical concern - bind, seize, damage, or obstruction of IMRC hardware		
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .	-	refer to **PINPOINT TEST HU** .

P1517 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) INPUT ERROR (BANK 2)

P1517 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) INPUT ERROR (BANK 2)

Description:	The IMRC system is monitored for failure during continuous or key on engine off (KOEO) self-test. Each DTC distinguishes the corresponding bank for IMRC actuator assemblies with dual monitor switches. The test fails when the signal is outside an expected calibrated range.		
Possible Causes:	• Mechanical concern - bind, seize, damage, or obstruction of IMRC hardware		
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.		
Application	**Key On Engine Off**	**Key On Engine**	**Continuous Memory**

			Running	
All		refer to **PINPOINT TEST HU** .	-	refer to **PINPOINT TEST HU** .

P1518 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN BANK 1

P1518 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN BANK 1

Description:	This DTC is set when the electrically actuated IMRC is commanded closed, but the IMRC monitor indicates open.		
Possible Causes:	• IMRC monitor signal circuit shorted to PWR GND or SIG RTN • Damaged IMRC actuator		
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P1519 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED BANK 1

P1519 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED BANK 1

Description:	This DTC is set when the electrically actuated IMRC is commanded open, but the IMRC monitor indicates closed.		
Possible Causes:	• IMRC monitor circuit open • IMRC control circuit open • IMRC monitor circuit short to VREF • IMRC monitor return circuit open • Damaged IMRC actuator • IMRC VPWR circuit open		
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P151A - INTAKE MANIFOLD RUNNER CONTROLLER PERFORMANCE

P151A - INTAKE MANIFOLD RUNNER CONTROLLER PERFORMANCE

Description:	The intake manifold runner control (IMRC) system is monitored for failures. The test fails when the system detects a loss of bi-directional communication or signal(s) between the PCM and the IMRC solenoid.
	• IMRC control circuit open • Mechanical concern - bind, seize, damage, or obstruction of IMRC

Possible Causes:	hardware • IMRC control circuit short to voltage • IMRC VPWR circuit open • IMRC GND circuit open • Damaged IMRC actuator		
Diagnostic Aids:	View the IMRCF PID to monitor for a fault.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P1520 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) CIRCUIT

P1520 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) CIRCUIT

Description:	This DTC indicates a failure in the IMRC primary control circuit.		
Possible Causes:	• IMRC control circuit open		
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P1537 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN (BANK 1)

P1537 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN (BANK 1)

Description:	This DTC is set when the vacuum actuated IMRC is commanded closed, but the IMRC monitor indicates open.		
Possible Causes:	• IMRC monitor signal circuit shorted to PWR GND or SIG RTN • Damaged IMRC solenoid • Blocked vacuum hoses		
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P1538 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN (BANK 2)

P1538 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN (BANK 2)

Description:	This DTC is set when the vacuum actuated IMRC is commanded closed, but the IMRC monitor indicates open.
Possible Causes:	• IMRC monitor signal circuit shorted to PWR GND or SIG RTN • Damaged IMRC solenoid

	• Blocked vacuum hoses		
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P1548 - ENGINE AIR FILTER RESTRICTION

P1548 - ENGINE AIR FILTER RESTRICTION

Description:	The powertrain control module (PCM) monitors the manifold absolute pressure (MAP) at various engine speeds during wide open throttle (WOT) operation, and compares the information to a calibrated value. If the air flow is out of range, the DTC is set.		
Possible Causes:	• Intake air restriction • Clogged air filter		
Diagnostic Aids:	If this DTC is set, inspect the intake air system and replace the air filter if no obstructions are found.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	REFER to the Workshop article part 303-12.		

P1549 - INTAKE MANIFOLD COMMUNICATION CONTROL (IMCC) CIRCUIT (BANK 1)

P1549 - INTAKE MANIFOLD COMMUNICATION CONTROL (IMCC) CIRCUIT (BANK 1)

Description:	The IMCC or intake manifold tuning (IMTV) system is monitored for failure during continuous or key on engine off (KOEO) self-test. The test fails when the powertrain control module (PCM) detects a concern with the IMTV output circuit.		
Possible Causes:	• Open IMTV circuit • Open VPWR circuit • Shorted IMTV circuit • Damaged IMTV		
Diagnostic Aids:	An IMTV fault PID (IMTVF) displaying YES may indicate a fault.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .	-	refer to **PINPOINT TEST HU** .

P1550 - POWER STEERING PRESSURE (PSP) SENSOR OUT OF SELF-TEST RANGE

P1550 - POWER STEERING PRESSURE (PSP) SENSOR OUT OF SELF-TEST RANGE

	The PSP sensor input signal to the powertrain control module (PCM) is

Description:	continuously monitored. The test fails when the signal falls out of a maximum or minimum calibrated range.			
Possible Causes:	• Steering wheel not turned during self-test. • PSP sensor or circuit damaged • Power steering concern			
Diagnostic Aids:	The DTC indicates the PSP sensor is out of self-test range.			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All		refer to **PINPOINT TEST DT** .	refer to **PINPOINT TEST DT** .	-

P1572 - BRAKE PEDAL SWITCH CIRCUIT

P1572 - BRAKE PEDAL SWITCH CIRCUIT

Description:	Indicates the brake input rationality test for brake pedal position (BPP) and brake pressure switch (BPS) has detected a concern. One or both inputs to the powertrain control module (PCM) did not change state when expected. On some vehicles with stability assist, the BPP switch is connected to the anti-lock brake system (ABS) module and the ABS generates a driver brake application (DBA) signal, which is then sent to the PCM.			
Possible Causes:	• Misadjusted brake switches, BPP or BPS • Blown fuse • Damaged BPP switch • Damaged BPS switch • Open or short in the BPP circuit • Open or short in the DBA circuit • Open or short in the BPS circuit			
Diagnostic Aids:	DTC P1572 is set when the PCM does not sense the proper sequence of the brake pedal input signal from both the BPP and BPS switches when the brake pedal is pressed and released.			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All		-	-	refer to **PINPOINT TEST FD** .

P1575 - PEDAL POSITION OUT OF SELF TEST RANGE

P1575 - PEDAL POSITION OUT OF SELF TEST RANGE

Description:	During key on engine off (KOEO) self-test, the powertrain control module (PCM) monitors the accelerator pedal position (APP) sensor inputs to determine if the APP1 and APP2 signals are less than an expected value. If either APP1 or APP2 is greater than the expected value, the DTC is set.

Possible Causes:	• Accelerator pedal applied during KOEO self-test		
Diagnostic Aids:	Repeat the self-test without applying the accelerator pedal. Make sure the floor mat is not interfering with the accelerator pedal. Diagnose any APP circuit DTCs first.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DK** .	-	-

P1633 - KEEP ALIVE POWER (KAPWR) VOLTAGE TOO LOW

P1633 - KEEP ALIVE POWER (KAPWR) VOLTAGE TOO LOW

Description:	Indicates the KAPWR circuit has experienced a voltage interrupt.		
Possible Causes:	• Open KAPWR circuit • Intermittent KAPWR		
Diagnostic Aids:	Loss of KAPWR to the powertrain control module (PCM) results in immediate malfunction indicator lamp (MIL) illumination and DTC P1633.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST QB** .		

P1635 - TIRE/AXLE RATIO OUT OF ACCEPTABLE RANGE

P1635 - TIRE/AXLE RATIO OUT OF ACCEPTABLE RANGE

Description:	This DTC indicates the tire and axle information contained in the vehicle ID block (VID) does not match the vehicle hardware.		
Possible Causes:	• Incorrect tire size • Incorrect axle ratio • Incorrect VID configuration parameters		
Diagnostic Aids:	Using the scan tool, view the tire and axle parameters within the VID. They must match the vehicle hardware.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

P1636 - INDUCTIVE SIGNATURE CHIP COMMUNICATION ERROR

P1636 - INDUCTIVE SIGNATURE CHIP COMMUNICATION ERROR

Description:	Indicates the powertrain control module (PCM) has lost communication with the inductive signature chip.
Possible Causes:	• Damaged PCM

Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	DTC P1636 indicates the PCM has lost communication with the inductive signature chip. Install a new PCM. Refer to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM.		

P1639 - VEHICLE ID (VID) BLOCK CORRUPTED, NOT PROGRAMMED

P1639 - VEHICLE ID (VID) BLOCK CORRUPTED, NOT PROGRAMMED

Description:	This DTC indicates the VID block is not programmed or the information within is corrupt.		
Possible Causes:	• New powertrain control module (PCM) • Incorrect PCM • Incorrect VID configuration		
Diagnostic Aids:	Program the PCM to the most recent calibration available.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	The VID block must be programmed. Refer to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Making Changes to the VID Block.		

P1640 - POWERTRAIN DTCS AVAILABLE IN ANOTHER MODULE

P1640 - POWERTRAIN DTCS AVAILABLE IN ANOTHER MODULE

Description:	Vehicles using a secondary engine control module can request that the powertrain control module (PCM) illuminates the malfunction indicator lamp (MIL) when a failure occurs which affects emissions.		
Possible Causes:	• DTCs stored in a secondary module, which requested the MIL to be turned on		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

P1641 - FUEL PUMP PRIMARY CIRCUIT

P1641 - FUEL PUMP PRIMARY CIRCUIT

For Vehicles Equipped With a FPDM	
Description:	See the description for DTC P1235/P1236.
Possible Causes:	See the possible causes for DTC P1235/P1236.

Diagnostic Aids:	See the diagnostic aids for DTC P1235/P1236.		
For All Others			
Description:	See the description for DTC P0230.		
Possible Causes:	See the possible causes for DTC P0230.		
Diagnostic Aids:	See the diagnostic aids for DTC P0230.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Vehicles Equipped With a FPDM	refer to **PINPOINT TEST KB** .		
All others	refer to **PINPOINT TEST KA** .		

P1646 - LINEAR O2 SENSOR CONTROL CHIP (BANK 1)

P1646 - LINEAR O2 SENSOR CONTROL CHIP (BANK 1)

Description:	The powertrain control module (PCM) monitors the application-specific integrated circuit that controls and monitors the heated oxygen sensor (HO2S). The test fails when the PCM detects an internal circuit or communication concern.		
Possible Causes:	• Damaged PCM		
Diagnostic Aids:	Internal PCM concern.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Reprogram or update the calibration. Check for other DTCs and diagnose those first. Make sure to check for aftermarket performance products before installing a new PCM. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** .		

P1647 - LINEAR O2 SENSOR CONTROL CHIP (BANK 2)

P1647 - LINEAR O2 SENSOR CONTROL CHIP (BANK 2)

Description:	See the description for DTC P1646.		
Possible Causes:	See the possible causes for DTC P1646.		
Diagnostic Aids:	See the diagnostic aids for DTC P1646.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Reprogram or update the calibration. Check for other DTCs and diagnose those first. Make sure to check for aftermarket performance products before installing a new PCM. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** .		

P1650 - POWER STEERING PRESSURE (PSP) SWITCH OUT OF SELF-TEST RANGE

P1650 - POWER STEERING PRESSURE (PSP) SWITCH OUT OF SELF-TEST RANGE

Description:	In the key on engine off (KOEO) self-test, this DTC indicates the PSP input to the powertrain control module (PCM) is high. In the key on engine running (KOER) self-test, this DTC indicates the PSP input did not change state.		
Possible Causes:	• The steering wheel must be turned during KOER self-test • PSP switch/shorting bar damaged • SIG RTN circuit open • PSP circuit open or shorted to SIGRTN		
Diagnostic Aids:	Check if the vehicle was towed or a power steering repair was carried out. Observe the PSP PID while checking the wires for intermittent concerns.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST FF** .	refer to **PINPOINT TEST FF** .	-

P1651 - POWER STEERING PRESSURE (PSP) SWITCH INPUT

P1651 - POWER STEERING PRESSURE (PSP) SWITCH INPUT

Description:	The powertrain control module (PCM) counts the number of vehicle speed transitions from 0 to a calibrated speed. After a calibrated number of speed transitions, the PCM expects the PSP input to change. This DTC is set if the transition is not detected.		
Possible Causes:	• Vehicle towed with the engine running • The power steering hydraulic concern was repaired but the DTC was not erased • PSP switch/shorting bar damaged • SIG RTN circuit open • PSP circuit open or shorted to SIGRTN		
Diagnostic Aids:	Check if the vehicle was towed or a power steering repair was carried out. Observe the PSP PID while checking the wires for intermittent concerns.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST FF** .

P1674 - CONTROL MODULE SOFTWARE CORRUPTED

P1674 - CONTROL MODULE SOFTWARE CORRUPTED

Description:	Indicates an error occurred in the powertrain control module (PCM). This DTC is set in combination with P2105.
Possible Causes:	• Software incompatibility issue • Damaged PCM

Diagnostic Aids:	Verify the PCM is at the latest calibration level.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST QE** .

P1703 - BRAKE SWITCH OUT OF SELF-TEST RANGE

P1703 - BRAKE SWITCH OUT OF SELF-TEST RANGE

Description:	Indicates that during the key on engine off (KOEO) self-test, the brake pedal position (BPP) signal was high, or during the key on engine running (KOER) self-test, the BPP signal did not cycle high and low.		
Possible Causes:	• Open or short in the BPP circuit • Open or short in the stoplamp circuits • Concern in module(s) connected to the BPP circuit • Damaged brake switch • Misadjusted brake switch		
Diagnostic Aids:	Check for correct function of the stoplamp. Using the scan tool, check the BPP PID. The stoplamp and PID should toggle on and off with brake pedal activation.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST FD** .		

P1705 - TRANSMISSION RANGE SENSOR OUT OF SELF-TEST RANGE

P1705 - TRANSMISSION RANGE SENSOR OUT OF SELF-TEST RANGE

Description:	The transmission range circuit is not indicating PARK/NEUTRAL during self-test.		
Possible Causes:	• Gear selector not in PARK/NEUTRAL		
Diagnostic Aids:	Verify the gear selector is in PARK/NEUTRAL.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P1709 - PARK/NEUTRAL POSITION (PNP) SWITCH OUT OF SELF-TEST RANGE

P1709 - PARK/NEUTRAL POSITION (PNP) SWITCH OUT OF SELF-TEST RANGE

Description:	This DTC indicates that the voltage is high when it should be low.
Possible Causes:	• PNP/CPP circuit short to PWR • Damaged PNP or CPP switch • PNP/CPP circuit open in the SIGRTN

Diagnostic Aids:	When activating either the PNP or CPP switch, the voltage should cycle from 5 volts to low.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P1729 - 4X4L SWITCH

P1729 - 4X4L SWITCH

Description:	The 4x4L switch is an on/off switch. If the powertrain control module (PCM) does not sense appropriate voltage when the switch is cycled on and off, a DTC sets for mechanical shift on the fly systems.		
Possible Causes:	• The 4x4L harness between the PCM and the 4x4L switch is open or shorted • Damaged 4x4L switch		
Diagnostic Aids:	Verify the 4x4L switch cycles on/off.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Workshop article part 308-07A, Four-Wheel Drive Systems.		

P1780 - TRANSMISSION CONTROL SWITCH (TCS) OUT OF SELF-TEST RANGE

P1780 - TRANSMISSION CONTROL SWITCH (TCS) OUT OF SELF-TEST RANGE

Description:	During key on engine running (KOER) self-test the TCS must be cycled, or a DTC is set.		
Possible Causes:	• TCS not cycled during the self-test. • TCS circuit short or open • Damaged TCS switch		
Diagnostic Aids:	Verify the TCS switch cycles on/off.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST TB** .		

P1781 - 4X4L SWITCH OUT OF SELF-TEST RANGE

P1781 - 4X4L SWITCH OUT OF SELF-TEST RANGE

Description:	The 4x4L switch is an on/off switch. If the powertrain control module (PCM) does not sense low voltage when the switch is on, the DTC sets.
Possible Causes:	• 4x4L harness open or shorted • Damaged electronic shift module
Diagnostic Aids:	Verify the 4x4L switch cycles on/off.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Workshop article part 308-07A, Four-Wheel Drive Systems.		

P17XX -

P17XX -

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P18XX -

P18XX -

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Workshop article part 308-07A, Four-Wheel Drive Systems.		

P1900 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT INTERMITTENT

P1900 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT INTERMITTENT

Description:	The OSS sensor signal to the powertrain control module (PCM) is irregular or interrupted.		
Possible Causes:	• Harness connector not properly seated • Harness intermittently shorted or open • Harness connector damaged • OSS sensor damaged, or not installed correctly		
Diagnostic Aids:	Verify harness and connector integrity. Verify proper installation of the OSS sensor.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Manual Transmission	refer to **PINPOINT TEST DP** .		
Automatic Transmission	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P1901 - TURBINE SHAFT SPEED (TSS) SENSOR CIRCUIT INTERMITTENT

P1901 - TURBINE SHAFT SPEED (TSS) SENSOR CIRCUIT INTERMITTENT

Description:	The TSS sensor signal to the powertrain control module (PCM) is irregular or interrupted.		
Possible Causes:	• Harness connector not properly seated • Harness intermittently shorted or open • Harness connector damaged • TSS sensor damaged or not installed correctly		
Diagnostic Aids:	Verify harness and connector integrity. Verify proper installation of the TSS sensor.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **AUTOMATIC TRANSAXLE/TRANSMISSION - 4R70E/4R75E -- E-SERIES** .		

P2004 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN (BANK 1)

P2004 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN (BANK 1)

Description:	This DTC is set when the IMRC is commanded closed, but the IMRC monitor indicates open. This DTC replaces P1518 and P1537.		
Possible Causes:	• IMRC monitor signal circuit shorted to PWR GND or SIG RTN • Damaged IMRC actuator or solenoid • Blocked vacuum hoses		
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P2005 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN (BANK 2)

P2005 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN (BANK 2)

Description:	This DTC is set when the IMRC is commanded closed, but the IMRC monitor indicates open. This DTC replaces P1538.		
Possible Causes:	• IMRC monitor signal circuit shorted to PWR GND or SIG RTN • Damaged IMRC actuator or solenoid • Damaged PCM • Blocked vacuum hoses		
Diagnostic Aids:	An IMRCM PID reading near approximately 1 volt at closed throttle may indicate a fault.		
Application	**Key On Engine**	**Key On Engine**	**Continuous Memory**

	Off	Running		
All	refer to **PINPOINT TEST HU** .			

P2006 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED (BANK 1)

P2006 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED (BANK 1)

Description:	This DTC is set when the IMRC is commanded open, but the IMRC monitor indicates closed. This DTC replaces P1512 and P1519.		
Possible Causes:	• IMRC monitor circuit open • IMRC control circuit open • IMRC monitor circuit short to VREF • Damaged IMRC actuator or solenoid		
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P2007 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED (BANK 2)

P2007 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED (BANK 2)

Description:	This DTC is set when the IMRC is commanded open, but the IMRC monitor indicates closed. This DTC replaces P1513.		
Possible Causes:	• IMRC monitor circuit open • IMRC control circuit open • IMRC monitor circuit short to VREF • Damaged IMRC actuator or solenoid		
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P2008 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) CIRCUIT OPEN (BANK 1)

P2008 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) CIRCUIT OPEN (BANK 1)

Description:	This DTC indicates a failure in the IMRC primary control circuit. This DTC replaces P1520.		
Possible Causes:	• IMRC control circuit open		
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.		
Application	**Key On Engine**	**Key On Engine**	**Continuous Memory**

		Off	**Running**	
All		refer to **PINPOINT TEST HU** .		

P2014 - INTAKE MANIFOLD RUNNER POSITION SENSOR/SWITCH CIRCUIT (BANK 1)

P2014 - INTAKE MANIFOLD RUNNER POSITION SENSOR/SWITCH CIRCUIT (BANK 1)

Description:	The intake manifold runner control (IMRC) system is monitored for failure during continuous or key on engine off (KOEO) self-test. Each DTC distinguishes the corresponding bank for IMRC actuator assemblies with dual monitor switches. The test fails when the signal on the monitor pin is outside an expected calibrated range. This DTC replaces P1516.		
Possible Causes:	• IMRC monitor circuit open • Mechanical concern - bind, seize, damage or obstruction of IMRC hardware		
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P2015 - INTAKE MANIFOLD RUNNER POSITION SENSOR/SWITCH CIRCUIT RANGE/PERFORMANCE (BANK 1)

P2015 - INTAKE MANIFOLD RUNNER POSITION SENSOR/SWITCH CIRCUIT RANGE/PERFORMANCE (BANK 1)

Description:	The intake manifold runner control (IMRC) system is monitored for failures. Each DTC distinguishes the corresponding bank. The test fails when the system detects the presence of a broken or persistently out of range linkage.		
Possible Causes:	• Mechanical concern - bind, seize, damage, or obstruction of IMRC hardware		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P2019 - INTAKE MANIFOLD RUNNER POSITION SENSOR/SWITCH CIRCUIT (BANK 2)

P2019 - INTAKE MANIFOLD RUNNER POSITION SENSOR/SWITCH CIRCUIT (BANK 2)

Description:	The intake manifold runner control (IMRC) system is monitored for failure during continuous or key on engine off (KOEO) self-test. Each DTC distinguishes the corresponding bank for IMRC actuator assemblies with dual monitor switches. The test fails when the signal on the monitor pin is outside an expected calibrated range. This DTC replaces P1517.

Possible Causes:	• IMRC monitor circuit open • Mechanical concern - bind, seize, damage or obstruction of IMRC hardware		
Diagnostic Aids:	Monitor the IMRC and IMRCM PIDs. The IMRCM state should change when the IMRC is commanded open or closed.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P2020 - INTAKE MANIFOLD RUNNER POSITION SENSOR/SWITCH CIRCUIT RANGE/PERFORMANCE (BANK 2)

P2020 - INTAKE MANIFOLD RUNNER POSITION SENSOR/SWITCH CIRCUIT RANGE/PERFORMANCE (BANK 2)

Description:	See the description for DTC P2015.		
Possible Causes:	See the possible causes for DTC P2015.		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HU** .		

P2065 - FUEL LEVEL SENSOR B CIRCUIT

P2065 - FUEL LEVEL SENSOR B CIRCUIT

Description:	Fuel level information is sent to the powertrain control module (PCM) on the communication link.		
Possible Causes:	• Communication link concern • Damaged instrument cluster (IC) • Damaged generic electronic module (GEM) • Damaged PCM		
Diagnostic Aids:	Refer to the **INSTRUMENT CLUSTER (IC) AND WARNING CHIMES -- E-SERIES** for fuel level indicator diagnosis.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **INSTRUMENT CLUSTER (IC) AND WARNING CHIMES -- E-SERIES** to diagnose the incorrect fuel gauge indication symptom		

P2066 - FUEL LEVEL SENSOR B CIRCUIT RANGE/PERFORMANCE

P2066 - FUEL LEVEL SENSOR B CIRCUIT RANGE/PERFORMANCE

Description:	See the description for DTC P2065.
Possible Causes:	See the possible causes for DTC P2065.

Diagnostic Aids:	See the diagnostic aids for DTC P2065.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **INSTRUMENT CLUSTER (IC) AND WARNING CHIMES -- E-SERIES** to diagnose the incorrect fuel gauge indication symptom		

P2067 - FUEL LEVEL SENSOR B CIRCUIT LOW

P2067 - FUEL LEVEL SENSOR B CIRCUIT LOW

Description:	See the description for DTC P2065.		
Possible Causes:	See the possible causes for DTC P2065.		
Diagnostic Aids:	See the diagnostic aids for DTC P2065.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **INSTRUMENT CLUSTER (IC) AND WARNING CHIMES -- E-SERIES** to diagnose the incorrect fuel gauge indication symptom		

P2068 - FUEL LEVEL SENSOR B CIRCUIT HIGH

P2068 - FUEL LEVEL SENSOR B CIRCUIT HIGH

Description:	See the description for DTC P2065.		
Possible Causes:	See the possible causes for DTC P2065.		
Diagnostic Aids:	See the diagnostic aids for DTC P2065.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **INSTRUMENT CLUSTER (IC) AND WARNING CHIMES -- E-SERIES** to diagnose the incorrect fuel gauge indication symptom		

P2070 - INTAKE MANIFOLD TUNING VALVE (IMTV) STUCK OPEN BANK 1

P2070 - INTAKE MANIFOLD TUNING VALVE (IMTV) STUCK OPEN BANK 1

Description:	The IMTV system is monitored for failure during continuous, key on engine off (KOEO), or key on engine running (KOER) self-tests. The test fails when the signal is more or less than an expected calibrated range.		
Possible Causes:	• IMTV signal circuit shorted to PWR GND or SIG RTN • Damaged IMRC actuator		
Diagnostic Aids:	An IMTVM PID reading may indicate a fault.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST HU** .	refer to **PINPOINT TEST HU** .

P2071 - INTAKE MANIFOLD TUNING VALVE (IMTV) STUCK CLOSED BANK 1

P2071 - INTAKE MANIFOLD TUNING VALVE (IMTV) STUCK CLOSED BANK 1

Description:	The IMTV system is monitored for failure during continuous, key on engine off (KOEO), or key on engine running (KOER) self-tests. The test fails when the signal is more or less than an expected calibrated range.		
Possible Causes:	• IMTV signal circuit shorted to PWR GND or SIG RTN • Damaged IMRC actuator • IMTV circuit open		
Diagnostic Aids:	An IMTVM PID reading may indicate a fault.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST HU** .	refer to **PINPOINT TEST HU** .

P2072 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - ICE BREAKAGE

P2072 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - ICE BREAKAGE

Description:	This DTC only identifies that the strategy has carried out several open and close cycles to remove potential ice build up. This DTC does not imply any system concerns, only that the mode has occurred, and that mode may be causing a long start time.		
Possible Causes:	• Ice or oil in the intake air system could be the result of a positive crankcase ventilation (PCV) system concern		
Diagnostic Aids:	Do not install a new electronic throttle body (ETB) for this DTC. Check the PCV system for evidence of water or ice. Disconnect the intake air fresh air plenum from the throttle body. Check for water or oily residue at the PCV fresh air port. Disconnect the tube at the valve cover and check the tube for ice obstruction/ice. Start the engine and, to check the PCV system, place a piece of cardboard on the crankcase vent in the rocker cover. If the cardboard is held on the crankcase vent and fumes are not exiting, reconnect the tube to the valve cover and the intake air port. If the test passes, the PCV system is OK. If the cardboard is not held in place, turn off the engine and check the PCV valve side of the system for ice or obstruction and repair as necessary. If no obstruction is found there, isolate and repair any obstruction in the intake manifold connection. If no obstruction is found there, make sure the PCV coolant heater is functional and repair as necessary. If no concern is present, make sure the PCV valve is allowing the proper vacuum flow and repair as necessary.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

P2096 - POST CATALYST FUEL TRIM SYSTEM TOO LEAN BANK 1

P2096 - POST CATALYST FUEL TRIM SYSTEM TOO LEAN BANK 1

Description:	The powertrain control module (PCM) monitors the correction value from downstream heated oxygen sensor (HO2S) as part of the fore-aft oxygen sensor control routine. The test fails when the correction value is greater than a calibrated limit.		
Possible Causes:	• Loose connection, and damaged or corroded terminals • Exhaust leaks • Contaminated HO2S		
Diagnostic Aids:	Inspect the connectors for signs of damage, water ingress, or corrosion.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST DZ** .

P2097 - POST CATALYST FUEL TRIM SYSTEM TOO RICH BANK 1

P2097 - POST CATALYST FUEL TRIM SYSTEM TOO RICH BANK 1

Description:	See the description for DTC P2096.		
Possible Causes:	See the possible causes for DTC P2096.		
Diagnostic Aids:	See the diagnostic aids for DTC P2096.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST DZ** .

P2098 - POST CATALYST FUEL TRIM SYSTEM TOO LEAN BANK 2

P2098 - POST CATALYST FUEL TRIM SYSTEM TOO LEAN BANK 2

Description:	See the description for DTC P2096.		
Possible Causes:	See the possible causes for DTC P2096.		
Diagnostic Aids:	See the diagnostic aids for DTC P2096.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST DZ** .

P2099 - POST CATALYST FUEL TRIM SYSTEM TOO RICH BANK 2

P2099 - POST CATALYST FUEL TRIM SYSTEM TOO RICH BANK 2

Description:	See the description for DTC P2096.
Possible Causes:	See the possible causes for DTC P2096.
Diagnostic Aids:	See the diagnostic aids for DTC P2096.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	-	-	refer to **PINPOINT TEST DZ** .

P2100 - THROTTLE ACTUATOR CONTROL (TAC) MOTOR CIRCUIT/OPEN

P2100 - THROTTLE ACTUATOR CONTROL (TAC) MOTOR CIRCUIT/OPEN

Description:	A powertrain control module (PCM) fault flag is set indicating the motor circuit is open. May require cycling the key.		
Possible Causes:	• TAC motor has an open winding • TAC motor is damaged • TAC motor harness is open • TAC motor harness is short to PWR • TAC motor harness circuits are short together • TAC motor harness connector is unplugged		
Diagnostic Aids:	A TAC motor circuit PID reading may indicate a concern, if available.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DV** .		

P2101 - THROTTLE ACTUATOR CONTROL (TAC) MOTOR RANGE/PERFORMANCE

P2101 - THROTTLE ACTUATOR CONTROL (TAC) MOTOR RANGE/PERFORMANCE

Description:	A powertrain control module (PCM) fault flag is set indicating the motor circuit is open, and may require cycling the key.		
Possible Causes:	• TAC motor circuits are cross-wired		
Diagnostic Aids:	A TAC motor circuit PID reading may indicate a concern, if available.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DV** .		

P2104 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - FORCED IDLE

P2104 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - FORCED IDLE

Description:	The TAC system is in the failure mode effects management (FMEM) mode of forced idle.		
Possible Causes:			
Diagnostic Aids:	This DTC is an informational DTC and may be set in combination with a number of other DTCs which are causing the FMEM. Diagnose other DTCs first.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**

All		refer to **PINPOINT TEST QE** .

P2105 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - FORCED ENGINE SHUTDOWN

P2105 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - FORCED ENGINE SHUTDOWN

Description:	The TAC system is in the failure mode effects management (FMEM) mode of forced engine shutdown.		
Possible Causes:			
Diagnostic Aids:	This DTC is an informational DTC and may be set in combination with a number of other DTCs which are causing the FMEM. Diagnose other DTCs first.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST QE** .		

P2107 - THROTTLE ACTUATOR CONTROL (TAC) MODULE PROCESSOR

P2107 - THROTTLE ACTUATOR CONTROL (TAC) MODULE PROCESSOR

Description:	The electronic throttle control (ETC) area of the powertrain control module (PCM) failed the self-test. The concern could be the result of an incorrect throttle position (TP) command, or TAC motor wires shorted together.		
Possible Causes:	• TAC motor harness circuit short to ground • TAC motor harness circuit short to voltage • Damaged electronic throttle body (ETB) • Damaged PCM		
Diagnostic Aids:	This DTC may be accompanied by other DTCs. If DTC P2110 is present along with other DTCs, disregard DTCs P2107 and P2110 at this time. Diagnose other DTCs first. A TAC motor circuit PID reading may indicate a concern, if available.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DV** .		

P2110 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - FORCED LIMITED RPM

P2110 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - FORCED LIMITED RPM

Description:	The TAC system is in the failure mode effects management (FMEM) mode of forced limited RPM.		
Possible Causes:			
Diagnostic Aids:	This DTC is an informational DTC and may be set in combination with a number of other DTCs which are causing the FMEM. Diagnose other DTCs first.		
	Key On Engine	**Key On Engine**	

Application		Off	Running	Continuous Memory
All		refer to **PINPOINT TEST QE** .		

P2111 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - STUCK OPEN

P2111 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - STUCK OPEN

Description:	This powertrain control module (PCM) fault status indicates the throttle plate is at a greater angle than commanded.			
Possible Causes:	• Binding throttle body, stuck open • TAC motor circuit open • TAC motor circuits are cross-wired • TAC motor harness circuits are shorted together • Damaged PCM			
Diagnostic Aids:				
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All		refer to **PINPOINT TEST DV** .		

P2112 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - STUCK CLOSED

P2112 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - STUCK CLOSED

Description:	This powertrain control module (PCM) fault status indicates the throttle plate is at a lower angle than commanded.			
Possible Causes:	• Binding throttle body, stuck closed • TAC motor circuit open • TAC motor circuits are cross-wired • TAC motor harness circuits are shorted together • Damaged PCM			
Diagnostic Aids:				
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All		refer to **PINPOINT TEST DV** .		

P2121 - THROTTLE/PEDAL POSITION SENSOR/SWITCH D CIRCUIT RANGE/PERFORMANCE

P2121 - THROTTLE/PEDAL POSITION SENSOR/SWITCH D CIRCUIT RANGE/PERFORMANCE

Description:	The accelerator pedal position (APP) sensor fault flag is set for sensor 1 by the powertrain control module (PCM), indicating the signal is out of the normal self-test operating range.
Possible Causes:	• APP sensor 1 is open, or short to ground or voltage • APP sensor signal circuits are short together • Damaged APP sensor

	• Damaged PCM		
Diagnostic Aids:	An APP1 sensor PID reading may indicate a concern.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DK** .		

P2122 - THROTTLE/PEDAL POSITION SENSOR/SWITCH D CIRCUIT LOW

P2122 - THROTTLE/PEDAL POSITION SENSOR/SWITCH D CIRCUIT LOW

Description:	The accelerator pedal position (APP) sensor 1 is out of self-test range low.		
Possible Causes:	• APP sensor harness open (ETC system with a 2-track APP sensor) • APP sensor harness short to ground • Damaged APP sensor		
Diagnostic Aids:	An APP1 sensor PID reading may indicate a concern.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DK** .		

P2123 - THROTTLE/PEDAL POSITION SENSOR/SWITCH D CIRCUIT HIGH

P2123 - THROTTLE/PEDAL POSITION SENSOR/SWITCH D CIRCUIT HIGH

Description:	The accelerator pedal position (APP) sensor 1 is out of self-test range high.		
Possible Causes:	• APP sensor harness open (ETC system with a 3-track APP sensor) • APP sensor harness is short to VREF • Damaged APP sensor		
Diagnostic Aids:	An APP1 sensor PID reading may indicate a concern.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DK** .		

P2126 - THROTTLE/PEDAL POSITION SENSOR/SWITCH E CIRCUIT RANGE/PERFORMANCE

P2126 - THROTTLE/PEDAL POSITION SENSOR/SWITCH E CIRCUIT RANGE/PERFORMANCE

Description:	The accelerator pedal position (APP) sensor fault flag is set for sensor 2 by the powertrain control module (PCM), indicating the signal is out of the normal self-test operating range.
Possible Causes:	• APP sensor assembly is binding • Damaged APP sensor • Damaged PCM
Diagnostic Aids:	An APP2 sensor PID reading may indicate a concern.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	refer to **PINPOINT TEST DK** .		

P2127 - THROTTLE/PEDAL POSITION SENSOR/SWITCH E CIRCUIT LOW

P2127 - THROTTLE/PEDAL POSITION SENSOR/SWITCH E CIRCUIT LOW

Description:	The accelerator pedal position (APP) sensor 2 is out of self-test range low.
Possible Causes:	• APP sensor circuit is short to ground • APP sensor circuit is open • Damaged APP sensor
Diagnostic Aids:	An APP2 sensor PID reading may indicate a concern.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	refer to **PINPOINT TEST DK** .		

P2128 - THROTTLE/PEDAL POSITION SENSOR/SWITCH E CIRCUIT HIGH

P2128 - THROTTLE/PEDAL POSITION SENSOR/SWITCH E CIRCUIT HIGH

Description:	The accelerator pedal position (APP) sensor 2 is out of self-test range high.
Possible Causes:	• APP sensor assembly is binding • APP sensor harness is short to voltage • Damaged APP sensor
Diagnostic Aids:	An APP2 sensor PID reading may indicate a concern.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	refer to **PINPOINT TEST DK** .		

P2131 - THROTTLE/PEDAL POSITION SENSOR/SWITCH F CIRCUIT RANGE/PERFORMANCE

P2131 - THROTTLE/PEDAL POSITION SENSOR/SWITCH F CIRCUIT RANGE/PERFORMANCE

Description:	The accelerator pedal position (APP) sensor fault flag is set for sensor 3 by the powertrain control module (PCM), indicating the signal is out of the normal self-test operating range.
Possible Causes:	• APP sensor assembly is binding • Damaged APP sensor • Damaged PCM
Diagnostic Aids:	An APP3 sensor PID reading may indicate a concern.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

All	refer to **PINPOINT TEST DK** .		

P2132 - THROTTLE/PEDAL POSITION SENSOR/SWITCH F CIRCUIT LOW

P2132 - THROTTLE/PEDAL POSITION SENSOR/SWITCH F CIRCUIT LOW

Description:	The accelerator pedal position (APP) sensor 3 is out of self-test range low.		
Possible Causes:	• APP sensor assembly is binding • APP sensor circuit is open • APP sensor harness short to ground • Damaged APP sensor		
Diagnostic Aids:	An APP3 sensor PID reading may indicate a concern.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DK** .		

P2133 - THROTTLE/PEDAL POSITION SENSOR/SWITCH F CIRCUIT HIGH

P2133 - THROTTLE/PEDAL POSITION SENSOR/SWITCH F CIRCUIT HIGH

Description:	The accelerator pedal position (APP) sensor 3 is out of self-test range high.		
Possible Causes:	• APP sensor assembly is binding • APP sensor harness is short to voltage • Damaged APP sensor		
Diagnostic Aids:	An APP3 sensor PID reading may indicate a concern.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DK** .		

P2135 - THROTTLE/PEDAL POSITION SENSOR/SWITCH A/B VOLTAGE CORRELATION

P2135 - THROTTLE/PEDAL POSITION SENSOR/SWITCH A/B VOLTAGE CORRELATION

Description:	The powertrain control module (PCM) flagged a concern indicating that throttle position (TP) 1 and TP2 disagree by more than a calibrated limit.
Possible Causes:	• TP sensor shorted internally to VREF • TP sensor harness is short to voltage • TP sensor signal wires are short together • Damaged TP sensor
Diagnostic Aids:	Compare the TP1 and TP2 PID values for a full sweep and correlation. Refer to the chart in pinpoint test DV. refer to **PINPOINT TEST DV** . Check the wiring harness for an open or a short circuit. Check the TP sensor for an internal open or short circuit. If no circuit concerns are

	present, install a new TP sensor.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DV** .		

P2138 - THROTTLE/PEDAL POSITION SENSOR/SWITCH D/E VOLTAGE CORRELATION

P2138 - THROTTLE/PEDAL POSITION SENSOR/SWITCH D/E VOLTAGE CORRELATION

Description:	The powertrain control module (PCM) monitors the accelerator pedal position (APP) sensor for a concern. The PCM compares the accelerator pedal position information from the APP sensor inputs, APP1 and APP2. If the APP sensor inputs APP1 and APP2 disagree on the position of the accelerator pedal by more than an expected value, the DTC is set.		
Possible Causes:	• APP sensor circuit concerns • Damaged APP sensor		
Diagnostic Aids:	Monitor the APP_MAXDIFF PID while applying and releasing the accelerator pedal.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST DK** .		

P2195 - O2 SENSOR SIGNAL BIASED/STUCK LEAN - BANK 1, SENSOR 1

P2195 - O2 SENSOR SIGNAL BIASED/STUCK LEAN - BANK 1, SENSOR 1

Description:	A heated oxygen sensor (HO2S) indicating lean at the end of a test is trying to correct for an over-rich condition. The test fails when the fuel control system no longer detects switching for a calibrated amount of time. Electrical: • Short to VPWR in the harness or HO2S • Water in the harness connector • Open/shorted HO2S circuit • Open UO2SPC circuit • Corrosion or incorrect harness connections • Damaged HO2S • Damaged powertrain control module (PCM) Fuel System: • Excessive fuel pressure • Leaking/contaminated fuel injectors • Leaking fuel pressure regulator

Possible Causes:	• Low fuel pressure or running out of fuel • Vapor recovery system Intake Air System: • Air leaks after the mass air flow (MAF) sensor • Vacuum leaks • Positive crankcase ventilation (PCV) system is leaking or the valve is stuck open • Incorrectly seated engine oil dipstick EGR System: • Leaking gasket • Stuck EGR valve • Leaking diaphragm or EGR vacuum regulator Base Engine: • Oil overfill • Camshaft timing • Cylinder compression • Exhaust leaks before or near the HO2S(s)
Diagnostic Aids:	

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST H** .	refer to **PINPOINT TEST H** .

P2196 - O2 SENSOR SIGNAL BIASED/STUCK RICH - BANK 1, SENSOR 1

P2196 - O2 SENSOR SIGNAL BIASED/STUCK RICH - BANK 1, SENSOR 1

Description:	A heated oxygen sensor (HO2S) indicating rich at the end of a test is trying to correct for an over-lean condition. The test fails when the fuel control system no longer detects switching for a calibrated amount of time.
Possible Causes:	See the possible causes for DTC P2195.
Diagnostic Aids:	

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**

All		refer to **PINPOINT TEST H** .

P2197 - O2 SENSOR SIGNAL BIASED/STUCK LEAN - BANK 2, SENSOR 1

P2197 - O2 SENSOR SIGNAL BIASED/STUCK LEAN - BANK 2, SENSOR 1

Description:	See the description for DTC P2195.		
Possible Causes:	See the possible causes for DTC P2195.		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST H** .	refer to **PINPOINT TEST H** .

P2198 - O2 SENSOR SIGNAL BIASED/STUCK RICH - BANK 2, SENSOR 1

P2198 - O2 SENSOR SIGNAL BIASED/STUCK RICH - BANK 2, SENSOR 1

Description:	See the description for DTC P2196.		
Possible Causes:	See the possible causes for DTC P2195.		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST H** .		

P2257 - SECONDARY AIR INJECTION (AIR) SYSTEM CONTROL A CIRCUIT LOW

P2257 - SECONDARY AIR INJECTION (AIR) SYSTEM CONTROL A CIRCUIT LOW

Description:	The AIR system monitor circuit is low, indicating the secondary AIR pump is off although the secondary AIR pump was commanded on by the powertrain control module (PCM).		
Possible Causes:	• Open B+ circuit • Open VPWR circuit • Open voltage circuit between the AIR relay and the secondary AIR pump • Damaged AIR relay		
Diagnostic Aids:	The AIR monitor circuit PCM input contains a pull up voltage through a resistance internal to the PCM. This voltage is normally held low by the resistance path through the secondary AIR pump when the secondary AIR pump is off. A single electrical open circuit component such as an AIR relay coil in this multi-component circuit is not detected by the PCM output driver, yet it sets DTC P2257.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HM** .		

P2258 - SECONDARY AIR INJECTION (AIR) SYSTEM CONTROL A CIRCUIT HIGH

P2258 - SECONDARY AIR INJECTION (AIR) SYSTEM CONTROL A CIRCUIT HIGH

Description:	The AIR system monitor circuit is high, indicating the secondary AIR pump is on although the secondary AIR pump was commanded off by the powertrain control module (PCM).		
Possible Causes:	• AIR relay fault - stuck closed • Secondary AIR pump fault - circuit open in motor • Open ground to secondary AIR pump • Open AIR monitor circuit between the secondary AIR pump and the PCM • Short to voltage in the AIR relay to secondary AIR pump voltage circuit		
Diagnostic Aids:	The AIR monitor circuit PCM input contains a pull up voltage through a resistance internal to the PCM. This voltage is normally held low by the resistance path through the secondary AIR pump when the secondary AIR pump is off.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HM** .		

P2270 - O2 SENSOR SIGNAL STUCK LEAN - BANK 1, SENSOR 2

P2270 - O2 SENSOR SIGNAL STUCK LEAN - BANK 1, SENSOR 2

Description:	The downstream heated oxygen sensor (HO2S) is forced rich and lean and monitored by the powertrain control module (PCM). The test fails if the PCM does not detect the output of the HO2S in a calibrated amount of time.		
Possible Causes:	• Pinched, shorted, and corroded wiring and pins • Crossed HO2S wires • Exhaust leaks • Contaminated or damaged HO2S		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST H** .	refer to **PINPOINT TEST H** .

P2271 - O2 SENSOR SIGNAL STUCK RICH - BANK 1, SENSOR 2

P2271 - O2 SENSOR SIGNAL STUCK RICH - BANK 1, SENSOR 2

Description:	See the description for DTC P2270.
Possible Causes:	See the possible causes for DTC P2270.

Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST H** .	refer to **PINPOINT TEST H** .

P2272 - O2 SENSOR SIGNAL STUCK LEAN - BANK 2, SENSOR 2

P2272 - O2 SENSOR SIGNAL STUCK LEAN - BANK 2, SENSOR 2

Description:	See the description for DTC P2270.		
Possible Causes:	See the possible causes for DTC P2270.		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST H** .	refer to **PINPOINT TEST H** .

P2273 - O2 SENSOR SIGNAL STUCK RICH - BANK 2, SENSOR 2

P2273 - O2 SENSOR SIGNAL STUCK RICH - BANK 2, SENSOR 2

Description:	See the description for DTC P2270.		
Possible Causes:	See the possible causes for DTC P2270.		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST H** .	refer to **PINPOINT TEST H** .

P2274 - O2 SENSOR SIGNAL STUCK LEAN - BANK 1, SENSOR 3

P2274 - O2 SENSOR SIGNAL STUCK LEAN - BANK 1, SENSOR 3

Description:	See the description for DTC P2270.		
Possible Causes:	See the possible causes for DTC P2270.		
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST H** .	refer to **PINPOINT TEST H** .

P2275 - O2 SENSOR SIGNAL STUCK RICH - BANK 1, SENSOR 3

P2275 - O2 SENSOR SIGNAL STUCK RICH - BANK 1, SENSOR 3

Description:	See the description for DTC P2270.
Possible Causes:	See the possible causes for DTC P2270.

Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	refer to **PINPOINT TEST H** .	refer to **PINPOINT TEST H** .

P2448 - SECONDARY AIR INJECTION SYSTEM HIGH AIRFLOW (BANK 1)

P2448 - SECONDARY AIR INJECTION SYSTEM HIGH AIRFLOW (BANK 1)

Description:	The AIR system detects excessive mass air flow change with the pump ON and a rich exhaust system air fuel ratio.		
Possible Causes:	• AIR outlet hose leak. • AIR outlet hose is disconnected.		
Diagnostic Aids:	Measured air flow is less than expected. Visually inspect the secondary AIR inlet hose.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HM** .		

P260F - EVAPORATIVE SYSTEM MONITORING PROCESSOR PERFORMANCE

P260F - EVAPORATIVE SYSTEM MONITORING PROCESSOR PERFORMANCE

Description:	This DTC sets when a concern is detected internal to the powertrain control module (PCM). The microprocessor that controls the engine off natural vacuum (EONV) leak check monitor is separate from the main processor within the PCM.		
Possible Causes:	• Module communications network concerns • PCM calibration level • Damaged PCM		
Diagnostic Aids:	Verify the PCM is at the latest calibration level. Reprogram if necessary.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	refer to **PINPOINT TEST HX** .		

PXXXX -

PXXXX -

Description: **Possible Causes:** **Diagnostic Aids:**			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
	For Pxxxx DTCs not listed in this chart, refer to the customer's		

All		symptom to determine the applicable Workshop article part for diagnosis.

U0101 - LOST COMMUNICATION WITH TRANSAXLE CONTROL MODULE (TCM)

U0101 - LOST COMMUNICATION WITH TRANSAXLE CONTROL MODULE (TCM)

Description:	The powertrain control module (PCM) continuously monitors the controller area network (CAN) for messages from the TCM. This DTC sets when the PCM does not receive the TCM message within the defined amount of time.		
Possible Causes:	• Damaged CAN communication bus circuit		
Diagnostic Aids:	Network DTC concerns occur during module-to-module communication. Refer to the **MODULE COMMUNICATIONS NETWORK -- E-SERIES** to diagnose the transmission control module (TCM) does not respond to the scan tool symptom.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-		

U0121 - LOST COMMUNICATION WITH THE ANTILOCK BRAKING SYSTEM (ABS) CONTROL MODULE

U0121 - LOST COMMUNICATION WITH THE ANTILOCK BRAKING SYSTEM (ABS) CONTROL MODULE

Description:	The powertrain control module (PCM) continuously monitors the controller area network (CAN) for messages from the ABS. This DTC sets when the PCM fails to receive the ABS message within the defined amount of time.		
Possible Causes:	• Damaged CAN communication bus circuit		
Diagnostic Aids:	Network DTC concerns occur during module-to-module communication. Refer to the **MODULE COMMUNICATIONS NETWORK -- E-SERIES** , to diagnose the anti-lock brake system (ABS) module does not respond to the scan tool symptom.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-		

U0155 - LOST COMMUNICATION WITH INSTRUMENT PANEL CLUSTER CONTROL MODULE

U0155 - LOST COMMUNICATION WITH INSTRUMENT PANEL CLUSTER CONTROL MODULE

Description:	Missing message concerns are logged by a module upon failure to receive a message from another module within a defined retry period.
Possible Causes:	• Open VPWR circuit to the sending module • Open GND circuit to the sending module

	• Open network circuits to the sending module		
Diagnostic Aids:	Carry out the diagnostics for the associated network module.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **INSTRUMENT CLUSTER (IC) AND WARNING CHIMES -- E-SERIES** to diagnose the instrument cluster does not respond to the scan tool symptom.		

U0300 - INTERNAL CONTROL MODULE SOFTWARE INCOMPATIBILITY

U0300 - INTERNAL CONTROL MODULE SOFTWARE INCOMPATIBILITY

Description:	This DTC indicates that there are incompatible software levels within the powertrain control module (PCM) that control the electronic throttle control (ETC) system. The ETC system uses multiple microprocessors within the PCM, each having its own software level and function. The microprocessors must have the correct level of software in order to communicate and function together.		
Possible Causes:			
Diagnostic Aids:	Verify the PCM is at the latest calibration level.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	-	-	refer to **PINPOINT TEST QE** .

U1039 - SCP (J1850) INVALID OR MISSING DATA FOR VEHICLE SPEED

U1039 - SCP (J1850) INVALID OR MISSING DATA FOR VEHICLE SPEED

Description:			
Possible Causes:	Network DTC(s) occur during module-to-module communication concerns. Two types of network concerns can be categorized: • Invalid data network concerns - data is transferred within the normal inter-module message, but contains known invalid data. The transmitting module logs a DTC related to the invalid data concern. • Missing message network concerns - missing message concerns are logged by the module upon failure to receive a message from another module within a defined retry period.		
Diagnostic Aids:	Carry out the on-board diagnostics for the associated network module.		
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the **MODULE COMMUNICATIONS NETWORK -- E-SERIES** to diagnose the no international standards organization (ISO) 9141 network communication symptom or the antilock braking system (ABS) module does not respond to the scan tool symptom.		

UXXXX - NETWORK COMMUNICATION DIAGNOSTIC TROUBLE CODE (DTC)

UXXXX - NETWORK COMMUNICATION DIAGNOSTIC TROUBLE CODE (DTC)

Description: **Possible Causes:** **Diagnostic Aids:**	Powertrain related DTC from another module.			
Application		**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All		For U DTC(s) received during self-test of a module other than the powertrain control module (PCM), refer to the **SYMPTOM CHARTS** article, Powertrain Control Module (PCM) Quick Test.		
Note: 'x' equals any number 0 through 9 or letter A through F. Note 1: Reprogram or update the calibration. Check for other DTCs or drive symptoms for further action. Make sure to check for aftermarket performance products before installing a new PCM. If it is necessary to install a new PCM, refer to**FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** , Programming the VID Block for a Replacement PCM. Note 2: DTC P1000 is ignored in the key on engine off (KOEO) and key on engine running (KOER) self-tests. Disregard DTC P1000 and continue as directed.				

2008 ENGINE PERFORMANCE

Reference Values - Gasoline Engines

REFERENCE VALUE SYMPTOM CHART

The Reference Value Symptom Chart provides guidance in selecting the appropriate parameter identification (PID) or measured signal related to the fault area. Select a symptom from the symptom chart along with the category number and go to the PID/Measured Signal Chart. For multiple symptoms, select the symptom that is the most evident.

SYMPTOM CHART

Symptom Occurs During	Symptom	Category Number
Startup:	No start/Normal crank	1
	Hard start/Long crank	2
	Stall after start	3
	Diesels/Runs on	4
Idle:	MIL	5
	Stalls/Quits	6
	Slow	7

[a] Generic PID

Some signals can only be measured and require the use of a digital multimeter (DMM).

TYPICAL DIAGNOSTIC REFERENCE VALUES

NOTES:

Footnotes are referenced throughout the Typical Diagnostic Reference Value Charts. A letter in parentheses next to a value indicates supplemental information is applicable.

An attempt is made to provide as much information as possible; some vehicles may not display all input and output signals.

The Typical Diagnostic Reference Value Charts do not display fault parameter identifications (PIDs). These are PIDs which indicate a hard fault with the circuit. They display a value of YES or NO and are PIDs ending with the letter F.

Reference values may vary 20% depending on operating conditions, altitude, and other factors. RPM values are axle and tire dependent.

Values are taken at an altitude of approximately Meters 55.7 (600 ft) above sea level.

Refer to the Introduction part, Acronyms and Definitions for technical terms applicable to Ford Motor Company products.

Refer to**PARAMETER IDENTIFICATION (PID)** , for PID descriptions.

For detailed transmission diagnostics, refer to the Workshop article. Transmission signals may be referred to in either alpha or numeric form. For example, 1=A, 2=B, 3=C.

A. A/C on.
B. Cooling fan on (single, low or high speed).
C. Heated oxygen sensors (HO2S) should switch from rich to lean at least once every 3 seconds. HO2S voltage should toggle above and below 0.450 DCV and never be a negative value. Valid HO2S switching occurs only during closed loop fuel control operation.
D. Downstream HO2S(s) stay close to a constant voltage when the catalyst monitor is off (positive value only). When the catalyst monitor is on, the HO2S switches rich to lean above and below 0.450 DCV and never be a negative value. For downstream HO2S(s) (12, 13, 22) greater activity results when the catalyst monitor is active.
E. Brake pedal applied.
F. The electric vapor management valve (VMV) commanded current varies from 0 mA - 1000 mA depending on the PCM command to purge the EVAP system.
G. While pressing the transmission control switch (TCS) or switching to manual drive mode.
H. Value is dependent on fuel tank level. Typical operating range is 15% (empty) to 90% (full).
I. Steering wheel turned.
J. Clutch pedal applied.
K. Value is dependent upon ambient air temperature and may fall outside of range.
L. Value is not useful under this condition.
M. If equipped.

N. Transmission in selected range.
O. May change state under this condition.
P. While pressing switch.
Q. Value may cycle 5-6 times every 5 seconds.
R. Canister vent duty cycles to 100% (close) when EVAP monitor test is running.
S. Refer to Workshop article part 419-01.
T. EGR voltage and duty cycle will vary from 0-VBAT or 0-100% depending on EGR demand.
U. RPM dependent. If signal is 0 Hz at idle, check signal at 900 RPM.
V. Crank position.
W. Value may vary 20% depending on altitude, operating conditions, weather, and other factors.

2008 ENGINE PERFORMANCE

Symptom Charts - Gasoline Engines

DIAGNOSTIC TESTS

PINPOINT TEST QT: POWERTRAIN CONTROL MODULE (PCM) QUICK TEST

QT1 CARRY OUT THE PCM QUICK TEST

NOTE:	**If the vehicle was brought in with an emission compliance concern, refer to PINPOINT TEST EM - EMISSION COMPLIANCE .**

NOTE:	**For applications that use a stand-alone transmission control module (TCM), the PCM does not output TCM related diagnostic trouble codes (DTCs). Refer to the Workshop Manual Section 307-01, Automatic Transaxle/Transmission, diagnostic strategy to continue diagnosis.**

NOTE:	**If unable to access the PCM DTCs, or a scan tool communication concern exists, refer to PINPOINT TEST QA - UNABLE TO ACTIVATE SELF-TEST/NETWORK COMMUNICATION ERROR . For additional information on retrieving malfunction indicator lamp (MIL) and non-MIL DTCs, refer toQUICK TEST DESCRIPTION for the Continuous Memory Self-Test.**

- Complete the preliminary checks looking for obvious concerns that may relate to the symptom. Check for the following items:
  - fuses
  - electrical circuits and connectors
  - vacuum lines (leaks, routing)
  - air intake system (leaks, restrictions)
  - fuel quality (octane, contamination, winter/summer blend)
  - cooling system (engine operating at correct temperature)
- Access any related On-line Automotive Service Information System (OASIS) or Technical Service Bulletin (TSB) information (if available).
- Carry out the PCM self-test to access any DTCs. Record any key on engine off (KOEO), key on engine running (KOER) (if the engine runs) and continuous memory (MIL and non-MIL) DTCs.
- **Are any DTCs present?**

Yes	No
GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** for direction to repair DTCs after noting the following: DIAGNOSE the DTCs in the following order (begin	

diagnosis with the first DTC output in that mode and diagnose any circuit related DTCs first). For multiple circuit DTCs that are set as a result of a concern with more than one component, REFER to the Wiring Diagrams Manual Electronic Engine Controls Cell and identify the common cause such as SIGRTN, VREF, or VPWR. Continue DTC diagnosis by referring to the appropriately identified pinpoint test. Any KOEO self-test DTCs Any KOER self-test DTCs Any continuous memory self-test DTCs. Retrieve any available freeze frame data and disregard any identical/related continuous DTCs already repaired.	GO to **NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX** for direction to the correct symptom chart in **NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS**. If the symptom is not listed, REFER to the applicable Workshop Manual Section to continue diagnosis.

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX

Driveability

System/Symptom		Chart Number
Starting Concerns	Hard Start/Long Crank/Erratic Start/Erratic Crank	**CHART NUMBER: 2**
	No crank	**CHART NUMBER: 23**
	No start (engine cranks)	**CHART NUMBER: 3**
Unique Idle Concerns	Slow return to idle	**CHART NUMBER: 4**
	Rolling idle	**CHART NUMBER: 1**
	Fast idle	**CHART NUMBER: 5**
	Low/Slow idle	**CHART NUMBER: 6**

Driveability - Performance While Driving Concerns

System/Symptom		Chart Number
Stalls/Quits	Idle/Acceleration/Cruise	**CHART NUMBER: 1**
	Deceleration	**CHART NUMBER: 6**
	Stall after start	**CHART NUMBER: 1**
Runs Rough		**CHART NUMBER: 1**
Misses		**CHART NUMBER: 1**
Buck/Jerk		**CHART NUMBER: 1**
Hesitation/Stumble		**CHART NUMBER: 1**
Surge		**CHART NUMBER: 1**
Backfires		**CHART NUMBER: 7**
Lack/Loss of Power		**CHART NUMBER: 8**

Spark Knock	**CHART NUMBER: 9**

Note: OASIS identifiers (the x means any number (1-9) can be used) xxx4xx equals during idle, xxx5xx equals during acceleration, xxx6xx equals during cruise, xxx7xx equals during deceleration.

Additional Driveability Concerns

System/Symptom	Chart Number
Diesels/Runs On	**CHART NUMBER: 5**
Poor Fuel Economy	**CHART NUMBER: 10**
Emissions Compliance	**CHART NUMBER: 11**

Electrical

System/Symptom		Chart Number
Warning Indicators	Malfunction indicator lamp (MIL)	**CHART NUMBER: 12**
	Transmission control indicator lamp (TCIL)	**CHART NUMBER: 12**
	Power take off (PTO)	**CHART NUMBER: 12**
	Temperature warning indicator or gauge (for vehicles equipped with a cylinder head temperature (CHT) sensor only)	**CHART NUMBER: 12**
	Check fuel cap indicator	**CHART NUMBER: 12**
	Powertrain malfunction indicator (wrench)	**CHART NUMBER: 12**
Climate Control	Lack of A/C cooling, A/C not functioning	**CHART NUMBER: 21**
	A/C always on or A/C compressor runs continuously	**CHART NUMBER: 21**
Instrumentation	Tachometer inoperative	**CHART NUMBER: 14**
	Speedometer/odometer inoperative	**CHART NUMBER: 14**
	Boost gauge indicates higher than normal boost	**CHART NUMBER: 14**
	Fuel gauge inoperative	**CHART NUMBER: 14**

Engine

System/Symptom		Chart Number
Oil System Concerns	High oil consumption	**CHART NUMBER: 15**
	Leaks	**CHART NUMBER: 15**
Cooling System Concerns	Electric cooling fan(s) does not operate (low, medium, high or variable speed)	**CHART NUMBER: 16**
	Cooling fan clutch does not operate	**CHART NUMBER: 16**
	Electric cooling fan(s) always runs	**CHART NUMBER: 17**
Exhaust System Concerns	Visible smoke	**CHART NUMBER: 18**

CHART 1

- Stalls/Quits: Idle, Acceleration, Cruise, Stall After Start
- Runs Rough
- Misses
- Buck/Jerk
- Hesitation/Stumble
- Surge
- Unique Idle Concerns: Rolling Idle

NOTE: For some vehicle applications, the engine may stall if left running while refueling. Advise the customer to turn the engine off while refueling to avoid contamination or damage to the evaporative emission (EVAP) system.

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Check the following parameter identifiers (PIDs): • DPFEGR (if equipped) (hot idle value within 0.15 volt of the key ON, engine OFF	**DPFEGR PID value not within 0.15 volt of key ON, engine OFF value:** • For vehicles equipped with an exhaust gas recirculation system module (ESM), refer to **PINPOINT TEST HH - Exhaust Gas Recirculation System Module (ESM)** . • For all others, refer to **PINPOINT TEST HE - Exhaust Gas Recirculation (EGR) Systems** . **LONGFT1/LONGFT2 value low (-):** Continue diagnosis. Concentrate checks in areas that would cause the engine to run

value) • LONGFT1/LONGFT2 (value between -20 and +20%) • VPWR (value between 10.5 and 17.0 volts, and within 0.5 volt of battery voltage)	rich. **LONGFT1/LONGFT2 value high (+):** Continue diagnosis. Concentrate checks in areas that would cause the engine to run lean. **VPWR not between 10.5 and 17.0 volts:** REFER to the Workshop Manual Section 414-00, Charging System and carry out the Inspection and Verification to continue diagnosis. **VPWR between 10.5 and 17.0 volts, but not within 0.5 volt of battery voltage:** CHECK the B+ voltage to the powertrain control module (PCM) power relay. CHECK the VPWR circuit between the PCM and the PCM power relay. CHECK the PWR GND circuits.
For vehicles that run rough at idle: Check the INJx_F PIDs (the "x" indicates the injector number) with the key ON, engine OFF. There is 1 INJx_F PID for each engine cylinder. All INJx_F PIDs must indicate no fault (or NO).	The INJx_F PID(s) indicate a fault (an injector circuit concern is indicated), refer to **PINPOINT TEST KG - Fuel Injector** .
Mass Air Flow (MAF) Sensor	refer to **PINPOINT TEST DC - Mass Air Flow (MAF) Sensor** .
Secondary Ignition System	For vehicles equipped with a coil pack ignition system, refer to **PINPOINT TEST JC - Secondary Ignition (Coil Pack)** . For all others, refer to **PINPOINT TEST JB - Secondary Ignition (COP)** .
Fuel Delivery System	refer to **PINPOINT TEST HC - Fuel Delivery System** .
Exhaust System	refer to **PINPOINT TEST HF - Catalyst Efficiency Monitor and Exhaust Systems** .
Positive Crankcase Ventilation (PCV) System	refer to **PINPOINT TEST HG - Positive Crankcase Ventilation (PCV) System** .
EVAP System	refer to **PINPOINT TEST HX - Evaporative Emission (EVAP) Monitor and System** .
Charging System	refer to **PINPOINT TEST HY - Generator/Regulator System** .

Heated Oxygen Sensor (HO2S) (for Taurus, Taurus X, Sable PZEVs)	refer to **PINPOINT TEST DZ - Universal Heated Oxygen Sensor (HO2S)** .
Automatic Transmission	REFER to the Workshop Manual Section 307-01, Automatic Transmission/Transaxle diagnostic strategy to continue diagnosis.
Base Engine	REFER to the Workshop Manual Section 303-00, Engine System and carry out the Inspection and Verification to continue diagnosis.
Intake Air System	refer to **PINPOINT TEST HU - Intake Air Systems** .
A/C Pressure (ACP) Transducer Sensor	refer to **PINPOINT TEST DS - Air Conditioning Pressure (ACP) Sensor** .
Additional Testing	refer to **PINPOINT TEST Z - Intermittent** .
Additional Checks: • Some vehicles have a TQ_CNTRL PID available. Check this PID to determine if the PCM is reducing torque, and if so, why the torque is being reduced. As a PID display example; 0 equals no torque reduction requested, 1 equals torque truncation, which cuts fuel to protect when line pressure falls to minimum limit and 2 equals traction control event, which cuts fuel/spark for traction control. • Correct PCM vehicle identification (VID) block information. Refer to Section 2, **FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** to carry out the Making Changes to the VID Block procedure. • Be aware of engine RPM/speed limiting functions of the PCM (look for incorrect high vehicle speed signal from ABS, VSS, or OSS). • Verify the fuel filler cap is correctly tightened or the capless fuel tank filler pipe is correctly sealed and not physically damaged. • Driveline	REFER to the applicable Workshop Manual section.

- Manual transmission/clutch - Charging system - Traction control system (if equipped) - A/C system (for surge with A/C on) - Speed control system (for surge with speed control on) - A/C compressor diode, if equipped (for rolling idle)	

CHART 2

- Starting Concerns: Hard Start/Long Crank/Erratic Start/Erratic Crank

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Battery Condition and Current Draw	Visual. REFER to the Workshop Manual Section 414-00, Charging System and carry out the Inspection and Verification to continue diagnosis.
Secondary Ignition System	For vehicles equipped with a coil pack ignition system, refer to **PINPOINT TEST JC - Secondary Ignition (Coil Pack)** . For all others, refer to **PINPOINT TEST JB - Secondary Ignition (COP)** .
Fuel Delivery System	refer to **PINPOINT TEST HC - Fuel Delivery System** .
Exhaust System	refer to **PINPOINT TEST HF - Catalyst Efficiency Monitor and Exhaust Systems** .
PCV System	refer to **PINPOINT TEST HG - Positive Crankcase Ventilation (PCV) System** .
EVAP System	refer to **PINPOINT TEST HX - Evaporative Emission (EVAP) Monitor and System** .
Intake Air System	refer to **PINPOINT TEST HU - Intake Air Systems** .
Starting System	REFER to the Workshop Manual Section 303-06, Starting System and diagnose the engine cranks slowly

	symptom.
MAF Sensor	refer to **PINPOINT TEST DC - Mass Air Flow (MAF) Sensor** .
Additional Testing	refer to **PINPOINT TEST Z - Intermittent** .
Additional Checks: • For vehicles equipped with 2 camshaft position (CMP) sensors, verify the CMP1 and CMP2 circuits are not shorted together.	Visual

CHART 3

- Starting Concerns: No Start (Engine Cranks)

NOTE: An extended crank because of a no start may load the exhaust system with raw fuel, damaging the catalytic converter after the engine starts. For vehicles equipped with a secondary air injection (AIR) system, carry out the following after the no start concern is repaired: Disconnect the electric AIR pump relay, run the engine until the surplus fuel is used up, and connect the relay. Disconnecting the relay may set a continuous memory PCM DTC that needs to be cleared.

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Add-on Anti-Theft Devices	Visual. CHECK with the customer.
Fuel/Ignition	refer to **PINPOINT TEST A - No Start** .
Intake Air System (for vehicles equipped with an IAC valve). If the engine will not start at closed throttle, but will start and run normally at part throttle, check the IAC valve.	refer to **PINPOINT TEST KE - Idle Air Control (IAC) Valve** .
Exhaust System Restrictions	refer to **PINPOINT TEST HF - Catalyst Efficiency Monitor and Exhaust Systems** .
Base Engine	REFER to the Workshop Manual Section 303-00, Engine System and carry out the Inspection and Verification to continue diagnosis.
Additional Testing	refer to **PINPOINT TEST Z - Intermittent** .

CHART 4

- Unique Idle Concerns: Slow Return To Idle

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Vacuum Leaks, Throttle Body	Visual
PCV System	refer to **PINPOINT TEST HG - Positive Crankcase Ventilation (PCV) System** .
Intake Air System Leaks (for vehicles equipped with an IAC valve)	refer to **PINPOINT TEST HU - Intake Air Systems** .

CHART 5

- Unique Idle Concerns: Fast Idle
- Diesels/Runs On

NOTE: **If the vehicle runs normally with the key in the OFF position, check for a damaged ignition switch, an IGN START/RUN or ISP-R circuit short to voltage, or a VPWR circuit short to voltage.**

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Base Engine Check for air leaks, including correct sealing of intake manifold and components/vacuum lines attached to intake air (such as the PCV, EGR or IAC valve/vacuum lines).	Visual. REFER to the Workshop Manual Section 303-00, Engine System and carry out the Inspection and Verification to continue diagnosis.
Verify the engine operates at normal temperature.	Visual. REFER to the Workshop Manual Section 303-03, Engine Cooling or **No Diagnostic Trouble Codes (DTCs) Present Symptom Chart Index**, to diagnose any cooling system concerns that are present.
Fast idle concerns (for vehicles equipped with an IAC valve)	TP MODE PID is not C/T with the throttle closed: At vehicle start, the TPREL begins at about 1.25 volts and counts down to the lowest TP voltage value seen since engine start. If the TP voltage value goes below the normal range, then increases again, TPREL sets to the lower voltage.

With the key ON, engine OFF monitor the TP MODE PID while wiggling the TP sensor circuits. The TP MODE PID can also be monitored during vehicle drive. With the throttle closed, the TP MODE PID must be C/T (closed throttle).	If the TP voltage is about 0.04 volt greater than the TPREL value at closed throttle, the PCM goes into part throttle mode. MONITOR the TP voltage and TPREL PIDs for sudden changes while checking for intermittent TP circuit/connector concerns. CHECK for loose or worn throttle plates. If no concern is found, refer to **PINPOINT TEST Z - Intermittent** .
Intake Air System Leaks (for vehicles equipped with an IAC valve)	refer to **PINPOINT TEST HU - Intake Air Systems** .
Additional Testing	refer to **PINPOINT TEST Z - Intermittent** .

CHART 6

- Unique Idle Concerns: Low/Slow Idle
- Stalls/Quits: Deceleration

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Verify the fuel filler cap is correctly tightened or the capless fuel tank filler pipe is correctly sealed.	Visual
Automatic Transmission (stalls/quits on deceleration)	REFER to the Workshop Manual Section 307-01, Automatic Transmission/Transaxle to diagnose the torque convertor operation concerns.
Fuel Delivery System	refer to **PINPOINT TEST HC - Fuel Delivery System** .
Intake Air System	refer to **PINPOINT TEST HU - Intake Air Systems** .
Charging System	refer to **PINPOINT TEST HY - Generator/Regulator System** .
Heated Oxygen Sensor (HO2S) (for Taurus, Taurus X, Sable PZEVs)	refer to **PINPOINT TEST DZ - Universal Heated Oxygen Sensor (HO2S)** .
Base Engine	REFER to the Workshop Manual Section 303-00, Engine System and carry out the Inspection and Verification to continue diagnosis.
Additional Testing	refer to **PINPOINT TEST Z - Intermittent** .

CHART 7

- Backfires

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Secondary Ignition	For vehicles equipped with a coil pack ignition system, refer to **PINPOINT TEST JC - Secondary Ignition (Coil Pack)** . For all others, refer to **PINPOINT TEST JB - Secondary Ignition (COP)** .
Fuel Delivery System	refer to **PINPOINT TEST HC - Fuel Delivery System** .
Base Engine	REFER to the Workshop Manual Section 303-00, Engine System and carry out the Inspection and Verification to continue diagnosis.
Exhaust System	refer to **PINPOINT TEST HF - Catalyst Efficiency Monitor and Exhaust Systems** .
Additional Testing	refer to **PINPOINT TEST Z - Intermittent** .

CHART 8

- Lack/Loss of Power

NOTE: **Verify the symptom is reported under normal driving conditions without excessive engine or vehicle load. Also, be aware of the engine RPM/speed limiting functions of the PCM.**

NOTE: **For vehicles equipped with a knock sensor, a lack of power may result when the vehicle is operated with a breakout box installed at the PCM. The knock sensor circuits are not shielded in the breakout box, and knock sensor signal noise may be noticed by the PCM. If this happens, spark timing is retarded and a lack of power may result.**

NOTE: **For applications with a knock sensor, a lack of power may result if the engine has developed an abnormal noise. The knock sensors may interpret some abnormal noise as detonation and retard spark timing.**

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)

Automatic Transmission Fluid	Visual
Throttle Linkage	Visual
Air Cleaner Element	Visual
Check the following PIDS: • LONGFT1/LONGFT2 (value between -20 and +20%) • IMTVF (if equipped): For both key ON, engine OFF and key ON, engine running with the transmission in PARK/NEUTRAL and the engine RPM greater than 3,000 RPM, the PID should indicate no fault (or NO) in both situations.	**LONGFT1/LONGFT2 value low (-):** Continue diagnosis. Concentrate checks in areas that would cause the engine to run rich. **LONGFT1/LONGFT2 value high (+):** Continue diagnosis. Concentrate checks in areas that would cause the engine to run lean. **IMTVF PID indicates a fault:** refer to **PINPOINT TEST HU - Intake Air Systems** .
Fuel Delivery System	refer to **PINPOINT TEST HC - Fuel Delivery System** .
Secondary Ignition	For vehicles equipped with a coil pack ignition system, refer to **PINPOINT TEST JC - Secondary Ignition (Coil Pack)** . For all others, refer to **PINPOINT TEST JB - Secondary Ignition (COP)** .
MAF Sensor	refer to **PINPOINT TEST DC - Mass Air Flow (MAF) Sensor** .
Exhaust System	refer to **PINPOINT TEST HF - Catalyst Efficiency Monitor and Exhaust Systems** .
Variable Camshaft Timing (VCT) System	refer to **PINPOINT TEST HK - Variable Camshaft Timing (VCT)** .
Accelerator Pedal Position Sensor	refer to **PINPOINT TEST DK - Accelerator Pedal Position Sensor** .
Base Engine	REFER to the Workshop Manual Section 303-00, Engine System and carry out the Inspection and Verification to continue diagnosis.
Automatic Transmission	REFER to the Workshop Manual Section 307-01, Automatic Transmission/Transaxle diagnostic strategy to continue diagnosis.
Brake System Drag or Binding	REFER to the Workshop Manual Section 206-00, Brake System.

Supercharger Bypass System	refer to **PINPOINT TEST KJ - Supercharger Bypass Control** .
Additional Testing	refer to **PINPOINT TEST Z - Intermittent** .
Additional Checks: • Some vehicles have a TQ_CNTRL PID available. Check this PID to determine if the PCM is reducing torque, and if so, why the torque is being reduced. As a PID display example; 0 equals no torque reduction requested, 1 equals torque truncation, which cuts fuel to protect when line pressure falls to minimum limit, and 2 equals traction control event, which cuts fuel/spark for traction control. • Customer driving habits • Correct PCM vehicle identification (VID) block information. Refer to Section 2, **FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** to carry out the Making Changes to the VID Block procedure. • Intake manifold runner control (IMRC) linkage (if equipped) • Clutch (M/T) • Charging system • Engine RPM/speed limiting functions of the PCM (look for incorrect high vehicle speed signal from ABS, VSS, or OSS)	Visual. REFER to the applicable Workshop Manual section.

CHART 9

- Spark Knock

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Verify the engine operates at normal temperature	Visual. REFER to the Workshop Manual Section 303-03, Engine Cooling or **No Diagnostic Trouble Codes (DTCs) Present Symptom Chart Index** to diagnose any cooling system concerns that are present.

Verify correct coolant level and coolant concentration	REFER to the Workshop Manual Section 303-03, Engine Cooling for correct coolant concentrations and fill procedures.
MAF Sensor	refer to **PINPOINT TEST DC - Mass Air Flow (MAF) Sensor** .
Base Engine	REFER to the Workshop Manual Section 303-00, Engine System and carry out the Inspection and Verification to continue diagnosis.
Fuel Delivery System	refer to **PINPOINT TEST HC - Fuel Delivery System** .
Secondary Ignition System	For vehicles equipped with a coil pack ignition system, refer to **PINPOINT TEST JC - Secondary Ignition (Coil Pack)** . For all others, refer to **PINPOINT TEST JB - Secondary Ignition (COP)** .
PCV System	refer to **PINPOINT TEST HG - Positive Crankcase Ventilation (PCV) System** .
Engine Oil Quality	Visual
Additional Testing	refer to **PINPOINT TEST Z - Intermittent** .

CHART 10

- Poor Fuel Economy

NOTE: **Driving styles may have a significant influence on fuel economy. Verify the concern before starting an in-depth diagnosis. If available, use the IDS fuel economy test to verify a concern is present. The following external factors may contribute to poor fuel economy:**

- stop and go driving
- incorrect tire pressure and size
- vehicle loads (such as trailer towing)
- extended winter warm-up conditions
- high speed driving
- incorrect axle ratio

- road/weather conditions
- aftermarket add-ons
- short run operations
- customer expectations

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Check the following PIDs: • LONGFT1/LONGFT2 (value between -20 and +20%) • VPWR (value between 10.5 and 17.0 volts, and within 0.5 volt of battery voltage)	**LONGFT1/LONGFT2 value low (-):** Continue diagnosis. Concentrate checks in areas that would cause the engine to run rich. **LONGFT1/LONGFT2 value high (+):** Continue diagnosis. Concentrate checks in areas that would cause the engine to run lean. **VPWR not between 10.5 and 17.0 volts:** REFER to the Workshop Manual Section 414-00, Charging System and carry out the Inspection and Verification to continue diagnosis. **VPWR between 10.5 and 17.0 volts, but not within 0.5 volt of battery voltage:** CHECK the B+ voltage to the PCM power relay. CHECK the VPWR circuit between the PCM and the PCM power relay. CHECK the PWR GND circuits.
Verify the engine operates at normal temperature.	Visual. REFER to the Workshop Manual Section 303-03, Engine Cooling to diagnose any cooling system concerns that are present.
Secondary Ignition System	For vehicles equipped with a coil pack ignition system, refer to **PINPOINT TEST JC - Secondary Ignition (Coil Pack)** . For all others, refer to **PINPOINT TEST JB - Secondary Ignition (COP)** .
Fuel System	refer to **PINPOINT TEST HC - Fuel Delivery System** .
Exhaust System	refer to **PINPOINT TEST HF - Catalyst Efficiency Monitor and Exhaust Systems** .
	refer to **PINPOINT TEST HK -**

Variable Camshaft Timing (VCT) System	**Variable Camshaft Timing (VCT)** .
Transmission Fluid Level	Visual
Automatic Transmission	REFER to the Workshop Manual Section 307-01, Automatic Transmission/Transaxle diagnostic strategy to continue diagnosis.
PCV System	refer to **PINPOINT TEST HG - Positive Crankcase Ventilation (PCV) System** .
Additional Checks: • Correct PCM VID block information. Refer to Section 2, **FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)** to carry out the Making Changes to the VID Block procedure. • Brake drag • Base engine concerns • Incorrect PCV valve • Contaminated MAF sensor • Intake air system	REFER to the applicable Workshop Manual section.
Additional Testing	refer to **PINPOINT TEST Z - Intermittent** .

CHART 11

- Emissions Compliance

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Emissions Related Systems	refer to **PINPOINT TEST EM - Emission Compliance** .

CHART 12

- Warning Indicators: Check Fuel Cap Indicator, Malfunction Indicator Lamp (MIL), Power Take Off (PTO), Temperature Warning Indicator or Gauge (applications with CHT sensor only), Transmission Control Indicator Lamp (TCIL), Powertrain Malfunction Indicator (Wrench)
- PTO Concerns: Not Working Correctly

NOTE:

- **If the symptom is both a MIL on and exhaust emission test failure, GO directly to Chart 11.**

- **If the engine is a no start, GO directly to Chart 3.**
- **If the engine runs rough at idle, GO directly to Chart 1.**

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Verify the fuel filler cap is correctly tightened or the capless fuel tank filler pipe is correctly sealed.	Visual
Check Fuel Cap Indicator • Never/always on	REFER to the Workshop Manual Section 413-01, Instrument Cluster to diagnose the check fuel cap indicator is never/always on or Section 413-08 Information and Message Center to diagnose the CHECK FUEL CAP warning is inoperative.
MIL • Always on when the engine is running (no DTCs present) • Never on (including during indicator prove out)	REFER to the Workshop Manual Section 413-01, Instrument Cluster and carry out the Inspection and Verification to continue diagnosis.
PTO • PTO indicator never/always on • PTO not working correctly	refer to **PINPOINT TEST FB - Power Take Off (PTO)** .
Temperature Warning Indicator or Gauge (applications with CHT sensor only) • Engine cooling system • Indicator circuits	For an engine that is overheating, REFER to the Workshop Manual Section 303-03, Engine Cooling to diagnose the engine overheating symptom. Be aware that since a PCM DTC is not present, the PCM is not attempting to activate the indicator. For an engine operating at normal temperature, refer to **PINPOINT TEST DL - Cylinder Head Temperature (CHT) Sensor** .
TCIL • Always on when the engine is running (no DTCs present) • Never on	For E-Series, refer to **PINPOINT TEST TB - Transmission Control Switch (TCS)/ Transmission Control Indicator Lamp (TCIL)** . For all others, REFER to the Workshop Manual Section 413-01, Instrument Cluster.
Powertrain Malfunction Indicator (Wrench)	REFER to the Workshop Manual Section 413-01, Instrument Cluster to diagnose the wrench indicator is never/always on or

• Never/always on	Section 413-08 Information and Message Center to diagnose the POWERTRAIN MALFUNCTION warning is inoperative .
Additional Testing	refer to **PINPOINT TEST Z - Intermittent** .

CHART 13

- Automatic Transmission (A/T) Shift Concerns: Upshift, Downshift, Engagement

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Transmission	REFER to the Workshop Manual Section 307-01, Automatic Transmission/Transaxle diagnostic strategy to continue diagnosis.
Additional Tests	refer to **PINPOINT TEST Z - Intermittent** .

CHART 14

- Instrumentation: Tachometer Inoperative, Speedometer/Odometer Inoperative, Boost Gauge Indicates Higher Than Normal Boost, Fuel Gauge Inoperative

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Tachometer Inoperative	REFER to the Workshop Manual Section 413-01, Instrument Cluster to diagnose the incorrect tachometer indication.
Speedometer/Odometer Inoperative	REFER to the Workshop Manual Section 413-01, Instrument Cluster to diagnose the inoperative speedometer/odometer.
Boost Gauge (for vehicles equipped with a supercharger) • Indicates higher than normal boost	For supercharger bypass control concerns, refer to **PINPOINT TEST KJ - Supercharger Bypass Control** . For charge air cooler (CAC) system concerns, refer to **PINPOINT TEST KP - Charge Air Cooler (CAC) Pump** .
Fuel Gauge Inoperative • Fuel gauge always indicates full or empty	REFER to the Workshop Manual Section 413-01, Instrument Cluster to diagnose the incorrect fuel gauge indication.
Instrumentation	REFER to the Workshop Manual Section 413-01, Instrument Cluster.

CHART 15

- Oil System Concerns: High Oil Consumption, Leaks

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
PCV System	refer to **PINPOINT TEST HG - Positive Crankcase Ventilation (PCV) System** .
Base Engine	REFER to the Workshop Manual Section 303-00, Engine System and carry out the Inspection and Verification to continue diagnosis.
Additional Checks • External leaks • Correct dipstick • Correct oil viscosity	Visual

CHART 16

- Cooling System Concerns: Electric Cooling Fan(s) Does Not Operate (Low, Medium, High or Variable Speed), Cooling Fan Clutch Does Not Operate

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Electric Cooling Fan	For Crown Victoria/Grand Marquis, Fusion/Milan/MKZ, Edge/MKX, Taurus/Taurus X/Sable, and Town Car, refer to **PINPOINT TEST KN - Variable Speed Electric Cooling Fan** . For all others, refer to **PINPOINT TEST KF - Fan Control (FC) Relays** .
Cooling Fan Clutch	refer to **PINPOINT TEST HV - Visctronic Drive Fan (VDF)** .
Cooling System	REFER to the Workshop Manual Section 303-03, Engine Cooling to diagnose the cooling fan clutch.

CHART 17

- Cooling System Concerns: Electric Cooling Fan(s) Always Runs

NOTE: **This chart is only intended to diagnose an electric cooling fan that always runs with a cool engine and the A/C and defroster off.**

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Cooling Fan A/C pressure switch (ACPSW) or ACP transducer sensor circuits	For Crown Victoria/Grand Marquis, Fusion/Milan/MKZ, Edge/MKX, Taurus/Taurus X/Sable, and Town Car, VERIFY the results of the PCM self-test. Visually INSPECT the cooling fan for concerns. For all others, refer to **PINPOINT TEST KF - Fan Control (FC) Relays** .
Cooling System	REFER to the Workshop Manual Section 303-03, Engine Cooling to diagnose the electric cooling fans.

CHART 18

- Exhaust System Concerns: Visible Smoke

NOTE: **Black smoke indicates a rich fuel mixture, blue smoke indicates burning oil, and white smoke indicates water in the combustion chamber.**

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Base Engine	REFER to the Workshop Manual Section 303-00, Engine System and carry out the Inspection and Verification to continue diagnosis.
Fuel Delivery System • Black smoke	refer to **PINPOINT TEST HC - Fuel Delivery System** .
Ignition System • Black smoke	For vehicles equipped with a coil pack ignition system, refer to **PINPOINT TEST JC - Secondary Ignition (Coil Pack)** . For all others, refer to **PINPOINT TEST JB - Secondary Ignition (COP)** .
PCV System • Blue smoke	REFER to the Workshop Manual Section 303-00, Engine System for a description of the Oil Consumption Test.

CHART 19

- Fuel System Concerns: Odor, Engine Compartment

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
EVAP System	Visual
Fuel System	Visual. refer to **PINPOINT TEST HC - Fuel Delivery System** .

CHART 20

- Engine Noise (under hood)

NOTE: **Attempt to identify the source of the noise. If the noise is from a source other than those listed below, refer to NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX (for noise such as spark knock) or the applicable Workshop Manual section to continue diagnosis.**

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Secondary Ignition System Snap noise that may be due to secondary ignition arcing.	For vehicles equipped with a coil pack ignition system, refer to **PINPOINT TEST JC - Secondary Ignition (Coil Pack)** . For all others, CHECK the condition of the spark plug boots.

CHART 21

- Climate Control: Lack of A/C Cooling, A/C Not Functioning, A/C Always On, or A/C Compressor Runs Continuously

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
A/C System	If sent here from the Workshop Manual with WAC_F PID indicating a fault (or YES), GO to**DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS** and follow the directions for KOEO DTC P0645. For all others, REFER to the Workshop Manual Section 412-00, Climate Control System.

CHART 22

- Exhaust System Concerns: Odor (Sulfur or Rotten Egg Smell)

NOTE: **A slight sulfur smell may be normal. Catalysts with less than 8,000-16,000 kilometers (5,000-10,000 miles), either from a new vehicle or new catalyst, are likely to have a sulfur smell due to the highly active state of new catalysts. Installing a new catalyst may actually make the symptom worse.**

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Check for any driveability or exhaust smoke symptoms.	REFER to **No Diagnostic Trouble Codes (DTCs) Present Symptom Chart Index** for direction to repair other symptoms.
Fuel Delivery System	refer to **PINPOINT TEST HC - Fuel Delivery System** .
Fuel Source	Talk with the customer. Sulfur content can vary in different fuels. Suggest trying a different fuel source.

CHART 23

- Starting Concerns: No Crank

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Add-on Anti-Theft Devices	Visual. CHECK with the customer.
Anti-Theft	REFER to the Workshop Manual Section 419-01, Anti-Theft and diagnose the vehicle does not start symptom.
Base Engine • Starting system	REFER to the Workshop Manual Section 303-06, Starting System and diagnose the engine does not crank symptom.

DESCRIPTION AND OPERATION

ENGINE COOLING

NOTE: **The engine cooling system is filled with Motorcraft Premium Gold Engine Coolant. Mixing coolant types degrades the corrosion protection of Motorcraft Premium Gold Engine Coolant.**

NOTE: **Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog or damage the cooling system, resulting in degraded cooling system performance and/or failure.**

The cooling system components are the:

- block heater (if equipped).
- radiator.
- bypass tube.
- pressure relief cap.
- degas bottle.
- radiator draincock.
- coolant pump.
- thermostat (cold side).
- Engine Coolant Temperature (ECT) sensor.
- variable speed fan motor assembly.
- fan control module.

- engine block coolant weep hole (3.5L only).

The 3.5L engine is equipped with an engine block coolant weep hole. If the inner coolant pump shaft seal fails, coolant will be diverted out the weep hole in the LH side of the engine block. This prevents any coolant from entering the crankcase.

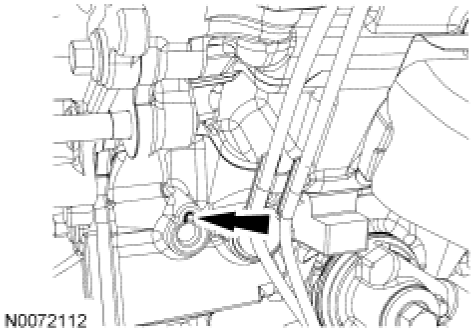

Fig. 1: Locating Engine Block Coolant Weep Hole
Courtesy of FORD MOTOR CO.

Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the degas bottle.

When adding engine coolant, use a 50/50 mixture of engine coolant and distilled water.

To maintain the integrity of the coolant and the cooling system:

- Add Motorcraft Premium Gold Engine Coolant or equivalent meeting Ford Specification WSS-M97B51-A1 (yellow color). Do not mix coolant types.
- Do not add/mix orange-colored Motorcraft Specialty Orange Engine Coolant or equivalent meeting Ford specification WSS-M97B44-D or green-colored Motorcraft Premium Engine Coolant meeting Ford specification ESE-M97B44-A or equivalent. Mixing coolants may degrade the coolant's corrosion protection.
- Do not add alcohol, methanol or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft Premium Gold Engine Coolant since a Ford-approved recycling process is not yet available.
- Used engine coolant should be disposed of in an appropriate manner. Follow the community's regulations and standards for recycling and disposing of automotive fluids.

Fail Safe Cooling (2.3L and 3.5L only)

NOTE:	**If the driver is using a high percentage of throttle travel (for example, an overtaking maneuver) when the PCM starts, engine deactivation will be delayed for 10 seconds.**

NOTE: After the cylinder deactivation operation has begun, the engine will not revert to operating on all cylinders, even if the temperature should fall, until the ignition is switched OFF and then ON again.

NOTE: The Malfunction Indicator Lamp (MIL) can only be extinguished by using a scan tool after the fault has been rectified and the DTC cleared.

The vehicle has a strategy built into the PCM that will control the engine if it starts to overheat.

Stage 1 of the strategy will commence if the engine starts to overheat. The Cylinder Head Temperature (CHT) sensor transmits a signal to the PCM, which then moves the temperature gauge pointer into the red zone.

If the engine is not switched OFF and the temperature continues to rise, the powertrain check lamp is illuminated. This indicates to the driver that the engine is approaching critical limits and should be stopped. At this point, DTC P1285 is set in the PCM and can be retrieved using a scan tool.

Stage 2 of the strategy will commence if the lamp and temperature gauge are ignored by the driver. The PCM will start to control the engine by cutting out cylinders and restricting the RPM to below 3,000 RPM. Simultaneously, the MIL will be illuminated. This indicates that long-term engine damage can occur and vehicle emissions will be affected. At this point, DTC 1299 is set in the PCM and can be retrieved using a scan tool.

Air is then drawn into the deactivated cylinders. This helps to control the temperature of the engine internal components. The deactivated cylinders are alternated to allow even cooling of all the cylinders.

Stage 3 of the strategy will commence if the engine temperature still continues to rise. This will result in the engine being totally disabled before major engine damage or seizure occurs. The powertrain check lamp will begin to flash, indicating to the driver that the engine will be switched OFF after 30 seconds. This allows the driver time to choose a suitable parking place.

Coolant Flow Diagram

NOTE: Black arrows indicate hot, white arrows indicate cold.

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (bittered in US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1

Principles of Operation

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. On most engines, the coolant pump is operated by engine rotation through a pulley which is driven by the accessory drive belt to circulate the coolant. Some engines use a belt driven by a pulley attached to the camshaft and some engines use a sprocket driven by the timing chain to operate the coolant pump. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant is allowed to flow through the radiator circuit in order to transfer engine generated heat to the outside air.

NOTE: The vehicle is equipped with either a degas bottle or an expansion tank.

The degas bottle, if equipped, holds surplus coolant and removes air from the cooling system, which reduces hot spots. It also allows for coolant expansion and system pressurization, replenishes coolant to the cooling system and serves as the location for service fill.

The coolant expansion tank, if equipped, holds surplus coolant, allows for coolant expansion and replenishes coolant to the cooling system. It is equipped with a non-pressurized cap which allows coolant to be added to the tank to keep it filled to prescribed levels.

The cooling fan draws air through the radiator to help cool the system coolant as it passes through the radiator.

The thermostat monitor is a function of the PCM and is designed to verify correct thermostat operation. The monitor will be executed once per drive cycle and has a monitor run duration of 300-800 seconds. If a malfunction occurs, DTC P0125 or P0128 is set, and the malfunction indicator lamp (MIL) will be illuminated.

For vehicle/engine specific information, refer to **Engine Cooling**.

Inspection and Verification

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTE: The engine cooling system is filled with Motorcraft Premium Gold Engine Coolant. Mixing coolant types degrades the corrosion protection of Motorcraft Premium Gold Engine Coolant. Do not mix coolant types. Failure to follow these instructions may result in engine or cooling system damage.

NOTE: Vehicles equipped with a degas bottle system have the pressure relief cap on the degas bottle and no radiator cap. Vehicles equipped with a coolant expansion tank system have the pressure relief cap on the radiator.

1. Verify the customer concern.
2. Visually check the engine coolant level at the degas bottle or coolant expansion tank when the system is cold.
3. Make sure the pressure relief cap is installed correctly.
4. Record any cooling system DTCs retrieved. Refer to the PCM DTC chart in **Inspection and Verification**.

NOTE: Take note of any coolant odor or steam coming from cooling system components.

5. If the system coolant is filled correctly and no DTCs associated with fail-safe cooling are retrieved, verify the customer's concern by operating the engine to duplicate the condition.

NOTE: Refer to the coolant flow diagram in the Description and Operation Engine Cooling.

6. Inspect to determine if any of the following mechanical or electrical concerns apply.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Leaks or weeps at: ○ Hoses ○ Tubes ○ Clamp joints ○ Quick connect couplings (if equipped) ○ Gaskets ○ O-rings ○ Thermostat housing ○ Radiator ○ Pressure relief cap ○ Coolant pump ○ Heater core (wet floor or coolant odor in vehicle) ○ Heater control valve ○ Heated throttle body (TB) or heated TB adapter	• Inoperative or damaged: ○ Electric cooling fan (if equipped) ○ Electronically actuated fan clutch ○ Electronically actuated fan clutch controller ○ Wiring, connectors, relays or modules

(if equipped) ◦ Coolant crossover manifold assembly (if equipped) ◦ Oil cooler (if equipped) ◦ Degas bottle (if equipped) ◦ Coolant expansion tank (if equipped) ◦ Heated PCV (if equipped) ◦ Fuel pressure regulator coolant bowl (if equipped, natural gas engine) ◦ Cylinder block core plugs (if equipped) ◦ Cylinder head core plugs (if equipped) ◦ Block heater (if equipped)	◦ Engine coolant temperature (ECT) sensor (if equipped) ◦ Cylinder head temperature (CHT) sensor (if equipped) ◦ Intake air temperature (IAT) sensor (if equipped) ◦ Mass air flow (MAF) sensor ◦ Vehicle speed sensor (VSS)

VISUAL INSPECTION CHART

Mechanical	Electrical
• Cracked or damaged: ◦ Hoses ◦ Tubes ◦ Hose clamps ◦ Heater control valve (if equipped) ◦ Thermostat housing ◦ Radiator ◦ Pressure relief cap ◦ Cooling fan ◦ Fan clutch (if	

equipped) ◦ Coolant pump ◦ Degas bottle (if equipped) ◦ Coolant expansion tank (if equipped) ◦ Oil cooler (if equipped) ◦ Coolant crossover manifold assembly (if equipped) ◦ Cylinder block core plugs (if equipped) ◦ Cylinder head core plugs (if equipped) ◦ Block heater (if equipped) • Restricted airflow through the A/C condenser/radiator • Drive belt loose, worn or installed incorrectly • Broken or weak drive belt tensioner • Excessive white or light gray exhaust smoke (may have burnt coolant odor) • Coolant in engine oil • Engine oil in coolant • Coolant in automatic transmission fluid (if equipped) • Automatic transmission fluid (if equipped) in coolant	

7. If the inspection reveals an obvious concern that can be readily identified, repair it as necessary. Test the system for normal operation.
8. Inspect the coolant condition in the following sequence:

1. Inspect the coolant color.
    - If Motorcraft Premium Gold Engine Coolant has a clear or pale yellow color, this indicates higher water content than required. Test the engine coolant freezing point range with the Battery/Antifreeze Tester. The freezing point should be in the range -45°C to -23°C (-50°F to -10°F). If the vehicle is driven in cold climates less than -36°C (-34°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 50/50 ethylene glycol to distilled water.
    - A pale green color indicates incorrect coolant (green in color) may have been added to the system. Use of incorrect (green in color) coolant degrades the corrosion protection of Motorcraft Premium Gold Engine Coolant. Flush the system and refill with the correct mixture of distilled water and Motorcraft Premium Gold Engine Coolant.

    NOTE: **If Cooling System Stop Leak Pellets are used, darkening of the Motorcraft Premium Gold Engine Coolant from yellow to golden tan will occur.**

    - Dark brown could indicate a commercially available stop leak may have been used. Flush the system and refill with the correct mixture of distilled water and Motorcraft Premium Gold Engine Coolant.
    - A light or reddish brown color indicates that rust may be present in the cooling system. Flush the system and refill with the correct mixture of distilled water and Motorcraft Premium Gold Engine Coolant.
    - An iridescent sheen on top of the coolant could indicate a trace of oil is entering the system. For information on engine diagnosis, refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.
    - A milky brown color may indicate that engine oil is entering the cooling system. Pressure test the cooling system. Refer to **Component Tests**. If engine oil is suspected, the cause of the leak may be internal to the engine. Refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.
    - A red, orange or light green colored sheen on top of the coolant may indicate that transmission fluid is entering the cooling system. The cause may be a leaky radiator. Pressure test the cooling system. Refer to the **Component Tests**.
2. If the engine coolant appearance is acceptable, test the engine coolant freezing point range with the Battery/Antifreeze Tester. The freezing point should be in the range -45°C to -23°C (-50°F to -10°F). If the vehicle is driven in cold climates less than -36°C (-34°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 50/50 ethylene glycol to distilled water.
    - Maximum coolant concentration is 60/40 for cold weather areas.
    - Minimum coolant concentration is 40/60 for warm weather areas.
3. Adjust coolant range and level if necessary:
    - If coolant is low, add specified coolant mixture only.
    - If the engine coolant tests too weak, remove some of the engine coolant and add undiluted engine coolant until the readings are within acceptable levels.
    - If the engine coolant tests strong, remove some of the engine coolant and add distilled water

until the readings are within acceptable levels.

9. If an obvious cause for an observed or reported concern is found, correct the cause and test the system for normal operation before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

10. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

11. If the scan tool does not communicate with the VCM:
    - check the VCM connection to the vehicle.
    - check the scan tool connection to the VCM.
    - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
12. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
13. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record continuous memory DTCs.
14. Clear the continuous DTCs and carry out the self-test diagnostics PCM.
15. If the DTCs recovered are related to the concern, go to the PCM DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
16. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

PCM DTC CHART

DTC	Description	Action
P0217	Engine Coolant Overtemperature Condition	Go to **Pinpoint Test B**.
P1285	Cylinder Head Overtemperature Condition	Go to **Pinpoint Test B**.
P1299	Cylinder Head Overtemperature Protection Active	Go to **Pinpoint Test B**.
P0125	Insufficient Coolant Temp For Closed Loop Fuel Control	Go to **Pinpoint Test C**.
P0128	Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)	Go to **Pinpoint Test C**.
P0480 P0481 P0482	Fan 1, 2 or 3 Control Circuit, Respectively	REFER to the **Introduction - Gasoline Engines** article.
All Other	-	REFER to the **Introduction**

DTCs		**- Gasoline Engines** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Loss of coolant	• Coolant hoses or tubes • Hose clamps • Coolant pump O-ring seal or gasket • Thermostat O-ring seal or gasket • Thermostat housing • Radiator • Transmission fluid cooler (in radiator) (if equipped) (may leak internally or externally) • Degas bottle (if equipped) • Coolant expansion tank (if equipped) • Pressure relief cap • Coolant pump leaking from weep hole • Auxiliary coolant pump (if equipped) • Heater core • Heater control valve (if equipped) • Coolant crossover manifold assembly (if equipped) • Engine gaskets (may leak internally or externally) • Oil cooler (if equipped) (may leak internally or externally) • Heated throttle body (TB) or heated TB adapter (if equipped) • Heated PCV (if equipped) • Fuel pressure regulator coolant bowl (if equipped, natural gas engine) • Cylinder block core plugs (if equipped) • Cylinder head core plugs (if equipped) • Block heater (if equipped)	• Go to **Pinpoint Test A**.
	• Low coolant level • External engine coolant leak • Air lock in system	

• The engine overheats	• Pressure relief cap installation • Restricted airflow through the A/C condenser/radiator • Internal engine coolant leak • Coolant condition/concentration • Accessory drive components • Non-OEM engine enhancement components • Electric cooling fan (if equipped) • Mechanical cooling fan (if equipped) • Mechanical cooling fan clutch (if equipped) • Radiator • Thermostat • Engine coolant temperature (ECT) indicator system (gauge) • ECT sensor (if equipped) • Cylinder head temperature (CHT) sensor (if equipped) • Heater core • Coolant pump • Coolant flow restriction	• Go to **Pinpoint Test B**.
• The engine does not reach normal operating temperature	• Low coolant level • Thermostat • Mechanical fan clutch always engaged • Electric cooling fan always on • Engine coolant temperature indicator system (gauge) • ECT sensor (if equipped) • CHT sensor (if equipped)	• Go to **Pinpoint Test C**.
• The block heater does not operate correctly	• Block heater power cable • Block heater	• CHECK continuity in all 3 power cable circuits. If any circuit measures greater than 5 ohms, INSTALL a new power cable. • CHECK the resistance of the block heater. If the resistance does not measure between 12.5

		and 17 ohms, INSTALL a new block heater.
• The electric cooling fan(s) or electronically controlled fan clutch is inoperative in one or more speeds or does not operate correctly (if equipped)	• Wiring • Relays • Fuses • Fan control module • Cooling fan motor(s) • Cooling fan resistor(s) • Electric fan clutch	• REFER to the **Introduction - Gasoline Engines** article.
• The electric cooling fan(s) stay(s) on all the time (if equipped)	• Wiring • Relays	• REFER to the **Introduction - Gasoline Engines** article.
• Noisy electric cooling fan operation (if equipped)	• Foreign material contamination • Fan motor	• REMOVE the foreign material from the cooling fan and shroud. TEST the system for normal operation. If still noisy, INSTALL a new cooling fan assembly.
	• Fan blade detached from fan motor	• INSTALL a new cooling fan assembly.
• Noisy mechanical fan operation (if equipped)	• Fan clutch	• CARRY OUT the Fan Clutch Test - Minimum Speed Requirement component test.

Pinpoint Tests

Pinpoint Test A: Loss of Coolant

Normal Operation

The engine cooling system is a closed system that provides for coolant expansion and contraction and also changes in pressure as coolant warms and cools with engine operation. Various gaskets, seals, hoses and clamps are used to contain coolant within the cooling system and keep other fluids and contaminants from entering the cooling system.

Coolant loss can be attributed to either external or internal leaks anywhere within the cooling system.

For vehicle/engine specific information, refer to **Engine Cooling**.

This pinpoint test is intended to diagnose the following:

- Coolant hoses or tubes
- Hose clamps
- Thermostat O-ring seal or gasket
- Coolant pump O-ring seal or gasket
- Thermostat housing
- Heater control valve (if equipped)
- Radiator
- Transmission fluid cooler (in radiator) (if equipped)
- Pressure relief cap
- Coolant pump leaking from weep hole
- Auxiliary coolant pump (if equipped)
- Heater core
- Heated throttle body (TB) or heated TB adapter (if equipped)
- Coolant crossover manifold assembly (if equipped)
- Engine gaskets
- Oil cooler (if equipped)
- Degas bottle (if equipped)
- Coolant expansion tank (if equipped)
- Heated PCV (if equipped)
- Fuel pressure regulator coolant bowl (if equipped, natural gas engine)
- Cylinder block core plugs (if equipped)
- Cylinder head core plugs (if equipped)
- Block heater (if equipped)
- Engine coolant temperature (ECT) sensor (if equipped)

PINPOINT TEST A: LOSS OF COOLANT

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

A1 CARRY OUT INSPECTION AND VERIFICATION

- Carry out the **Inspection and Verification**.
- **Were any concerns found?**

YES : REPAIR as needed. TEST the system for normal operation.

NO : Go to A2 .

A2 CHECK THE ENGINE COOLANT LEVEL

NOTE: Allow the engine to cool before checking the engine coolant level.

- Key in OFF position.
- Visually inspect the engine coolant level at the degas bottle or the coolant expansion tank.
- **Is the engine coolant level within specifications?**

  YES : Go to A3.

  NO : ADJUST the engine coolant level as necessary. Go to A3.

A3 PRESSURE TEST THE ENGINE COOLING SYSTEM

- Pressure test the engine cooling system. Refer to **Pressure Test - Coolant Expansion Tank Systems**.
- **Does the engine cooling system leak?**

  YES : REPAIR or INSTALL new components. TEST the system for normal operation.

  NO : If the vehicle is equipped with a coolant expansion tank, go to A4. If the vehicle is equipped with a degas bottle, go to A5.

A4 CHECK THE PRESSURE RELIEF CAP

- Carry out the pressure relief cap pressure test. Refer to **Cap**.
- **Is the pressure relief cap OK?**

  YES : Go to A5.

  NO : INSTALL a new pressure relief cap. TEST the system for normal operation.

A5 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK

- Inspect the engine coolant in the degas bottle or coolant expansion tank for signs of engine oil or transmission fluid.
- **Is engine oil or transmission fluid evident in the coolant?**

  YES : If engine oil is evident, go to **ENGINE SYSTEM - GENERAL INFORMATION** article for engine diagnosis. If transmission fluid is evident, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate Automatic Transmission article for the procedure. TEST the system for normal operation.

  NO : Go to A6.

A6 CHECK THE ENGINE OIL AND TRANSMISSION FLUID FOR COOLANT

- Remove the oil level indicators from the engine and the transmission.
- **Is coolant evident in the oil or transmission fluid?**

  YES : If coolant is in the engine oil, go to **ENGINE SYSTEM - GENERAL INFORMATION** article. If coolant is in the transmission fluid, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate Automatic Transmission article for the procedure.

  NO : Go to A7.

A7 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES

NOTE: Use U-View® Combustion Leak Tester part number 560000 or equivalent.

- Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases.
- **Are combustion gases present?**

  YES : Go to **ENGINE SYSTEM - GENERAL INFORMATION** article for engine diagnosis.

  NO : The cooling system is operational.

Pinpoint Test B: The Engine Overheats

Normal Operation

The engine cooling system functions to maintain engine temperatures during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. On most engines, the coolant pump is operated by engine rotation through a pulley which is driven by the accessory drive belt to circulate the coolant. Some engines use a belt driven by a pulley attached to the camshaft, and some engines use a sprocket driven by the timing chain to operate the coolant pump. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant is allowed to flow through the radiator circuit in order to transfer engine generated heat to the outside air.

Engine overheating generally occurs when there is a disruption in the ability to control either coolant flow at the correct rate, the inability to transfer heat from the engine through the coolant (including low coolant) or an inability to transfer engine generated heat to the outside air through the radiator.

For vehicle/engine specific information, refer to **Engine Cooling**.

- DTC P0217 Engine Coolant Overtemperature Condition
- DTC P1285 Cylinder Head Overtemperature Condition
- DTC P1299 Cylinder Head Overtemperature Protection Active

This pinpoint test is intended to diagnose the following:

- Low coolant level
- External engine coolant leak
- Air lock in system
- Pressure relief cap installation
- Restricted airflow through the A/C condenser/radiator
- Internal engine coolant leak

- Coolant condition/concentration
- Accessory drive components
- Non-OEM engine enhancement components
- Electric cooling fan (if equipped)
- Mechanical cooling fan blade (if equipped)
- Mechanical cooling fan clutch (if equipped)
- Engine coolant temperature (ECT) indicator system (gauge)
- ECT sensor (if equipped)
- Cylinder head temperature (CHT) sensor (if equipped)
- Heater core
- Coolant pump
- Coolant flow restriction

PINPOINT TEST B: THE ENGINE OVERHEATS

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

B1 CARRY OUT INSPECTION AND VERIFICATION

- Carry out the **Inspection and Verification**.
- **Were any concerns found?**

  YES : REPAIR as needed. TEST the system for normal operation.

  NO : Go to B2 .

B2 CHECK FOR DTCs

NOTE: Refer to the Introduction - Gasoline Engines article for correct scan tool hook-up procedure.

- Check for DTC P0217, P1285 or P1299.
- **Is DTC P0217, P1285 or P1299 present?**

  YES : Go to B3.

  NO : Actual engine overheating has not been verified. CHECK the ECT gauge operation. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. If any other DTCs are retrieved, REFER to the **Introduction - Gasoline Engines** article.

B3 CHECK FOR AN AIRFLOW OBSTRUCTION

- Check the radiator or A/C condenser for an external obstruction such as leaves or cardboard.
- **Is an obstruction present?**

YES : REMOVE the obstruction. TEST the system for normal operation.

NO : Go to B4.

B4 CHECK THE ENGINE COOLANT LEVEL

NOTE: Allow the engine to cool before checking the coolant level.

- Key in OFF position.
- Visually check the engine coolant level in the degas bottle or coolant expansion tank.
- **Is the engine coolant level within specification?**

  YES : Go to B5.

  NO : ADJUST the engine coolant level as necessary. Go to B5.

B5 PRESSURE TEST THE ENGINE COOLING SYSTEM

- Pressure test the engine cooling system. Refer to **Pressure Test - Coolant Expansion Tank Systems**.
- **Does the engine cooling system leak?**

  YES : REPAIR or INSTALL new components. TEST the system for normal operation.

  NO : Vehicles equipped with an expansion tank, go to B6. Vehicles equipped with a degas bottle, go to B7.

B6 CHECK THE PRESSURE RELIEF CAP

- Carry out the pressure relief cap pressure test. Refer to **Cap**.
- **Is the pressure relief cap OK?**

  YES : Go to B7.

  NO : INSTALL a new pressure relief cap. TEST the system for normal operation.

B7 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK

- Inspect the engine coolant in the degas bottle or coolant expansion tank for signs of engine oil or transmission fluid.
- **Is engine oil or transmission fluid evident in the coolant?**

  YES : If engine oil is evident, go to **ENGINE SYSTEM - GENERAL INFORMATION** article for engine diagnosis. If transmission fluid is evident, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate Automatic Transmission article for the procedure. TEST the system for normal operation.

  NO : Go to B8.

B8 CHECK THE ENGINE OIL AND TRANSMISSION FLUID FOR COOLANT

- Remove the oil level indicators from the engine and the transmission.
- **Is coolant evident in the oil or transmission fluid?**

  YES : If coolant is in the engine oil, go to **ENGINE SYSTEM - GENERAL INFORMATION** article. If coolant is in the transmission fluid, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate Automatic Transmission article for the procedure.

  NO : Go to B9.

B9 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES

NOTE: Use U-View® Combustion Leak Tester part number 560000 or equivalent.

- Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases.
- **Are combustion gases present?**

  YES : Go to **ENGINE SYSTEM - GENERAL INFORMATION** article for engine diagnosis.

  NO : Go to B10.

B10 CHECK COOLANT CONDITION

- Check the coolant for dirt, rust or contamination and check the coolant concentration.
- **Is the coolant condition OK?**

  YES : Vehicles equipped with an electric cooling fan, go to B11 . Vehicles equipped with only a mechanical cooling fan, go to B12 .

  NO : FLUSH the engine cooling system. REFER to **Cooling System Flushing**. TEST the system for normal operation.

B11 CHECK THE ELECTRIC COOLING FAN OPERATION

- Start the engine.
- Place the climate control function selector in the MAX A/C position and the blower motor switch in the HI position.
- **Did the electric cooling fan operate?**

  YES : If the vehicle is also equipped with a mechanical cooling fan, go to B12 . Otherwise, go to B13 .

  NO : DIAGNOSE the electric cooling fan operation. REFER to **Introduction - Gasoline Engines** article.

B12 CHECK THE MECHANICAL COOLING FAN OPERATION

- Key in OFF position.
- If the vehicle is equipped with a viscous fan clutch, carry out the **Fan Clutch Test**. If the vehicle is equipped with an electronically actuated fan clutch, refer to the **Introduction - Gasoline Engines** article.
- **Is the cooling fan operation OK?**

  YES : Go to B13.

  NO : INSTALL a new fan clutch. TEST the system for normal operation.

B13 CHECK THE COOLANT PUMP OPERATION

- Start the engine.
- Allow the engine to run for 10 minutes (hot side thermostat equipped vehicles) or 30 minutes (cold side thermostat equipped vehicles). Place the climate control function selector in the MAX HEAT position. Feel the heater outlet hose.
- **Is the heater outlet hose hot?**

  YES : Go to B14.

  NO : INSTALL a new coolant pump. TEST the system for normal operation.

B14 CHECK THE THERMOSTAT OPERATION

- Start the engine.
- Allow the engine to run for 10 minutes (hot side thermostat equipped vehicles) or 30 minutes (cold side thermostat equipped vehicles). Feel the upper radiator hose (hot side thermostat equipped vehicles) or the lower radiator hose (cold side thermostat equipped vehicles).
- **Is the upper (hot side thermostat equipped vehicles) or lower (cold side equipped vehicles) radiator hose hot?**

  YES : CHECK the engine coolant temperature gauge operation. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

  NO : Go to B15.

B15 VISUALLY INSPECT THE THERMOSTAT

- Carry out the **Thermostat Visual Inspection**.
- **Is the thermostat damaged?**

  YES : INSTALL a new thermostat. TEST the system for normal operation.

  NO : INSTALL a new thermostat. TEST the system for normal operation. If the engine still overheats, INSTALL a new radiator. TEST the system for normal operation.

Pinpoint Test C: The Engine Does Not Reach Normal Operating Temperature

Normal Operation

The engine cooling system functions to maintain engine temperatures during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. On most engines, the coolant pump is operated by engine rotation through a pulley which is driven by the accessory drive belt to circulate the coolant. Some engines use a belt driven by a pulley attached to the camshaft, and some engines use a sprocket driven by the timing chain to operate the coolant pump. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant is allowed to flow through the radiator circuit in order to transfer engine generated heat to the outside air.

Concerns of engine inability to reach normal operating temperature typically occur when the rate of coolant flow through some coolant circuits (radiator, heater core) is more than expected given the conditions, or when the cooling fans operate all the time (electric fans) or the fan clutch is always engaged (engine driven fans). Heat is not allowed to build in the engine because a heat exchanger is removing too much heat, including the radiator, heater core and oil cooler. In addition, perceived concerns that the engine does not reach normal operating temperature can be related to a low coolant level or trapped air which does not allow for hot coolant to be available at the heater core, an inoperative climate control system, or for concerns perceived or related to an incorrect engine temperature gauge indication.

For vehicle/engine specific information, refer to **Engine Cooling**.

- DTC P0125 Insufficient Coolant Temp for Closed Loop Fuel Control
- DTC P0128 Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)

This pinpoint test is intended to diagnose the following:

- Low coolant level
- Thermostat
- Engine coolant temperature (ECT) indicator system (gauge)
- Engine cooling fan

PINPOINT TEST C: THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

C1 CARRY OUT INSPECTION AND VERIFICATION

- Carry out the **Inspection and Verification**.
- **Were any concerns found?**

  YES : REPAIR as needed. TEST the system for normal operation.

  NO : Go to C2.

C2 CHECK FOR DTCs P0125 or P0128

NOTE: **Refer to the Introduction - Gasoline Engines article for correct scan tool hook-up procedure.**

- Check for DTC P0125 or P0128.
- **Is DTC P0125 or P0128 present?**

  YES : If the vehicle is equipped with an electric cooling fan, go to C3. If the vehicle is equipped with only a mechanical cooling fan, go to C4.

  NO : The cooling system is operational. If an inoperative engine coolant temperature gauge is suspected, CHECK the engine coolant temperature gauge operation. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. If an inoperative climate control system is suspected, CHECK the climate control system operation. REFER to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article. If any other DTCs are retrieved, REFER to the **Introduction - Gasoline Engines** article.

C3 CHECK THE ELECTRIC COOLING FAN OPERATION

- Allow the engine to cool.
- Make sure the A/C switch is OFF (if equipped).
- Start the engine.

- Check the electric cooling fan.
- **Is the electric cooling fan on all the time?**

  YES : DIAGNOSE the electric cooling fan operation. REFER to the **Introduction - Gasoline Engines** article.

  NO : If the vehicle is also equipped with a mechanical cooling fan, go to C4. Otherwise, go to C5.

C4 CHECK THE MECHANICAL COOLING FAN OPERATION

- Carry out the Cooling Fan Clutch Component Test. For a mechanical cooling fan clutch, refer to **Component Tests**. For an electronic cooling fan clutch, refer to the **Introduction - Gasoline Engines** article.
- **Is the cooling fan clutch OK?**

  YES : Go to C5.

  NO : INSTALL a new cooling fan clutch. TEST the system for normal operation.

C5 CHECK THE COOLANT LEVEL

NOTE: Allow the engine to cool before checking the coolant level.

- Visually check the engine coolant level in the degas bottle or coolant expansion tank.
- **Is the engine coolant level within specification?**

  YES : INSTALL a new thermostat. TEST the system for normal operation.

  NO : Go to **Pinpoint Test A** to diagnose a coolant leak.

Component Tests

Pressure Test - Degas Bottle Systems

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTE: Vehicles equipped with a degas bottle system have the pressure relief cap on the degas bottle and no radiator cap. Vehicles equipped with a coolant expansion tank system have the pressure relief cap on the radiator.

1. Turn the engine OFF.
2. Check the engine coolant level. Adjust the coolant level as necessary.
3. Attach the Radiator/Heater Core Pressure Tester to the degas bottle nipple and overflow hose. Install a pressure test pump to the quick connect fitting of the test adapter.

NOTE: Do not pressurize the cooling system beyond the maximum pressure

listed in the SPECIFICATIONS or cooling system components may be damaged.

NOTE: If the plunger of the pressure tester is depressed too fast, an erroneous pressure reading will result.

4. Slowly depress the plunger of the pressure test pump until the pressure gauge reading stops increasing and note the highest pressure reading obtained. If the pressure reading exceeds the maximum cap pressure listed in the specifications table, install a new pressure relief cap.
5. If the system does not hold pressure, remove the pressure relief cap and wash in clean water to dislodge all the foreign material from the gasket. Check the sealing surface in the filler neck of the degas bottle for nicks or cuts. Install the pressure relief cap.
6. Pressurize the engine cooling system as described in Step 4 above. Observe the gauge reading for approximately 2 minutes. Pressure should not drop during this time. If the pressure drops within this time, inspect for leaks and repair as necessary.
7. If no leaks are found and the pressure drops. the pressure relief cap may be leaking. Install a new pressure relief cap and retest the system.
8. If no leaks are found after a new pressure relief cap is installed, and the pressure drops, the leak may be internal to the radiator transmission cooler (if equipped). Inspect the coolant for transmission fluid and the transmission fluid for coolant. Repair as necessary.
9. If there is no contamination of the coolant or transmission fluid, the leak may be internal to the engine. Inspect the coolant for engine oil and the engine oil for coolant. Refer to **ENGINE SYSTEM - GENERAL INFORMATION** article to diagnose the engine.
10. Release the system pressure by loosening the pressure relief cap. Check the coolant level and adjust as necessary.

Pressure Test - Coolant Expansion Tank Systems

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

NOTE: Vehicles equipped with a degas bottle system have the pressure relief cap on the degas bottle and no radiator cap. Vehicles equipped with a coolant expansion tank system have the pressure relief cap on the radiator.

1. Turn the engine OFF.
2. Remove the pressure relief cap. Top off the radiator as needed. Fit the pressure tester to the radiator fill neck.

NOTE: Do not pressurize the cooling system beyond 138 kPa (20 psi) or cooling

system components may be damaged.

NOTE: If the plunger of the pressure tester is depressed too fast, an incorrect pressure reading will result.

3. Pump the cooling system to a maximum of 138 kPa (20 psi) and hold for 2 minutes. If the pressure drops within this time, inspect for leaks and repair as necessary.
4. If no leaks are found and the pressure drops, the leak may be internal to the radiator transmission cooler (if equipped). Inspect the coolant for transmission fluid and the transmission fluid for coolant. Repair as necessary.
5. If there is no contamination of the coolant or transmission fluid, the leak may be internal to the engine. Inspect the coolant for engine oil and the engine oil for coolant. Refer to **ENGINE SYSTEM - GENERAL INFORMATION** article to diagnose the engine.

Cap

1. Inspect the pressure relief cap and seals for damage or deterioration. Install a new pressure relief cap if necessary.
2. Fit the pressure relief cap to the Radiator/Heater Core Pressure Tester Kit using the correct adapter.

NOTE: If the plunger of the pressure tester is depressed too fast, an incorrect pressure reading will result.

3. Slowly pump the pressure tester until the pressure gauge stops increasing and note the highest pressure reading. Release the pressure and repeat the test. Install a new pressure relief cap if the pressure is not within specification. Refer to **SPECIFICATIONS**.

Thermostat

A new thermostat should be installed only after the following tests and checks have been carried out:

- Pinpoint Test A, B or C
- Thermostat Visual Inspection

Thermostat Visual Inspection

1. Remove the thermostat.
2. Examine the thermostat for signs of damage including:
    - Valve not fully seated (light visible through the valve)
    - Foreign material lodged in the main valve
    - Bent or broken frame or flange
    - Bent or broken spring
    - Bent or broken valve or valve stem
    - Wax leaking from wax reservoir or a bulge in the reservoir

- Any other damage or distortion

NOTE: If no damage is found during the inspection, do not attempt to open the thermostat using hot water or other heat sources. This method is not an accurate means to test the function of the thermostat and may damage the thermostat.

3. If damage is found during the inspection, remove any foreign material or broken pieces and install a new thermostat.
4. If no damage is found during the inspection, continue troubleshooting the system concern. Go to the Symptom Chart for further instructions.

Radiator Leak Test, Removed From Vehicle

NOTE: Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners may be present in the cleaning tank and they will damage aluminum radiators.

NOTE: Always install plugs in the oil cooler fittings before leak testing or cleaning any radiator.

NOTE: Clean the radiator before leak testing to avoid contamination of tank.

1. Leak test the radiator in clean water with 138 kPa (20 psi) air pressure.

Fan Clutch Test

1. Turn the engine OFF and wait until the fan comes to a complete stop.
2. Spin the fan blade by hand. A light resistance should be felt. If there is no resistance or very high resistance, the minimum and maximum fan speeds must be checked. For an electronically actuated fan clutch, refer to the **Introduction - Gasoline Engines** article. For a viscous fan clutch, carry out the following:

Fan Clutch Test - Minimum Speed Requirement

1. Use a suitable marker to mark the coolant pump or fan pulley and one of the fan blades.
2. Make sure the A/C is OFF, if equipped.

WARNING: Do not operate the engine with the hood open until the fan blade has been examined for possible cracks and separation. A damaged fan can separate during operation. Failure to follow this instruction may result in serious personal injury.

3. Start the engine and run it at approximately 2,000 RPM for 5 minutes or until there is a noticeable reduction in fan noise to allow the fan clutch to go into disengaged mode.

4. Aim a laser photo tachometer at the coolant pump or fan pulley. Run the engine to achieve 3,000 RPM at the coolant pump or fan pulley.
5. With the coolant pump or fan pulley at 3,000 RPM, aim the laser photo tachometer at the fan blade. Monitor and record fan speed.
6. The fan blade speed must be less than the specified RPM at 3,000 RPM coolant pump or fan pulley RPM. Refer to **SPECIFICATIONS** for correct fan speed.
7. Turn the engine off.
8. If the fan blade speed was greater than specified, install a new fan clutch.

Fan Clutch Test - Maximum Speed Requirement

1. Use a suitable marker to mark the coolant pump or fan pulley and one of the fan blades.
2. Block off areas on each side of the radiator in the engine compartment, the front of the radiator grille and the bumper. Close the hood. This will raise the temperature of the air striking the fan clutch and should cause the fan blade to operate at maximum speed.
3. Place the climate control function selector switch in the MAX A/C position and the blower motor switch in the HI position, if equipped.

WARNING: **Do not operate the engine with the hood open until the fan blade has been examined for possible cracks and separation. A damaged fan can separate during operation. Failure to follow this instruction may result in serious personal injury.**

NOTE: **Do not open the hood to check the coolant pump or fan pulley temperature. This will lower the temperature of the air reaching the fan clutch and void the test. Aim the infrared thermometer through the wheel well or from under the vehicle.**

4. Start the engine and run it at approximately 2,000 RPM until normal operating temperature has been achieved. Using an infrared thermometer, monitor the coolant pump or fan pulley. Run the engine until the coolant pump or fan pulley is at least 96°C (205°F).

NOTE: **Do not open the hood to check the coolant pump or fan pulley or fan blade speed. This will lower the temperature of the air reaching the fan clutch and void the test. Aim the laser photo tachometer through the wheel well or from under the vehicle.**

5. Aim a laser photo tachometer at the coolant pump or fan pulley. Run the engine to achieve 3,000 RPM at the coolant pump or fan pulley.
6. With the coolant pump or fan pulley at 3,000 RPM, aim the laser photo tachometer at the fan blade. Monitor and record fan blade speed.
7. The fan blade speed must be greater than the specified RPM at 3,000 RPM coolant pump or fan pulley RPM. Refer to **SPECIFICATIONS** for correct fan speed.
8. Open the hood and allow the engine to idle momentarily to lower engine temperature. Turn the engine off

and remove the blocks from the radiator, grille and bumper.

9. If the fan blade speed is less than specified, install a new fan clutch.

GENERAL PROCEDURES

COOLING SYSTEM DRAINING, FILLING AND BLEEDING

Special Tools

Illustration	Tool Name	Tool Number
 ST2818-A	RADKITPLUS	078-00497

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (bittered in US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1

Draining

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

NOTE: The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated, it must be recycled or disposed of correctly. Using contaminated coolant may result in damage to the engine or cooling system components.

NOTE: The engine cooling system is filled with Motorcraft Premium Gold Engine Coolant. Mixing coolant types degrades the corrosion protection of Motorcraft Premium Gold Engine Coolant.

NOTE: Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog or damage the cooling system, resulting in degraded cooling system performance and/or failure.

NOTE: Less than 80% of coolant capacity can be recovered with the engine in the vehicle. Dirty, rusty or contaminated coolant requires replacement.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Release the pressure in the cooling system by slowly turning the pressure relief cap one half turn counterclockwise. When the pressure is released, remove the pressure relief cap.
3. Place a suitable container below the radiator draincock.
    - Open the draincock and allow to drain.
    - Close the draincock after draining.
4. When the coolant is drained, make sure drain plugs are installed and tight.

Filling and Bleeding with RADKITPLUS

1. Install the RADKITPLUS and follow the manufacturer's instructions to fill and bleed the cooling system.

Filling and Bleeding without RADKITPLUS

NOTE: Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the degas bottle.
When adding engine coolant, use a 50/50 mixture of engine coolant and distilled water.
To maintain the integrity of the coolant and the cooling system:

- **Vehicle cooling systems are filled with Motorcraft Premium Gold Engine Coolant. Always fill the cooling system with the same coolant that is present in the system. Do not mix coolant types.**
- **Do not add/mix orange-colored Motorcraft Specialty Orange Engine Coolant or equivalent meeting Ford specification WSS-M97B44-D or green-colored Premium Engine Coolant. Mixing coolants may degrade the coolant's corrosion protection.**
- **Do not add alcohol, methanol or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.**
- **Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft Premium Gold Engine Coolant since a Ford-approved recycling process is not yet available.**
- **Used engine coolant should be disposed of in an appropriate manner. Follow the community's regulations and standards for recycling and disposing of automotive fluids.**

NOTE: **Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog or damage the cooling system, resulting in degraded cooling system performance and/or failure.**

2.3L engine

1. Open the degas bottle cap and the bleed valve on the back of the engine water outlet.

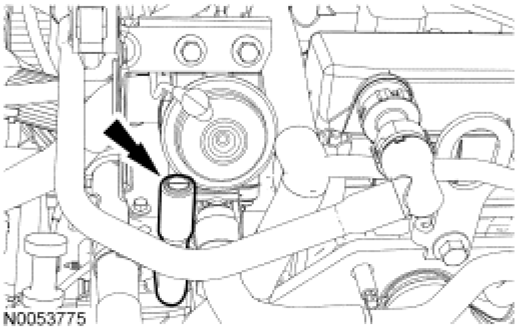

Fig. 5: Identifying Bleed Valve (2.3L)
Courtesy of FORD MOTOR CO.

3.0L engine

2. Open the degas bottle cap and the bleed valve on the upper radiator hose.

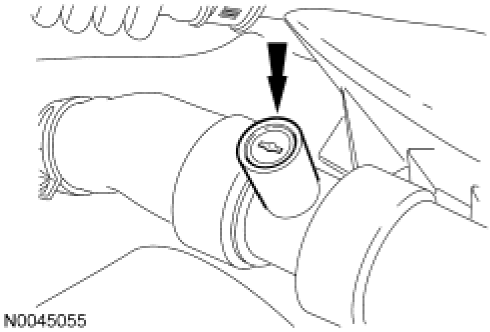

Fig. 6: Identifying Bleed Valve (3.0L)
Courtesy of FORD MOTOR CO.

2.3L and 3.0L engines

NOTE: **Make sure the coolant flows from the radiator through the upper radiator hose and fills the engine. When full, coolant should flow from the bleed hole.**

3. Fill the degas bottle to the MAX fill line.
4. Close the degas bottle cap and the bleed valve.

NOTE: If the engine overheats or the fluid level drops below the minimum fill line, shut off the engine and add fluid to the degas bottle maximum fill line once the engine cools. Failure to follow these instructions may result in damage to the engine.

5. Start the engine and let it idle for 10 minutes (3.0L), 30 minutes (2.3L) or until the engine reaches normal operating temperature.
6. Allow the engine to cool and repeat Step 3 if necessary.
7. Start the engine and turn the heater to the MAX position.

NOTE: If the engine overheats or the fluid level drops below the minimum fill line, shut off the engine and add fluid to the degas bottle maximum fill line once the engine cools. Failure to follow these instructions may result in damage to the engine.

8. Run the engine at 2,500 RPM for 10 minutes.
9. Repeat Step 8 if necessary.

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

10. Check the engine coolant level in degas bottle and fill as necessary.

3.5L engine

11. Open the degas bottle cap and fill the degas bottle to the MAX fill line.
12. Close the degas bottle cap.

NOTE: If the engine overheats or the fluid level drops below the minimum fill line, shut off the engine and add fluid to the degas bottle maximum fill line once the engine cools. Failure to follow these instructions may result in damage to the engine.

13. Start the engine and let idle for 10 minutes or until the engine reaches normal operating temperature.
14. Repeat Step 13 if necessary.
15. Start the engine and turn the heater to the MAX position.

NOTE: If the engine overheats or the fluid level drops below the minimum fill line, shut off the engine and add fluid to the degas bottle maximum fill line once the engine cools. Failure to follow these instructions may result in damage

to the engine.

16. Idle engine until the fan turns on, indicating the thermostat is fully open.
    1. Increase engine speed to 2,500 RPM for 30 seconds.
    2. Idle engine for 2 minutes.
    3. Repeat Steps 1 and 2 five times.
17. Repeat Step 16 if necessary.

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

18. Check the engine coolant level in the degas bottle and fill as necessary.

COOLING SYSTEM FLUSHING

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (bittered in US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1
Premium Cooling System Flush VC-1	ESR-M14P7-A

1. To remove rust, sludge and other foreign material from the cooling system, use cooling system flush that is safe for use with aluminum radiators. For additional information, refer to **SPECIFICATIONS**. This cleaning restores cooling system efficiency and helps prevent overheating. A pulsating or reversed direction of flushing water will loosen sediment more quickly than a steady flow in the normal coolant flow direction. In severe cases where cleaning solvents will not clean the cooling system efficiently, it will be necessary to use the pressure flushing method using cooling system flusher. Dispose of old coolant and flushing water contaminated with antifreeze and cleaning chemicals in accordance with local, state or federal laws.
2. Remove the radiator. For additional information, refer to **Radiator**.

NOTE: **Radiator internal pressure must not exceed 138 kPa (20 psi). Damage to the radiator can result.**

3. Backflush the radiator with the radiator in an upside-down position with a high-pressure hose in the lower hose location and backflush.

NOTE: On 2.3L engines, the thermostat and housing are serviced as an assembly.

4. Remove the thermostat. For additional information, refer to **Thermostat Housing - 2.3L**, **Thermostat - 3.0L** or **Thermostat - 3.5L**.
5. Backflush the engine. Position the high-pressure water hose into the engine through the engine return and backflush the engine.

REMOVAL AND INSTALLATION

BLOCK HEATER

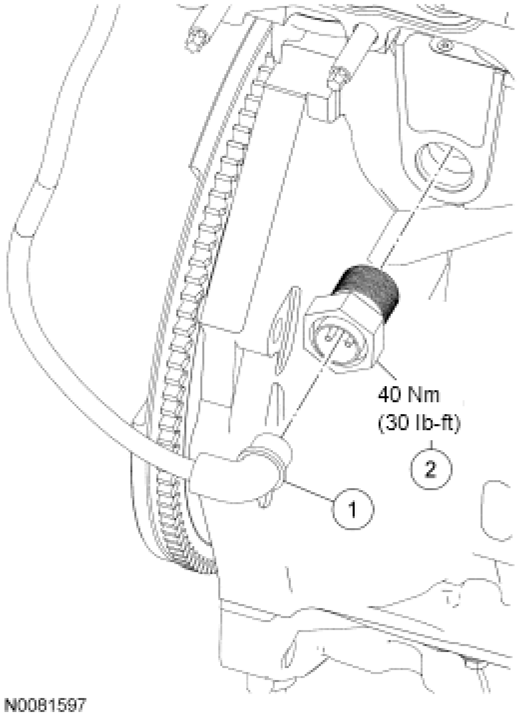

Fig. 7: Exploded View Of Block Heater With Torque Specification - 2.3L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	6B018	Block heater electrical connector
2	6A051	Block heater

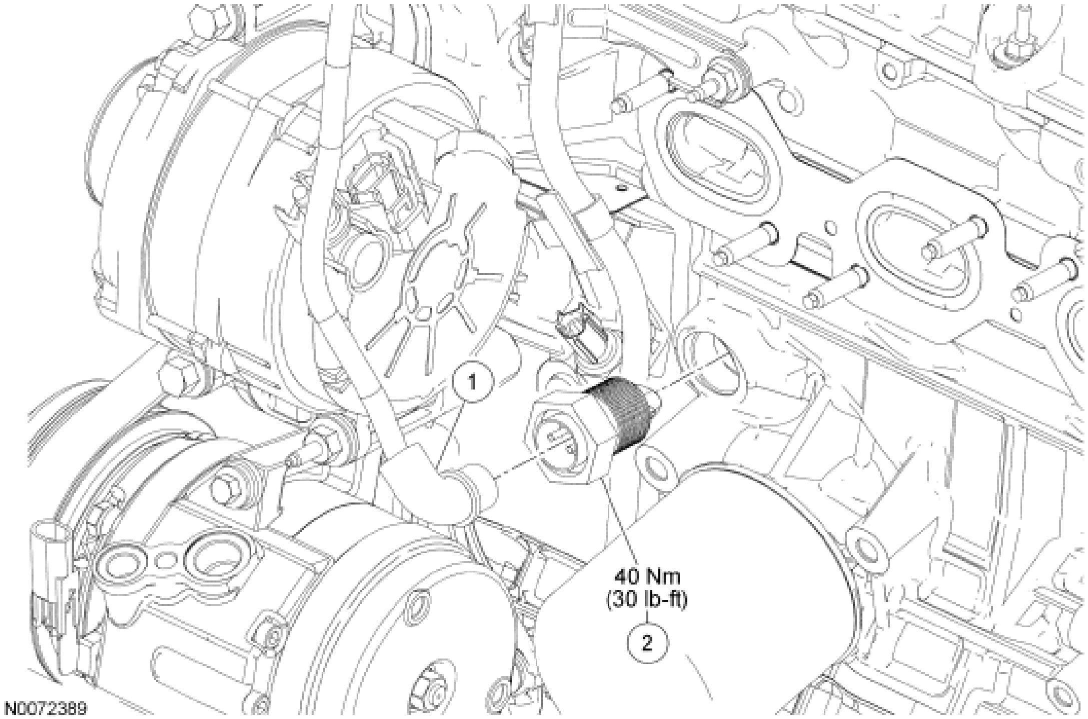

Fig. 8: Exploded View Of Block Heater With Torque Specification - 3.0L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description

2	6A051	Block heater

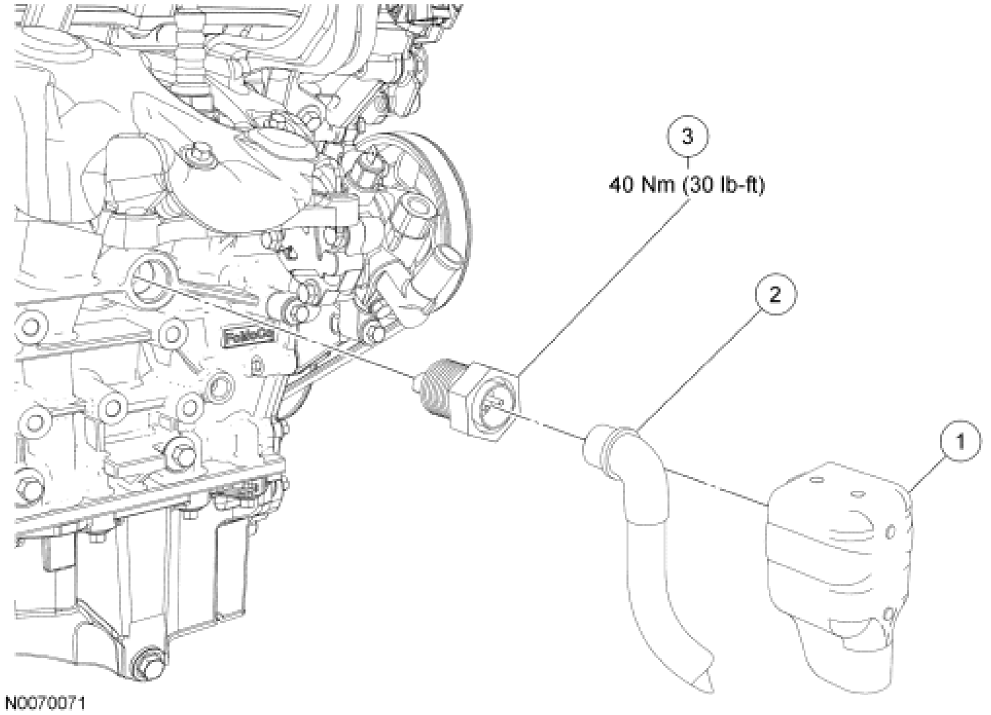

Fig. 9: Exploded View Of Block Heater With Torque Specification - 3.5L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	030104	Block heater cover
2	6B018	Block heater electrical connector
3	6A051	Block heater

REMOVAL AND INSTALLATION

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Drain the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.
3. If equipped, remove the 7 screws and the underbody cover.

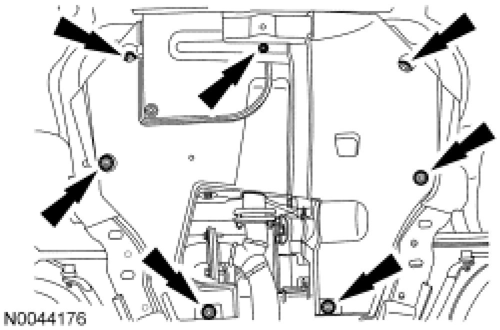

Fig. 10: Locating Underbody Cover Screws
Courtesy of FORD MOTOR CO.

3.5L only

4. Remove the RH catalytic converter. For additional information, refer to **EXHAUST SYSTEM** article.
5. Remove the block heater cover.

All vehicles

NOTE: Make sure that the block heater wiring is routed and secured away from rotating or hot components, or damage to the wiring can occur.

6. Disconnect the block heater electrical connector.
7. Remove the block heater.
   - To install, tighten to 20 Nm (177 lb-in) (2.3L only).
   - To install, tighten to 40 Nm (30 lb-ft) (3.0L and 3.5L).
8. To install, reverse the removal procedure.
9. Fill and bleed the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.

THERMOSTAT HOUSING - 2.3L

NOTE: The thermostat and thermostat housing are serviced as an assembly.

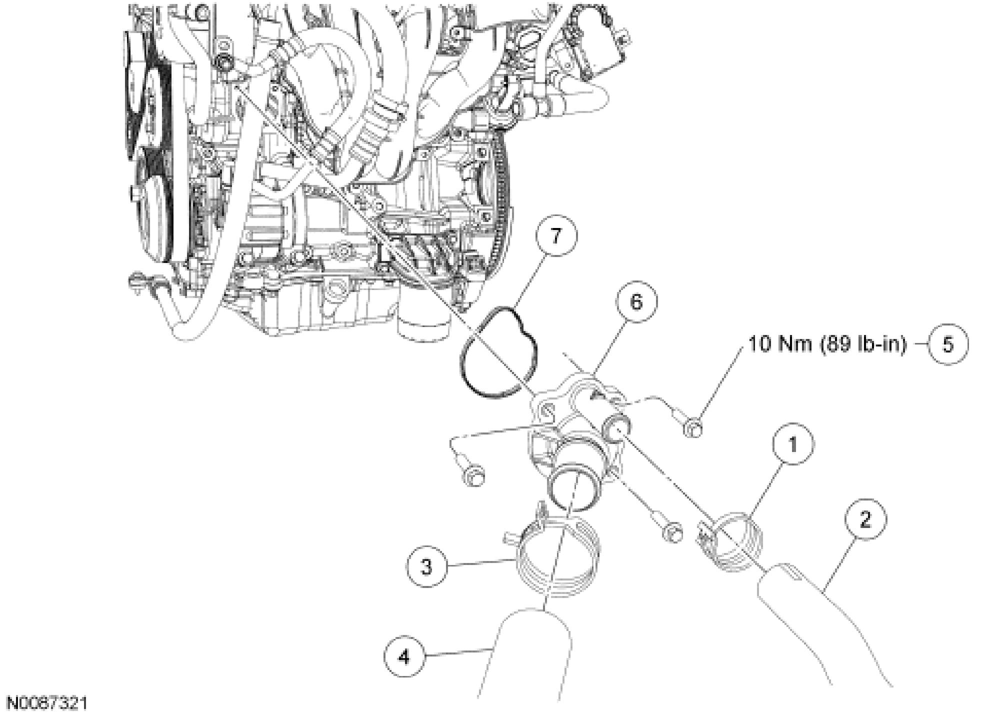

Fig. 11: Exploded View Of Thermostat Housing With Torque Specifications - 2.3L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	15161	Heater hose clamp
2	18C266	Heater hose
3	15161	Radiator hose clamp
4	8B273	Radiator hose
5	W500015	Thermostat housing bolt (3 required)
6	8575	Thermostat housing
7	8K530	Gasket

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Drain the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.

NOTE: **The view of the thermostat housing bolts is obstructed by power steering, A/C and engine components. However, the bolts can be removed using 1/4-in drive hand tools.**

NOTE: **The LH upper thermostat housing bolt can be accessed from under the hood. The RH upper and lower thermostat housing bolts can be accessed**

from under the vehicle as viewed in the illustration below.

3. Remove the 3 bolts and reposition the thermostat housing to gain access to the hose clamps.
    - Remove and discard the gasket.
    - To install, tighten the bolts to 10 Nm (89 lb-in).

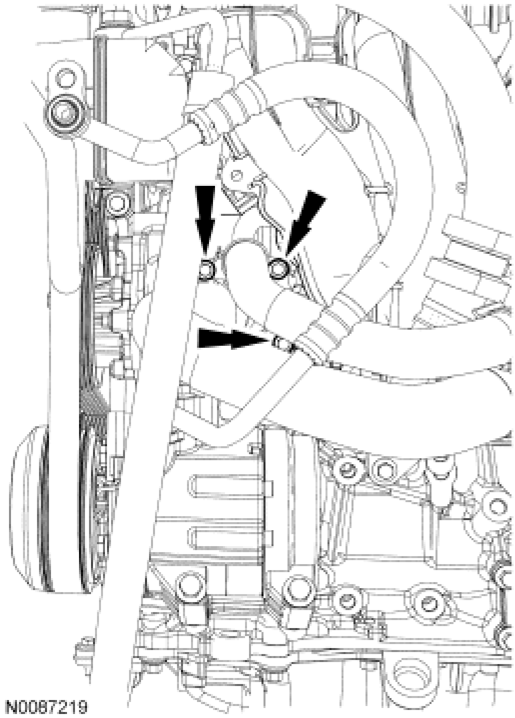

Fig. 12: Locating Bolts On Hose Clamps
Courtesy of FORD MOTOR CO.

4. Disconnect the heater hose from the thermostat housing.
5. Disconnect the lower radiator hose from the thermostat housing and remove the thermostat housing.
6. To install, reverse the removal procedure.
    - Install a new thermostat housing gasket.
7. Fill and bleed the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.

THERMOSTAT - 3.0L

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (bittered in US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1

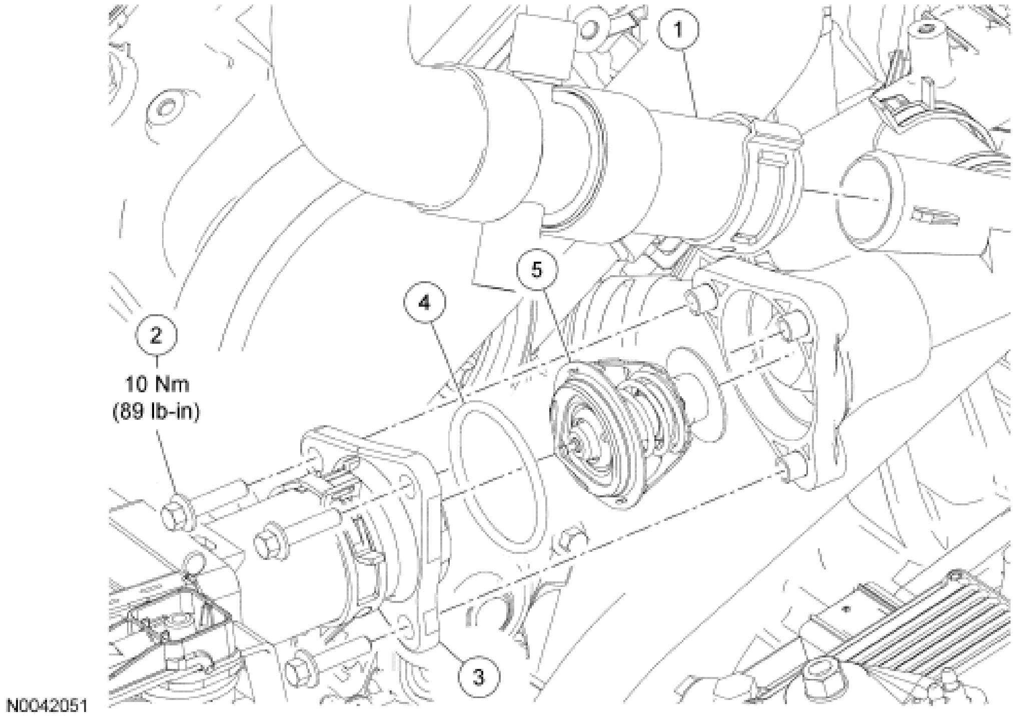

Fig. 13: Exploded View Of Thermostat With Torque Specification - 3.0L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	8B274	Upper radiator-to-thermostat housing hose
2	W500015	Thermostat housing cover bolt (3 required)
3	8K528	Thermostat housing cover
4	N806807	O-ring seal
5	8575	Thermostat

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Drain the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.
3. Disconnect the upper radiator-to-thermostat housing hose and position aside.
4. Remove the 3 bolts, thermostat housing cover, O-ring seal and thermostat.
   - Clean and inspect the O-ring seal. Install a new seal if necessary.
   - To install, tighten to 10 Nm (89 lb-in).

NOTE: Lubricate the thermostat O-ring seal with clean engine coolant.

5. To install, reverse the removal procedure.
6. Fill and bleed the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.

THERMOSTAT HOUSING - 3.0L

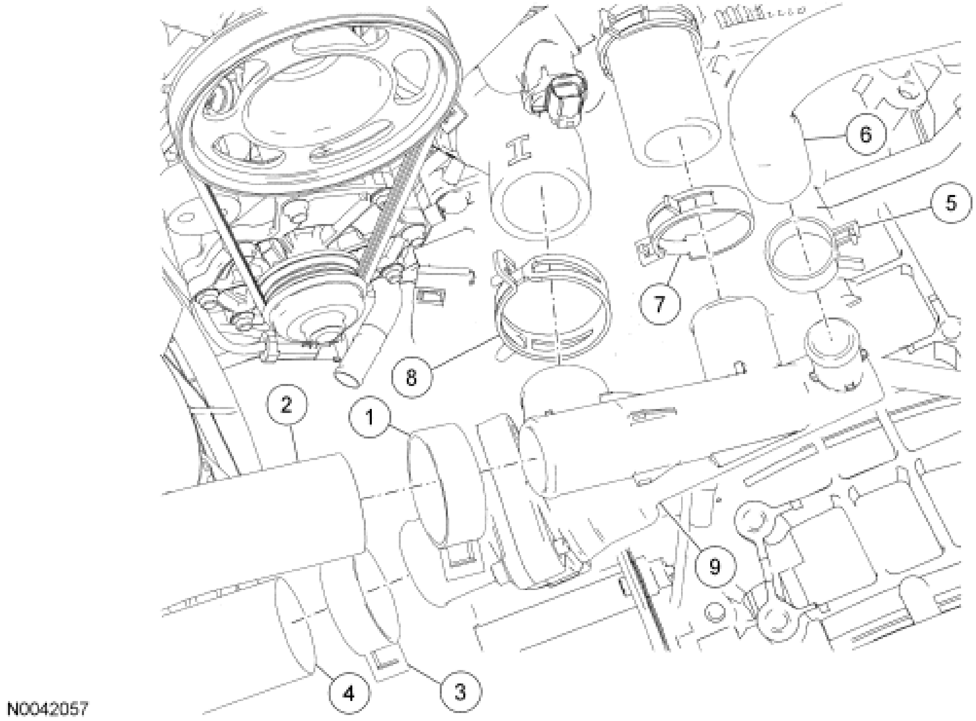

Fig. 14: Exploded View Of Thermostat Housing - 3.0L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W527371	Radiator hose clamp
2	8B274	Upper radiator hose
3	W527375	Radiator hose clamp
4	8B273	Lower radiator hose
5	W527212	Heater hose clamp
6	18C266	Heater hose
7	8287	Clamp
8	8287	Clamp
9	8A586	Thermostat housing

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

2. Drain the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.
3. Remove the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.0L (4V)** article.
4. Disconnect the upper radiator hose from the thermostat housing and position aside.
5. Disconnect the lower radiator hose from the thermostat housing and position aside.
6. Disconnect the heater hose from the thermostat housing and position aside.
7. Reposition the 2 thermostat housing-to-engine hose clamps.
    - Remove the thermostat housing.
8. To install, reverse the removal procedure.
9. Fill and bleed the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.

THERMOSTAT - 3.5L

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (bittered in US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1

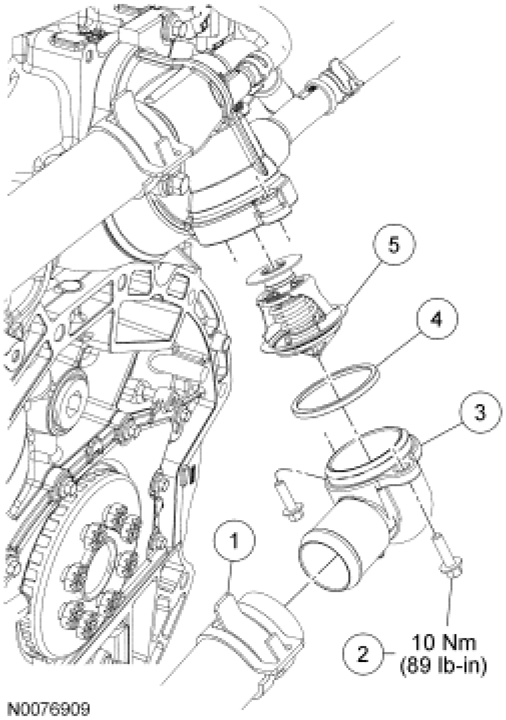

Fig. 15: Exploded View Of Thermostat With Torque Specification - 3.5L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	8B273	Lower radiator-to-thermostat housing cover hose
2	W500014	Thermostat housing cover bolt (2 required)
3	8594	Thermostat housing cover
4	-	O-ring seal
5	8575	Thermostat

REMOVAL AND INSTALLATION

1. Drain the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.
2. Remove the air cleaner and outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.
3. Disconnect the lower radiator hose from the thermostat housing cover and position it aside.
4. Remove the 2 bolts, thermostat housing cover, O-ring seal and thermostat.
    - Clean and inspect the O-ring seal. Install a new seal if necessary.
    - To install, tighten to 10 Nm (89 lb-in).

NOTE: Lubricate the thermostat O-ring seal with clean engine coolant.

5. To install, reverse the removal procedure.
6. Fill and bleed the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.

THERMOSTAT HOUSING - 3.5L

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (bittered in US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1

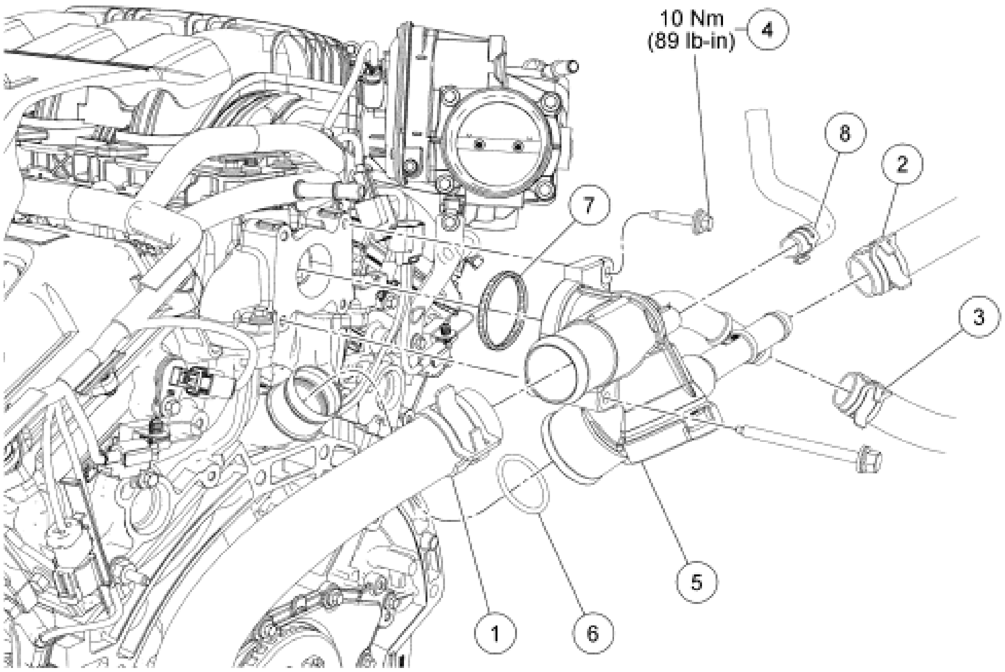

Fig. 16: Exploded View Of Thermostat Housing With Torque Specification - 3.5L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	8B274	Upper radiator-to-thermostat housing hose
2	18C266	Heater outlet hose
3	18C266	Heater inlet hose
4	W503279	Thermostat housing bolt (2 required)
5	8A586	Thermostat housing
6	8565	O-ring seal
7	8A571	O-ring seal
8	8B541	Thermostat housing-to-degas bottle hose

REMOVAL AND INSTALLATION

1. Remove the thermostat. For additional information, refer to **Thermostat - 3.5L**.
2. Disconnect the 4 coolant hoses from the thermostat housing and position them aside.
3. Remove the 2 thermostat housing bolts.
   - To install, tighten to 10 Nm (89 lb-in).

NOTE: **Do not pull the other end of the coolant tube out of the engine block when separating the thermostat housing.**

4. Separate the thermostat housing from the coolant tube and remove the thermostat housing.
   - Remove and discard the O-ring seals.
5. To install, reverse the removal procedure.
   - Lubricate the new O-ring seals with clean engine coolant.

BYPASS TUBE - 2.3L

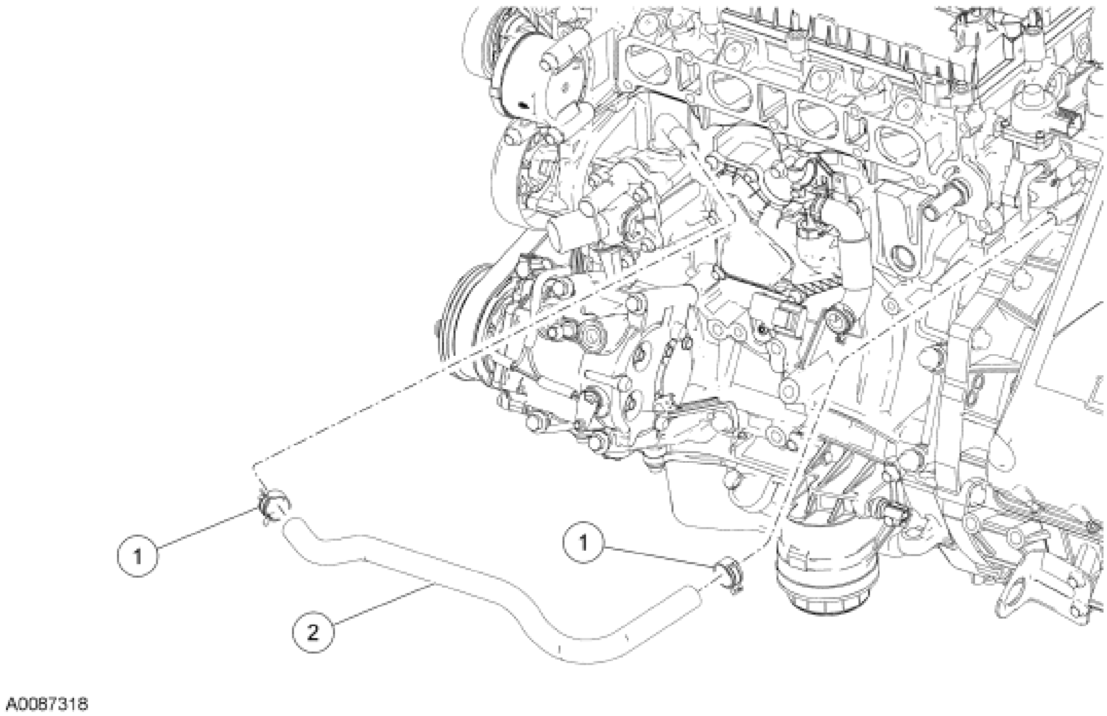

Fig. 17: Exploded View Of Bypass Tube
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W525958	Hose clamps (2 required)
2	8548	Bypass tube

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Drain the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.
3. Remove the intake manifold. For additional information, refer to **ENGINE - 2.3L** article.
4. Disconnect and remove the coolant bypass tube from the engine.
5. To install, reverse the removal procedure.
6. Fill and bleed the cooling system. For additional information, refer to **Cooling System Draining, Filling**

and Bleeding.

BYPASS TUBE - 3.0L

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (bittered in US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1

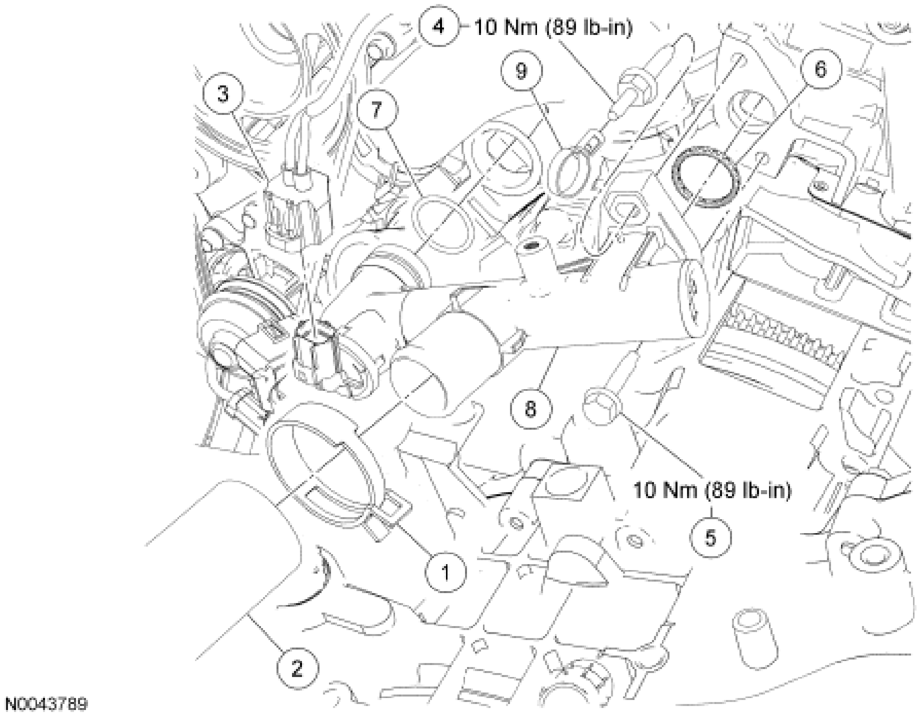

Fig. 18: Exploded View Of Bypass Tube With Torque Specifications - 3.0L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	8287	Hose clamp
2	8A520	Bypass tube-to-thermostat housing hose
3	14A464	Engine Coolant Temperature (ECT) sensor electrical connector
4	W701632	Stud bolt
5	W7016699	Bolt
6	8548	O-ring seal
7	391552	O-ring seal
8	8548	Bypass tube
9	-	Wiring harness retainer

REMOVAL AND INSTALLATION

1. Remove the thermostat housing. For additional information, refer to **Thermostat Housing - 3.0L**.
2. Remove the bypass tube-to-thermostat housing hose.
3. Disconnect the Engine Coolant Temperature (ECT) sensor electrical connector.
4. Detach the wiring harness retainer from the bypass tube stud bolt.

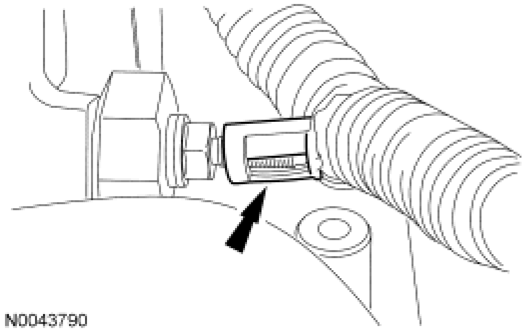

Fig. 19: Locating Wiring Harness Retainer
Courtesy of FORD MOTOR CO.

5. Remove the bolt, stud bolt and bypass tube.
    - To install, tighten the bolt and stud bolt to 10 Nm (89 lb-in).
6. Remove and inspect the O-ring seals, install new seals if necessary.
7. To install, reverse the removal procedure.
    - Lubricate the O-ring seals with clean engine coolant.
8. Fill and bleed the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.

COOLANT PUMP - 2.3L

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (bittered in US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1

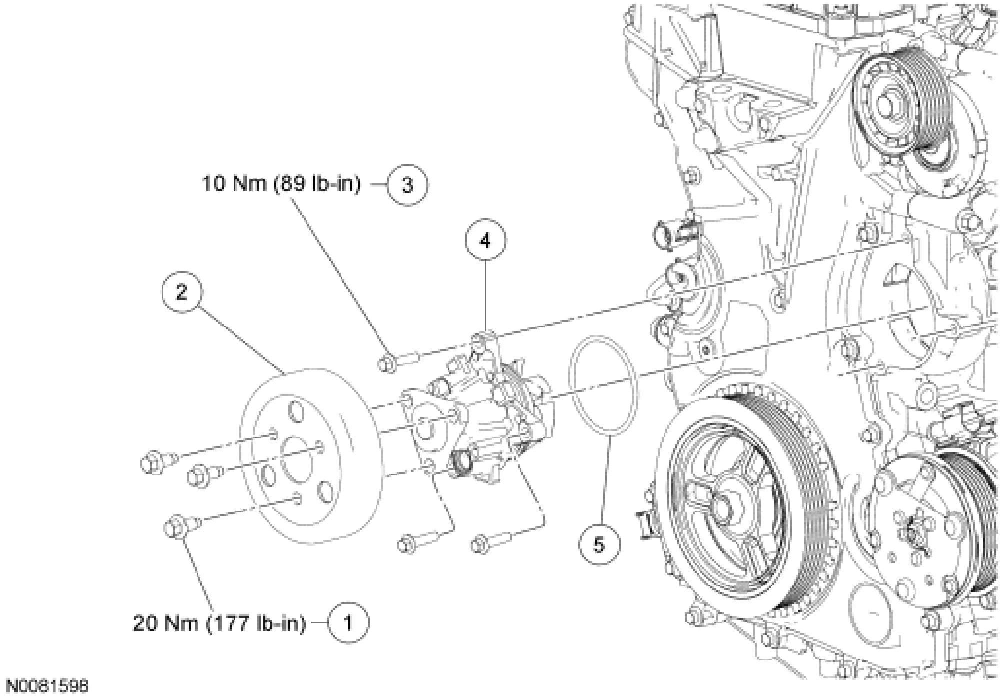

Fig. 20: Exploded View Of Coolant Pump With Torque Specifications - 2.3L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W500221	Coolant pump pulley bolt (3 required)
2	8509	Coolant pump pulley
3	W500015	Coolant pump bolt (3 required)
4	8501	Coolant pump
5	8507	Coolant pump O-ring seal

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Drain the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.
3. Loosen the 3 coolant pump pulley bolts.
4. Remove the accessory drive belt. For additional information, refer to **ACCESSORY DRIVE - 2.3L** article.
5. Remove the 3 bolts and the coolant pump pulley.
    - To install, tighten to 20 Nm (177 lb-in).

NOTE: **Make sure the coolant pump is correctly seated to the engine block before installing and tightening the fasteners, or damage to the coolant pump**

may occur.

6. Remove the 3 bolts and the coolant pump.
   - Remove and discard the O-ring seal.
   - To install, tighten to 10 Nm (89 lb-in).
7. To install, reverse the removal procedure.
   - Lubricate the O-ring seal with clean engine coolant.
8. Fill and bleed the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.

COOLANT PUMP - 3.0L

Special Tools

Illustration	Tool Name	Tool Number
 ST3042-A	Installer, Camshaft Pulley	303-458 (T94P-6312-AH3), part of 303-S455
 ST1586-A	Installer, Power Steering Pump Pulley (Nut only)	211-185 (T91P-3A733-A)
 ST3044-A	Plate, Water Pump Pulley	303-456 (T94P-6312-AH1), part of 303-S455
 ST3045-A	Protector, Water Pump Shaft	303-457 (T94P-6312-AH2), part of 303-A455
 ST1286-A	Remover, Crankshaft Vibration Damper	303-009 (T58P-6316-D)
		303-459 (T94P-6312-AH4), part

	Spacer, Water Pump Pulley	of 303-S455

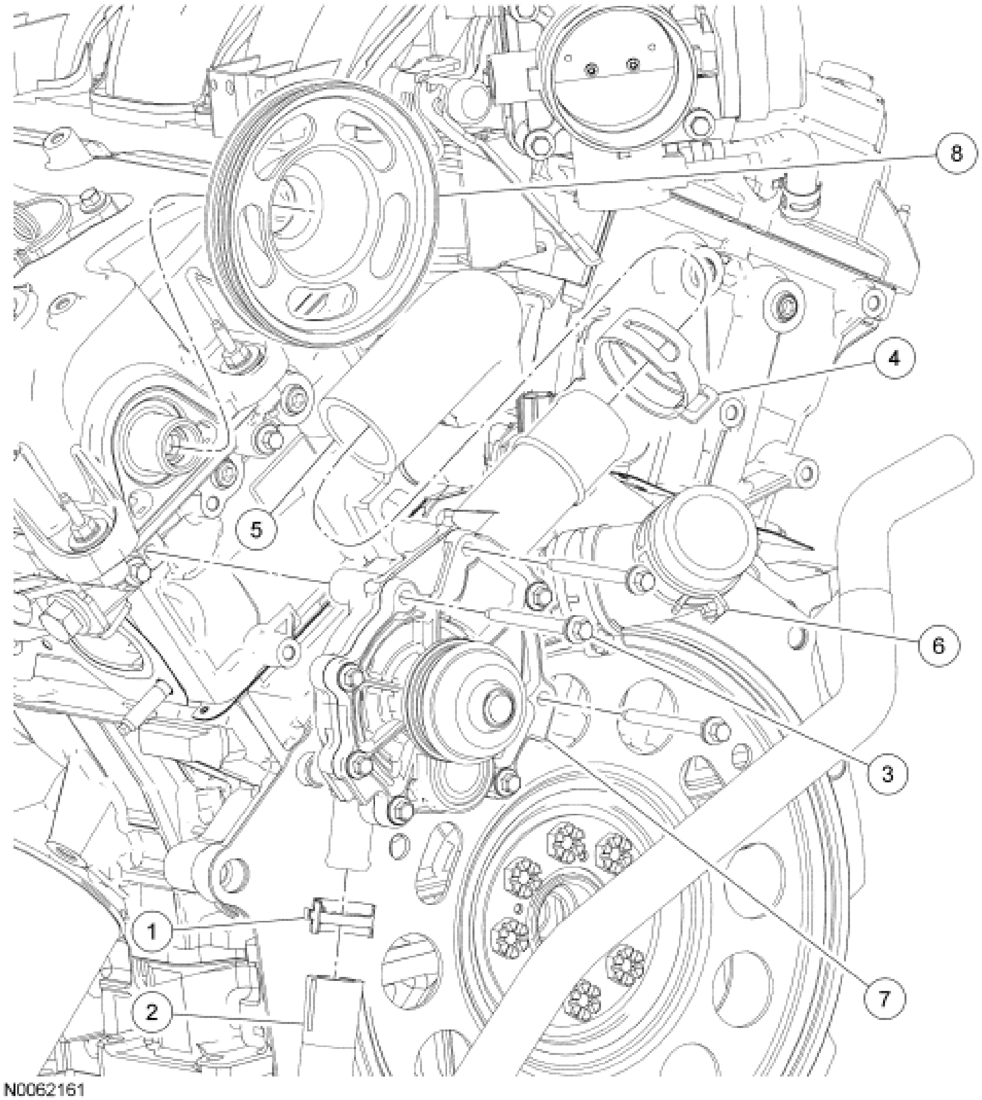

Fig. 21: Exploded View Of Coolant Pump - 3.0L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W525958	Heater hose clamp
2	18K359	Heater hose
3	W701544	Coolant pump assembly bolt (3 required)
4	8287	Coolant pump-to-engine hose clamp

5	8A577	Coolant pump-to-engine hose
6	8287	Coolant pump-to-thermostat housing hose clamp
7	8501	Coolant pump assembly
8	6A359	Coolant pump drive pulley

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Drain the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.
3. Remove the coolant pump belt. For additional information, refer to **ACCESSORY DRIVE - 3.0L (4V)** article.

NOTE: Failure to use the correct Water Pump Pulley Plate, Water Pump Shaft Protector and Crankshaft Vibration Damper Remover, assembled as shown in the illustration, will result in damage to the coolant pump pulley and/or the Water Pump Pulley Plate, Water Pump Shaft Protector and Crankshaft Vibration Damper Remover.

4. Using the Water Pump Pulley Plate, Water Pump Shaft Protector and the Crankshaft Vibration Damper Remover, remove the coolant pump pulley.

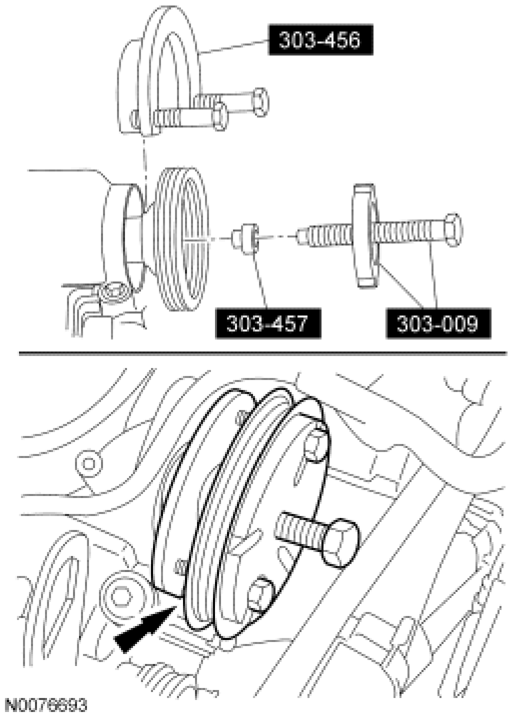

Fig. 22: Removing Coolant Pump Pulley Using Special Tools (303-009, 303-456, 303-457)

Courtesy of FORD MOTOR CO.

5. Disconnect the heater hose from the coolant pump.
6. Disconnect the coolant pump-to-engine hose and position aside.
7. Remove the 3 bolts from the coolant pump assembly.

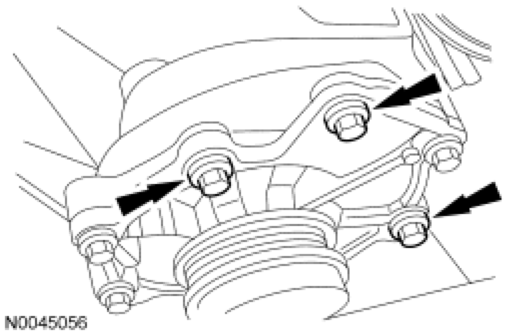

Fig. 23: Coolant Pump Assembly Bolts
Courtesy of FORD MOTOR CO.

8. Reposition the coolant pump-to-thermostat housing hose clamp and remove the coolant pump and hose as an assembly.

INSTALLATION

1. Connect the coolant pump-to-thermostat housing hose and reposition the clamp.
2. Position the coolant pump assembly and install the 3 bolts.
   - Tighten to 10 Nm (89 lb-in).
   - Tighten the 3 bolts an additional 90 degrees.
3. Connect the coolant pump-to-engine hose and the heater hose.

NOTE: **Failure to use the correct Camshaft Pulley Installer, assembled as shown in the illustration, will result in damage to the coolant pump pulley and/or the Camshaft Pulley Installer.**

4. Install the Camshaft Pulley Installer on the camshaft as shown in the illustration.
   - Adjust the collar on the Camshaft Pulley Installer to get the best thread engagement in the rear of the camshaft.

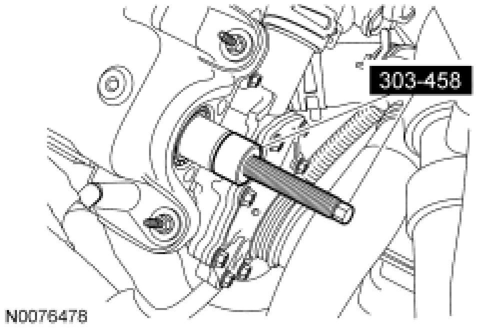

Fig. 24: Installing Special Tool On Camshaft
Courtesy of FORD MOTOR CO.

NOTE: Failure to use the correct Power Steering Pump Pulley Installer, Camshaft Pulley Installer and Water Pump Pulley Spacer assembled as shown in the illustration, will result in damage to the coolant pump pulley and/or the Power Steering Pump Pulley Installer, Camshaft Pulley Installer and Water Pump Pulley Spacer.

NOTE: Only the roller collared nut from the Power Steering Pump Pulley Installer is used on the Camshaft Pulley Installer.

5. Position the coolant pump pulley over the previously installed Camshaft Pulley Installer on the end of the camshaft. Install the Camshaft Pulley Installer, Water Pump Pulley Spacer and the Power Steering Pump Pulley Installer as shown in the illustration.
   - Using the Camshaft Pulley Installer, Water Pump Pulley Spacer and the Power Steering Pump Pulley Installer, install the coolant pump pulley flush with the end of the camshaft.

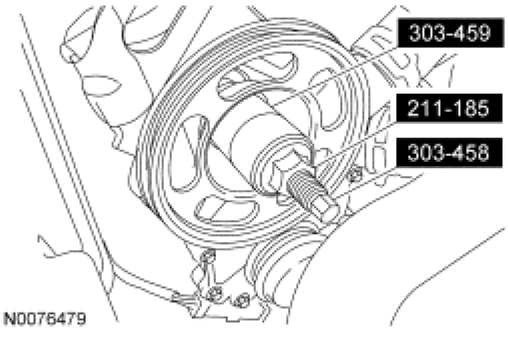

Fig. 25: Installing Coolant Pump Pulley Using Special Tools (211-185, 303-458, 303-459)
Courtesy of FORD MOTOR CO.

6. Install the coolant pump belt. For additional information, refer to **ACCESSORY DRIVE - 3.0L (4V)** article.
7. Fill and bleed the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.

COOLANT PUMP - 3.5L

Special Tools

Illustration	Tool Name	Tool Number
	Camshaft Holding Tool	303-1248

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

REMOVAL

NOTE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

1. Remove the engine front cover. For additional information, refer to **ENGINE - 3.5L** article.
2. Remove and discard the engine oil filter.
3. Rotate the crankshaft clockwise and align the timing marks on the variable camshaft timing Variable Camshaft Timing (VCT) assemblies as shown.

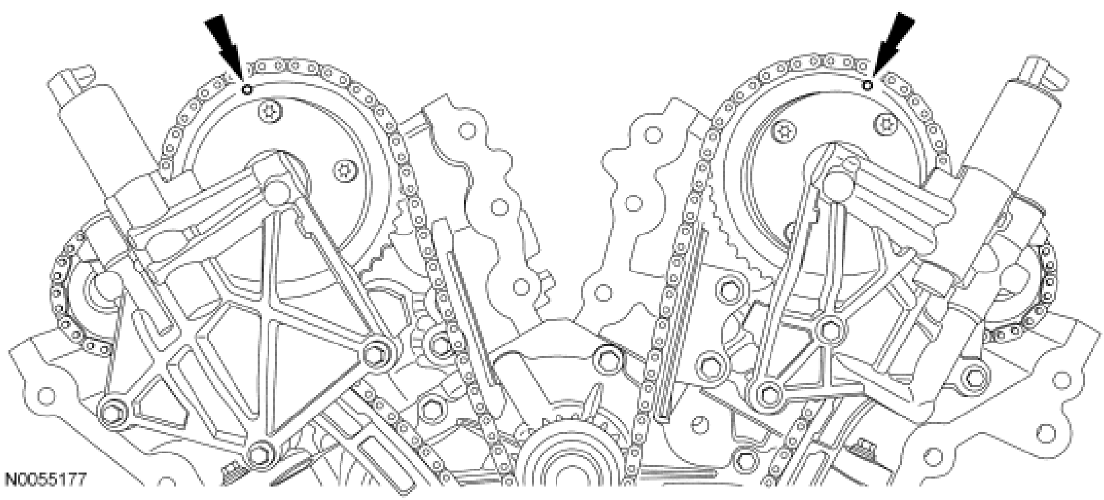

Fig. 26: Aligning Timing Marks On Variable Camshaft Timing (VCT) Assemblies
Courtesy of FORD MOTOR CO.

NOTE: The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

4. Install the Camshaft Holding Tool onto the flats of the LH camshafts.

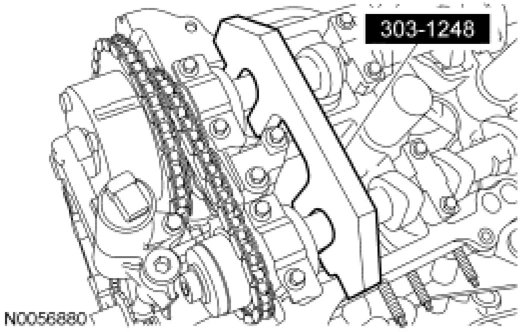

Fig. 27: Installing Special Tool (303-1248) Onto Flats Of LH Camshafts
Courtesy of FORD MOTOR CO.

NOTE: The Camshaft Holding Tool will hold the camshafts in the TDC.

5. Install the Camshaft Holding Tool onto the flats of the RH camshafts.

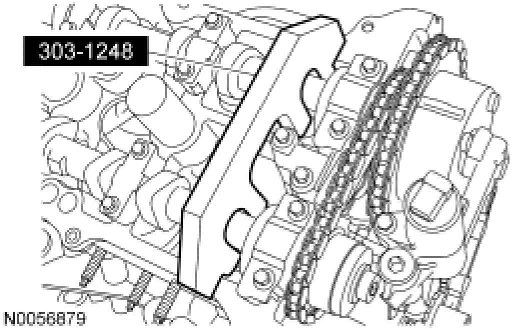

Fig. 28: Installing Special Tool (303-1248) Onto Flats Of RH Camshafts
Courtesy of FORD MOTOR CO.

6. Remove the 3 bolts and the RH VCT housing.

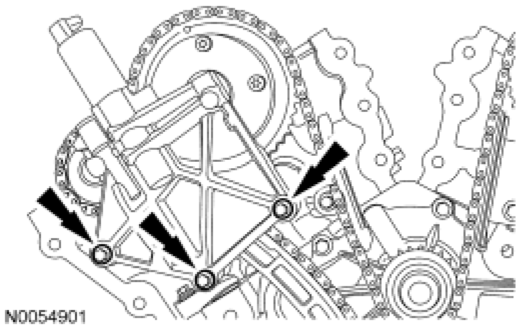

Fig. 29: Locating RH VCT Housing
Courtesy of FORD MOTOR CO.

7. Remove the 3 bolts and the LH VCT housing.

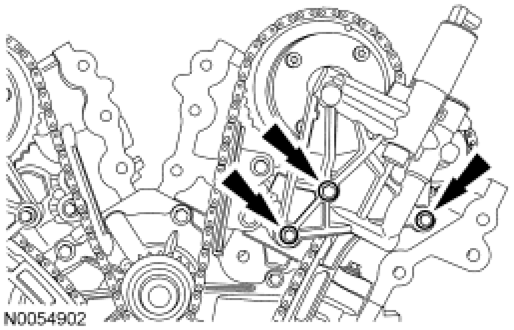

Fig. 30: Locating LH VCT Housing
Courtesy of FORD MOTOR CO.

8. Remove and discard the VCT housing seals.

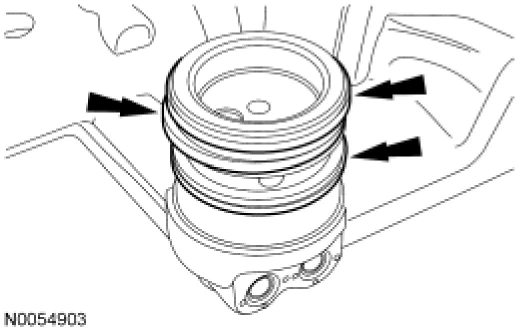

Fig. 31: Locating VCT Housing Seals
Courtesy of FORD MOTOR CO.

9. Remove the 2 bolts and the primary timing chain tensioner.

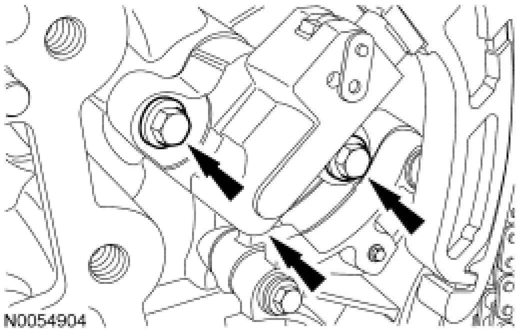

Fig. 32: Locating Primary Timing Chain Tensioner Bolts
Courtesy of FORD MOTOR CO.

10. Remove the primary timing chain tensioner arm.

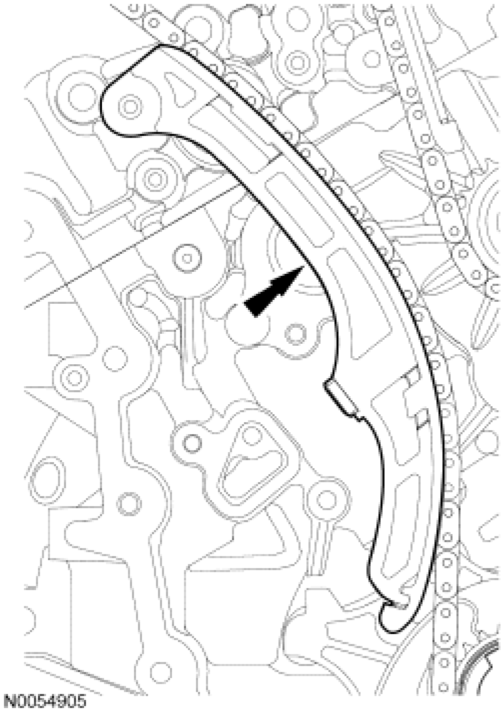

Fig. 33: Locating Primary Timing Chain Tensioner Arm
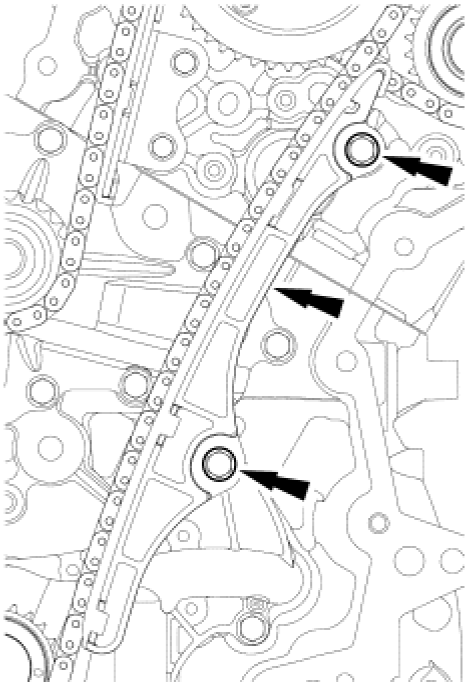
Courtesy of FORD MOTOR CO.

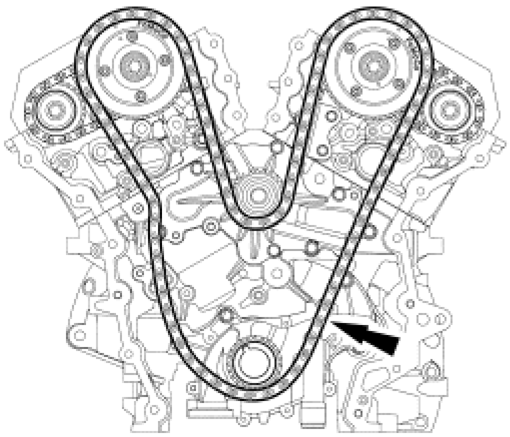
11. Remove the 2 bolts and the lower LH primary timing chain guide.



N0054906

Fig. 34: Locating Lower LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

12. Remove the primary timing chain.



N0054908

Fig. 35: Locating Primary Timing Chain

Courtesy of FORD MOTOR CO.

13. Remove the 2 bolts and the upper LH primary timing chain guide.

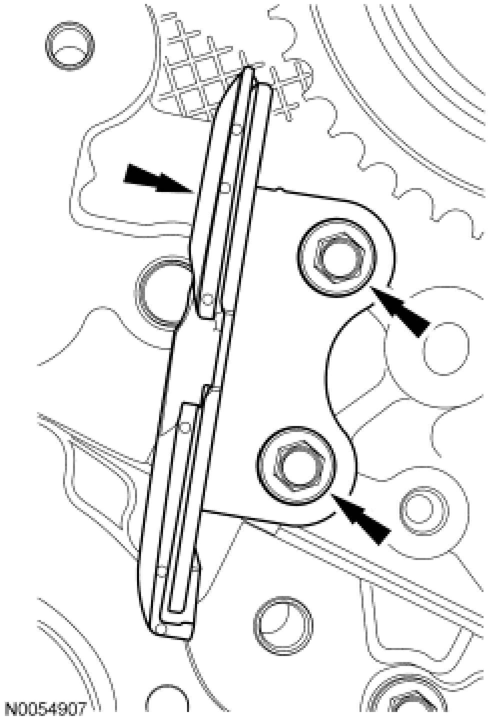


Fig. 36: Locating Upper LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

14. Remove the RH primary timing chain guide lower bolt.

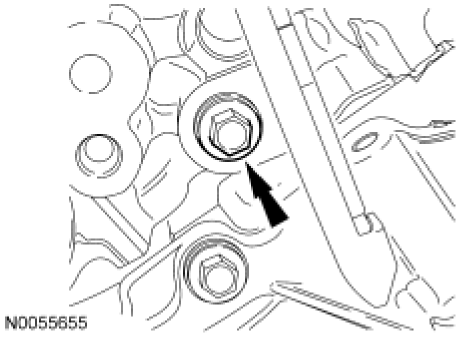

Fig. 37: Locating RH Primary Timing Chain Guide Lower Bolt
Courtesy of FORD MOTOR CO.

NOTE:	**The RH primary timing chain guide must be repositioned to allow the coolant pump to be removed.**

15. Loosen the RH primary timing chain guide upper bolt.

- Rotate the guide and tighten the bolt.

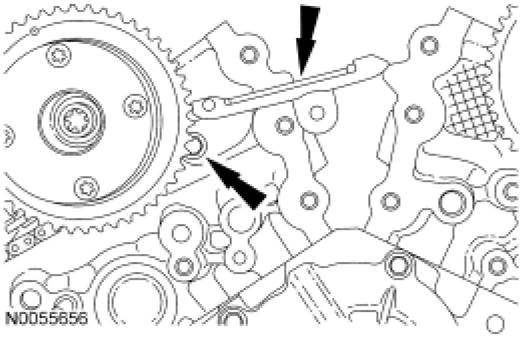

Fig. 38: Locating RH Primary Timing Chain Guide Upper Bolt
Courtesy of FORD MOTOR CO.

16. Place clean, lint-free shop towels in the oil pan opening to prevent coolant from entering the oil pan during coolant pump removal.
17. Remove the 8 bolts and the coolant pump.

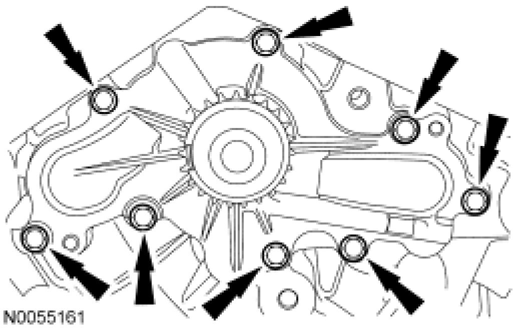

Fig. 39: Locating Coolant Pump Bolts
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE: Clean and inspect all sealing surfaces.

1. Install the coolant pump and the 8 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

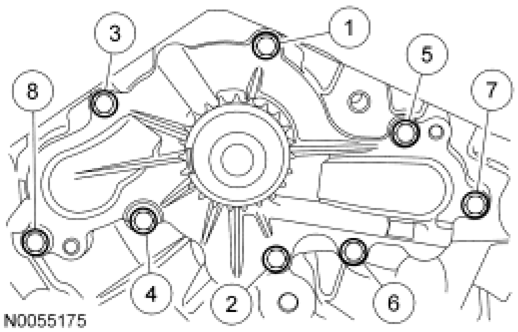

Fig. 40: Identifying Coolant Pump Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

2. Remove all of the shop towels from the oil pan opening.

NOTE: Any coolant that has accumulated in the oil pan must be drained from the pan and any residual coolant cleaned from the front of the engine and oil pan. Failure to remove all traces of the coolant can result in oil contamination and severe engine damage.

3. Remove the oil pan drain plug and allow any accumulated coolant to drain.
   - Remove any residual coolant from the front of the engine and the oil pan using regulated, compressed air and clean, lint-free shop towels.
   - Install the oil pan drain plug and tighten to 27 Nm (20 lb-ft).
4. Loosen the RH primary timing chain guide upper bolt.
   - Position the RH primary timing chain guide and install the lower bolt.
   - Tighten the 2 bolts to 10 Nm (89 lb-in).

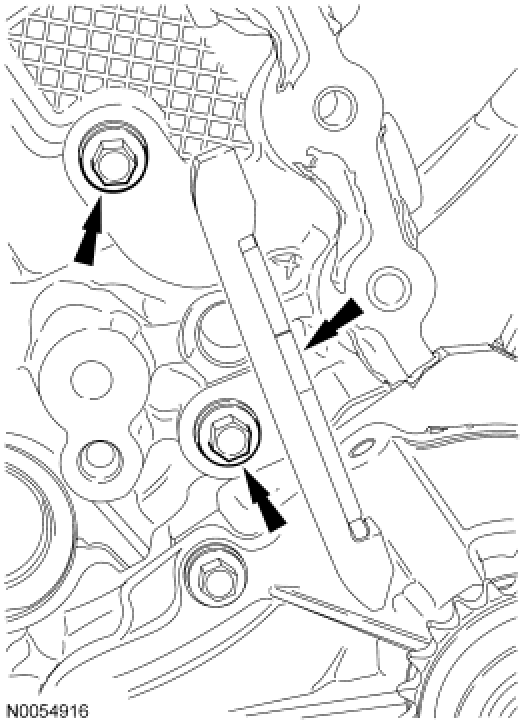

Fig. 41: Locating RH Primary Timing Chain Guide Lower Bolt
Courtesy of FORD MOTOR CO.

5. Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.

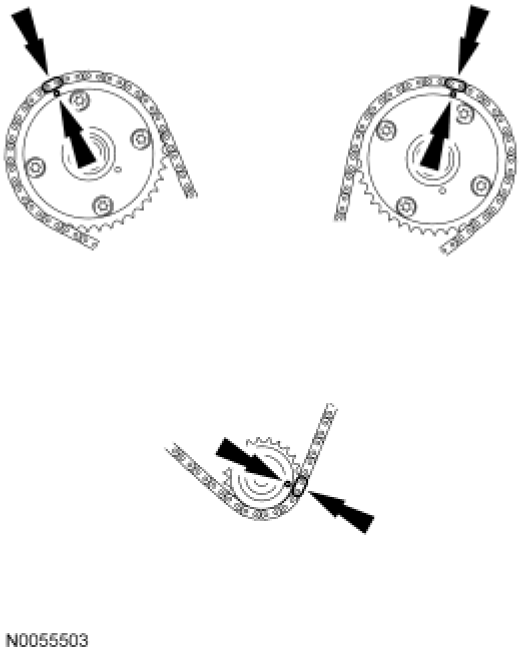

Fig. 42: Aligning Timing Marks On VCT Assemblies & Crankshaft Sprocket
Courtesy of FORD MOTOR CO.

6. Install the upper LH primary timing chain guide and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

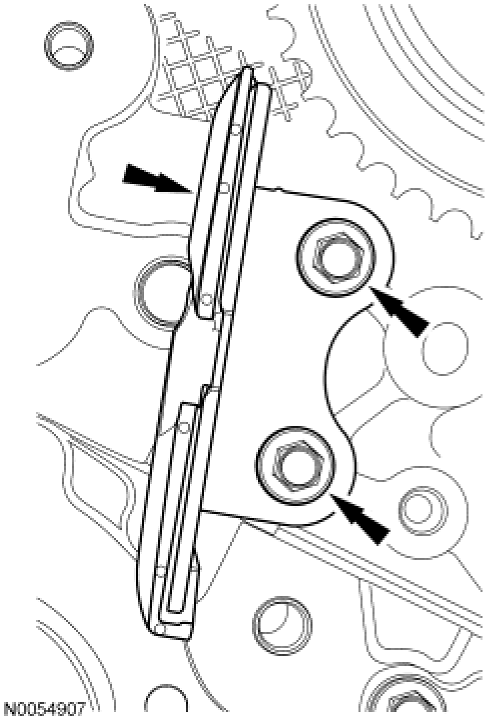

Fig. 43: Locating Upper LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

7. Install the lower LH primary timing chain guide and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

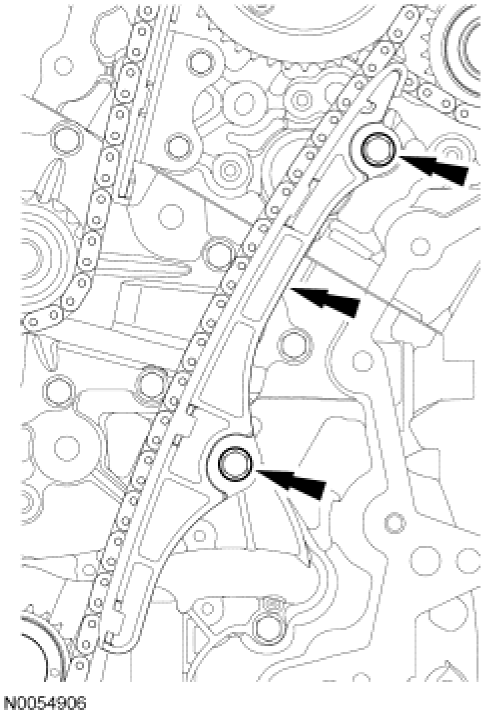

Fig. 44: Locating Lower LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

8. Install the primary timing chain tensioner arm.

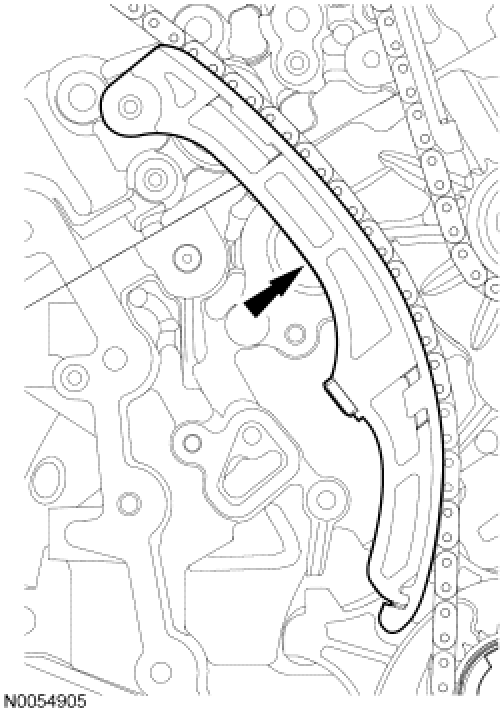

Fig. 45: Locating Primary Timing Chain Tensioner Arm

Courtesy of FORD MOTOR CO.

9. Reset the primary timing chain tensioner.
   - Rotate the lever counterclockwise.
   - Using a soft-jawed vise, compress the plunger.
   - Align the hole in the lever with the hole in the tensioner housing.
   - Install a suitable lock pin.

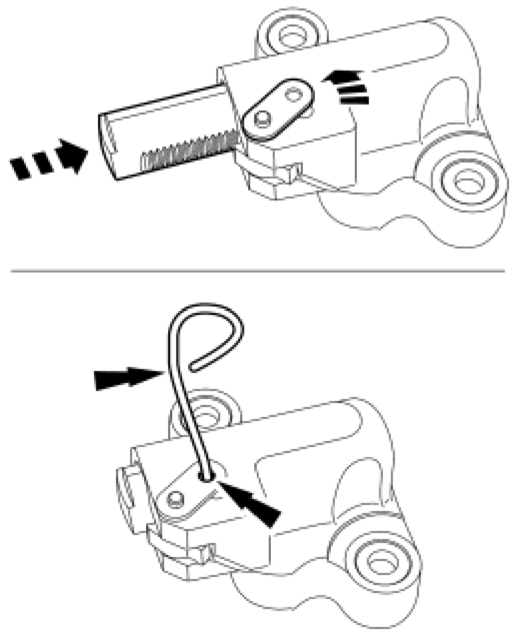

Fig. 46: Compressing Plunger Using A Soft-Jawed Vise
Courtesy of FORD MOTOR CO.

NOTE: It may be necessary to rotate the crankshaft slightly to remove slack from the timing chain and install the tensioner.

10. Install the primary tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the lock pin.

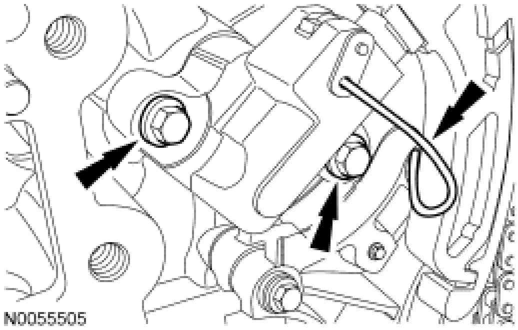

Fig. 47: Locating Primary Tensioner Bolts
Courtesy of FORD MOTOR CO.

11. As a post check, verify correct alignment of all timing marks.

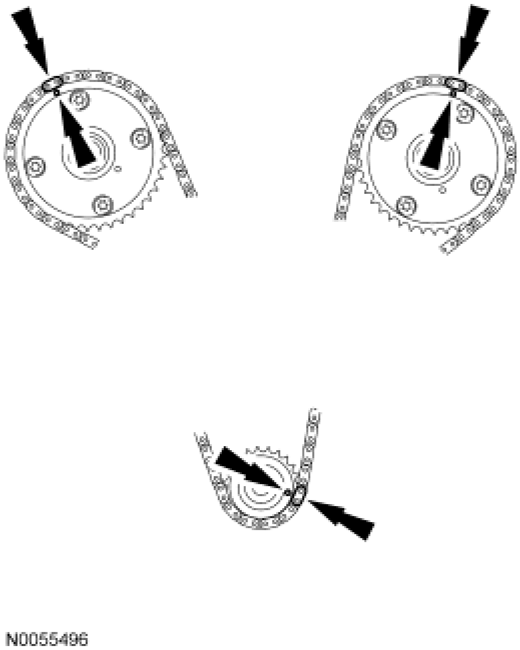

Fig. 48: Verifying Correct Alignment Of All Timing Marks
Courtesy of FORD MOTOR CO.

12. Install new VCT housing seals.

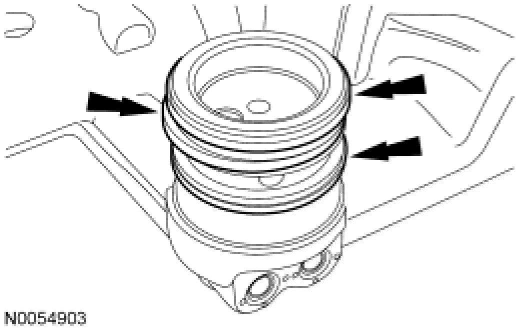

Fig. 49: Locating VCT Housing Seals
Courtesy of FORD MOTOR CO.

NOTE:	**Make sure the dowels on the VCT housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

13. Install the LH VCT housing and the 3 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

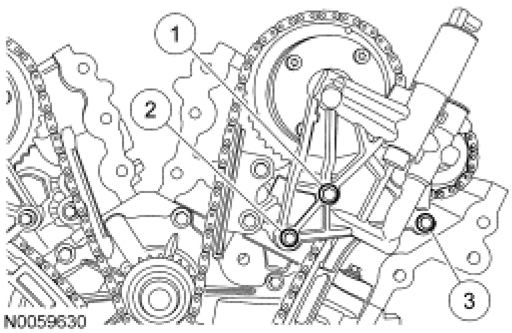

Fig. 50: Identifying LH VCT Housing Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

NOTE:	**Make sure the dowels on the VCT housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

14. Install the RH VCT housing and the 3 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

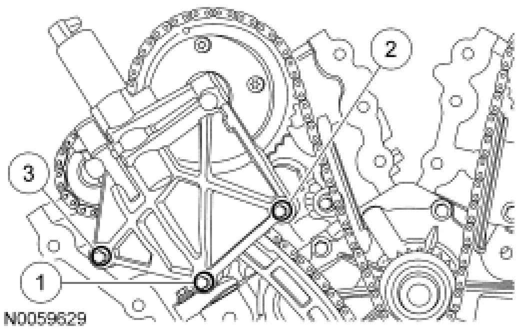

Fig. 51: Identifying RH VCT Housing Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

NOTE: Lubricate the engine oil filter gasket with clean engine oil prior to installing the oil filter.

15. Install a new engine oil filter.
    - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.
16. Install the engine front cover. For additional information, refer to **ENGINE - 3.5L** article.

COOLING FAN MOTOR AND SHROUD

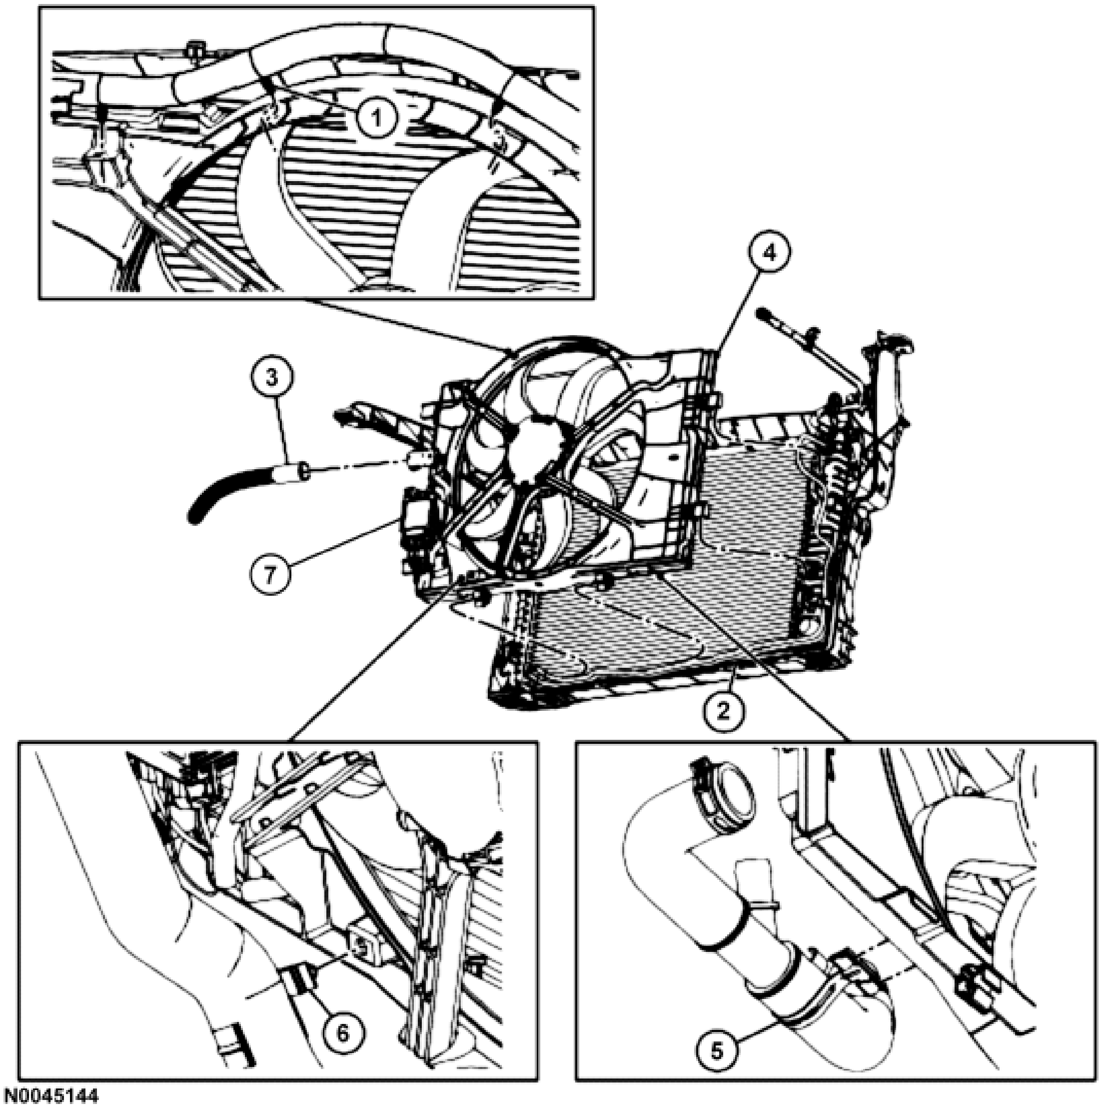

Fig. 52: Exploded View Of Cooling Fan Motor & Shroud - 2.3L and 3.0L Engines
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	13A506	Wiring harness retainer
2	7H420	Transmission cooler tube (automatic transmission only)
3	14A464	Cooling fan motor electrical connector
4	8C607	Cooling fan motor and shroud
5	-	Lower radiator hose bracket
6	-	Lower radiator hose retainer (3.0L only)
7	6E5Z-8B658-A	Fan Control Module/Relay

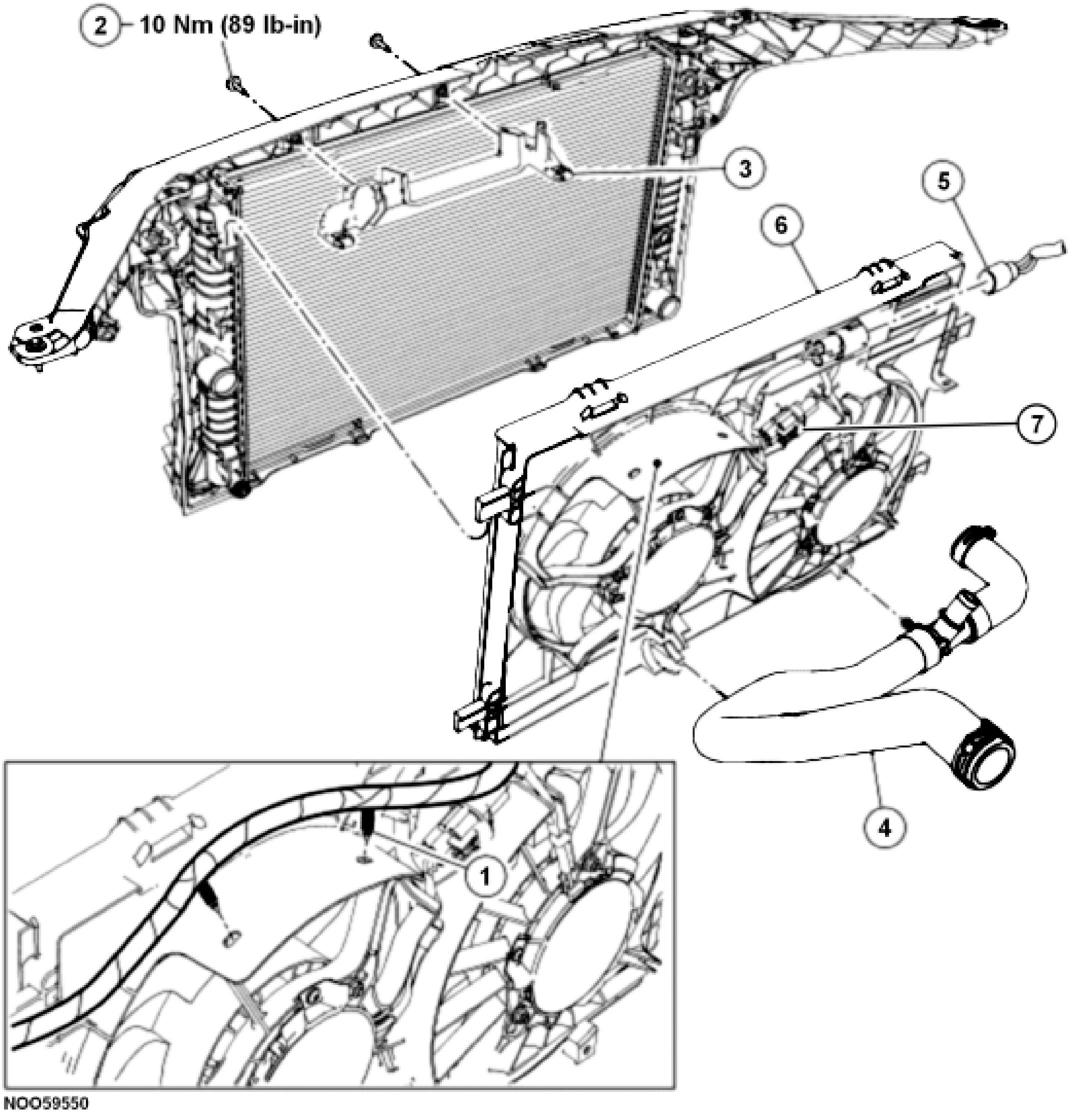

Fig. 53: Exploded View Of Cooling Fan Motor & Shroud With Torque Specification - 3.5L Engines
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	13A506	Wiring harness retainer
2	W505425	Air cleaner bracket bolt (2 required)
3	9W541	Air cleaner bracket
4	8B273	Lower radiator hose
5	14A464	Cooling fan motor electrical connector
6	8C607	Cooling fan motor and shroud
7	6E5Z-8B658-A	Fan Control Module/Relay

All vehicles

1. With vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND**

LIFTING article.

2.3L engines

2. Remove the generator air inlet duct.

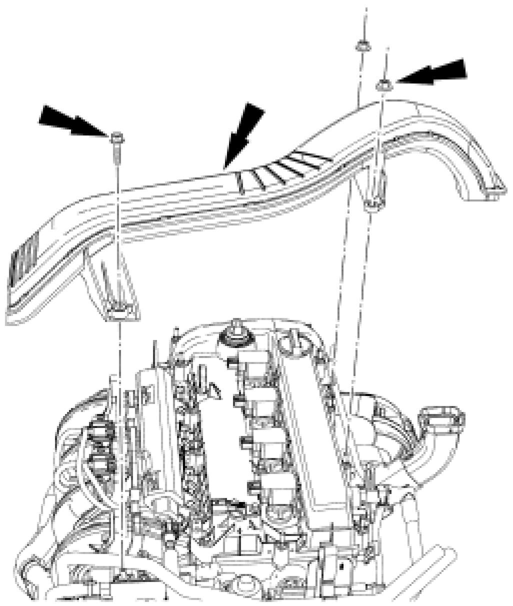

Fig. 54: Locating Generator Air Inlet Duct, Bolt And Nuts
Courtesy of FORD MOTOR CO.

3.5L engines

3. Remove the air cleaner. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.
4. Remove the 2 bolts and the air cleaner bracket.
   - To install, tighten to 10 Nm (89 lb-in).

All vehicles

5. If equipped, detach the 3 block heater wiring retainers from the cooling fan motor and shroud and position aside.

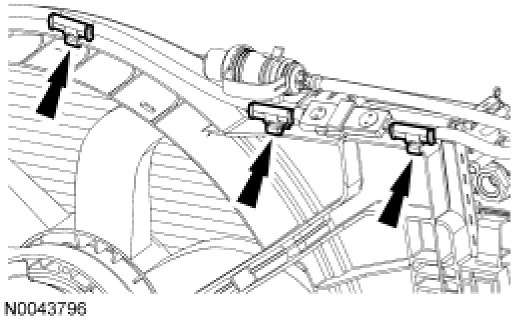

Fig. 55: Locating Block Heater Wiring Retainers
Courtesy of FORD MOTOR CO.

6. Remove the splash shield.

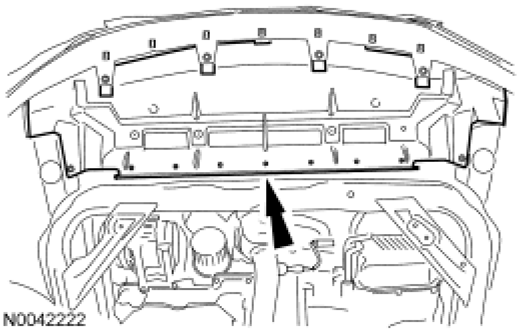

Fig. 56: Locating Splash Shield
Courtesy of FORD MOTOR CO.

7. Detach the lower radiator hose from the cooling fan motor and shroud.

3.0L and 3.5L engines

8. Detach the retainer on the lower radiator hose from the cooling fan motor and shroud.

All vehicles

9. If equipped, detach the transmission cooler tubes from the cooling fan motor and shroud.
10. Detach the wiring harness retainers and position the harness aside.
11. Disconnect the cooling fan electrical connector.
12. Release the 2 tabs and remove the cooling fan motor and shroud.

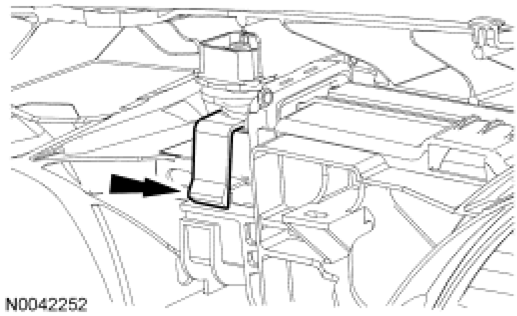

Fig. 57: Locating Cooling Fan Motor And Shroud Tab
Courtesy of FORD MOTOR CO.

13. To install, reverse the removal procedure.

RADIATOR

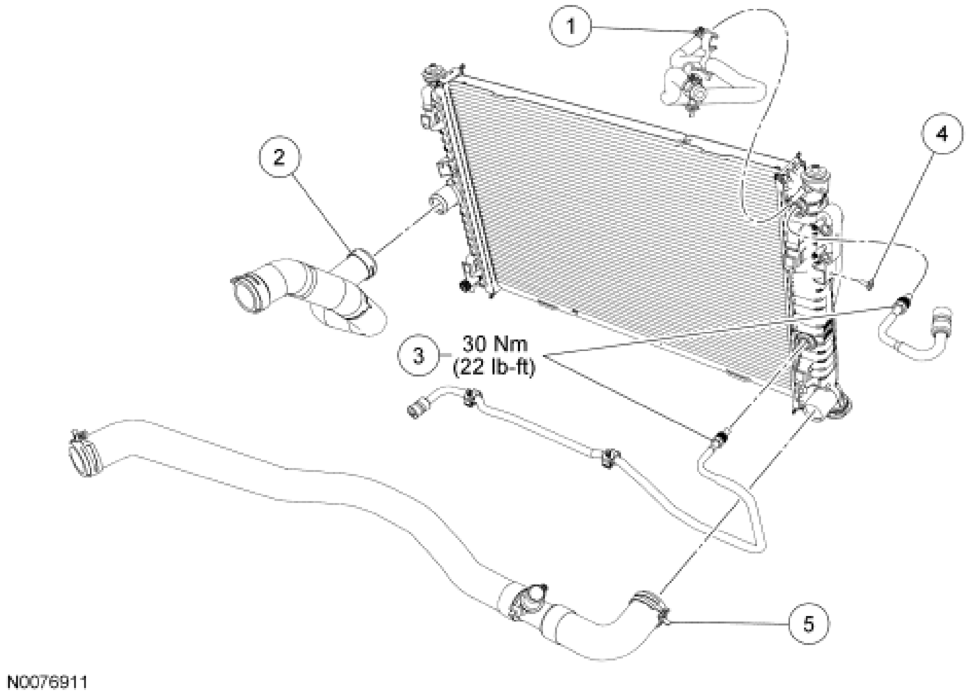

Fig. 58: Exploded View Of Radiator With Torque Specification (1 Of 2)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	8276	Radiator-to-degas bottle hose (3.0L and 3.5L)
2	8B274	Upper radiator hose
3	7H420	Transmission cooler tubes (automatic transmission only) (2 required)

4	19710	A/C condenser-to-radiator pin-type retainer
5	8B273	Lower radiator hose

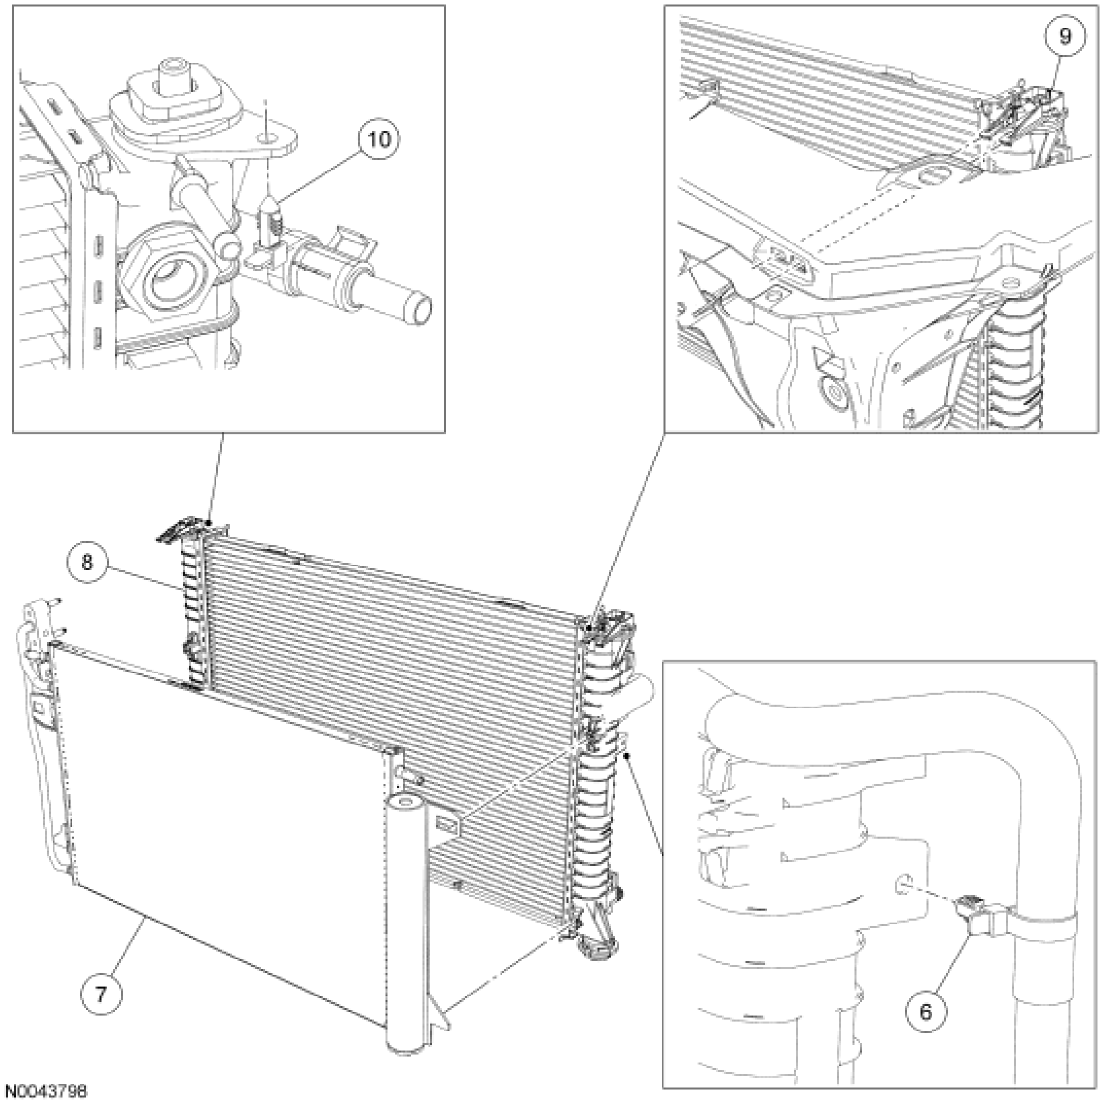

Fig. 59: Exploded View Of Radiator (2 Of 2)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
6	3493	Retainer
7	19710	A/C condenser
8	8005	Radiator
9	8A194	Upper radiator support
10	-	Power steering hose retainer

All vehicles

1. Drain the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.
2. Remove the cooling fan motor and shroud. For additional information, refer to **Cooling Fan Motor and Shroud**.
3. Detach the power steering hose retainer from the radiator.

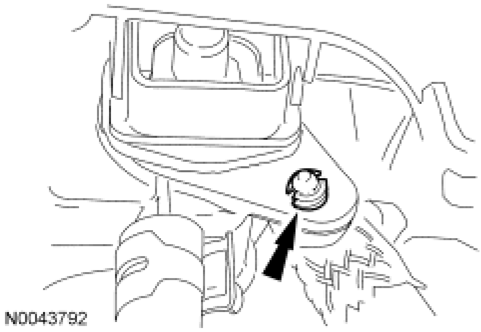

Fig. 60: Locating Power Steering Hose Retainer
Courtesy of FORD MOTOR CO.

4. Disconnect the upper radiator hose from the radiator.
5. Detach the retainer from the radiator.

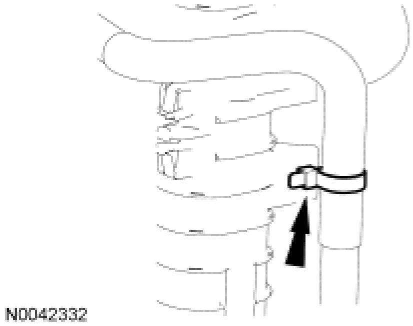

Fig. 61: Locating Radiator Retainer
Courtesy of FORD MOTOR CO.

6. Disconnect the radiator-to-degas bottle hose from the radiator.

Automatic transmission vehicles

7. Disconnect the 2 transmission cooling tubes from the radiator.
   - To install, tighten to 30 Nm (22 lb-ft).

All vehicles

8. Disconnect the lower radiator hose from the radiator.

9. Lift and remove the tabs from the upper radiator support and position the radiator towards the engine.

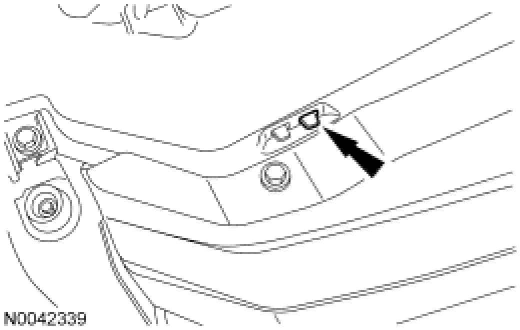

Fig. 62: Locating Upper Radiator Support Tab
Courtesy of FORD MOTOR CO.

10. Remove the A/C condensor-to-radiator pin-type retainer.

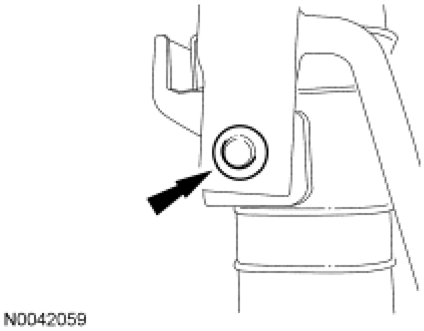

Fig. 63: Locating A/C Condensor-To-Radiator Pushpin-Type Retainer
Courtesy of FORD MOTOR CO.

11. Squeeze the tabs and separate the A/C condenser from the radiator.
    - Remove the radiator.

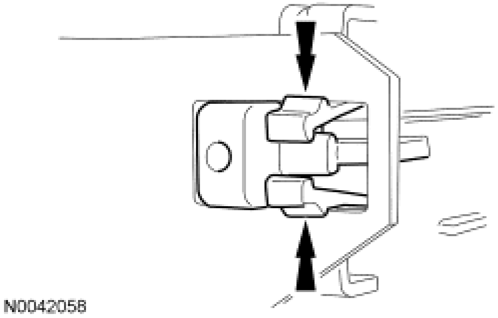

Fig. 64: Locating A/C Condenser Tabs
Courtesy of FORD MOTOR CO.

12. To install, reverse the removal procedure.

13. Fill and bleed the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding**.

DEGAS BOTTLE

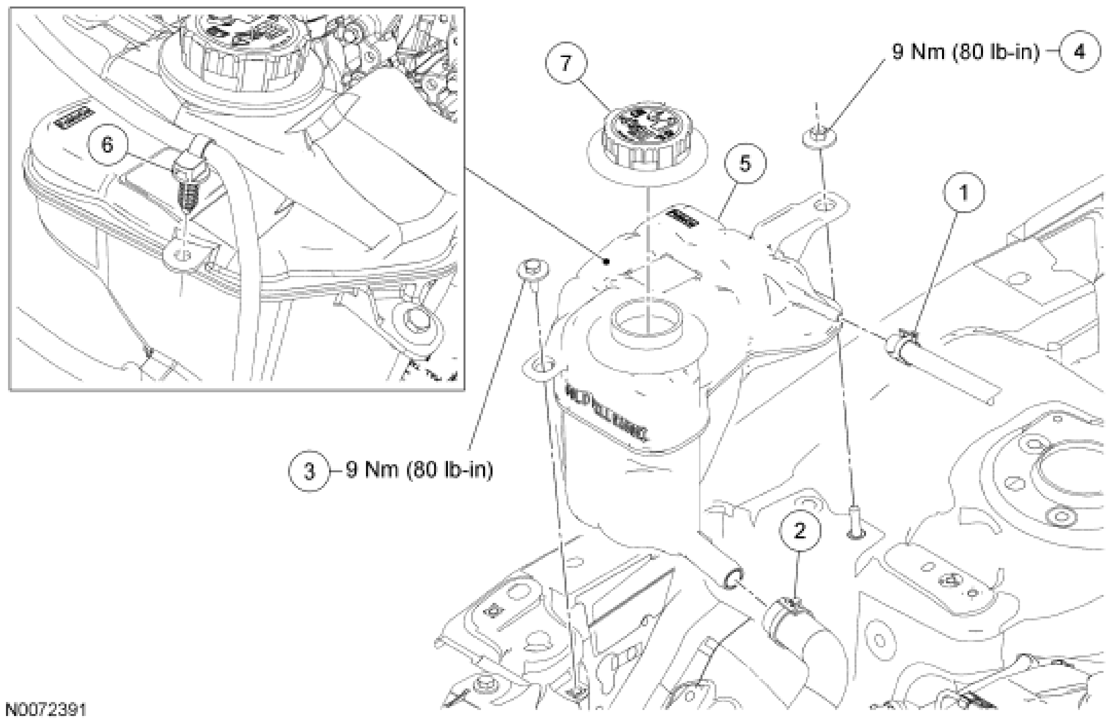

Fig. 65: Exploded View Of Degas Bottle With Torque Specifications - 2.3L and 3.0L Engines
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	8276	Degas bottle-to-radiator hose
2	8C351	Lower degas bottle hose
3	W707398	Degas bottle-to-fender bolt
4	W709603	Degas bottle-to-fender nut
5	8A080	Degas bottle
6	14197	Wiring retainer (if equipped)
7	8100	Pressure relief cap

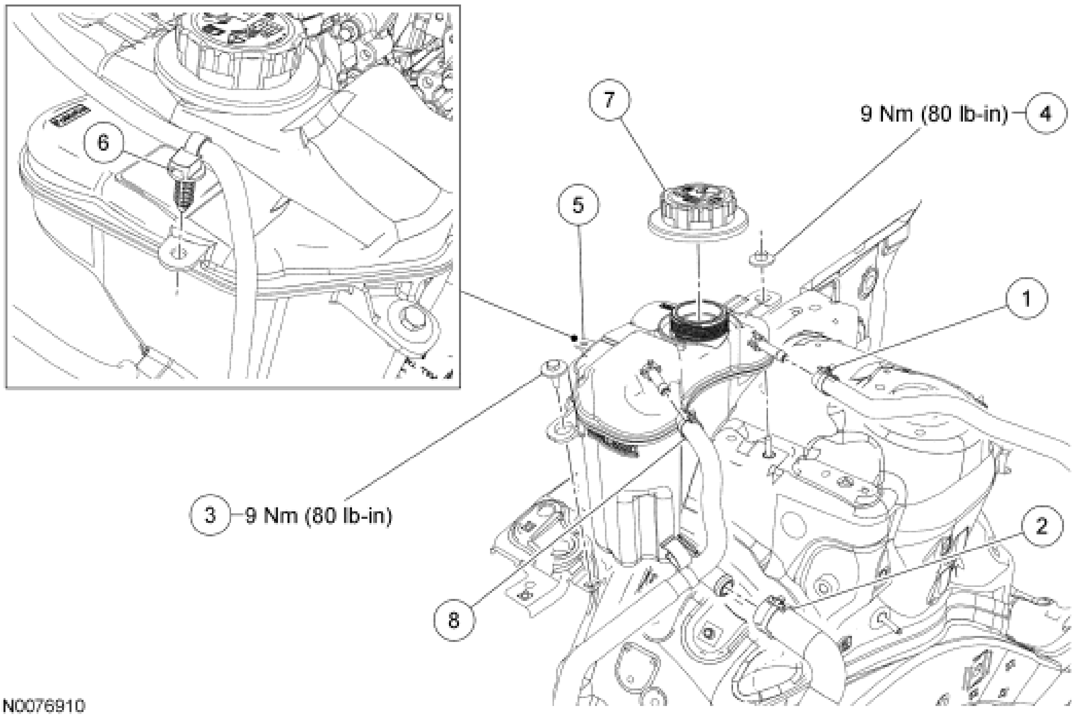

Fig. 66: Exploded View Of Degas Bottle With Torque Specifications - 3.5L Engines
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	8B541	Degas bottle-to-thermostat housing hose
2	8C351	Lower degas bottle hose
3	W707398	Degas bottle-to-fender bolt
4	W709603	Degas bottle-to-fender nut
5	8A080	Degas bottle
6	14197	Wiring retainer (if equipped)
7	8100	Pressure relief cap
8	8276	Degas bottle-to-radiator hose

REMOVAL AND INSTALLATION

All vehicles

WARNING: **Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

1. Release the pressure in the cooling system by slowly turning the pressure relief cap one half turn

counterclockwise. When the pressure is released, remove the pressure relief cap.

2. Using hose clamp pliers, clamp the lower degas bottle hose.
3. Using a suitable suction device, siphon the coolant from the degas bottle.
4. If equipped, detach the wiring retainer from the degas bottle.
5. Disconnect the degas bottle-to-radiator hose and position aside.

3.5L engines

6. Disconnect the degas bottle-to-thermostat housing hose and position aside.

All vehicles

7. Disconnect the lower degas bottle hose and position aside.
8. Remove the nut, bolt and the degas bottle.
   - To install, tighten to 9 Nm (80 lb-in).
9. To install, reverse the removal procedure.
10. Fill the degas bottle. Refer to **Cooling System Draining, Filling and Bleeding** for the recommended coolant mixture and fill level.

2008 ENGINE PERFORMANCE

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-in
PCV heater element retaining screws	6	53

DESCRIPTION AND OPERATION

ENGINE EMISSION CONTROL

NOTE: **Do not permanently remove or render inoperative any part of the vehicle emission control system including related hardware. Failure to comply may violate applicable state and federal law.**

The engine emission control system consists of the PCV system:

PCV System - The PCV system:

- uses intake manifold vacuum to ventilate blow-by vapors from the crankcase.
- returns the vapors to the intake manifold for combustion.

The PCV system consists of the:

- PCV heater element (early build engines only).
- crankcase ventilation tube.
- PCV valve.

The PCV valve:

- varies the amount of blow-by gases returned to the intake manifold based on available engine vacuum.
- prevents combustion gases backfiring into the crankcase.
- utilizes an internal heater (early build engines only).

The PCV heater element:

- heats the ventilating air and blow-by gases going to the intake manifold.
- is retained by 2 self-tapping screws and mounted in the intake manifold.
- has an optional set of mounting holes located in the intake manifold.

Vehicle Emission Vacuum Routing

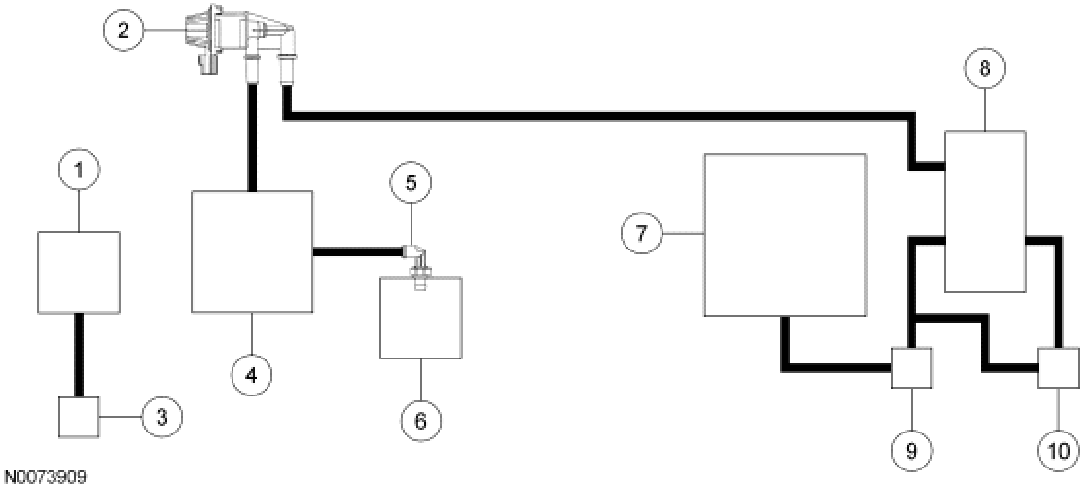

Fig. 1: View Of Vehicle Emission Vacuum Routing - All Wheel Drive (AWD) Vehicles

1. For additional information, refer to the procedures.

POSITIVE CRANKCASE VENTILATION (PCV) VALVE

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20	WSS-M2C930-A

Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	

REMOVAL AND INSTALLATION

Early build engines

1. Disconnect the PCV valve electrical connector.

   All engines

2. Disconnect the crankcase ventilation tube from the PCV valve.

CAUTION: A new positive crankcase ventilation (PCV) valve must be installed if removed from the valve cover. Damage will occur to the locking mechanism on the PCV valve.

NOTE: To install, apply clean engine oil to the O-ring seal.

NOTE: Upon installation, make sure the PCV valve electrical connector is pointing in the correct position to allow the wiring harness to be connected. Incorrect installation would require removal and replacement of the valve.

3. Rotate the PCV valve counterclockwise and remove from the valve cover.
   - Discard the PCV valve.
4. To install, reverse the removal procedure.

POSITIVE CRANKCASE VENTILATION (PCV) HEATER ELEMENT

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

REMOVAL AND INSTALLATION

1. Disconnect the PCV heater element electrical connector.
2. Release the spring tension clamp and remove the crankcase ventilation tube from the PCV heater element.

NOTE: The intake manifold is manufactured with an optional set of mounting holes for the PCV heater element self-tapping retaining screws that may be used if necessary.

3. Remove the 2 PCV heater element retainer screws.
   - To install, tighten to 6 Nm (53 lb-in).
4. Remove the PCV heater element from the intake manifold.

NOTE: To install, apply clean engine oil to the O-ring seal.

NOTE: Upon installation, make sure the PCV heater element electrical connector is in the correct position to allow the wiring harness to be connected.

5. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

ENGINE IGNITION

The Electronic Ignition (EI) system is a coil-on-plug ignition system. The coil-on-plug ignition system consists of:

- Camshaft Position (CMP) sensors.
- a Crankshaft Position (CKP) sensor.
- ignition coil-on-plugs.
- spark plugs.

The CMP sensors:

- are variable reluctance sensors.

- are mounted in the rear of the cylinder head.
- are triggered by a 3-plus-1 timing wheel on each intake camshaft.
- provides camshaft rotational location information to the PCM.

The CKP sensor:

- is a variable reluctance sensor.
- is triggered by a 36-minus-1 tooth trigger wheel mounted on the crankshaft, at the rear of the engine.
- provides base timing and crankshaft speed (RPM) to the PCM.

The ignition coil-on-plugs:

- change low voltage signals from the PCM to high voltage pulses.
- produce the high voltage pulses to the spark plugs.
- are connected directly to each spark plug.
- have replaceable coil seals.

The spark plugs:

- change high voltage pulses into a spark which ignites the fuel and air mixture.
- originally equipped on the vehicle have a platinum-enhanced fine wire electrode for long life.

DIAGNOSTIC TESTS

ENGINE IGNITION

IGNITION COIL-ON-PLUG

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

REMOVAL AND INSTALLATION

LH side

1. Disconnect the crankcase ventilation tube-to-valve cover quick connect coupling and position aside. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.

   RH side

   NOTE: The upper intake manifold must be removed to access the RH ignition coil-on-plugs.

2. Remove the upper intake manifold. For additional information, refer to **ENGINE - 3.5L** article.

   Both sides

3. Disconnect the 6 ignition coil-on-plug electrical connectors.

   NOTE: When removing the ignition coil-on-plugs, a slight twisting motion will break the seal and ease removal.

4. Remove the 6 bolts and the 6 ignition coil-on-plugs.
   - To install, tighten to 7 Nm (62 lb-in).
5. Inspect the coil seals for rips, nicks or tears. Remove and discard any damaged coil seals.
   - To install, slide the new coil seal onto the coil until it is fully seated at the top of the coil.

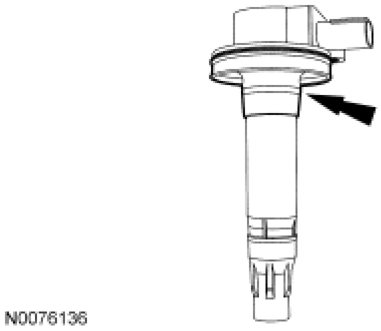

Fig. 3: Identifying Coil Seal On Coil
Courtesy of FORD MOTOR CO.

6. To install, reverse the removal procedure.
   - Apply a small amount of dielectric grease to the inside of the ignition coil-on-plug boots before attaching to the spark plugs.

XG-3-A	

REMOVAL

LH side

1. Disconnect the crankcase ventilation tube-to-valve cover quick connect coupling and position aside. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.

   RH side

   NOTE: **The upper intake manifold must be removed to access the RH spark plugs.**

2. Remove the upper intake manifold. For additional information, refer to **ENGINE - 3.5L** article.

   Both sides

3. Disconnect the 6 ignition coil-on-plug electrical connectors.

   NOTE: **When removing the ignition coil-on-plugs, a slight twisting motion will break the seal and ease removal.**

4. Remove the 6 bolts and the 6 ignition coil-on-plugs.

   NOTE: **Only use hand tools when removing or installing the spark plugs, or damage may occur to the cylinder head or spark plug.**

   NOTE: **Use compressed air to remove any foreign material in the spark plug well before removing the spark plugs.**

5. Remove the 6 spark plugs.

INSTALLATION

Both sides

1. Inspect the 6 spark plugs. For additional information, refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.
2. Adjust the spark plug gap as necessary.

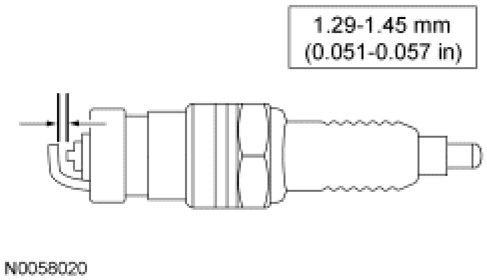

Fig. 4: Adjusting Spark Plug Gap With Specification
Courtesy of FORD MOTOR CO.

NOTE: **Only use hand tools when removing or installing the spark plugs, or damage may occur to the cylinder head or spark plug.**

3. Install the 6 spark plugs.
    - Tighten to 15 Nm (133 lb-in).

NOTE: **Apply a small amount of dielectric grease to the inside of the ignition coil-on-plug boots before attaching to the spark plugs.**

4. Install the 6 ignition coil-on-plugs and the 6 bolts.
    - Tighten to 7 Nm (62 lb-in).
5. Connect the 6 ignition coil-on-plug electrical connectors.

RH side

6. Install the upper intake manifold. For additional information, refer to **ENGINE - 3.5L** article.

LH side

7. Position and connect the crankcase ventilation tube-to-valve cover quick connect coupling. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.

DESCRIPTION AND OPERATION

ENGINE

NOTE: **When repairing engines, all parts must be contamination free. If contamination/foreign material is present when repairing an engine, premature engine failure may occur.**

NOTE: **Specifications show the expected minimum or maximum condition. Refer to the appropriate Engine article for the procedure.**

NOTE: **If a component fails to meet the specifications, it is necessary to refinish it or install a new component. Wear limits are provided as an aid to determine if the component can be refinished. A new component must be installed when any component fails to meet specifications and cannot be refinished.**

NOTE: **This part contains information, steps and procedures that may not be specific to this engine.**

This part covers general procedures and diagnosis and testing of the engine system, except for exhaust emission control devices, which are covered in the **Introduction - Gasoline Engines** article.

The engine incorporates the following features: Refer to the appropriate Engine article for the procedure.

- Crankcase ventilation or breather system

- Exhaust emission control system
- Evaporative Emission (EVAP) control system

Some engines incorporate a fail-safe cooling system. Refer to the appropriate Engine article for the procedure.

The engine, fuel system, ignition system, emissions system and exhaust system all affect exhaust emission levels and must be maintained according to the maintenance schedule. Refer to the scheduled Maintenance Guide.

Correct engine identification is required to order parts. Refer to the appropriate Engine article for the procedure.

For complete vehicle and engine identification codes, refer to **IDENTIFICATION CODES** article.

There are 2 diagnostic paths that can be followed depending on the type of engine concern. Carry out Inspection and Verification - Engine Performance or Inspection and Verification - NVH.

Inspection and Verification - Engine Performance

1. Verify the customer concern by operating the engine to duplicate the condition.
2. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

VISUAL INSPECTION CHART

Mechanical
• Engine coolant leaks • Engine oil leaks • Fuel leaks • Damaged or severely worn parts • Loose mounting bolts, studs and nuts

3. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

NOTE: The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.
9. If the DTCs retrieved are related to the concern, go to the DTC Chart, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart - Engine Performance**.

Inspection and Verification - NVH

1. NVH symptoms should be identified using the diagnostic tools and techniques that are available. For a list of these techniques, tools, an explanation of their uses and a glossary of common terms, refer to **NOISE, VIBRATION AND HARSHNESS** article.

2. Verify the customer concern by operating the engine to duplicate the condition.
3. Check the engine oil level and check the oil for contamination. Low engine oil level or contaminated oil are a common cause of engine noise. If the oil is contaminated, the source of the contamination must be identified and repaired as necessary.
4. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

VISUAL INSPECTION CHART

Mechanical
• Loose mounting bolts, studs and nuts • Damaged or leaking powertrain mounts • Damaged or disconnected vacuum hoses • Obstruction of cooling fan • Obstruction of Front End Accessory Drive (FEAD) • Obstruction of Rear End Accessory Drive (READ), if equipped • Damaged or disconnected air intake components

5. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.

NOTE: Make sure to use the latest scan tool software release.

6. If the cause is not visually evident, connect the scan tool to the DLC.

NOTE: The VCM LED prove out confirms power and ground from the DLC are provided to the VCM.

7. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
8. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
9. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
10. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.

11. If the DTCs retrieved are related to the concern, go to the DTC Chart, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
12. If no DTCs related to the concern are retrieved, continue the inspection and verification if a noise concern is related to the engine. For vibration concerns and noise concerns, such as powertrain mounts, air intake system and starter, Go to **Symptom Chart - NVH**.

    In some cases, a noise may be a normal characteristic of that engine type. In other cases the noise may require further investigation. Comparing the noise to a similar year/model vehicle equipped with the same engine will aid in determining if the noise is normal or abnormal.

    Once a customer concern has been identified as an abnormal engine noise, it is critical to determine the location of the specific noise. Use the EngineEAR/ChassisEAR or stethoscope to isolate the location of the noise to one of the following areas.

    - Fuel injector(s)
    - Upper end of engine
    - Lower end of engine
    - Front of engine
    - Rear of engine

    Fuel injector noise - A common source of an engine ticking noise can be related to the fuel injector(s). This is normal engine noise that can be verified by listening to another vehicle. If the injector noise is excessive or irregular, use the EngineEAR/ChassisEAR or stethoscope to isolate the noise to a specific fuel injector.

    Upper end engine noise - A common source of upper end engine noise (ticking, knocking or rattle) includes the camshaft(s) and valve train. Upper end engine noise can be determined using the EngineEAR/ChassisEAR or stethoscope on the valve cover bolts. If the noise is loudest from the valve cover bolts, then the noise is upper end. The EngineEAR/ChassisEAR or stethoscope can be used to further isolate the noise to the specific cylinder bank and cylinder. Removal of the valve covers will be required to pinpoint the source of the noise.

    Lower end engine noise - A common source of lower end engine noise (ticking or knocking) includes the crankshaft, connecting rod(s) and bearings. Lower end noises can be determined by using the oil pan or cylinder block lug bosses. If the noise is loudest from these areas, then the noise is lower end. If an engine noise is isolated to the lower end, some disassembly of the engine may be required to inspect for damage or wear.

    Front of engine noise - A common source of noise from the front of the engine (squeal, chirp, whine or hoot) is the Front End Accessory Drive (FEAD) components. To isolate FEAD noise, carry out the Engine Accessory Test, refer to **NOISE, VIBRATION AND HARSHNESS** article.

    Some other noises from the front of the engine (ticking, tapping or rattle) may be internal to the engine. Use the EngineEAR/ChassisEAR or stethoscope on the engine front cover to determine if the noise is internal to the engine. Removal of the engine front cover may be necessary to inspect internal engine components.

Rear of engine noise - A common source of noise from the rear of the engine (knocking) is the flywheel/flexplate. Inspection of the flywheel/flexplate will be necessary.

Some engines have timing drive components at the rear of the engine and may be the source of noise (ticking, knocking or rattle). Use the EngineEAR/ChassisEAR or stethoscope on the rear of the engine if you suspect the noise is internal to the engine. Some disassembly of the engine may be required to inspect for damage or wear.

If equipped, the Rear End Accessory Drive (READ) can also be a source of noise from the rear of the engine (squeal or chirp). The READ consists of the coolant pump and belt.

13. After you have localized the noise, note the characteristics of the noise, including type of noise, frequency and conditions when the noise occurs and Go to **Symptom Chart - NVH**.

Symptom Chart - Engine Performance

Symptom Chart - Engine Performance

Condition	Possible Sources	Action
• Difficult starting	• Inoperative or damaged ignition system • Air or vacuum leak • Inoperative or damaged fuel system • Inoperative or damaged starting system	• Refer to the appropriate Engine article for the procedure. REFER to the **Introduction - Gasoline Engines** article.
	• Damaged charging system/battery	• REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article.
	• Burnt valve	• INSTALL a new cylinder head. TEST the system for normal operation after the repair.
	• Worn piston • Worn piston rings • Worn cylinder	• INSTALL a new short block. TEST the system for normal operation after the repair.
	• Damaged head gasket	• INSTALL a new cylinder head gasket. TEST the system for normal operation after the repair.
	• Inoperative or damaged cooling system	• Refer to the appropriate Engine article for the procedure.
	• Fail-safe cooling invoked (if equipped)	• REFER to the **Introduction - Gasoline Engines** article.
• Poor idling	• Vacuum leaks • Inoperative or damaged	• Refer to the appropriate Engine article for the procedure. REFER

	EGR system	to the **Introduction - Gasoline Engines** article.
	• Inoperative or damaged ignition system	• Refer to the appropriate Engine article for the procedure.
	• Inoperative or damaged cooling system • Inoperative or damaged fuel system	• Refer to the appropriate Engine article for the procedure.
	• Fail-safe cooling invoked (if equipped)	• REFER to the **Introduction - Gasoline Engines** article.
	• Incorrect valve clearance	• ADJUST valve clearance. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
	• Incorrect valve-to-valve seat contact	• INSTALL a new cylinder head. TEST the system for normal operation after the repair.
	• Damaged head gasket	• INSTALL a new cylinder head gasket. TEST the system for normal operation after the repair.
• Engine runs rough	• Inoperative or damaged fuel system • Air or vacuum leaks • EGR system fault • Inoperative or damaged cooling system • Inoperative or damaged ignition system	• Refer to the appropriate Engine article for the procedure.
	• Fail-safe cooling invoked (if equipped)	• REFER to the **Introduction - Gasoline Engines** article.
	• Burnt or sticking valve	• INSTALL a new cylinder valve. TEST the system for normal operation after the repair.
	• Weak or broken valve spring	• INSTALL a new valve spring. TEST the system for normal operation after the repair.
	• Carbon accumulation in combustion chamber	• ELIMINATE carbon buildup. TEST the system for normal operation after the repair.
• Excessive oil	• Leaking oil	• REPAIR oil leakage. TEST the system for normal operation after

consumption	• Inoperative PCV system	the repair. • REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Incorrect oil	• CHANGE oil to correct specification.
	• Worn valve stem seal	• INSTALL a new valve stem seal. TEST the system for normal operation after the repair.
	• Worn valve stem or valve guide	• INSTALL a new cylinder head. TEST the system for normal operation after the repair.
	• Sticking piston rings • Worn piston ring groove • Worn piston or cylinder	• INSTALL a new short block. TEST the system for normal operation after the repair.
• Insufficient power	• Inoperative or damaged ignition system • Air intake system blockage • Lubrication system blockage • Inoperative or damaged fuel system	• Refer to the appropriate Engine article for the procedure. REFER to the **Introduction - Gasoline Engines** article.
	• Oil level too high	• DRAIN oil to correct level. TEST the system for normal operation after the repair.
	• Incorrect engine oil	• INSTALL correct specification engine oil. TEST the system for normal operation after the repair.
	• Excessive accessory drive belt loading • Inoperative or damaged cooling system	• Refer to the appropriate Engine article for the procedure.
	• Fail-safe cooling invoked (if equipped)	• REFER to the **Introduction - Gasoline Engines** article.
	• Damaged or plugged exhaust system	• INSPECT exhaust system. TEST the system for normal operation after the repair.
	• Incorrect tire size	• REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

	• Dragging brakes	• REFER to **BRAKE SYSTEM - GENERAL INFORMATION** article.
	• Slipping transmission	• Refer to the appropriate Automatic Transmission article for the procedure.
	• Incorrect valve clearance	• ADJUST valve clearance. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
	• Worn or damaged valve tappet	• INSTALL a new valve tappet. TEST the system for normal operation after the repair.
	• Damaged valve guide • Compression leakage at valve seat • Seized valve stem	• INSTALL a new cylinder head assembly. TEST the system for normal operation after the repair.
	• Weak or broken valve spring	• INSTALL a new valve spring. TEST the system for normal operation after the repair.
	• Worn or damaged cam	• INSTALL a new camshaft. TEST the system for normal operation after the repair.
	• Damaged head gasket	• INSTALL a new head gasket. TEST the system for normal operation after the repair.
	• Cracked or distorted cylinder head	• INSTALL a new cylinder head assembly. TEST the system for normal operation after the repair.
	• Damaged, worn or sticking piston ring(s) • Worn or damaged piston	• INSTALL a new short block. TEST the system for normal operation after the repair.

Symptom Chart - NVH

NOTE: **NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible that any one of multiple systems may be the cause of the symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the**

next likely system and continue diagnosis.

Symptom Chart - NVH

Condition	Possible Sources	Action
• Drone type noise	• Powertrain mount(s)	• CARRY OUT the **Powertrain/Drivetrain Mount Neutralizing** procedure. TEST the system for normal operation after the repair.
• Drumming noise - occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very rpm dependent	• Engine vibration excites the body resonances inducing interior noise	• CARRY OUT the **Powertrain/Drivetrain Mount Neutralizing** procedure. TEST the system for normal operation after the repair.
• Engine drumming noise - accompanied by vibration	• Powertrain mount(s)	• CARRY OUT the **Powertrain/Drivetrain Mount Neutralizing** procedure. TEST the system for normal operation after the repair.
• Rattle - occurs at idle or at light acceleration from a stop	• Powertrain mount(s)	• CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the appropriate Engine article for the procedure. For automatic transmission, Refer to the appropriate Automatic Transmission article for the procedure. For manual transmission, REFER to **MANUAL TRANSAXLE/TRANSMISSION** article. TEST the system for normal operation after the repair.
• Whine/moan type noise - pitch increases or changes with vehicle speed	• Powertrain mount(s)	• CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the appropriate Engine article for the procedure. For automatic transmission, Refer to the appropriate Automatic Transmission article for the procedure. For manual transmission, REFER to **MANUAL TRANSAXLE/TRANSMISSION** article. TEST the system for normal operation after the repair.
		• CHECK the powertrain/drivetrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the

• Clunk - occurs when shifting from PARK or between REVERSE and DRIVE	• Powertrain mounts	appropriate Engine article for the procedure. For automatic transmission, Refer to the appropriate Automatic Transmission article for the procedure. For manual transmission, REFER to **MANUAL TRANSAXLE/TRANSMISSION** article. TEST the system for normal operation after the repair.
	• Idle speed is too high	• CHECK for the correct idle speed. TEST the system for normal operation after the repair.
• Accessory drive bearing hoot - occurs at idle or high idle in cold temperatures of approximately 4° C (40°F) or colder at the first start of the day	• Accessory drive idler or tensioner pulley bearing is experiencing stick/slip between ball bearings and the bearing race	• CARRY OUT the engine cold soak procedure. REFER to **NOISE, VIBRATION AND HARSHNESS** article. • PLACE the EngineEAR probe directly on the idler/tensioner center post or bolt to verify which bearing is making the noise. INSTALL new parts as necessary. Refer to the appropriate Engine article for the procedure. TEST the system for normal operation after the repair.
